THE ADVICE, not to put hives on a bench much closer than about 6 inches, p. 397, is correct. But the same number could be on the bench with less danger of bees entering wrong hives by having first space between hives 2 inches, the next space 10 inches, then 2 and 10 alternately. [When I visited Dr. Miller two years ago he demonstrated the truth of the statement he has just made. His hives were arranged as he describes in this *Straw*, and yet there was no confusion among the bees.—ED.]

YE EDITOR, it seems to me, is a little too ready to concede to Prof. Cook that the A B C is wrong in calling formic acid a vegetable acid, p. 402. The A B C doesn't call it so, although it squints that way. It wonders whether the poison is not similar to formic acid or the same, and says it (the bee poison) is probably a vegetable acid. According to Prof. Langer (p. 382) it is vegetable, but not an acid, "a vegetable base, an alkaloid." [Then you think Prof. Cook is wrong. Possibly he would modify his opinion if he were referred to your authority.—ED.]

THE OLD-COMB discussion has crossed the ocean. One writer calls ten-year-old combs a myth. *Per contra*, *Abille Hongroise* reports a hive continuously occupied for 133 years! The able editor of *Le Rucher Belge* says a great number of distinguished practitioners carefully preserve their old combs, and that the objection to them is nothing but an old prejudice. [Is it not a fact, however, that when the old-comb discussion crossed the ocean it crossed from Europe to America, and not from America to Europe? That is, is it not true that we are reviving an old problem that has long been settled in Europe?—ED.]

THAT DARK CLOTHING is decidedly objectionable to bees, Editor Gravenhorst thinks proven by the following incident: With three visitors he was in the apiary, when a dog stirred up a colony. The excited bees pitched upon the lady and gentleman dressed in black, while himself and the lady in white were undisturbed. [I have seen cases where bees would attack persons with black hats when they would not molest those with light-colored head-gear. I have been slow to believe that they recognize color in this way; but in view of the evidence that has been cropping out here and there for a number of years, I am prepared to believe that black, at least, is at times offensive to bees that are not particularly good-natured.—ED.]

SOMETHING a little out of whack about the advice of Henry Segelken, p. 384. He says it's claimed twice as much extracted as comb can be produced. Expenses for sections, foundation, and shipping-cases far exceed cost of packages for extracted, so a pound of comb costs producer more than twice as much as a pound of extracted. So the New York mar-

ket for buckwheat comb ought to be more than twice as much as for extracted, but he wants the extracted men to change to comb while the market, p. 375, quotes comb at less than twice as much as extracted. [If it is true that twice as much extracted as comb can be produced, then there would be something wrong about the advice given by Mr. Segelken; but I do not think it is true, and under some circumstances as much comb as extracted will be produced. If there is a difference at all, it probably would not exceed a half more, and generally not more than a quarter. Mr. R. C. Aikin once said at a National convention that it was not true that more extracted could be produced than comb.]

But, look here, doctor; you are putting the difference of the cost of packages between extracted and comb a little too high. I should say that packages for comb would cost about a half more if we figure in barrels and square cans. You would have to figure in these large packages because the great bulk of honey sent to market is either in barrels or square cans. I think Mr. Segelken's general statement is true, that it would be more profitable for many bee-keepers to produce more comb rather than extracted honey. If there is any error in the statement it is the error in the relative cost of comb and extracted honey per pound.—ED.]

MR. EDITOR, you're another. I don't believe I'm a bit wrong "in assuming that a given number of eggs laid by the queen will give the same number of bees" in the circumstances under consideration, p. 380. You say when frames well filled with eggs are given to a queenless colony, only about two-thirds of the cells that had those eggs will be continued to sealed brood. Instead of two-thirds, I don't believe the average will be one fourth. I've known cases in which I think 19 out of 20 eggs disappeared. Queenless bees do that sort of thing. I don't know why, but they do. But we were not talking about queenless bees. You say, this spring when it was too cold for bees to take care of much brood the queens kept on laying, and the bees reared only what they could cover. Exactly. But we were not talking about a time when it is too cold. We were talking about a time when queens would lay 3400 eggs daily, and I don't believe any queen will do that unless the bees are fully able to care for all of them. She may lay eggs just for the fun of it when only a few hundred are required daily; but when it comes to thousands, that's business, and she'll lay no more than are needed. You know you can lift out frame after frame evenly filled and evenly sealed without a vacancy. If some were destroyed the vacancies ought to show. You say we'd be doing well to get half of a hen's eggs hatched into chickens. And you the son of a poultry-fancier! Better come and take lessons of Mrs. Miller. She thinks she doesn't do well unless she gets at least 10 chickens out of 13 eggs. But we were not talking about poultry, queenless bees, nor weak colonies in cold weather. We were talking about colonies with weather and queens that would allow 3400 eggs daily. Now you

figure how many bees ought to be in such a colony. And give proof, if you have any, that the bees destroy *any* eggs in such a colony. [Yes, while it is true that the destruction of eggs in the spring may not be particularly german to the question at issue, yet I introduced it to show that eggs do disappear at certain times, and why not at others? Then how do you know, doctor, that those combs that are filled solid with brood (by "filled" I mean two-thirds full) may not have had some cells filled with eggs more than once? You will remember that brood does not all hatch in the same day. As a rule it will continue hatching out young bees for a week. I can not escape the conclusion that, even during the height of the season, some eggs are laid which do not produce bees. At your next opportunity, weigh the heaviest swarm of bees just as it is taken from the tree. Confine them in a box for a day, and then weigh the swarm; or, better still, weigh all the bees in a two or three story colony occupying and covering 24 frames. If you can find a case where there will be more than 9 lbs. of bees (45,000 in number) I will buy you the best plug hat you can find in Marengo. This is not a bet, because I have nothing to gain, and I do not believe you have either. The real issue is whether a large colony of bees of three stories can have 40,000 to 50,000 or 90,000 to 100,000. I should doubt very much whether you could get 90,000 bees in a two-story hive, half the combs filled with brood and the other half with honey. If you can, go to the store and get your plug hat and send the bill to me.—E.D.]

Bees, buds, and blossoms
Are the order of the day;
Heaven's clime seems prophesied
In this month of May.

A writer in the *Australian Bee Bulletin* says, "I have a call for granulated honey, and would have more if I encouraged it, but liquid honey is less trouble to me. If you want honey to granulate, leave the cover off during wet weather for a day or two."

It is greatly to be regretted that Mr. Will Ward Mitchell, who assumed the editorship of the *Progressive Bee-Keeper* lately, was compelled to relinquish the work almost immediately, on account of failing eye-sight. If the good wishes of his friends avail, he will soon recover from what all consider the summit of misfortune—a failure of sight. May his "lines" fall in pleasant places.

That honey from pennyroyal, to which the senior editor refers on page 407, is here, but he is not; hence I take occasion to say a word

about it. It is light amber in color, and is practically invisible when spread on bread and butter. There is nothing about the flavor to suggest the pennyroyal of the North. To me the flavor is just like that of birch candy, which I consider a good recommendation. I shall use it while the present supply lasts.

Relative to the Caucasian bee in its native land, Mr. Fr. Greiner makes the following translation from the *Leipziger Bienenzeitung*:

The Mohammedan inhabitants of Caucasia not only love good horses but also honey, and the wealthier portion of them are often extensively engaged in bee-keeping some of them owning from 100 to 400 skeps of bees. As might be expected, the hives used by these people differ greatly from ours. The bee keepers make them themselves in the winter season from willow, basket fashion, daubed inside and out with clay.

As simple as are the hives, so is the management of the apiary, although migratory bee-keeping is the order. In the spring the colonies are moved on heavy wagons drawn by ox-teams toward the river, where the bees find the first pasture. A little later, and before swarming again, they are moved to the bountifully blooming heath (*steppe*). There are no trees or forests in these regions, and so the bee-keeper makes some kind of boxes out of bark, and places them about for the young swarms to light on. The bees are then easily dumped out and hived in the regular hive.

Practically the Caucasian bee does *not* sting except in sheer desperation or self-defense; consequently the bees are easily handled, and no protection is needed or used by the Tartar bee-keeper.

After swarming, the bees are moved for the third time, and this time into the mountains. Here most of these skeps become so crowded that more room must be given, which is done by digging a hole under each hive (all colonies are placed directly on the ground, without any floor-board under them). As soon as the fall flow ceases, all the heaviest colonies are brimstoned, and then the honey is sold in the city. Of course, this honey is cheap, yet quite an income is secured from its sale, and bee-keeping is considered a lucrative business.

GAZETTE APICOLE.

This journal, a French exchange, gives the following recipe for making caramels, which it pronounces "incomparable." Rose water, 15 grams; powdered sugar, 100 grams; fine honey, 200 grams. Mix and boil, stirring constantly, until a drop of the compound, when cooled, is hard and fragile. Pour out on a buttered or oiled marble slab, and shape the mixture into suitable pieces by means of a teaspoon.

To protect combs from the moth-miller, put them in a perfectly tight box in which are one or two bottles of sulphide of carbon. Stop the bottles loosely with cotton or paper, so as to allow a slight leakage of the drug. The eggs will hatch as usual, but the larvae will die immediately.

AMERICAN BEE JOURNAL.

In the issue for April 25, Mr. York has rendered us a great service in giving us a portrait of Mr. G. Kandratieff, editor of what is probably the only Russian bee-journal. Also quite a sketch of his remarkable life is given as a soldier, musician, and writer. More than any other man he has been the means of introducing modern apiculture into that very conservative country, Russia. He uses and recom-

mends what is here known as the Dadant hive and system. He translated Mr. Bertrand's "Guide to Apiculture" into Russian. These two men are very close friends. It is to be hoped he can make a visit to this country some time.

W

Prof. Cook's talk for the home circle, now running in the Old Reliable, constitutes a most excellent feature of it. They bear largely on the proper management of children, and home conduct in general. All who have Mr. York's paper will do well to read these lines of Prof. Cook the first thing, as they fit one for what follows. Best of all, we know that the writer speaks from experience, and in his daily life is an exponent of what he enjoins.

BEE-KEEPING IN CUBA.

Some Remarkable Figures; Unoccupied Fields
among the Mosquitoes.

BY H. G. OSBURN.

You will remember that, a few months ago, I took charge of this wreck of what was once the finest apiary in the world so far as we could find out. Well, the crop is off for this year. What I have done this winter is only a drop in the bucket compared with what can be done in good locations by one who understands how to work his bees in this stubborn climate.

In the five months past I have increased to 105 colonies; raised 95 young laying queens, and taken a crop of 40,500 lbs. of honey on a range that is supporting at present 1200 hives of bees; or, in other words, within a radius of three miles of this apiary there are over 1200 colonies, and we had a cold spring too. But this is 15,000 lbs. short of what it ought to have been; but I shall try to make up for it next winter, as I expect to take 100,000 lbs. of honey from 1000 colonies in three apiaries. I have already 5000 gallons of honey sold for next year's crop, so the reduced price doesn't worry me much. The cheaper it gets, the more we have got to raise in order to make our ends meet.

It may interest some of your readers to know what this apiary has produced in its 15 years of existence. I myself became anxious to know, the other day, so I began to go over my father's old records, and, after running them all up, and those of smaller bee-keepers who have had charge of this place for a short period from time to time, I find that this one ranch has produced almost a million pounds of honey. The exact figures are about 800,000 lbs. I should like to hear from anybody who can show a similar record for 15 successive years. Had I been able to run this ranch during the war, or the winter of 1898, I should

have beaten any record the world has ever seen in the honey line. As it was, there was over 50,000 lbs. taken from 200 hives.

I notice a 69 hive bee-keeper, p. 136, taking some of us old experienced chaps by the neck for not printing a truthful picture of the real state of the bee-industry in Cuba. I do not wish to offend him; but does the man really know what a bee location for 300 or 500 colonies means? Does he know that here the average force of a good working colony is about 10,000 bees, or three million workers, for a 300-hive apiary, or three million drops of honey every half hour, and six million every hour? or from 300 to 600 lbs. every 30 or 60 minutes? Now, from a close observation I have come to the conclusion that 15 blossoms of this bellflower will, as a rule, furnish a bee its load, and some mornings it will not take half this number. Now we see that, in order to furnish our three million workers a load every half-hour we must have 45 million blossoms at their disposal, or 90 million for one hour's work; and for 6 hours' work it would take the grand total of 540 million flowers, or blossoms, to furnish our 300-hive apiary six hours' work, representing 3600 lbs. for the six hours' work. These figures do not include the enormous amount of honey consumed by these 300 colonies every 24 hours. These figures are not very far from correct, as nearly as we can make calculations, for in years gone by we have had to extract from 2000 to 2500 lbs. every day, six days in the week, to keep up with our 500-hive apiary; then there was the honey they stored in the brood-chamber and fed to the brood, which, I think, is about a third of what they gather every day.

Now, if Mr. Luaces knows more about what is required for a large apiary to feed upon I shall feel that my 15 years of practical experience and close observation have not been altogether void of good. I am well aware of the fact that there are hundreds of good locations here yet unclaimed, where 500 and even 1000 colonies can't clean up the range; but, where are they? I can answer this question myself. They are in the middle and along the southern and southwest coast of the island, where nobody but colored people can live, on account of the insects. Then they are almost entirely shut off from communication with any of the large cities. I expect to penetrate some of them next year, and then I can tell the readers of this journal more about the honey resources of Cuba.

. Punta Brava, Cuba, Mar. 5.

[Your figures and estimates in regard to the honey resources of Cuba may be and probably are correct; but you have made a strange mistake, apparently, in your estimate as to "the average working force of a good colony" as being about 10,000 bees. From other things you say in this connection I judge you consider this a large force. If so, you are certainly wrong. If you will turn to page 380 you will see that we must place the number of a good colony at anywhere from 40,000 to 90,000; and you have allowed only a little over a tenth of the largest figure; or, in other words, your

estimates all through might be increased almost ten times; for the largest number of bees allowed by Dr. Miller was nine times what you figure on, and about one-fourth the number figured by myself. In this locality a colony of 10,000 bees would not be worth much for honey; and while I should assume that you could get more honey in Cuba, from a given number of bees, than we can here in the United States, yet a colony of four or five times that strength would do a great deal more in the amount of honey gathered than four or five nuclei, each of 10,000 bees.—ED.]

INTERVIEW WITH MR. BROWN.

BY CHALON FOWLS.

Calling next on Mr Brown I found him feeling pretty blue. When I urged him to join the Association he said, "I'll tell you what, Mr. Fowls, I feel as though I had put too much money in the bee business already.

your bees have not paid this year, they represent so much capital invested; and your membership fee of a dollar a year may be considered as a necessary investment to protect you from loss on what you have already invested."

"But the Association is not an insurance company, and will not protect me from loss by fire or flood."

"No; but you get protection from loss in other ways. You know ignorant or ill-disposed persons might do you much damage. Suppose some one should get an ordinance passed prohibiting the keeping of bees in the corporation."

"That would ruin my bee business, for, as I keep only 25 or 30 colonies, it would not pay me to establish an out-apiary with so few; but I would sell or give them away rather than go to law."

"Well, our Association prevents troubles of this kind by preventing such laws being passed. Then no one can threaten you with lawsuits."

THE FOUL BROOD SITUATION IN OHIO.

I have had no returns from the bees the past season, and my other expenses have been heavy. You see my new building is just finished, and I have just had it insured, and you know these things all cost like sixty."

"Yes, that's so; but why don't you adopt the same business principles with regard to your investment in the bee business that you do with your other property?"

"Why, what do you mean by that, Mr. Fowls?"

"Just this: It is considered good management to get a new building insured, although it has given no returns as yet. Now, although

"But if I take membership, as a protection against unjust legislation by the town council, and I should need no help in the matter, would I get any benefit from the investment?"

"Yes, sir. The Association can help us as no individual can in prosecuting adulterators, helping to get pure-food laws passed, thus keeping up prices on a paying basis. Just think what a difference one or two cents a pound would make to the producers."

"Yes, and the rascals might damage the market that much if allowed to go unmolested."

"Besides all this, Mr. Brown, foul brood is liable to break out, and we have no foul-brood laws in our State."

"Well, Mr. Fowls, here is my dollar for membership. Glad you called my attention to the matter; and this point about foul brood is important. We need to be in position to do something in case it appears."

Oberlin, Ohio.

[Now that Michigan has recently passed a foul-brood law, Ohio, on the border, ought to follow suit. Our Ohio bee-keepers have talked over this matter a number of times, but so far it has all ended in "talk." In the picture accompanying, the artist intended to represent under the Ohio banner, beginning at the left, Mr. Fowls, your humble servant, and Dr. Mason. The man with a hammer in his hand, behind the legislative anti-foul-brood fence, is supposed to be N. E. France, the father of effective foul-brood legislation. No wonder he looks with complacency on such scenes in Ohio; and no wonder the poor little chaps in Ohio are beginning to be alarmed. But we must quit our "talking" and get down to business, and that means to see that our candidates *before* their nomination for the senate and legislature are favorable to a bill like the Wisconsin measure, for instance. I have already approached some of the candidates for my own district and county. Let's up and at 'em, *now*.—Ed.]

YELLOW SWEET CLOVER.

Some of Its Peculiarities.

BY M. M. BALDRIDGE.

I find from experience that sweet-clover seed, no matter how fresh it is, is no exception to the general rule about certain seeds germinating the first season. Only a part germinates, and there may be several distinct crops from one seeding.

Dec. 2, 1897, I planted a row of yellow-sweet-clover seed in my garden, in a shallow trench, and then covered the seed from one to two inches deep with soil. The seed was fresh, having been gathered by me in July the same year. In February or March following, we had a week or so of very warm spring weather, and a fine crop of plants came up. A few days after, there was a big change in the weather, and every sweet-clover plant was killed by frost. In April or May following, another crop of the plants made its appearance; and before the growing period ended they were perhaps 2 feet high. In February following (1898), the hard freeze destroyed these plants—roots included—with just one exception. At one end of the row one solitary stool of the plants survived, and they made a fine growth, and also a good crop of seed. This experiment thus far demonstrated that the yellow sweet clover will sometimes winterkill, and that the plant is a biennial, the same as the white variety, and not an annual, as some writer, whom I can not now recall, has claimed. This stool of plants was

at the extreme north end of the row of the seed I had planted in Dec., 1897.

Well, there came up in the spring of 1899 another crop of plants the whole length of that row, and from the same seed I planted in Dec., 1897, and they also made a satisfactory growth, being from 2 to 3 feet long before cold weather set in. These plants came through the winter in good condition, and in June, 1900, they were in full bloom quite early in the month—from 3 to 4 weeks before the white variety showed any blossoms. I think this row of plants was just passing out of bloom at the time Mr. A. I. Root visited this city and made me a brief call. See GLEANINGS for July 15, 1900, in Notes of Travel.

The foregoing shows three distinct crops of plants of the yellow sweet clover, and I know that only one planting of the seed had ever been made upon that plot of ground. As yet I have seen no sign of the fourth crop of plants, and do not expect to see it; but it would cause me no great surprise should it occur, for I am satisfied that the seed may remain in the soil for 20 years, more or less, and then germinate and grow. And this fact may explain why many who are not bee-keepers have tried to exterminate sweet clover from their premises, and have not succeeded.

St. Charles, Ill., Mar. 21.

THE SWARTHMORE SYSTEM OF QUEEN-REARING.

How to Prepare Small Nuclei: a Simple and Effective Plan for Getting Queens Fertilized.

BY SWARTHMORE.

A great deal has been written, said, and done to simplify and cheapen methods for cell-getting, until now queen-breeders have about all that can be desired in an almost perfect system of cellwork, from the egg to the mature queen, her care after hatching, and all that. But cell-getting is not the expensive part of queen-rearing; in fact, it does not represent an eighth part of the work connected with the securing of a laying queen, ready for posting to the customer far or near.

The *great* expense in queen-rearing is that necessary for the proper fertilization of the young queens after they are reared. The queen-breeder, heretofore, has been obliged to tear asunder large numbers of full colonies to form nuclei of a frame or two each to receive the young queens, each in a separate colony for mating purposes only.

Now, all this is expensive—not alone in bees but in time, labor, care, and a hundred other ways. Full colonies are ruined, and all revenue from bees thus treated is entirely cut off until a laying queen is secured, sold, caged, and mailed. All this woeful waste has set me to thinking about a plan of operation to lessen the expense and labor in queen-rearing at the mating period.

Some years ago I succeeded in mating a number of queens from $4\frac{1}{4} \times 4\frac{1}{4}$ section boxes, each supplied with a teacupful of bees; but not until the past season have I been able to say that I have discovered a practical meth-

od of mating young queens by the section-box plan, although I have used them now for about 13 years.

The plan I have at last adopted is as follows: Have a good-sized swarm (natural or forced) into a body containing ten all-wood or Simplicity frames, each frame filled with $4\frac{1}{4} \times 5\frac{3}{8} \times 1$ inch one-piece plain sections, thus:

FRAME WITH FOUNDATION.

Each section should be supplied with a starter of brood foundation, as shown, and the frames are set rather close together until fully drawn out by the bees. Unless honey is coming in rapidly the bees should be fed constantly during comb construction, in the event of the swarm being a forced one.

In a few days a good prolific queen will have filled the most of these little combs with eggs, and in due time it will be found that each little comb has its supply of brood, honey, and bee-bread—the exact condition necessary for the successful formation of nuclei for queen-fertilization.

At this point take away all the section-holding frames, supplementing them with full sheets of capped brood, honey, etc., taken from other colonies; put on surplus arrangement, and close the hive. That colony will yet show you honey before the end of the season, even though you have borrowed every particle of their work from the time of hiving. Let them work on; you will not need to molest them more.

Remove the section-holding frames now clear of bees, just as taken from the hive, to the honey-house, and adjust to each side of each little comb, containing brood, a cover made of thin stuff, with $\frac{1}{4}$ -inch strips nailed all around the edges, as shown at A, Fig. 1. Four small staples, C C C C, driven part way into each corner of the lid, so as to project or telescope into the section box, will serve to hold the lids in place until they have become glued a bit by the bees.

When the lids are all in place, each little comb will be in a compartment by itself, and each com-

partment may be entered by the bees through the perforated zinc that covers the two $\frac{1}{4}$ -inch auger-holes in the center of each lid, as shown in the drawing, E E, Fig. 4. The zincs are nailed fast to the inside of each lid. Pieces of section stuff do very well to close the zinc-covered holes when occasion demands (see dotted lines in Fig. 4). A $\frac{1}{2}$ -inch flight-hole is cut just below the two large holes in one lid only. This is stopped with an ordinary druggist's cork, which is easily drawn when queens are to be introduced.

Now run a perfect-winged and sound-legged young virgin queen into each compartment; then recork the flight-holes and expose the zincs on all sides so that the bees can readily enter all the compartments from the sides, yet no queen can leave the compartment in which it is intended to restrict her. Then hang the frames in the hives of such bees as you may have just used in getting a batch of cells, or any

FIG. 1.

FIG. 4.

FERTILIZER NUCLEUS-BOX.

A, lid; B, section-box frame: C C C C, hive-staples, for guidance; D, perforated zinc; F, cork in flight-hole. Fig. 4 is a view of the under side of H, showing holes uncovered; B, part of section box; E, E, holes covered inside with perforated zinc; F, flight-hole uncorked; dotted lines show position of thin board when excluder-holes are covered.

queenless and broodless bees you may have at hand. Be careful, however, that there be no sort of queen with them, virgin or otherwise; and if they have been over three days queenless, a little tobacco smoke should be used.

A very simple way of supplying the compartments with young queens is to attach a ripe queen cell to each comb before adjusting the lids; then hang the frames among queenless and broodless bees with flight-holes corked, and zincs exposed. The bees will at once occupy the compartments, and in due time a young queen will hatch inside each compartment.

Any queenless bees will soon enter the compartments, and care for the brood and queens; and as soon as they become settled, feeding may begin. Feed a little sugar syrup (no honey) each day; and at the end of the fifth, if the weather is fine, remove the frames carefully, bees and all. Close all the entrances so none can escape from the compartments. If the weather is very warm, cover the holes on the flight side with wire net, as shown in the engraving, taking in as you do so, as many bees, that may be on the outside of the boxes, as possible.

ALLEY CONFINING SCREEN.

Take these frames some distance from the old stand, and set them out separately on stakes driven into the ground, thus:

SWARTHMORE'S FERTILIZING-FRAMES, WITH NUCLEUS BOXES IN PLACE.

Toward evening open the flight-hole to each compartment—three on one side and three on

the other, as shown above by the letters F F F. If the next day or two be fine, each and every queen will leave its little chamber to mate, and just as large a percentage will return safely as by any method of nuclei management now in vogue.

The life of these little colonies may be sustained several weeks by feeding lozenges of

TOP VIEW OF COVER.—G, food feeder.

Good food every three to five days. Press the food into the holes at the back of each box. The blocks of Benton mailing-cages may be filled with Good food attached to the back of each compartment by two staples driven into the ends of same and hung on two corresponding wire nails driven into the back lid, as shown in engraving at G, Figs. 2, 3.

Examinations for eggs may be made quite well through the back-most holes, which are easily uncovered by unhooking the Benton cage feeders; and when it is found that the young queens are laying, they should be removed and other young virgins supplied; or the frames may be again collated and placed on a single stand where the laying queens will keep in good health for an indefinite period.

In my next letter, with the editor's kind permission I will tell more about these section-box nuclei; how I manage to run these miniature colonies through the entire season, taking from them several laying queens each during the months suitable for queen-rearing; also how I have succeeded in informing 40 little colonies from one large stock, and successfully mating nearly every queen given to them.

[As I have explained elsewhere, this is the introductory article of a series giving a new system of queen-rearing. This method of having queens fertilized is something we have not yet tried, as it is too early in the season; but we give it in order that other breeders may put the plan to a test at

once. In our next issue Swarthmore will describe a new method of making queen-cups that I believe is original with him; also several other valuable kinks that will come in very good play just now.—ED.]

.....
 RAMBLE 185.

Peculiarities of Central California: Extracting in the State; Strainers vs. Settling-tanks; Importance of Clear Honey.

BY RAMBLER.

"See here, Rambler, what have you stuck this thermometer up here under the shed for?"

"That's a funny question, Mr. McCubbin. I wonder if you do not know the use of a thermometer? Don-cher know that is to enable me to keep a record of the heat? You

ly so hot, shade-boards are used quite freely. Many are successful without them, and I am coming to the conclusion that the providing of shade-boards anywhere in California is a useless expense. Then you have such little entrances to the hives, barely three inches in length. I should think there would be a congestion of both bees and heat."

"You see, Rambler, that's where my open-work covers and sack honey-board helps the bees to keep the hive cool—plenty of ventilation, and no melting."

"Now, then, Mr. McCubbin, as a precaution to myself, as well as comfort, and to save labor, I suppose you would have no objection to my erecting a sort of pavilion extracting-house under the peach-trees, and right alongside the bee-hives?"

"Not the least, Mr. Rambler."

And it was so accomplished. The pavilion was made as shown in the half-tone—a light

RAMBLER'S COOL RETREAT AMONG THE BEES AND PEACHES; EXTRACTING-HOUSE IN THE BACKGROUND.

said the other day that the temperature sometimes climbed up to 120. Now, I do not wish to be so foolish as to work under such a temperature; then if it *does* get up to 120, I want something reliable to brag about."

"Rambler, that is wrong; you should never mention the heated condition of this valley. Why, if you were in the real-estate business, as I am, you'd never catch the Eastern buyer. Ignore the heat, Rambler; ignore it, and throw that thermometer into the ditch."

"No, sir; I will tie to that thermometer, and I will report every hot day, and the effect upon the bees; but it seems strange to me that no shade-boards are in use in this country. Down south, where we have it not near-

framework, 8 feet square, 6½ in height. The lower half of the frame was covered with sacking, the upper half on three sides with wire cloth. This gave free access to any comfortable wind that might be stirring. The top was also covered with sacking; and, to aid the shade of the peach-tree, leafy boughs from other peach-trees were piled on, making a delightful, shady, and really comfortable place to manipulate the extractor.

I hope the half-tone will bring out those luscious peaches that were on the tree; but, mind you, they were not long there after they became luscious; and, by the way, there are many acres of peach-trees within 200 rods of this apiary, and not a complaint about the

bees injuring the fruit—no utter here to utter against the bees.

The shady pavilion constructed, another matter caused anxiety. In the southern portion of the State our apiaries are located in canyons, and there is an abundance of uneven ground, so that the tank can be placed below the extractor; and still another drop below the tank, for the convenient filling and removal of the five-gallon cans. Honey runs naturally from one to the other, without waste or daub.

Here in Central California the land is a dead level, and we must put the extractor on a platform, and climb up to it or dig a hole in the ground and get into that to lift the cans out. Neither way is satisfactory, and many use a pail to draw off into from the extractor, then lift it and turn it into the tank; but that is a shiftless method, and not in harmony with neatness and cleanliness. Out of my anxiety

above it, it holds its level position. When the filled can gets to the proper place at the top, the catch drops into a slot automatically, and holds it secure. The empty can has, of course, followed the other end of the revolving framework, and is at the bottom ready to be filled. The spout is adjusted under the gate of the upper or full can, and the gate adjusted so as to draw it off fast or slow as desired. The honey runs into the Rambler's ahead-of-date strainer, and into the tank. While the upper can is losing its contents the extractor is extracting more honey, and the cans are filled, revolved, and emptied *ad infinitum*, or until the crop is harvested. After using it while extracting all by myself nearly ten tons of honey, I am sure I would not discard it for the old dauby way.

And now as to tanks, strainers, and the proper curing of honey. In Southern California, tanks are used holding all the way from one to six tons of honey. It is seldom that you find a bee-keeper, owning 100 or more colonies of bees, with a tank capacity of less than a ton—probably the average is between the two and three ton tanks.

My observation in respect to the tank question in Central California is limited; but in my immediate vicinity, 30 gallons or less is the rule, while not a few consider a galvanized-iron wash-tub a good-enough tank. One would suppose that where such small tanks are used the more care would

RAMBLER'S HONEY-ELEVATOR, STRAINER, AND SETTLING TANK.

to have things handy, up to date, and a little ahead of date, there was eliminated the honey-elevator shown in the smaller picture.

There is the four-frame Cowan extractor, and there is the tank—i. e., if a thirty-gallon tub can be called a tank. Under the small faucet are the five-gallon cans ready to be filled.

Between the extractor and tank is my non-patented honey-elevator especially adapted for use in a level country. Observe the two five-gallon tin honey-cans, one at the top and the other at the bottom of the uprights. The upper sides of these cans are cut out. They are also provided with screw-cap honey-gates, such as are advertised in A. I. Root's catalog. These honey-gates are set in a little below the level of the bottom of the cans. To operate, open the extractor-gate and fill the can under it. Now grasp the end of the upright that rises above and next to the extractor; loosen a little catch at the top of the upright next the tank, and revolve that portion of the frame which is pivoted in the large block in the center. The lower and filled can will rise, and, being suspended from the cross-piece

be taken in straining the honey; but the practice is quite the contrary. The honey is run through wire cloth such as we use for window-screens, and almost directly into the five-gallon cans.

A bee-keeper in my vicinity who owns upward of 500 colonies of bees had finished his day's work, had loaded his two frame extractor and twenty-gallon tank and his cans of honey into his wagon, and was ready to depart for his home when I rode up on my wheel. He showed me his day's work and his strainer.

"Well, now, see here, Mr. ———, is there not a quantity of particles of comb and other substances in the honey?"

"Probably there is," said he; and he unscrewed several caps from the cans, and, sure enough, any quantity of those specks were rising to the surface of the honey.

"Oh! well," said he, "I can sell it for as much as you can get for clean honey. It goes to San Francisco, and they mix it with glucose, and what is the difference?"

It does make a difference, though; for recently, in conversation with a gentleman who has purchased a good amount of honey, he

said that he would not purchase such honey. He had had experience in that line, and he said that all of those specks did not rise to the top of the honey in the can, but were mixed with the honey three or four inches down, and before it could be used it was necessary to warm and strain it.

With the large tanks used in Southern California the honey remains in the tank at least 24 hours, many times longer; and, even if the honey is strained, a thick scum will rise to the surface; and when the honey is drawn off, how beautifully clear it is!

The most complete clarifying process I ever saw was in the apiary of J. F. McIntyre. His method has been described in *GLEANINGS*, but will bear repeating. He strains his honey into a large shallow tank (it is clean from the start). After standing in this a proper length of time it is drawn off into another large tank, and when drawn from this it is honey fit for the most epicurian palate, and, as a general rule, Mr. McIntyre gets a better price for his honey than the majority of bee-keepers.

It would be better to use a large tank, and no straining whatever, than to allow a multitude of specks to run into the can with the honey; for, in the use of a large tank, there would be opportunity for clarifying the honey and skimming off the refuse. The dairyman is compelled to be particular respecting his milk and all receptacles for handling it. Our honey will not sour on our hands as the milk does in the hands of the careless milkman, but there is an aroma to retain; and to retain it in the highest quality requires as clean manipulation as is practiced in the dairy.

This hit-or-miss, careless, slovenish, whack-row-de dow, git-there-Eli honey-production will result only in a degradation of our product.

Referring to the small cut again, I wish to call attention to the bee-brush resting against the extractor. That brush has seen hard usage through the honey season, and it is a California invention, such brushes having been used here for the past dozen years or more. I use two of them. When one gets sticky with honey, wash it and throw it out in the hot sunshine. It will be dry enough to use by the time the other gets sticky.

[I envy Rambler the pleasure of that shady retreat, even though it be in a climate subject to extremes of 120 degrees. I envy the freedom of *any* Rambler, providing he is not of the tramp order. I am not sure that I shall see the Rambler this summer, but I am trying to get away; and if so I shall see him and other bee-keepers in California right in the midst of their extracting work.

Wherever practicable it is always advisable to have the extractor higher than the tank into which the honey flows; but in many cases it happens that both tank and extractor necessarily have to be on the same level. Mr. Coggs hall, who extracts so many tons of buckwheat in New York, allows the honey to run into a pail, and then when the pail is full he empties it into kegs; but while I was there the pail ran over once, and I should imagine

that that would be just the trouble where one has to *remember* to empty. But say, Rambler, suppose you forget to revolve your honey elevator. Can't you somehow make the thing semi-automatic so that, when a can gets to be so full, it will ring a bell so that the operator will know when to reverse the machine?

We have examined your strainer, and believe it to be all right—the very best device that has yet been brought to our notice. We have been planning to catalog it, but somehow it is so hard to get a new thing started and under way; but if I see you I'll study its operation more fully.

What you say about clarifying honey is very timely and important. Too many of the California producers are very careless. Sometimes in car lots one man's fine honey in square cans will be mixed up with another man's very dirty honey. While the honey is doubtless just as good, yet it must necessarily sell at a lower price, or cause "a kick" from the purchaser. This mixing of good and poor lots of honey is apt to knock the price of all honey down to the poorest. They had better cut out your remarks and paste them in their hats.—ED.]

Pshaw! Dr. Miller, we are not at outs. It is because we do not see exactly alike.

A person devoting his entire attention to queen rearing must necessarily improve his stock or he will lose his trade. His customers are the best judges; and the better the bees, the more orders. The secret, if any, in the matter, is, to get the very best stock to breed from, and continue to get the best stock. I have an idea that the plan outlined in the article referred to will be carried out in California at no distant day.

Well, well! that good-looking enthusiastic Arthur C. Miller seems to be knocking around quite a little in the bee-papers of late—getting the corners knocked off a little too. He will settle down into a steady gait after a while.

An old-time friend, Reynolds, from Merced Co., stopped a few hours with me, and then stayed a few hours more with Mr. McCubbin. We are both baching, Mc and I; and after 24 hours' experience with us, Reynolds exclaimed, "I'm going to get right back to Jane (my wife) as fast as I can go." He got. Mc and I are not dyspeptic—he is.

Those are very good "Hints on Keeping Well," by Prof. Cook, in the *American Bee Journal*. Along toward the end of his advice he says, "Cultivate the habit of conversation at the table." That's all right, Prof. C.; but what is a fellow going to do when he has no one to talk to? But, after all, in the absence of talk I am extremely well—no stomach trouble. I'll tell you what I have that's bet-

ter than talk. It is sunshine, professor — chunks of it all through my system.

This portion of Central California is receiving a thorough drenching to-day, Apr. 29, the first rain of any account for nearly three months. It will help out the newly sown alfalfa and many honey-producing plants.

MAKING NUCLEI.

“Mr. Doolittle! I wish to try my hand at rearing some queens this season, and I came over to see if you would tell me something about how I can make nuclei for this purpose.”

“Very well. Do you understand how to secure good queen-cells?”

“Yes, fairly well.”

“And about a queen-nursery to hatch them in?”

“Yes. I understand this part much better than how to get the nuclei to keep them afterward. Last season I tried to make nuclei, and made very nearly a failure of it on account of the bees going back home.”

“Well, bees taken from a colony having a laying queen are quite likely to go back to their old home unless some precaution is used. But if you will make a colony queenless, waiting till they have queen-cells sealed, you will have better success in regard to the bees staying.”

“I had not thought of that. How do you manage when you work that way?”

“Six to eight days after removing the queen I go to the colony and remove all the queen-cells but those which look the largest and best, and see that there are queen-cells on five frames, if the colony is a large one and in a ten-frame hive.”

“But suppose that the queen-cells are all on one or two combs—what then?”

“Then I cut out a queen-cell from the comb having more than one cell upon it, cutting out a piece of comb with it about an inch in diameter, so as to be sure not to injure the cell. Then I cut out a piece of comb from another frame of the same size as that having the cell on it, when the ‘cell-comb’ is slipped into the comb or frame where I wish it. In short, I graft a cell into each comb where I wish them.”

“But suppose the queenless colony is one you do not care to raise queens from—what then?”

“This is more apt to be the case than otherwise, and for this reason I start queen-cells from brood from which I desire to raise queens a day or two before I take the queen away from the colony I desire to break up into nuclei. Then at the proper time I destroy *all* queen-cells which the bees in the queenless colony have built, and put one, which has

been reared from the brood I desire, into each of five frames, when the colony is left for 24 hours to become accustomed to the new state of affairs.”

“What then do you do?”

“During the next day I place four hives, fitted up with a division-board, etc., ready for the nuclei, and place them where I wish the nuclei to remain during the season; and just at night, allowing me only time to complete the work before it gets too dark to see to work, I take two frames from the queenless hive, bees and all, one of which is to have one of the queen-cells on it, and set two in each of the four hives, thus making five nuclei out of the queenless colony. The one left on the old stand should have a division-board adjusted to its two combs the same as the others.”

“Why do you wait till so near night? Is that necessary?”

“Because, if done in the middle of the day the bees are more likely to go back. The change causes them to go to looking over their new quarters; and if it is midday they will often run out of the hive and take wing, only to return to their old home. But in the night they will not take wing, and by morning they become accustomed to their new surroundings, in a new hive having only two combs, and thus when they go out they are apt to mark their new location and stay by their young queen which will have emerged from its cell by this time, if you have timed the matter right.”

“Do you think this the best and easiest way of making nuclei?”

“No. I like the nucleus-box plan better.”

“What is that? I want the best.”

“The box is made as follows: Get out two pieces, 6 inches long by 6 wide by $\frac{3}{8}$ thick; also two pieces 12 long by 6 wide by $\frac{1}{4}$ thick. The latter are nailed to the former so as to make a box $10\frac{1}{2} \times 6$, inside measure, without sides. For sides I use two pieces of wire cloth, cut 12 inches long by $6\frac{1}{2}$ wide. One of them is nailed permanently to the box, while the other is left so as to be easily removable by nailing the wire cloth to a little frame like a slate-frame, which frame is lightly tacked to the box. In the top of the box is bored a large hole into which a funnel is to be inserted. This funnel is to be large enough to allow of one of your brood-frames to be shaken inside of it, and the hole in the small end should be 3 inches across, so that the bees will readily pass down through it and not clog. The hole in the box should have something to close it, like a large button or tin slide.”

“How is such a thing as that used in forming nuclei?”

“Having funnel and box ready, go to any hive that can spare from a pint to a quart of bees, according to the size of the nucleus desired; take out a frame or frames having bees on the combs (be sure you do not get the queen), and place it on the outside of the hive, or in a comb-carrier. Give the frame several sharp knocks with the thumb nail or a little stick, to cause the bees to fill themselves with honey, and, when so filled, shake as many down through the funnel into the box as you

wish in your nucleus. Take out the funnel and close the hole, when you will put the frame from which you shook the bees back into the hive and close it."

"Well, that is an easy way to secure bees, and a way I never thought of before. But what do you do next?"

"Next, take the box of bees into any room and throw a blanket over it, or darken in some way, when they are to be left three or four hours. At the expiration of this time they will realize their hopeless and queenless condition, telling you the same by their buzzing and running about the cage when you go to them, and be ready to take a queen of any kind."

"But where is the queen to come from, I should like to know?"

"As you said you knew how to raise queens and keep them in a nursery, I will only say that at this time I go to my queen-nursery and get a virgin queen, putting her in a cage having a 'candy cork,' and give them. Attach to the cage a short piece of wire, and you are ready. To put the cage in, set the box down suddenly, so that all of the bees will fall to the bottom, when the hole is opened, the cage put in and the hole closed again, all being done while the bees were trying to climb to the top again. The cage is pulled near the top of the box, and secured there by bending the wire over the button or tin closing the hole."

"Pray tell me what a 'candy cork' is."

"A candy cork is a cork, generally of wood, with a $\frac{3}{8}$ hole bored through it. This hole is filled with 'queen candy,' which the bees eat out and thus liberate the queen. The greater the length of the cork, the longer it will take the bees to eat out the candy. For this purpose I make the cork about half an inch long, so that the queen will be liberated in about twelve hours, or at some time during the night, as she is generally given about two to three o'clock in the afternoon."

"But you do not do any thing with this box of bees in the night?"

"No. They are left as they are after giving the queen, till near sunset of the next day, except to feed them if they need it, when they are put in a hive as follows: Prepare a hive by placing in it a frame containing a little brood and one of honey, together with a division-board, which are put on the opposite side of the hive from where you wish the bees. Now get the box, in which you will find the bees all compactly clustered like a swarm; carefully remove the movable wire cloth side, and with a quick jerk dislodge the bees from the box on the bottom of the hive. Now draw the comb of honey, then the comb of brood and the division-board, across the rabbets of the hive, in the order named, to where the bees are, and they will be immediately on them. The hive is now closed, and, if all has been rightly conducted, and works as it should, you will have a fine nucleus in that hive for the whole of the season, with the queen laying nicely in a week. But I must go now, as I have an appointment to meet at our village in half an hour."

THE TRICK OF PRODUCING LIGHT COLORED EXTRACTED HONEY; THE EFFECT OF THE COMBS.

One year when the Illinois State Fair convened at my home, Peoria, Ill., I made an effort to put on exhibition a choice article of extracted white-clover honey. With this end in view I exercised the greatest care in selecting the honey, and to have the utensils clean, and free from other honey. I extracted from no comb, unless of the purest white; in holding a comb up to the light, if I discovered a few cells off in color they were not uncapped.

This honey was put on exhibition, along with a large collection from different producers living far and near. It was all white-clover honey, in pint glass jars, and arranged on a shelf in front of a window. In looking at the exhibit, no one would fail to see that mine was the lightest in color, and was given first premium. There was not the slightest difference in color, in all the other honeys on exhibition.

I inquired of the other exhibitors why this difference in color, and they replied, "We thought there was some trick about it." I told them what must have made the difference. It is not at all surprising that they inferred a "trick," as all of the other white clover honey did not vary one point in color. It may make no difference in color from dark combs, when one extracting follows another in quick succession.

MRS. L. HARRISON.

St. Andrew's Bay, Fla., April 3.

[I believe it has been before stated that, in order to get an extra-light-colored honey for exhibition purposes, it is very necessary that such honey be taken from new or white combs. If I mistake not, Mr R. F. Holtermann, formerly editor of the *Canadian Bee Journal*, was among the first to urge the importance of this. But as a rule the average honey-producer uses combs of all colors and ages for the extracted honey he sends to market. It is possible that, when competition becomes stronger, as it probably will do, it will be best for him to discard the old black combs, melt them up in one of the presses shown in our columns recently, and use, instead, new combs made off from foundation. In spite of what you, Mr. Holtermann, and others have said on the subject of producing light colored honey, I do not think that very many of the average producers are "on to the trick." As some extracted honey may be produced for the Buffalo Pan-American, it may be well for some of our friends to bear this little "trick" in mind.—ED.]

A CORRECTION; COLLIER'S EXPERIMENTS.

Mr. Editor:—Please correct the third paragraph from top first column, page 245. The detailed experiments of myself concerning

bees and fruit were not conducted at the Agricultural College at all, but they were made at, I think, eleven different locations in the western part of the State. The work was done for the Connecticut Board of Agriculture.

Page 248, G. Collier, Warsaw, N. Y.—Your supposition about the comb following the line of the foundation is, in the main, correct. I have used that plan of putting foundation in the sections on the catcornered, oblique, and in every conceivable improper way, for the sake of having misshapen, malformed sections of honey to exhibit at fairs, and made a grand success of the grotesque production.

Woodbury, Conn.

H. L. JEFFREY.

WE have had no very bad reports of wintering losses so far, that I know of. Colonies themselves, however, as I have already stated, appear to be considerably weakened; but the fine weather the past ten days, and the great number of fruit-blossoms, appear to be making amends for the bad weather and the late spring of a few weeks ago.

IF there ever is a time in the whole year when the absence of a laying queen in a strong colony means a heavy loss to a bee-keeper it is now. Be sure to go over every colony, and see whether eggs are being laid regularly and in sufficient number. Queenless colonies of good strength should be supplied with laying queens from nuclei or some weak stock that has just come through the winter that has only a queen and a few bees. Give these bees a cell, and their queen to the strong colony that needs her.

I HAVE in hand the introductory article of a series that is to be written on the subject of "Bees in Law." The writer will take up the subject of common and statutory law as it relates to bees, and then proceed to give specific mention of various classes of special legislation directly and indirectly affecting them. The important court decisions that have been handed down will also be given. It is possible we may have this put in pamphlet form for the use of the members of the National Bee-keepers' Association.

THE heavy snows in the Eastern and Northern Central States have given the clovers a wonderful start. The snow fell to the depth of one or two feet, and during the quite warm weather it took all of ten days for the last vestiges of it to disappear. This vast quantity of water trickling down every day upon the grasses, clovers, and other vegetation, had a most stimulating effect, and we shall, therefore, expect that, if good weather has any thing to do with nectar secretion early in the season, the clovers will do well this year.

I AM glad to introduce to our readers Editor W. J. Craig, of the *Canadian Bee Journal*. Mr. Craig succeeded Mr. R. F. Holtermann, both in the management of the supply business of the Goold, Shapley & Muir Co. and in the editorial conduct of the *Canadian Bee Journal*. A man of pleasing address, Mr.

W. J. CRAIG.

Craig seems to have predominantly in his makeup the faculty of making and keeping friends. The *Canadian Bee Journal* is well edited, and is in the front ranks of other publications of its class.

COMB HONEY VERSUS EXTRACTED.

IN the last issue of GLEANINGS it was advised to turn our attention more to the production of comb honey than of extracted. There remains one thing more to be said in favor of comb-honey production; viz., colonies run for comb are almost invariably in better condition for wintering than those run for extracted. It would seem that a colony regards the brood chamber and the extracting-super above as its sole domain which is not to be meddled with; and when the fall honey comes in, the same is distributed around with a view of having it on hand for winter use. When we now remove the extracting-super we throw things badly out of balance.

A comb-honey super is apparently not regarded by the bees as a favorable spot to locate during winter; and when preparing their nest it is left entirely out of calculation.

HOW THOSE BEES CAME OUT OF THAT MACHINE-SHOP CELLAR, ETC.

ON the 1st, 2d, and 3d of May we took all the bees out of the cellar under the machine-shop. They were in fine condition, and apparently just as strong as when they were put in last fall, about the first of December, but

had little or no brood. They had been confined just about five months. During all this time they were very quiet, and the number of dead bees on the cellar bottom was the smallest I ever saw. Well, now for the results :

Our Mr. Wardell says that those colonies are away ahead of the outdoor-wintered ones of the same strength last fall. The large force of bees has enabled them to take care of large quantities of brood, now that they are outdoors ; and the probabilities are that, when the honey-flow comes on, they will be worth nearly two of the colonies wintered outdoors. We estimate that our outdoor bees lost very heavily during the great storm of April 20 — a storm that was a record-breaker, and which will go down in history as one of the heaviest ever known. While the weather was not very cold, yet after the snow had fallen the bees flew out on the warm days following, dropped on the snow, and never got back. Thousands and thousands of bees were lost that way ; but the other bees were housed during this big storm, and were not put on their summer stands till about ten days later.

Ira Barber, in our last issue, recommends putting more bees in the cellar and raising the temperature. Our cellared bees we kept in a higher temperature than any bees we ever wintered indoors ; and they wintered the best, irrespective of the noise above in the machine-shop. But I am afraid that, if the temperature had been as high as Mr. Barber recommends, they would not have fared as well as they did. Nevertheless, we shall test his ideas on a small scale next winter.

PROF. COOK'S REVIEW OF THE A B C OF BEE CULTURE REVIEWED, AGAIN.

In the third and last instalment of Professor Cook's review of the A B C, published in the *American Bee Journal*, he has a word more to say about bees dying because they have lost their stings. He does not claim that they die in less than a day or two, the time varying. Bees that had lost their stings from use were put into a cage, and died within a day or two, while others uninjured were also caged, and lived for weeks. With such testimony it certainly seems that it might be well to give the subject further consideration. If bees thus injured were put in the same cage with uninjured bees, it ought not to be difficult to come to a decision.

"I am a little skeptical," says Prof. Cook, "as regards the queen leading out the bees. I would not be sure that Mr. Root was right in his conclusion." The reading of that, without referring to the A B C, might induce one to think that the book taught that it is a common thing for queens to lead out swarms. Of course, that would be incorrect, and it is not taught in the book. The thing that Prof. Cook has reference to is the statement that in one particular case a queen from several miles away was put in a nucleus, and after a day or two the queen led the nucleus back to the hive from which she was taken. Prof. Cook may be right in thinking that, even in this case, the queen was in no sense a leader.

Prof. Cook agrees with the book that swarming depends upon conditions or causes, rather than with Mr. Doolittle, who says the real cause of swarming is the fiat of the Creator, "Go forth, multiply, and replenish the earth."

"I was surprised," says Prof. Cook, "to note that Dr. Miller also gives his authority in favor of bees not clustering in case the queen does not go forth with the swarm. . . . In such cases they will always return to the hive; but in my long experience and observation it will be decidedly the exception and not the rule that they return to the hive without forming at least a partial cluster." Dr. Miller has probably had as long an experience as Prof. Cook, with probably a larger number of colonies, and he is by no means a careless observer. Both men agree that, with clipped queens, some swarms return to the hive without clustering, and that some cluster first. Is it not just possible that the majority of Prof. Cook's swarms clustered, and that the majority of Dr. Miller's did not? But Prof. Cook is certainly wrong in saying, "In such cases they will always return to the hive," for in a large apiary it is unfortunately true that in too many cases the swarm will enter another hive where swarming has lately occurred.

The reviewer notes the error of the A B C in saying "soiling" instead of "green-manuring" when speaking of plowing under a growing crop of turnips. He also thinks turnips are of little value for green-manuring as compared with leguminous crops.

When a colony is suffocated because the hive is too tightly closed, the A B C says the bees are wet by the honey involuntarily discharged. Prof. Cook thinks much of this moisture is caused by perspiration, and he may be right. He says : "In such cases bees try hard to cool off. The only possible way they can do it is by the evaporation of water." That sounds as though evaporation, which is entirely involuntary on the part of man, is voluntary on the part of the bee. Can that be possible?

"Here again," says Prof. Cook, "our author refers to bees separating water from honey while on the wing. I believe this is physically impossible. I have never as yet seen this 'mist' fall from the bees while flying in the air." No doubt there are many who have not seen it, but that does not invalidate the testimony of those who *have* seen it. "If such mist does fall from the bees," he continues, "it certainly must be the water of evaporation in the air-tubes, or else excreta from the intestines." One can hardly imagine that water evaporating from so small a creature could immediately condense into drops that would fall like water ; but that it falls as excreta from the intestines is exactly what one would understand from the book when it says, "I distinctly saw them discharge from their bodies what seemed to be only pure water."

The A B C says : "There are also known in commerce such as Japanese and Chinese wax, both of which may or may not be the product of insects or plants." Prof. Cook says the

Chinese wax is the product of a scale insect related to the cochineal insect.

"In speaking of the willow," says Prof. Cook, "it is stated that it does not furnish honey, and the late Mr. Quinby is quoted to the same effect. This is certainly not true of all our willows." One is at a loss to know how it is possible for any one so to misread. The author says he has had little or no experience with the willow; but as it does yield honey and pollen in some localities he yields the floor to Mr. G. M. Doolittle, who has had much experience with it, and is, withal, one of the most careful observers. Mr. Doolittle ranks some of the willows, the large growing kinds, as exceedingly valuable honey-plants, the pussy willows that grow in his locality being valuable for pollen alone, in which he concurs with Quinby.

Angustifolium epilobium, says the professor, should be *Epilobium angustifolium*, and it is so corrected in the latest edition.

The A B C gives white honey the preference to dark for wintering, but says that, although the dark is a little more apt to give dysentery, it usually does not have that effect. Prof. Cook makes what is no doubt a proper distinction, by saying that buckwheat and other dark floral honey is good, while that from scale lice is unfit for wintering.

In the glossary, *Apis* is given as the family to which the bee belongs, when it should be *genus*, as it is found in the latest edition.

But it should be understood that all these criticisms relate to an old edition of the A B C, and not to the new one out last January, and now offered for sale.

HIGH-PRICED BREEDING-STOCK — IS IT RIGHT TO ADVERTISE IT?

It is well always to be on guard against such excitement as shall attach fictitious valuations far beyond the real worth of an article. Many a town site in the West has had its boom when corner lots went skyward in price, and the man who paid his hundreds or thousands for a single lot has seen the price come down, down—never to rise again. On the other hand, there have been cases in which a man has been laughed at for paying what seemed to be a fictitious price for a piece of ground, but who, with very shrewd foresight, has held on to it and made a fortune. A good many things need to be taken into consideration in getting at the actual value of an article. Even in the matter of queen-bees it may be possible greatly to over-estimate values, and it may also be possible to undervalue. An editorial in the *American Bee-Keeper* reads as follows:

When a queen-breeder offers as his greatest inducement to buyers to send out queens from a mother valued at 50, 100, 200, 500 or 1000 dollars he should be regarded with suspicion. If he is not a fakir pure and simple, he is not what he appears to be in the eyes of the honest business world.

According to the dictionary, "fakir" is a slang word which means "one who originates a fake, humbug, or swindling contrivance." It can not be that a man would be considered a swindler who should urge, as the chief inducement for purchasers to order from him, that the stock from which he bred was of

great value. Evidently the thought is that no queen can have so high a value, and that a queen-breeder who claims to have a queen valued at \$50 00 or more is, in the eyes of the honest business world, a swindler. If our co-temporary had given the matter sufficient thought to make a proper estimate of the possible value of a queen, it never would have published that paragraph.

When hens' eggs can be had in abundance at 12 cts. or less per dozen, the man who advertises to sell a sitting of 13 for \$1.00 is not considered a swindler. When the average price of a horse is less than \$100 there are a few animals which change hands at prices away up in the thousands; and the men who receive such prices are not considered swindlers. The man who buys such an animal is not considered a swindler if he puts a still higher price upon his purchase, even though he should never sell at the price set. The only question is whether he would rather keep the animal than to sell it at any thing less than the price set.

Queens can be had by the thousand for one dollar each, and many are sold for the half of that; yet it is a common thing to see advertisements of certain queens at much higher prices; and the man is not considered a swindler who has received \$2 00, \$5.00, \$10.00, or more for such a queen. There is no question, then, that a man may be an honest man and sell a queen for more than the ordinary price. The only question is as to the limit beyond which a man may not go without appearing as a swindler in the eyes of the honest business world.

A great many queens are sold at a price of \$5.00 each or more. The man who buys such a queen does not expect to get his money back on it if he uses it as the average queen is used for securing a crop of honey. But by the improvement of his stock he may get back his money many times over. The results obtained from it give it its value. The question is whether such results can be obtained in any case as to warrant a valuation of \$50.00 or more. Suppose a queen-breeder who sells a thousand queens in a year has a queen of such qualifications that he can get an extra dollar for every queen of her stock that he sells. It matters not whether the extra value be in color, length of tongue, working qualities, or what not; if it is what his customers want, and if they are glad to pay the price, he gets an extra thousand dollars in the course of the season, not for extra work on his part, but simply and solely for the value there is in that queen. Suppose at the beginning of the season some one should say to him, "I'll give you \$50.00 for that queen." He might reply, "I get \$1 00 extra on each queen of that stock. I expect to sell 1000 queens this season at that advanced price. If I hold on to her I shall be worth \$1000 more at the end of the season than to let her go and breed from another queen. I should be foolish to take \$50 00 now for the prospect of \$1000 at the end of the season. True, she may die to-morrow; but the chances in favor of her living are such that I should hardly be willing to take less

than a fourth or a half of what she will bring me in extra if she lives. The least I would take for that queen is \$250." And the honest business world, instead of condemning him as a fakir pure and simple, would commend him for his business judgment.

The fact is, that the bee-keeping world is just beginning to wake up to realize something of the value there is in blood. Doolittle has been preaching that the queen is the center upon which all pivots; but year after year the average bee-keeper has been going on, making his increase from stock most given to swarming, hence least given to storing. It is a good sign that attention is awakened in the right direction. We are used to extra values in horses and cows, but not in bees. We hear of a horse being sold for five hundred times the average price, without a shock; but if fifty times the average price of a queen is mentioned, it is another thing. Perhaps queens can not be worth \$25, \$50, \$100, or \$200. I have no quarrel with any one who thinks otherwise. Indeed, I can see how such a person may think he is right; and yet on the other hand I can not see but I am justified in holding the opposite view.

The laurels of our breeder do not rest solely on the long tongues of her bees. But long tongues or no long tongues, she rolled in the honey last year, and is doing the same thing this spring in a way that eclipses every thing else in the yard. Sell her? Why, she is worth many times her weight in gold. She is now three years old, strong and vigorous, and very prolific. She was wintered in a four or five frame nucleus outdoors, and yet she and her bees came through in good order.

E. R. ROOT'S WESTERN TRIP.

I HAVE before given intimation that I expected to go to California in the near future. My plans are now all matured, and I start from Medina on the 20th of this month, or about the time this issue will reach the bee keepers. My route is as follows: Cleveland, Cincinnati, and them to Wetumpka, Ala., where J. M. Jenkins, the southern supply-dealer, holds forth. Then to New Orleans; San Antonio and Uvalde, Texas; Maricopa, Tempe, and Phoenix, Ariz.; Los Angeles, Fresno, and San Francisco, Cal.; Portland, Ore.; Pocatello, Ida.; Salt Lake City, Utah; Grand Junction and Denver, Col.; Omaha, Neb.; Des Moines, Iowa; Chicago, and back to Medina.

I shall be gone about six weeks or possibly two months. From many of the points named I shall make side-trips; and some of our friends must not be disappointed if I do not stay more than an hour or so at a time. In some cases I may not be able to say more than "how d'ye do?" and "good by." In other cases I may stay a day, depending on the train connections. I shall stay, perhaps, a day with J. M. Jenkins; and while in New Orleans I shall be glad to meet some of our friends preparatory to taking the train for the West. From San Antonio I expect to run down to Hunter to see Mr. Louis Scholl; down to Beeville to see the Atchleys, Mr. W. H. Laws, and D. M. Edwards, at Uvalde, Tex. At Tempe,

Arizona, I have an uncle, and also quite a number of bee-keeping friends. Phoenix is a veritable hotbed of bee-keeping, and I shall be in that vicinity perhaps a day or two. From Los Angeles I shall make a number of side-trips. I shall be in the vicinity of San Francisco a short time before starting northward. At Portland and Salt Lake City, and Grand Junction and Denver, I shall make stops for a day or two, taking in short side-stops. Leaving Denver I shall probably hurry homeward, making a visit, perhaps, to our friend Nysewander at Des Moines, Iowa.

Those who desire to reach me by letter can do so by addressing general delivery, San Antonio, Texas; care J. H. Root, Tempe, Ariz.; Union Hive and Box Co., Los Angeles, Cal.; Buell Lamberson & Son, Portland, Ore.; general delivery, Grand Junction, Col.; care L. A. Watkins Co., Denver, Col. I shall have with me three of the best kodaks that money can buy, and I shall endeavor to bring back many interesting views as well as notes of travel.

I can not tell the *exact* dates when I shall be at different points; but I think I shall reach San Antonio about May 24 or 25; Tempe, about the 28th or 29th; and Los Angeles about the 3d or 4th of June. Other dates will be given later.

N. B.—I forgot to explain that I shall attempt to prepare copy and write editorial matter on the fly. Communications for GLEANINGS may be sent to me at the addresses named; or if they come to our general office at Medina they will be forwarded to me. Letters intended for me personally had better be sent to Medina, whence they will be remailed to me.

TONGUE REACH NOT IN DIRECT PROPORTION TO HONEY-YIELD.

ON page 401 I had an editorial on this subject; and in response to that I have received a letter from A. T. McKibben, of Ramey, Minn., that would seem to indicate that in the relative honey-yield there is no difference between the short-tongue and long-tongue bees. He has been measuring tongues, and was surprised to find that some of his "ornery" scrub colonies had a tongue-reach as great as that of his best honey-gatherers. This is the first and only report of this kind that has been received. All the others seem to point the other way; but let's have the reports, no matter what they show.

Another thing, Mr. K. gets a longer tongue-reach by following our directions than we do on the same bees; but in this letter he tells about "stretching" the tongues. This we do not do. We only comb them out straight on the scale. That our measurement is probably correct is shown by the fact that he took a glossometer, or extemporized one, and measured the reach of robbers scrambling for honey. This reach he found to be $\frac{20}{100}$. On the same bees he got $\frac{34}{100}$ and $\frac{35}{100}$ by stretching the tongues on the scale. By our method of measuring, and without stretching the tongues, we are supposed to get just what would be secured by the glossometer.

We have made a covenant with death, and with hell are we at agreement.—Isa. 28:15.

As I sit down to write this Home Paper, my conversation with Mrs. Root at the breakfast-table comes vividly to my mind. We were speaking of the bank robberies that are mentioned in almost every daily paper of late. First it is here, then it is there, then it is somewhere else. No portion of our country seems to be exempt. These hardened criminals are either scattered all through the community or else they are canvassing the country to find little towns or other places that promise a good field for their work. If some old farmer who does not read the papers, and is not up with the times, has been foolish enough to secrete a sum of money in or around his home, these emissaries of Satan, by some hook or crook, get hold of the matter. It does not matter how careful the old farmer has been to find a hiding-place for his money. It is of no avail. A gang of ruffians sufficient in number to overpower him and all the inmates of the home break down the doors, bind and gag the father, and make him tell where his money is hidden by torturing him by burning his hands or feet until he tells where his money is. Just lately, not far from here, a new scheme in this line (that must have been hatched out in the bottomless pit) is reported. When the farmer refused to tell where his hard earnings of thirty or forty years past were hidden they grabbed his daughter, 19 years old, and—I dare not put it on these pages; but one of them adde!l, "Tell us where your money is and we will let the girl alone." The father still refused. He was probably a sort of miser; but the mother could endure it no longer. She took them down cellar, and told them where to dig in the ground. They got their money and went away.

Bank buildings are being wrecked with tremendous charges of nitro-glycerine. In fact, they do not hesitate to leave the most expensive building in a little town in ruins; and if the people come out and undertake to show fight, half a dozen or more desperate wretches hold the town at bay. Of course, we (sometimes) capture some of them; some of them are shot in the encounter, and our policemen and sheriffs are shot down. But they go to work and build up their town again, get a stronger safe, and put on additional night watches. I fear criminals sometimes get off by some technicality in law, and then go at the same thing again.

In the neighborhood of Medina there has been for forty years a gang of criminals; but I understand that now the *last* of the notorious Foster gang is in prison. These fellows have been arrested time and time again, and stood trial. But their numbers were sufficient so they brought witnesses in such a crowd they got off almost every time. If the officers

were getting the upper hand of this thing, even though slowly, we might cease worrying about it.

The loss of the people's hard earnings, especially the rural people, and honest, hard-working people who generally reside around these country banks, is a bad thing—yes, it is a terrible thing to think of that there are wretches in this land of ours who are so utterly devoid of conscience or principle that they would want the money that has been saved little by little by sweat and toil. How *can* these people—how can any one in human form be so heartless and selfish?

But, dear brother and sister, there is something more terrible still than the loss of property or the loss of money, that is going on in our land. For months past a book has been on my table, the title of which follows me like a nightmare. I looked the book over, and said that, although there is a great deal of truth in it, its statements are largely exaggerated. Then I began watching the papers—yes, I began watching our own State of Ohio, and finally our own neighborhood. The very title of this book startles one. It is, "*Traffic in Girls.*" Why, the thought is horrible. It is a disgrace to our country. It is a disgrace to the whole wide world to be obliged to admit there is *any* truth in the title *at all*—that there is really in the United States, as well as in other countries, a traffic in *girls*.

In my childhood I used to hear about the traffic in colored people. We used to read about the slave trade vessels; we read of human beings being sold at auction; and those of my readers whose hair is white like mine will remember the struggle and fight we had to cast off the reproach that for so many years rested on us as a Christian nation. May God be praised for Abraham Lincoln and the public sentiment that was back of him.

Well, now, let us go back to the title of the book. I fear, dear friends, that the title might have another word put in that would make it still more horrible, and yet the word might belong there. Suppose we put it "*Traffic in Little Girls.*" As I think of it my little prayer wells up from my heart, not exactly "Lord, help," but, rather, "May God help us." God help us as a Christian nation to rouse ourselves with such determination and Christian courage and heroism that this thing shall be stopped before it goes any further.

If a man should come into your town with a great club, striking down the little children going to school, killing them, or maiming them for life, would you, after he had done a lot of this work, have him arrested and tried, and then let unprincipled, greedy lawyers get him off by some technicality, or say he is insane? If it transpired, when you came to get right down to the bottom of the matter, that he was a millionaire, and had plenty of money, would the people be content to say his money shall save him? Or, if you choose, after he had served a short time in the penitentiary, would you permit some governor with a heart as foul and wicked as that of the criminal himself, to pardon him out and then let him set to work and do the same thing over again? Perhaps my

illustration is a little strong. But there is one point where I did not make it *strong enough*. Suppose this fiend in human form that I have been picturing should single out all the little girls instead of the little boys; suppose he selects the brightest, prettiest-looking one of the lot; let us suppose, still further, that he inquired around and found one beautiful little girl whose mother is a widow, and had no grown-up brothers to take her part. Suppose he should exult with fiendish glee in striking down this little girl and mutilating and crippling her for life, and then laugh about it, and, may be, brag about it, and try to get off scot free. Why, dear friends, this is an awful story I am telling—a horrible thing I am picturing; and yet God knows it is not *all* of the truth. What I am coming to comes about in a different way, and people say, "Oh! he did not intend to do her any harm. It was unfortunate and unlucky all around." My natural disposition would prompt *me* to say it was unfortunate and unlucky all around that the wretch was ever permitted to live one hour in this beautiful world of ours.

Once while off on my wheelrides I was told I could save some travel by taking a path through the fields. On my way I met the daughter of my friend the bee-keeper, a beautiful child of ten or eleven years. I shook hands with her, and told her who I was. Then she seemed to feel somewhat acquainted, because she had read GLEANINGS. She was very prettily dressed, and, of course, a little shy at meeting a stranger off alone; but the innocent, childlike look on her face followed me for hours. She was just coming out of childhood, and getting a glimpse of womanhood. She was looking out into this great world of ours full of people, with trust and confidence. Her little heart was good and pure, and with childish trustfulness she no doubt believed this great world to be good and pure. Since then I have met the daughters of other bee-keepers. If there is any thing in this whole wide world that should rebuke sin, and prompt a bad man to turn from his evil ways, and to be pure in heart and honest in deed, it seems to me it is these pleading childish faces—the faces of the *little girls*.

When up on my ranch in the woods last fall I took a walk of two miles one morning. It happened to be toward the schoolhouse, and just about schooltime. Three or four little girls came out of their homes, and I talked with them. They told me about their school, their teacher, their homes, and about their neighbors. Why, in that walk of two miles we became so well acquainted that I felt almost sorry when we reached the schoolhouse. Their childish voices were to me like the music of singing birds. In their innocence they told me some things about their homes and about their neighbors that perhaps an older person would not have told. They *trusted* me. They believed I loved little girls. I need not go any further. Is it indeed true that there are wretches in our land who would take pains to become acquainted with these little girls just in order that they might not only crush and disfigure their little bodies,

but that they might crush and disfigure them, *body and soul*? You may say this thing is done only in big cities. Well, I will grant that it is *mostly* done where there are saloons or frequenters of saloons. I need not tell you that, when a saloon gets to doing a fair business, they must have gambling-devices to help them along. After they get the gambling devices, then there is a dance house in the back part of the saloon; and these dance-houses, to be attractive, must have girls—not women who are hardened criminals like the men who employ them. They must have innocent-looking country girls if they can get them. Yes, they offer *big prices* for them.

Some have told me that this is not so bad, because they bargain with the girls themselves, and the girls consent to this traffic. And this brings up a chapter of the book of which I have been speaking—the "age of consent." By the way, that word "consent," used in the connection I have just mentioned, always rolls me up. Through the work of the W. C. T. U. (thank God) the age of consent has been raised. In some of the States, if the girl is over twelve years of age her consent clears her betrayer. Alabama has got it the lowest of all—ten years. New York and quite a lot of others have got it up to eighteen. Ohio (and I say it to her shame) still holds to fourteen. A pamphlet comes with the book, in which is the following statement, together with an advertisement of the book:

There are 300,000 "felled" girls in our country, one-half of them from Christian homes or Sunday-schools, and three-fourths from country homes. They have been gotten into haunts of shame through the trickery and wiles of those engaged in the "traffic in girls," which is caused by the *traffic in drink*. Their average life is *five* years. Sixty thousand girls dragged down to this life every year; 5000 every month; 170 every day, or a young life blasted in our blessed land every eight minutes! Father! Mother! *Your* little girl is not safe. Read that startling book, "Traffic in Girls, and Work of Rescue Missions" and warn her in time. Price only 30 cents by mail; cloth, fully illustrated, 75 cents. All proceeds for mission work. Address

CHARLTON EDHOLM, The Temple, Chicago.

I do hope and pray that this book may be widely read throughout our land. People are waking up, thank God. The case I have twice alluded to, that of Jennie Boschiter, of Paterson, N. J., illustrates it. If these fellows serve out their full term, two for 30 years and one for 15, well and good; but I begin to tremble already for fear some governor, who may happen to be a man like themselves, will pardon them out after they have served only a very small part of their sentence. In regard to the statement that these things exist only in the large cities, if we look about us we shall find the same thing, only perhaps in a different form, in almost every neighborhood.

Years ago a poor woman on her deathbed implored me to look after her fatherless children. She was then many years a widow. I tried to watch over them; but in spite of all I could do—perhaps I had better say, however, in spite of all I *did* do, and I made a big row several times about it—an unscrupulous and designing man, and a married man at that, succeeded in getting a beautiful little girl away from her friends and home. He spent months if not years in carrying out his scheme,

and declared again and again before God that he was honest and true, and would not harm the child for the world. I listened to others, and tried for a time to think that he was honest and sincere in what he said; but before the end came he admitted to me he was getting a divorce from his wife as fast as the law would move along, and then he was going to marry the child. Some people would object to my calling her a child at the time she went away from here; but the beginning of the whole disgraceful affair was when she was only a trusting and confiding child, such as I have described.

Now, dear friends, it would hardly be in keeping with my profession as a believer in the gospel of Christ Jesus if I let this matter drop right here. Jesus, when here on earth, taught us there was not only redemption and pardon for these poor lost girls, but redemption and pardon for the author of and leader in their sin and ruin. Sometimes when speaking of the sin and crime of this new century, my conscience has troubled me because, as memory carries me back, I can see a finger pointing to the time when the writer of these same Home Papers was little better, *in heart*, than some he denounces so vehemently. Some great and good man once said, as he pointed to a drunken sot in the gutter, "But for the grace of God, there lies myself." And, dear friends, as I look back, honesty and truth compel me to say that, but for the grace of God and the love of Christ Jesus, your old friend A. I. Root might have been—God only knows where. But still I shall have to confess my faith wavers when I think of reclaiming and reforming such wretches as I have described. May God help me, when I pray, to pray with more faith for those who seem to be lost through Satan's wiles.

Let me emphasize, in closing, the point made in that extract I have given. The traffic in strong drink is at the bottom of all this. The papers have told us how this traffic in our new possessions has led directly, in a very short time, to a traffic in human beings—yes, and I fear not only to a traffic in girls, but to a traffic in *little girls*. When African slavery reached a point in the United States where the people would stand it no longer, there was a great revolution, and we at once and for ever threw off Satan's yoke. We are fast approaching the same state of affairs in regard to the traffic in strong drink. Our local option bills here in Ohio have been again and again defeated when the voice of the people was in a large majority in favor of the bill; and I believe the time is near at hand when the people will rise and unite as they did in slavery times, to throw off this yoke imposed on us by drunken or drinking legislators and senators. May Good speed the day.

Objections have been frequently made that it is better for children to know nothing about these things. I do not agree with this. Thousands upon thousands of children might have been saved had they known in time something of what I have been telling you in this Home Paper. If their fathers and mothers will not tell them and warn them, let them read it in

the papers and journals. I for one shall be glad to have every child ten years of age or more, who cares to read what I have written, read it. Our own boys and girls were all taught by their father and mother, after they were old enough to be in danger of having their young minds poisoned by having the matter presented from a wrong standpoint instead of the right one, by some one who does not care for their future welfare as the father and mother do.

What I have written above refers to this traffic in the United States. The papers are just now informing us that the traffic is opening up, both in the Sandwich Islands and in the Philippines, and that, too, under a sort of sanction of this government of ours. Yes, the United States government that proposed to Christianize and civilize these heathen lands is, in one sense, in partnership with the men who barter, not in African slaves, but in *girls* of every nationality. Their excuse is, protecting the soldiers from contagious diseases—the same excuse these men offered for continuing the sale of beer to the soldiers (to keep them away from *worse* places). What a tremendous compliment we pay the manhood and Christianity of our soldier boys when we claim they *will* have beer in spite of us!

Well, our great generals have decided, we are told, that sanitary measures must be enforced to protect our soldiers; therefore these women and girls, after examination, have a permit from the government of the United States—I think I have got it right—to continue their traffic. They pay so much a month for this permit; and these great generals defend the traffic by telling how much *money* it brings into the treasury of the government. In the Sandwich Islands they have put a high fence around a certain part of Honolulu. I would not dare to print the rules and regulations, more than to say that one of them is that boys under age can not enter the inclosure. Another is, that no girl under 16 years of age will be permitted to occupy one of the—I was going to say *buildings* inside of the inclosure, but I guess I had better call it a "booth." A girl too young, generally speaking, the world over, to trade off her doll-baby, or any of her other childish treasures, is permitted by this government, under God's blue sky, to sell herself, soul and body! A great string of names in the form of a petition from the Young Women's Christian Association of the United States has been sent to President McKinley, pleading with him for humanity's sake, and for the sake of the women under the stars and stripes, and for *God's sake*, to use the authority that is vested in him to at once and for ever put a stop to this part or partnership that this government has in this awful traffic. Now, father and mother, brother and sister, every one whose eyes meet these pages, let your prayers follow this petition; and let us each and all, by every act in our power, put down this growing traffic as we put down the traffic in African slaves through the pen of Abraham Lincoln, who died a martyr because he was not *afraid* to take the lead.

FLORIDA TRAVELS, CONTINUED.

The town of Miami, at the terminus of the East Coast Railway, is a very new one. It has been almost all built up within two or three years. It is very prettily laid out, has fine streets, and, like all the rest of these Florida railroad towns, is especially adapted to wheeling—that is, if you do not get too far away in the country. When people were talking about the danger of frost six years ago we were told the only really safe place was Biscayne Bay, where even tomatoes could be grown the year round without any fear of injury, no matter what the state of affairs was in the northern part of Florida. I had quite a notion of making my way over to Lake Okeechobee, and making an effort to see if I could not get a passage through to Fort Myers, on the Caloosahatchie River. But I was told by the people that it was a difficult and hazardous undertaking for even a middle-aged man in good health, when used to roughing it. Besides, it would take more time than I could possibly spare, so I reluctantly gave it up.

A little way out of Miami is a celebrated golf ground. It is a beautiful meadow, as fine as a lawn, covering, I should judge, toward half a square mile. This is maintained and kept in trim exclusively for golf players. I do not know much about golf; but it has this in its favor—it takes open air and a lot of it. I saw the golf-players with their kit of tools—that is, if that is what they call them, with their colored boys to carry said tools and wait on the players. I suspect it is a rather aristocratic game. But just beyond the golf ground I caught a view of acres of garden-stuff, and this interested me more. I was about to obey the printed sign-board at the entrance of the golf ground, and wheel around it; but the obliging watchman told me to go straight through the ground. He said there was nobody there at the time, and it would not hurt the walks a particle; in fact, it would make them better to run the rubber tires over them. I demurred a little at taking my chances of being arrested, but he assured me *he* was "boss and all hands" when there were no players around.

I can hardly take space to tell you about all the beautiful crops I saw in that garden on the Miami flats. The ground is a level piece of prairie, I should call it. It probably had been swampy before ditches had been put through to carry off the water. There were acres and acres of tomatoes, all the way from little plants clear up to ripe fruit. The best plantations are trained on stakes; but as it was quite an additional expense, there was a difference of opinion as to whether it paid or not. Almost every vegetable known was grown here for the Northern markets, unless it is some that, like asparagus, rhubarb, and

others that absolutely require freezing weather.

When out in the fields away from any residence or workmen I saw beautiful strawberries reddening under the tropical sunshine. It was a variety I could not exactly make out, and I longed to taste them; but even though nobody was in sight I concluded I would not set a bad example—well, a bad example before *myself*, if you choose. But a little further on I stopped at the house and obtained permission to sample the berries, promising to take not more than half a dozen. The proprietor was away from home; but one of the boys smilingly took the responsibility of giving me permission to pick so many, and the quality I found fully equal to berries raised north.

Now, in these Miami gardens there are good, bad, and indifferent crops of almost every kind. Some will tell you the ground is not suited for this, that, and the other; but before I got around, somebody had proven that the very thing in question could be grown to perfection. It was the old story over again—the successful man had studied his crop and his locality, and finally, by dint of repeated trying, he had found out just *how* to manage to grow beautiful strawberries, or this, that, and the other, even on that low level ground.

I was pleased with the ranch of Jordeau Brothers. They had succeeded in growing bananas, oranges, and cumquats, right side by side with corn, beans, and potatoes. In fact, they had got good crops of almost *every thing*. Up in front of the pretty little home was a bulletin-board, and on this board were tacked market quotations from New York, and also orders received for certain stuff. Any one of the employees could see by glancing at this bulletin-board that so many crates of cucumbers, tomatoes, and strawberries were to be loaded up and sent to the station by just such a time in the afternoon.

Although there is no drawback in the way of frost in this Miami region, they have blight, fungus, and noxious insects to contend with. I reached town just in time to hunt up another nice pineapple for my noonday meal, and then I started out to see where I could find some bread and butter to go with it. Now, there is one queer feature about these Florida railway towns, especially in the vicinity of the great hotels. There are very few restaurants or low priced eating houses. I do not know whether the hotels have been instrumental in keeping them out or not. In two places in Miami I saw bright new signs hung out, saying "Restaurant" in large plain letters. But one of the men had quit business. The other man was running a tailor shop. I pointed to the signs, but they said they had not had time to take them down. Finally, down by the boat-landing, I found some beautiful white bread and nice butter to match, and I was happy and contented with a dinner that cost less than 25 cents. In the outskirts of Miami there is another palatial hotel. The grounds and the surroundings make one think of the oriental tales of the Arabian Nights. I found a similar display of tropical and exotic plants, one shaded house being devoted

exclusively to all kinds of ferns, and at another spot a garden devoted to every thing in the way of cacti. All these beautiful things are free to the tourist, whether he patronizes the hotel or not; and I for one feel grateful to the millionaires for this sort of entertainment for everybody, without money and without price.

ONLY 31 LEFT

of the Doolittle "Scientific Queen-rearing" books that were slightly damaged by water during the fire in our building January 1st. Do you want one? They are as good as new, except the covers, which are discolored somewhat. We also have some of Prof. Cook's books left—of the slightly damaged kind—at these low prices to close out:

Prof. Cook's "Bee-keeper's Guide," only 60c.
Doolittle's Scientific Queen-rearing, only 50c.

They are cloth bound, and latest editions. If you want a year's subscription to the old **Weekly American Bee Journal**, with either or both of the above books, add 75c to your order. This is a **SPECIAL OFFER**, and will last only so long as the slightly damaged books last. Better order **AT ONCE** if you want a bargain. Remember we are

Tar Heel Apiaries!

THE BEST BEES KNOWN
IN AMERICA: TO-DAY.

American Albino Italians.

They have no superiors and few equals, as hundreds of bee-keepers testify. Untested queens, \$1.00; 6 \$5.00. Tested queens, \$2.00 each. Choice breeders, \$5.00 to \$10.00. Nuclei, 75c per L. frame—add price of queen. 200 3-frame (L.) nuclei for sale in May and June. Safe delivery insured always.

Swinson & Boardman, Box 358, Macon, Ga.

U - NEED - A GLOSSOMETER.

It measures the actual reach of the tongue of a living bee to thousandths of an inch, also the capacity of the honey-sac; accurate, durable, practical. No rule or magnifying-glass needed. Satisfaction guaranteed. Price \$1.00 postpaid. Send for *Queen Circular*, and learn how to get a glossometer free. High-grade queens of the Sweet-heart and other strains at reasonable prices.

A. J. WRIGHT, Bradford. Steuben Co., New York.

LONE STAR APIARIES

Italian Queens.

Estab'd 1885. Prices of queens from imported mothers: Tested, \$1.50; 6, \$6.50; 12, \$12.00. Untested, 75c; 6, \$4.00; 12, \$7.00. Golden, same price. Select tested of either race, \$2.50 each.

G. F. Davidson & Sons,
Fairview, Texas.

Long-tongued Golden.

According to E. R. Root's measurements our *breeders' bees* show a reach of 20 and 21-hundredths inches. We are booking orders for breeders, to be delivered in August and September. These queens will produce bees showing 95 per cent (or better) straight 5-banded, and have a guaranteed tongue-reach of 19-hundredths or better; all queens large and prolific. Price \$5.00; orders filled in rotation. Untested ones, this stock, ready June 1st, each 75c; 6 for \$4.25; 12 for \$8.00. Select warranted, \$1.00. Tested, \$1.25. Select tested, \$2.00. Also have a fine stock of three-banded Italians at the same price. Give our stock a trial. Our motto—good queens and prompt attention to business.

O. P. Hyde & Son, Hutto, Texas.

Your Order for Queens

—Tested and untested—will be promptly filled by return mail. Our strain of Italians is unsurpassed as honey-gatherers. Every queen guaranteed. Choice tested queens, \$1.00 each; \$12.00 per dozen; choice untested, 75c; \$8.00 per dozen. Send for price list. Address . . .

J. W. K. Shaw & Co., Loreauville, La.

Honey Queens.

Have you noticed the change in my P. O. address? Did you know I am seeking to give my customers the best service possible?

Did you know that I have as good or better queens than can be bought elsewhere? Many have found this out, and continue my best customers. Golden and leather colored honey queens, bred in separate apiaries. Bees, nuclei, and full colonies for sale.

Price of queens—March and April—tested or untested, each, \$1.00; 6 for \$5.00; \$10.00 per dozen. Breeders, \$2.50 to \$5.00 each.

— ADDRESS —

W. H. LAWS, BEEVILLE, TEXAS.

1901====Golden Italian Queens====1901

Untested—April, May, and June—\$1.00 each, or \$11.00 per dozen; after June, 50c each, or \$5.00 per dozen. Tested queens, half more. Breeding queens \$3.00 and \$4.00 each. W. P. Rock eggs from 91-scoring birds at \$1.00 per 15. Cocks, \$1.00 each.

GEORGE W. COOK, - SPRING HILL, KANSAS.

EARLY QUEENS FROM THE SOUTH

We are rearing queens now in full colonies by the best methods known. Tested queen, \$2.00. Untested, \$1.00; 6, 5.00; 12, \$9.00. Full colonies, \$6.00; 3-frame \$2.00; 2-frame, \$1.50. Add price of queen to nucleus wanted. Write for discount on large orders, and circular. Satisfaction guaranteed.

Christian & Hall, Meldrim, Georgia.

Albino Queens.

If you want the most prolific queens; if you want the gentlest bees; if you want the best honey-gatherers you ever saw, try my Albinos. Untested queens, \$1.00; tested, \$1.50.

J. D. GIVENS, Lisbon, Texas.

South Dakota Farms

is the title of an illustrated booklet issued by the Chicago, Milwaukee and St. Paul Railway, descriptive of the country between Aberdeen and the Missouri River, a section heretofore unprovided with railway facilities but which is now reached by a new line of the Chicago, Milwaukee & St. Paul R'y. Everyone contemplating a change of location will be interested in the information contained in it, and a copy may be had by sending a two-cent stamp to F. A. Miller, General Passenger Agent, Chicago, Ill.

Career and Character of Abraham Lincoln.

An address by Joseph Choate, Ambassador to Great Britain, on the career and character of Abraham Lincoln—his early life—his early struggles with the world—his character as developed in the later years of his life and his administration, which placed his name so high on the world's roll of honor and fame, has been published by the Chicago, Milwaukee & St. Paul Railway and may be had by sending six (6) cents in postage to F. A. Miller, General Passenger Agent, Chicago, Ill.

BUSINESS AT THIS DATE.

Orders continue to come in good volume, and keep us busy. It is gratifying to be able to fill them as fast as they come. If we should have an old time honey-flow and a consequent rush of orders we shall try hard to keep up our good record.

BEEWAX MARKET.

Bee-wax is coming in quite freely, and the prospect is that, inside a month, we shall be reducing the price we pay by one or two cents a pound. If you have any to dispose of you had better take advantage of the present market price. We are paying at present 28 cents cash, 30 cents in trade, for average wax delivered here. If you want goods in exchange, and don't want to wait till wax reaches us, send us the shipping receipt from the railroad company, and give the number of pounds shipped, and we will send on your order promptly.

NO. 2 SECTIONS.

We have, during the past season, been more particular than sometimes in the past in the grading of our sections; and a larger proportion have gone into the No. 2 grade, because not considered white enough for No. 1. This policy has served to increase our stock of No. 2 grade as well as to improve the quality of this grade. Candidly we consider our No. 2 grade of sections superior to any grade on the market ten years ago. They are, of course, not as white in color, but in every other particular they are superior. After all, the color is largely a matter of whim or prejudice. If many bee keepers who never used any but No. 1 grade could see the No. 2, or try them once, they would use them more largely. There are some sections of the country where only No. 1 grade is used. This is true of the Pacific coast trade and export trade. It is mainly because of this fact that we have a surplus of No. 2 grade, especially of certain sizes.

Our stock of sections has been melting away very fast during the past few weeks, and we are now using new lumber and running our full capacity to keep orders up and make prompt shipment. Six weeks ago we had over two million No. 1 sections on hand, and over a million No. 2. We still have over a million No. 2, but of No. 1 we have less than a quarter of a million available for domestic orders, besides half a million for export. The No. 2 grade, of which we have a large surplus, consists of:

- 4 1/2 - 4 1/2 - 2 in. 2 and 4 beeway.
- 4 1/2 - 4 1/2 - 1 1/2 2 and 4 beeway.
- 4 1/2 - 4 1/2 - 1 1/2 1, 2 and 4 beeway.
- 3 1/2 - 4 1/2 - 1 1/2 plain.
- 3 1/2 - 5 - 1 1/2 plain.
- 4 - 5 - 1 1/2 plain.

The price is \$3.00 per 1000; 3000 for \$8.25; 5000 for \$12.50; 10000 for \$23.50. Two years ago we could not supply as many No. 2 grade as were ordered.

Send in your orders now, and see how promptly we can furnish them. Such a veteran bee-keeper as Doolittle uses No. 2 grade sections because he prefers the darker color of wood as it sets off better the white comb honey, and to save something in the price as well.

Special Notices by A. I. Root.

SEED POTATOES AS PREMIUMS; 500 BUSHELS TO BE GIVEN AWAY.

As we still have a pretty fair stock of all kinds of seed potatoes in excellent condition, very little sprouting, many of them none at all, we make the following liberal offer to the readers of GLEANINGS:

Any one who sends us \$1.00 for GLEANINGS, past, present, or future, may have 50 cents' worth of potatoes; or anybody who sends \$1.00 for potatoes may have GLEANINGS six months free of charge, or six months for every dollar that is sent for potatoes. Second, every old subscriber who sends us a new name, and introduces GLEANINGS into a family or locality where it has not heretofore been going, may have \$1.00 worth of potatoes for every dollar he sends us for GLEANINGS as above; or for every dollar you send us for potatoes on and after this date

you may have GLEANINGS one year providing you introduce it into a new locality where it has not gone before. Now, please notice that the man who subscribed for GLEANINGS, even though he is new, does not have \$1.00 worth of potatoes. His subscription must be sent from somebody who is already a subscriber. Of course, we do not care who has the potatoes. Each of you can have half, or they can go wherever you choose. You will notice this exceedingly liberal offer is made in order to get GLEANINGS introduced into new homes and new neighborhoods. Last, but not least, please bear in mind you must pay your own transportation. If you want potatoes sent by mail you must send the money for postage. As a rule it does not pay to have potatoes sent by express. As small a quantity as a peck can be sent by freight. This offer lasts only so long as the potatoes hold out.

I presume our friends are aware that many of the most successful potato-growers prefer not to plant until June or even in July. In fact, up in the Traverse region I found the great potato growers wait till June before planting; and many of them plant clear up into July. In this way you get away from bugs and hot weather, and, as a sequence, you largely avoid the blight. Of course, there is danger of an early frost; but such a frost is not much worse than the bugs, blight, and hot weather—that is, if you do not put off your planting until too late.

We submit our table of varieties, once more in order that you may have it all before you. More than half of the 500 bushels are the Red River stock, Northern grown, Early Ohio.

TABLE OF PRICES.

WANTED.—Parties interested in ginseng culture to send 5 cts. in stamps for my illustrated catalog and circulars, giving valuable information about this plant. 500,000,000 Chinese use it; easy to raise; 300 per cent annually in profit. Book on culture, \$1.00. Six years' experience. **W. E. BOYCE, Houston, Mo.**

Wants and Exchange.

Notices will be inserted under this head at 10c per line. You must say you want your ad. in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We cannot be responsible for dissatisfaction arising from these "swaps."

WANTED.—To correspond with the party that has possession of the fire-arms formerly owned by the outlaws of Kansas, the Bender family. Address 216 Court St., Reading, Pa.

WANTED.—75 colonies of bees, to establish an out-apiary. **H. G. QUITMAN, Parkertown, Ohio.**

WANTED.—To exchange samples of honey. Before sending, state what you can use and what you have to offer. I have alfalfa, basswood, clover, goldenrod, willow-herb, heartsease, horsemint, manna, marigold, mesquite, raspberry, sumac, and Cuban bellflower, from which I can furnish samples. I want to get samples of all other American and foreign honeys of choice quality, true to name. Want also to exchange American and foreign stamps. **A. L. BOYDEN, Medina, Ohio.**

WANTED.—To exchange bee-hives, sections, supers, etc., for raspberry-plants or offers of cash. **F. R. DAVENPORT, Box 383, Kalamazoo, Mich.**

WANTED.—To exchange 500 L. frames (comb) for bees. **J. H. STANFORD, Larrabee, Cher. Co., Ia.**

WANTED.—To exchange 50M polished sect ons (No 1, nice) for beeswax, at a bargain. **W. H. NORTON, Skowhegan, Me.**

WANTED.—100 or 200 colonies of bees on shares or buy for one of my students, and 40 queens. Also chance for a man to learn trade; must have little experience. **W. L. COGGSHALL, W. Groton, N. Y.**

WANTED.—To buy 100 or more strong colonies of bees on Hoffman wired frames (10 frame hives preferred) at some station on a Chicago R. R., not more than 150 miles from that city. Price must be low, and colonies healthy. **B. WALKER, Ewart, Mich.**

WANTED.—Seed buckwheat and seed potatoes. I have a \$45.00 strawberry-box stamping-machine, at \$25.00. Shop worn. Bee hives and supplies of all kinds at a bargain. **W. H. PUTNAM, River Falls, Wis.**

WANTED.—To exchange an 8 in. York water-motor, little used; for second-hand L. frame extractor. **E. J. BAIRD, Lock Haven, Pa.**

Wanted! HONEY, WAX, MAPLE SUGAR, SYRUP, AND POPCORN.

A. L. JENKS, 42 W. Market St., Buffalo, N. Y.

The Long Pole

knocks the persimmon. The man best prepared outstrips his fellows. The bee with the long tongue can reach the honey the short-tongued bee can't get. My bees are long-tongued, large vigorous, good workers, and gentle. Queens are \$1.00 each; tested, \$1.50; selected, \$2.00; breeding, \$3.00 and up; latter tested for tongue-reach, $\frac{1}{16}$ to $\frac{3}{16}$ inch. E. R. Root's method.

Last August Mr Morrow bought queens from 8 of the most prominent queen breeders. He writes: "I put the second queen you sent me in a two-story hive last Saturday, and she is now laying in 10 frames, has an immense colony of bees, and they are gathering more honey than any colony I ever had in the yard. I would not take \$25 for the colony."—Wm. H. Morrow, 719 Temple Court, Atlanta, Ga. May 1, 1901.

For particulars see free circulars.

J. B. CASE, Port Orange, Fla.

Red-clover Italian Queens.

The great honey-gatherers; are bred for business; satisfaction guaranteed. Untested queen, 65c; 2, \$1.25. Warranted 80c; 2, \$1.50. Tested \$1.25. Select tested, \$2. Established 1872. **C. M. HICKS, Hicksville, Md.**

Queens. I have 150 fine tested three-banded Italian queens for sale. They are last August queens, and their bees are fine honey-gatherers. Tested, \$1.25; select tested, \$1.50; breeders, \$2.00; untested, 75c each, or \$8.00 per doz. I guarantee safe arrival, and satisfaction on every queen. I have been a queen-breeder for 12 years, and know what good queens are. **J. W. TAYLOR, Ozan, Ark.**

E. R. Root says: "One cage . . . showed a measurement of .18 and $\frac{1}{16}$; cage B showed a measurement of $\frac{1}{16}$ and cage D $\frac{1}{16}$. . . If tongue-reach means anything, they ought to be good workers." They are three strains and are good workers. Queen circular free. **W. A. H. GILSTRAP, Grayson, Cal.**

FOR SALE. One 10 h-p engine and boiler (up-right boiler), one 18-inch planer, one Root saw-table, 30 ft. line-shafting, hanger pulleys, and belting. Will take \$250. **J. W. BITTENBENDER, Knoxville, Ia.**

FOR SALE CHEAP.—100 nearly new second-hand Hilton chaff-hives. For particulars enquire of **L. C. WOODMAN, Grand Rapids, Mich.**

FOR SALE CHEAP.—California bee ranch and 500 colonies of bees. Write for particulars, price, and easy terms. **I. A. KING, Almond, San Diego Co., Cal.**

Black and Hybrid Queens for Sale.

I have some good hybrid queens for sale at 30 cts. each **CHAS. D. DAY, Siegfried, Pa.**

Our Advertisers.

Mr. L. W. Fullerton, Wadena, Ind., writes the Ohio Carriage Mfg. Co., 27 West Broad St., Columbus, Ohio: "Received my sp'it hickory buggy to-day, and am very much pleased with it, and feel that I saved at least 25 per cent in price." We are sure every one of our readers will be pleased equally well. Send for catalog.

One of the best booklets which has come to our desk is *Seed Truth*, issued by Northup, King & Co., Seedsmen, of Minneapolis, Minn., and which is sent free to those who write for it.

Seed Truth not only offers valuable suggestions to those wishing to purchase seeds, but takes a strong stand against the exaggerations which characterize so many seed catalogs.

Ten Days on Trial.

In the past several years certain manufacturers and others, with that knowledge and unbounded faith born of experience have been sending out all sorts of things to the farmer to be first tried by him and paid for only after he is convinced of their merit, and satisfied with the bargain. So far as we know, however, the Kalamazoo Carriage & Harness Co., of Kalamazoo, Michigan, is the first firm in the United States offering to send out carriages, buggies, wagons, harness, etc., on this plan. Those of our readers who have followed their advertising as it appeared from time to time in our paper will have observed the proposition. The plan is to send any article which appears in this catalog to anybody, anywhere, on ten days' free trial. The purchaser orders the vehicle he may wish, and when it is shipped he goes to the railroad station, hitches up to it and drives home. He can use it in any legitimate way, and subject it to any test arising from reasonable use, for the space of ten days. If at the end of that time he is satisfied with the job, he simply pays the catalog price for it. If not, he ships it back to the factory.

This appeals to us as being about as fair and open a method of doing business as it is possible to adopt. It is certainly a most gracious compliment to the honesty and fairness of the farmers of our country. It gives them the opportunity to see and try just what they are buying, and to test it in every way before being obliged to pay for it. Certainly the manufacturers who will offer their goods to people on such liberal terms have unbounded confidence in the value of their wares. We should expect under these conditions that the Kalamazoo Carriage & Harness Co. made only first-class vehicles, and trimmed and finished them in only a first-class and enduring manner. Any of our readers who are in need of a vehicle or harness of any kind should write them at once for illustrated and descriptive catalog. They mail it free.

\$50.00 POP CORN.

100 seeds of this wonderful new Pop Corn for 25c and chance to compete for our 25c prizes. Seed One Bill good for 25c worth of other goods **FREE** with every order for Pop Corn. First prize winner last year raised at the rate of 188 bushels per acre. We will pay \$50 for its equal in quality. Handsome seed catalog and free presents with every offer.

C. M. Coodspeed, Skaneateles, N. Y.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. LEY'S POULTRY CONDITION POWDER puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls—big and little get all their life in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. Ley's Thoroughbred Minorca eggs, \$1 for B. Thoroughbred Belgian Hares. **Geo. J. Ley, Florence, California.**

WANTED.—ALL TO KNOW that I sell my hives and Root's goods at Root's prices, and will pay \$50 in three cash prizes for the best white honey exhibited at the Pan-American Exposition at Buffalo this year, produced in Danzenbaker hives in New York State; also the same for the three best lots outside of New York State. Specific information given on application. **F. DANZENBAKER,** Box 66, Washington, D. C.

The Best Bees.

As I have several times mentioned in the editorial columns, my object in life is the good of bee-keepers. That I earn my living while thus engaged, makes me none the less sincere. In my younger days I taught several terms of district school. After securing a school I forgot, for the time being, that I was earning money. I went in to teach those children, and do them all of the good that I possibly could. For weeks at a time the thought never came to me that I was working for wages. I should be doubtful of the success of a teacher who taught simply for money. Now I am working for the good of bee-keepers. As in the case of school-teaching, I have become so interested that I often forget that I am earning my living by the work that I am doing. I should also be doubtful of the success of a bee-keeping editor who worked simply to make money. With that object in view, there are other occupations in which he could engage to better advantage.

I am trying to get bee-keepers to keep more bees, scatter them around the country, and learn to manage them with the least possible labor. I am trying to get bee-keepers to organize and secure the benefits of co-operation. I am trying to arouse them to the danger hanging over their heads from contagious diseases among bees, and to get them to bestir themselves and rid the country of these plagues. I am also striving to show them the importance of improving their stock—that there is just as much difference in bees as in other stock. Not only this, but circumstances have been such that I have been able to discover what, I am thoroughly convinced, is a strain of bees that are the equal, if not the superior, of any bees in this country; and I am trying to scatter this stock through the country. As I have said before, that I am earning my living while thus engaged does not make me any less sincere.

These bees are dark, leather-colored Italians. They are gentle, industrious, and hardy, and cap their honey as white as do the blacks. No bees, that have had their tongues measured, have shown a greater tongue-reach than have these bees. While there is little doubt that length of tongue and superior honey-gathering qualities go hand in hand, it has not yet

been PROVED, while it HAS been proved that THESE bees are very superior, whether it is from length of tongue or not. The price asked for these bees is higher than for common stock, and ought to be; superior stock always sells for more than common stock or scrubs. The Roots are now asking \$10.00 for a queen whose bees show a tongue reach of 19-100; \$15.00 for one whose bees show a reach of 20-100; and \$25.00 for one whose bees have tongues measuring 21-100; and it is all right to ask these prices. I hope that Mr. Root will sell a lot of these queens, as the more such queens are scattered around the country the better stock will there be. Only a queen-breeder, or some one with a large number of bees, could afford to pay such prices, but the ordinary bee-keeper can afford to pay the \$1.50 that I ask for a queen; and, while I do not guarantee the length of the tongues of the bees that such a queen will produce, it is true that the mother of these queens produces bees having a tongue-reach of 21-100. Not only this, but I guarantee safe arrival, safe introduction, if directions are followed, purity of mating, and complete satisfaction to the extent that, if, for any reason, the purchaser desires to return the queen inside of two years, he can have his money back and 50 cents in addition to pay for his trouble.

Besides this, there is a way in which one can get one of the queens for only one dollar, and that is in connection with a subscription to the Review. For \$2.00 I will send the Review one year, and one of these queens. This offer is open alike to old and new subscribers.

As my older readers know, I do not breed these queens myself. They are reared by a breeder who is neither in the North, nor in the extreme South, but whose name I do not give, simply because, if I did give it, the orders would go to him direct, and I would lose all of the advertising that I have done. A man has to be selfish to a certain extent, and it is all right that he should.

I make in the neighborhood of 50 cents on each queen that I sell, and it is right that I should, but the man who buys one will make dollars where I make cents.

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a select daughter of their \$200 queen that they refuse to quote me prices on. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

From recent measurements I find I can warrant all tested and select untested queens to produce bees whose reach is 19-100 with an average reach of 18 100; Select tested queens to produce bees whose reach is 20-100, with an average of 19 100.

Prices: Untested, \$1.00; 6, \$5.00. Select untested, \$1.25; 6, \$6.00. Tested, \$1.50; 6, \$8.00. Select tested, \$2.00; 6, \$11.00.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20 100, \$3.00. Breeders whose best bees show 21 100, with an average of 20 100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100, \$7.00.

I have discovered 2 breeders whose best bees show 23 100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2. Imported queens, daughters and grand-daughters. Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.
The Jennie Atchley Co., Beeville, Bee Co., Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.
Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldens, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3 1/2-inch; \$1.10; 3-inch, \$1.00; 2 1/2-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

ALBANY.—No demand for comb honey, with no receipts. Prices same as last quoted.

May 21.

MACDOUGAL & Co.,
Albany, N. Y.

DETROIT.—Very little desirable honey in sight. The new crop will find the market well cleaned up. The demand is always light in this market at this season of the year. Prices are held as last quoted. Fancy white comb, 11@15; No. 1, 13@14; dark and amber, 10@12. Extracted white, 6½@7; dark and amber, 5@6. Beeswax in fair demand at 27@28.

May 21.

M. H. HUNT & SON, Bell Branch, Mich.

CHICAGO.—Market is nominal in almost all lines. A little comb sells at 15@16 for choice white, with dark and amber grades ranging from 2c to 5c extra. No movement of any consequence in extracted. All dealers seem to be expecting a lower range of prices. A little fancy white clover and basswood sells at 7@8, depending on flavor, quality, and quantity taken; ambers, 6@7; dark and buckwheat, 5@5½. Beeswax steady at 30.

May 20.

R. A. BURNETT & Co.,
199 South Water St., Chicago, Ill.

MILWAUKEE.—The demand for honey is only local, and the limited supply of salable quality prevents the regular consumptive demand; and whenever a shipment of fancy grade comes to hand it sells very readily at 17@18, in 1-lb. sections, while the dark and lower grades do not move. We can now quote fancy 1-lb. sections, 17@18; No. 1, 16@17; off grades nominal at 12@15. Extracted white, in cans and pails, 9@9½; amber, in kegs, 7@7½. Beeswax, 28@30.

May 22.

A. V. BISHOP & Co.,
119 Buffalo St. Milwaukee, Wis.

BOSTON.—Our market continues dull on honey, with very light stocks on hand. Our nominal prices are as follows: Fancy, 1-lb. cartons, 17; A No. 1, 16; No. 1, 15; No. 2, 12@14. Extracted, 6½@7½.

BLAKE, SCOTT & LEE,
May 21. 31, 33 Commercial St., Boston, Mass.

NEW YORK.—There is little if any stock of comb honey on this market at the present moment, and the demand is very slight indeed. Market prices rule as follows: Fancy white, 15; No. 1 white, 13@14; No. 2 white, 11@12; mixed and buckwheat, 10. Beeswax, 28. Extracted honey of all kinds is ruling at low prices, with little if any demand.

FRANCIS H. LEGGETT & Co.,
Franklin, West Broadway, and Varick Sts.,
May 22. New York City.

PHILADELPHIA.—Comb honey entirely cleaned out of this market, except some odds and ends that are sold at buyer's offers. Extracted honey, fancy white, 7; amber, 6. Beeswax, 27. We are producers of honey—do not handle on commission. WM. A. SELSER,
May 23. 10 Vine St., Philadelphia, Pa.

CINCINNATI.—No demand for comb honey, also stock of it well exhausted. Extracted very dull. Sales are more or less forced. Lower prices from ½ to 1c per pound. C. H. W. WEBER,
May 20. 2146-8 Central Ave., Cincinnati, Ohio.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co.,
163 South Water St., Chicago, Ill.

FOR SALE.—Extracted honey from alfalfa; 60-lb. cans at 7 cts., and smaller cans.
D. S. JENKINS, Las Animas, Colo.

Northern Italian Queens

Reared from Imported Mothers.

Our stock is so carefully bred and selected as to secure carloads of honey. Locality free from foul brood and other bee-diseases. Prices: Untested queen, \$1.00; 6 for \$5.00; tested queen, \$1.50; 6 for \$7.50; best imported queen, \$6.00; fair imported queen, \$5.00.

Ada L. Pickard, : Richland Center, Wis.

The Long Pole

knocks the persimmon. The man best prepared outstrips his fellows. The bee with the long tongue can reach the honey the short-tongued bee can't get. My bees are long-tongued, large, vigorous, good workers, and gentle. Queens are \$1.00 each; tested, \$1.50; selected, \$2.00; breeding, \$3.00 and up; latter tested for tongue-reach, 10 to 15 inch, E. R. Root's method.

Last August Mr Morrow bought queens from 8 of the most prominent queen-breeders. He writes: "I put the second queen you sent me in a two-story hive last Saturday, and she is now laying in 10 frames, has an immense colony of bees, and they are gathering more honey than any colony I ever had in the yard. I would not take \$25 for the colony."—Wm. H. Morrow, 719 Temple Court, Atlanta, Ga. May 1, 1901.

For particulars see free circulars.

J. B. CASE, Port Orange, Fla.

Honey Queens.

Have you noticed the change in my P. O. address? Did you know I am seeking to give my customers the best service possible?

Did you know that I have as good or better queens than can be bought elsewhere? Many have found this out, and continue my best customers. Golden and leather colored honey queens, bred in separate apiaries. Bees, nuclei, and full colonies for sale.

Price of queens—March and April—tested or untested, each, \$1.00; 6 for \$5.00; \$10.00 per dozen. Breeders, \$2.50 to \$5.00 each.

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

ILLUSTRATED SEMI-MONTHLY

Published by THE A. H. ROOT CO. \$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

JUNE 1, 1901.

No. 11.

COLORADO State Bee-keepers' Association has 207 members. What other State can match it?

I NEVER WORE a plug hat, and couldn't be hired to wear one. And now just see what a deep-laid scheme the editor has concocted (p. 431) to inveigle me into wearing one of the abominations!

H. G. OSBURN reports taking 40,500 lbs. of honey with an increase to 105 colonies. That's a big thing in any case; but it makes a good deal of difference whether he started with 104 colonies or with 4, and he doesn't mention the number at start.

H. G. OSBURN and you are not so far apart as you think, Mr. Editor, p. 432, as to the working force of a colony. You are talking about the total population, and he's talking about the field force. You can tell that by his sending all afield.

VERY LEVEL-HEADED is this advice to beginners given by Editor York: "First get and read a good bee-book thoroughly, then get the bees. Then read your book again. Then you will be ready for a good bee-paper, and, very likely—more bees."

IF YOU CLIP the large wing of a queen on one side, it will change her looks so little that a hasty glance will not show that she is clipped at all. But just on that account I clip both wings on one side, for I want to see at a glance, as the queen runs over a comb, whether she is clipped or not.

L. STACHELHAUSEN, in *Southland Queen*, thinks it an error to teach that, because the winter in the South is warm enough for bees to fly more, bees consume more. They don't fly unless they can gather. From the last flower in fall to the first in spring, Southern bees consume less than Northern.

"HOW CAN QUEENS be forced to lay in queen-cell cups?" is given in *Southland Queen* as one of the topics for discussion at a

convention. Can they? [Forcing queens to lay in queen-cups—why, it seems to me we should do well if we could get them to lay, to order, in natural cups made by the bees themselves. In fact, I do not know that we are sure that they ever do so of their own sweet will under any circumstances.—ED.]

THE COLORADO foul-brood law is somewhat circumstantial. If you know of foul brood *anywhere*, and fail to report to the inspector or secretary of State association, you're subject to a fine of \$5 00. If you conceal the fact that your own bees have foul brood, you may be fined \$20 to \$50, or imprisoned one to two months. About right too. [I never noticed this provision in the law; but it is a very good one, and ought to be in every law designed to suppress foul brood or similar contagious diseases.—ED.]

I DON'T KNOW for sure all about it, but I *think* the old-comb discussion has been something like this: Some years ago it was the common thing across the ocean to teach that combs should be renewed when they became a few years old, and I do not remember that any on that side opposed such view. It was copied and commented upon here, and that started the discussion here. I don't know, but I suspect the discussion on that side arose from reading the discussions in American journals. But the advocacy of old-comb renewal is of trans-Atlantic origin.

THE BLUE-HEAD is a disease of the brood, named in *Deutsche Inker aus Boehmen*. Scattered among the sealed brood are pupæ, either unsealed or with holes in the sealing. The pupæ are dead, and have blue or white heads, or heads spotted white and blue. Turn the comb on its side, and many of these pupæ fall toward the opening. While the disease is not very malignant, and perhaps not contagious, the diseased colony makes poor headway. [Why, doctor, aren't you and those other people making a blunder? See what is said about "bareheaded" brood on page 57 of the A B C book. I should say there was nothing the matter with the pupæ at all, even if they do fall toward the opening when you tip the comb over. I have seen exactly what you describe, and have kept careful watch, and the

bees hatched out all right just as well as those that were capped over.—A. I. R.]

ARTHUR C. MILLER has the joke on me. On p. 325 I quote him saying, "If there is any class of people who seem prone to only half observe and to jump at conclusions, it is the bee-keepers," and then I reproach him by saying that, if he would "observe" more carefully himself he would find the observers all right, but the things observed, elusive. Now he comes back at me by saying that, if I had "observed more carefully" myself I would have seen that he made that identical remark right after the words I had quoted. And I don't know of any satisfactory reply to make.

SWARTHMORE, in *Rocky Mountain Bee-Journal*, reports success in obtaining early drones last year, by having drone eggs mailed to him from the South, and giving these eggs to queenless colonies. If eggs can be successfully mailed, there might be a traffic in eggs from choice queens for queen-rearing. [Something like twenty years ago we used to send worker-eggs from a choice queen by mail, and succeeded in doing it very nicely up to a distance of 100 miles; but beyond that we never had any success. I should have said that it would be impossible for Swarthmore to get drone eggs that would hatch, from a distance of three hundred miles.—ED.]

THE QUESTION whether extracting-combs should be cleaned out by the bees in the fall has had a thorough discussion in *Revue Internationale*. Reviewing the testimony, J. Crepieux-Jamin says it is remarkable that the advocates for fall cleansing offer the sole argument that the honey not cleaned out will ferment. The chief argument on this side, I think, is the granulation of particles left to hasten granulation in the next year's crop—an argument of double weight when applied to unfinished sections. [I think the only reason why we in this country prefer to have our extracting-combs cleaned out by the bees is, as you suggest, to prevent the accumulation of particles of granulated honey. But in Europe there may be localities where these wet combs will ferment.—ED.]

SOMETIMES it is said that a beginner gets a yield of honey that he never after equals, because his first enthusiasm is gone. I believe that's a libel on many of the veterans. A bee-keeper may ride his hobby so hard as to kill it, but they don't all do it. Just forty years ago I took the bee-fever, and the temperature is just as high now as it was then. I'm looking forward to some things I want to do with bees next summer with just as keen a relish as I had forty years ago. The extra results achieved by a beginner are largely to be credited to the fact that he has a small number of colonies, and so the bees have a better harvest. [Your last sentence explains it. In the A B C book the statement is made to the effect that the average yield per colony will be much larger in a small apiary, remote from any other yard of bees, than in larger apiaries.—ED.]

Four weeks ago we shoveled snow
That drifted deep all over;
And now to-day where frost held sway
We move great heaps of clover.

"Diseases of Bees and Legislation" is the succinct title of the report of N. E. France, Foul-brood Inspector of Wisconsin. It consists of an exceedingly detailed description of foul brood in all stages, together with the best known methods to arrest its ravages. It also treats on pickled brood and black brood, and dysentery and other diseases of the bees, and gives an account of the present state of legislation relative to these diseases in the United States. The subject of adulterated honey is well treated. No price for the book is given. All wishing a copy should apply to Mr. N. E. France, Platteville, Grant Co., Wis.

Mr. F. Greiner writes:

The Bee-keepers' Society of Erfurt, Germany, will hold its 50th anniversary this summer. An interesting exhibition is planned in connection with this convention or celebration. Bee-keeping of a hundred years ago is to be shown. One hundred and fifty stands of bees will be on the ground, which will be prepared and started for the health in Thuringia at the close of the festivities. A portable apiary of 30 colonies (wanderwagen) will also be on exhibition.

Mr. Greiner also adds the following relative to an improvement in comb foundation:

Lorence Horvat, of Austria, speaks of a new style of comb foundation in a recent number of the *Centralblatt*. He describes it as having *notched* cell-walls instead of the smooth, and says, when this new foundation was first brought out the claim was made that the bees would more readily draw it out into combs, but he did not take much stock in it. Since then a test has been made at a bee-keepers' institute, held at Vienna last summer, as follows: Three brood-frames were filled with new-style, three others with old-style foundation. The six were inserted in the brood-nest of a good colony, bees between brood-combs, alternating them with the frames of foundation. When an examination was made 24 hours later, it was found that the three frames of new-style foundation had been drawn out into combs, and eggs had already been deposited in a few cells. The three forms of ordinary foundation had hardly been touched by the bees, although they had been given an equally favorable position in the hive. A number of trials of this kind were made, but turned out practically the same in each instance.

Our thanks are due to E. N. Eaton, State Analyst of Illinois, for a copy of the report of the State Food Commissioner, Mr. Alfred H. Jones. As a copy of it can be had (free, I think) by addressing the Illinois State Food Commission, Room 1623, Manhattan Build'g, Chicago, it will not be necessary to say much about it, except that it shows the result of the analyses of nearly every thing used as food in that State (or perhaps all States), such as milk, cheese, extracts, butter, ice, honey, vinegar, etc. Even a hasty glance at its pages shows a very strange feature of our life. It seems as if adulteration of the most unblushing kind were the fate of nearly every thing the people of Illinois get to eat. Of course

this is not really the case, but it is true to a fearful extent, as the laws against adulteration fully attest. Fortunately sugar and flour seem to get to us in a pure state, as their adulteration is difficult, and the things themselves are about as cheap as any adulterant could be. Liquor-sellers have long been styled the "poisoners-general" of the people; but they must certainly share that honor with the adulterators of food-stuffs which all *must* buy, while they *can* get along without the liquor. Mr. Eaton will be remembered with gratitude by bee-keepers as the one who made such a vigorous attack on the adulterators of extracted honey in Chicago two years ago. Concerning this matter I quote the following:

Pure honey may be defined as the nectar of flowers, transformed, and stored in a comb by the honey-bee. Extracted or strained honey is the same article removed from the comb by man, usually by centrifugal force. Comb honey can be adulterated only by the bee, which seems to have a patent on capping the cells. Extracted honey, next to vinegar, is more universally adulterated than any other staple food products.

In Minnesota, before the honey clause was added to the Food Statute, about 33 $\frac{1}{3}$ per cent of extracted honey proved to be adulterated. In Illinois, about the same ratio of adulteration was proven to exist. Last year a committee acting for the National Beekeepers' Association secured a large number of samples in Chicago. Being at that time employed in commercial work I examined the samples for the Association and found that more than 50 per cent were adulterated. This month (Dec. 1900) finds extracted honey again seeking the winter trade. Inspector Mrs. Frank Hubbard has visited many stores in Chicago, and reports finding very much less extracted honey offered than the year before. This is owing to the enforcement of State law requiring the labeling of adulterated honey, thus driving a dishonest competitor from the market. While none of the samples taken this winter have as yet been analyzed, many of them are of those brands which proved genuine in former analyses.

The most common adulterant of honey is glucose, although adulteration with cane sugar and invert sugar is possible, and sometimes practiced. The adulteration thus far discovered on the Illinois market has been of the cheapest and most gross kind—glucose flavored with a small slice of honey in comb.

STARTING BEES INTO SECTIONS.

Hiving Swarms on Full Combs and Starters; Hive-Covers; some Peculiarities of the Colorado Climate; Wetting Sections for Folding.

BY M. A. GILL.

In advising the use of an extracting-super to start to work in sections, are you not aware that thousands of us bee keepers do not have an extracting-super on the place? I would advise any bee keeper working for comb honey to exchange supers with colonies that are tardy about working in sections with one that has made a *good start*, and be sure to carry along some of the comb-builders (young bees) which are the last to leave the super. The colony given the super with full sheets of

foundation will at once resume work, from the force of the same habit you say they have acquired by the use of your extracting-super.

Dr. Miller asks you how many days after the extracting-super is given before they will start work in the sections. I would say that depends upon two conditions—namely—the condition in the brood-chamber, and the other condition in the field.

If the brood-chamber is full of brood, and running over with bees, and the conditions in the field are such that honey is coming in, they will start at once; otherwise they will wait until these conditions do exist, even if it takes all summer. I prefer to work for those conditions that force the bees into the sections, rather than to bait them, although I have just finished filling 500 supers with drawn comb for the first round.

On page 239 Dr. Miller advises using full combs and dummies to hive swarms upon. Some one has said starters for the expert, and full sheets of foundation for the novice, in hiving swarms, but never full frames of comb when working for comb honey. Somehow my experience just fits the above advice, and I feel like saying amen to it. If I have full combs for young swarms I cut them out and make them into wax, leaving from one to two inches of comb along the top-bar; this strip will be stored full of honey within a very few hours after hiving, and then you have just the proper condition for getting honey in the sections, for the bees will commence building comb upon each side of these narrow combs of stored honey, and the queen will occupy the new comb being built in the brood-combs; and the honey coming in is thus forced into the sections. I frequently get two supers of comb honey by the time the brood-chamber is filled.

Some will say I will get too much drone comb built. If the queens are old, and will perhaps be superseded that season, such will be the case. But there will be a time the next season, between hay and grass, which, in fact, is just the time for spreading brood, when these combs will be empty or nearly so, if kept at the outside of the hive; then take them out and exchange with full sheets of foundation. This is the only time I use full sheets in the brood-chamber when working for comb honey. The combs taken out are made into wax. There are certain times when the construction of comb is not as expensive as some have been led to believe. As a rule, I think bee-keepers could make much more wax than is made.

On page 233 you speak of a new cover you have adopted for hot climates. Along this line I wish to say that the best flat cover ever put out for this climate was the old $\frac{7}{8}$ inch thick, with grip on each end, and painted on both sides so as to be reversible. The Higginsville and Danz. covers are not the thing for this climate, and neither will be the cover you have adopted, as I understand it is simply your old flat cover covered with paper. Here we winter out of doors, and sealed covers are not the thing. With two or three thicknesses of burlap, and an air-chamber, our bees win-

ter nicely. Again, we need the air-chamber badly, on account of the summer heat, as shade is not practicable here in many of our out-apiaries, and for my part I don't want it.

Last season I bought 100 of your Colorado covers. They gave the best of satisfaction during the summer, and every one of the 100 colonies under them has wintered nicely. Last season, during the heat of midday, when the bees would be driven out of the supers under flat covers, the supers under Colorado covers would be full of bees, and comb-building going on undisturbed. But there is too much wood surface and too many nail-heads for the sun to get at for them to last. Remember, there is no nail-puller invented like the Colorado sun. No wonder the microbes kink up their backs and quit when it strikes them. Why, I heard a "lunger" from the East say last summer that he dried out so that his shin bones and short ribs rattled when he walked.

What we want is some kind of cover with an air-chamber like the Colorado cover, and that covered with something to keep it from the sun. I have adopted a cover with a rim nearly like the Colorado cover, so as to give two inches of air-space, and covered with roofing-paper (Neponset), and painted two coats of lead and oxide of zinc. They are neat and attractive, water-proof, and I think they will stand, say, ten years, and perhaps longer. I have a notion to send you one.

I saw covers yesterday covered with old second-hand duck, and painted well, that have stood 12 years, and they are absolutely water-proof yet. They are made with $\frac{3}{8}$ -inch rim and $\frac{1}{2}$ -inch thick top, and poor lumber can be used.

In wetting sections I use a fountain syringe. Don't hang it too high; take the "shut off" in left hand to control the stream. In this way I can wet a crate of 500 sections, ready for immediate use in a moment, and can cut 500 (full sheet) starters with a miter-box and a sharp scalloped bread-knife in the same length of time.

Longmont, Col.

[I am well aware that many do not have extracting-supers. Perhaps the full-depth brood-nest might answer the purpose of drawing the bees above; but if I did not have extracting-supers I would get a few and use them exclusively for getting stubborn colonies to working upward. As fast as the combs are sealed I would extract them and put them back into use.

The new cover that we have in mind for hot or dry countries, and which we shall probably put out for another season, will be a good deal like the ordinary flat cover in appearance. It will consist of two thicknesses of boards about $\frac{3}{8}$ inch thick, separated by three narrow strips of wood, one in each end and one in the middle. The top will then be covered with Neponset red-rope roofing-paper. On each end will be nailed the ordinary grooved cleats such as are used on flat covers that were sold so extensively a few years ago. The side edges of the paper will be held in place with side

cleats, and the top surface of the paper will be kept from wrinkling by means of large-headed tacks. When completed it will look very much like a single-board flat cover, except that it will be covered with paper. Such a cover will have the advantage of being light and strong, with dead-air spaces.

All that you say about the ability of the Colorado climate to pull nails out of hives and covers is too true. When I came back from your State I made up my mind that the covers and hives would have to be of special construction to stand such exacting conditions; and, as a consequence, we made a special cover for our Colorado trade. But if the bee-keepers of your State would be willing to pay the price, it strikes me that drive-screws should be used instead of nails—I mean screws that are driven by means of a hammer. These, I think, would hold their place, providing, of course, the stuff had been properly seasoned in Colorado before nailing together. Stuff that is seasoned in the East, and then sent to Colorado, will season still more.

I am quite prepared to believe that a cover of duck well painted would last for years on hive-covers; but I see no reason why good roofing-paper like Neponset would not give equally good results, and save money in the investment. The perfect hive-cover for Colorado is yet to be made, I believe—yes, and for Cuba and all other countries that have special conditions that are very different from those of the northern part of the United States.—Ed.]

COMB HONEY—HOW TO LOAD ON WAGONS.

Feeding Thin v. Thick Syrup in the Fall.

BY H. D. BURRELL.

I agree with Dr. Miller about the placing of hives of bees on wagons for moving, referred to on page 908, Dec. 1st; that is, the combs should extend *across* the wagon. On ordinarily good roads there is considerable side shaking to wagons; and if roads are rough or much cut up by ruts the side-to-side strain on combs is serious, as first one wheel and then another drops into a hole. With careful driving there are few sudden jars forward or backward, even when there are hills. In an experience of over 20 years I have moved a great many bees on wagons, distances varying from a few miles to over 25, and with very little injury to bees or combs. Formerly I thought it necessary to fasten loose hanging frames in hives, but soon found even that unnecessary, unless the combs had been handled and brace-combs broken a short time before the moving. In moving bees on cars the worst strain is endwise of the car, in starting and stopping, and the combs should be lengthwise of the car.

On page 869 the old subject of preparing syrup is referred to. Is it not possible that the inexperienced may be misled by such directions? In most localities there is more or less honey gathered from fall flowers, and in most cases it is not possible to tell how much

feeding will be necessary until this fall bloom is gone, often not till October. Then it would be hardly safe to feed thin syrup, and depend on the bees to ripen it into good winter stores. The nights then are usually cool, and bees work slowly; and it is not best to stimulate brood-rearing so late in the season. Very young bees are apt to winter poorly. One winter I had about 50 colonies starve after they had been fed with sugar syrup, which hardened in the combs. The thin syrup is all right fed slowly in August; but after Sept. 15th I would by all means feed a syrup of nearly the consistency of good ripe honey. About 10 lbs. of the best granulated sugar, boiled with 4 lbs. of water, is about right in my experience. To prevent granulation, mix thoroughly in at least a fourth as much good extracted honey, or, if that is not convenient, for each 10 lbs. of sugar dissolve in a little warm water one even teaspoonful of tartaric acid. Feed the syrup quite warm, and enough at one feed if possible.

South Haven, Mich.

[As to the matter of feeding where the food is to be given late in the fall, I have and do advocate making it thicker. But better—far better—feed early, and make the syrup *thin*.

Here is something further on the loading question, from Mr. Greiner.—Ed.]

LENGTHWISE OR CROSSWISE.

BY F. GREINER.

In an article on moving bees, written for the *American Bee-keeper*, I made no special mention of how the hives should be placed on a wagon. I thought it was well understood that the combs should run crosswise of the wagon. I am somewhat surprised that the editor should think differently. The roads in and around Medina may be so excellent, and come so near the steel roads, that it is practical to carry the hives lengthwise, and he may, therefore, have come to the conclusion that *that* is the proper manner. Here with us, even when the roads are the finest, the side shake is more severe than the jerking endwise, and I would not think of loading comb otherwise than across the wagon. Our land here is not as level as that around Medina and Marengo. Mr. W. F. Marks says the most of it lies "up and down," and still I find it safer to carry hives with their combs crosswise. Half-story hives with loose hanging frames I often carry without fastening the frames, which I am sure I could not do with frames running lengthwise. The moving on a sleigh is a different thing. There is no side motion worth noticing, but the jerk endwise is severe; so I always load the hives with frames running lengthwise as we would load on railroad cars. I believe it would be safe to lay down a rule thus:

For moving on sleigh or car, load with the frames running lengthwise. For moving on a wagon, load with frames running crosswise. On a very smooth road it will do no harm to

have combs run lengthwise with the wagon, and I would load as most convenient.

Naples, N. Y.

[And here is something further.—Ed.]

In regard to the instructions on your caution-cards, we might say that we have always considered that the part which refers to loading honey on to wagons was wrong. The side bumps on our road to market are, we believe, a thousand to one end bump, and consequently we have always loaded our honey with the edge of the comb pointing toward the wheels. This brings the crates crosswise of the wagon, and also economizes room. How many crates could you get in an ordinary wagon-box if loaded as directed on the cards? Mr. Byron Walker's caution-cards have the instructions right, as we consider it, and he evidently thinks so too.

Dr. Miller says, p. 908, that on *good* roads the side shake is more; and we want to add that it is the same on *bad* roads. We have to travel several miles to market, over the worst broken corduroy road in the country.

Sanilac Center, Mich. W. J. MANLEY.

[This is quite in line with other evidence that we have been having from time to time, especially with the Stray Straw on this subject, page 326. I think we may set it down now as a fact that comb honey should be loaded crosswise in a wagon, and lengthwise on a car. Our printers have had instructions to change our printed labels accordingly.—Ed.]

INTERVIEW WITH HANS PRETZEL.

BY CHALON FOWLS.

There is that scattereth and increaseth yet more; and there is that withholdeth more than is meet, but it tendeth only to want.—PROV. II : 24.

My next call was on an old German back in the country, whom I will call Hans Pretzel, because that isn't his name. On approaching the house I found my way barred by a big bulldog; but the owner soon appeared, saying,

"Vell, vell, vell; vy don'd you come in, Mr. Fowls? Looks like you vas pushful."

"Well, you see, Hans, your dog looks so big that I feel small. Say—he looks as though he could see clear through me. May be he knows that I came after money."

"Vy, mine goot gracious, Mr. Fowls; I refer taut as you would pe after my monish. What have you now in your hedt?"

"Oh! I want you to subscribe for GLEANINGS, and join the Bee-keepers' Association."

"Nit; my bees do notting dis year. I haf notting to fool away on dem vellers."

"Yes; but you have got the bees, and ought to keep posted, so you can get a good price when you do get a crop, and we may get a good crop next season."

"Nix; I vill no more fool away good monish in handt for dat good-for-notting bird mit de bush; he vill prob'ly pe un old crow when I get him."

"Why, how do you make that out, Hans?"

"Vell, ven I got someding, den first ting I know I don'd ain'd got it. Ven I taut I got a big brice for my honey, I youst gif it away. Dem shneaks in de city stheal de whole shooting-match. Say—I like now pretty bad, ven I could set my dog Bose on dem vellers."

"You seem to have a good deal of confidence in your big watchdog."

"Yaas, I eats him vell and he keeps me vatch."

"Well, that just illustrates what our association would do for you if you would support it. It would be like your big watchdog, ready to protect you from these commission sharks and other enemies."

"Vell, vell; may pe so; but I don'd like to pay monish for someding I don'd got alretty."

RAMBLE NO. 186.

Some New Facts Relative to Alfalfa.

BY RAMBLER.

Perhaps with only two seasons' experience with alfalfa as a honey-factor I should hold my peace. I am, however, inclined to give my experience so far as it goes, and will.

My first crop of honey from alfalfa was secured in Scott Valley, in the extreme northern portion of the State. The first cutting for hay was early in July; the next, late in August. Upon both growths there was a profusion of flowers, and the farmers allowed it to stand several days in bloom, and the bees secured a fair honey crop of excellent quality.

It was stated by the bee-keepers of the val-

A DOLLAR CLOSE BEFORE THE EYES WILL SHUT OUT GOD'S RESPLENDENT SKIES.

"But, Hans, even your big dog would not keep watch for you if you were too stingy to feed him first. The trouble with you is that you have been too much in the dark. A dollar may blind you if held close to your eye. It is penny wise and pound foolish for a bee-keeper to withhold the dollar that should go to support the best organization for mutual protection that the bee-keepers of this country ever had, and just as foolish to hang on to the dollar that should go to pay for a journal like GLEANINGS."

"Vell, vell; here is my tollar; you send in my name right quick, for I vant to get in mit dem vellers vat vatch out for dem rascals like my big dog."

ley that the yield from this source fluctuated to quite an extent; and there was proof of this the next year when I learned that the yield was very light.

In respect to honey in other localities, we have been led to believe that it never fails to yield from a fair to a good crop of honey. For instance, in Arizona we never hear of total failures, and I think the same conditions exist in Colorado and Utah, and I presume Central California has reported no failures. From my own observations in the latter location I must conclude that alfalfa yields honey sparingly occasionally, in some districts.

The experience of others has been the same, for I know of five bee-keepers who moved

their bees from Southern California, into widely different portions of the central portion, and their success was indifferent. Still, in some portions of Central California a fair yield of honey was secured, and I presume it was attributed to alfalfa.

Let us observe the conditions in the locality under my own observation. The first blossoms the bees work upon with vigor are the almond, in February; after this comes a profusion of fruit-bloom in March, with a few honey-producing wild flowers—alfileria the principal one. After the fruit-bloom there is a dearth of honey producing flora; and if the bees are not well supplied with honey to last them through May, and often through June, a little feeding will be necessary.

"But," you say, "where was the alfalfa bloom in that alfalfa country?"

There is certainly a splendid growth of alfalfa, and the first mowing is in April; but there is no bloom upon it worth mentioning. A good share of the heads are blasted, and there is a fuzzy whiteness where the bloom ought to be. If there should happen to be a few or many blossoms, the bees are not inclined to work upon them. In May the conditions are about the same. While in June alfalfa may and may not secrete nectar, some seasons an extracting can be obtained; the next, perhaps not a pound.

The bees have made a useless spurt of brood-rearing from fruit-bloom away back in March. If they swarm during this bloom, the new swarms will hardly make honey enough to live upon, and the old colonies will use their stores upon useless brood-rearing, finally diminishing the brood-nest. As the honey-season approaches in an uncertain way in June or July, the first few weeks of it are spent in bracing the colonies up for business.

My experience with our out-apiary in the weed-patch during this dearth of nectar was new and very interesting. The colonies were not in very good condition in the spring—weak, and short of honey. On the 25th of May I put down this record: "Average of one ounce of honey to the colony."

Many of these colonies were examined in the morning; and, though there was, on an average, 200 square inches of brood in each hive, I failed, after close scrutiny, to find one cell of honey. Examine the same combs near evening, and a few cells of honey would be found near the brood. They were actually living from hand to mouth, and decreasing instead of increasing the brood-nest. Yellow sweet clover was the source of the honey-supply. The weakest colonies were fed sparingly, and they came up to the July honey-flow in fair condition.

If the bees do not get up to the swarming-point during the fruit-bloom, the starving-period in April and May takes the desire all out of them, and, no matter how freely honey comes in afterward, or how full the hives become, there is no desire to swarm; and, as a bee-keeper remarked, who owns 500 colonies in several apiaries, and cares for all of them himself, "this starvation-period is our salvation from the swarming-fever."

If there is no alfalfa-bloom previous that the bees work upon, there is a profuse bloom in July, August, and September; but even during these months the secretion of alfalfa nectar is sometimes meager.

The failure of the bees to secure alfalfa honey is wholly due to an atmospheric condition, and not because the alfalfa is cut too early. It would be much to the advantage of the bee-keeper if it were allowed to stand a little longer; but in a district where there is a large acreage there is more or less of it in bloom all the time. Each farmer cuts his alfalfa four times during the hay-curing season. Mr. A cuts his this week, Mr. B next week; they are not all ready to cut at the same time, and the whir of the mower is heard almost continuously through the summer. Then there are the alfalfa-pastures where hundreds of cattle are grazing. There is quite an amount of bloom in these fields.

But if alfalfa is almost a failure, sometimes there are other flowers in many localities that come to the rescue.

If there were a small hill handy I would take you to the top of it and direct your attention eastward. Well, let's climb to the roof of the veranda. Off toward Dinuba, five miles away, are hundreds of acres of wheat land. After the wheat is cut, the California compass-plant, or

The sunflower that, with warrior mein,
Still eyes the orb of glory where he glows,

puts in an appearance, and grows and blooms with utmost luxuriance. The bees work upon it with considerable vigor for both pollen and honey for six weeks in August and September.

BEE WORKING ON BLUE CURLS.

- 1.—Tube straightened by bee, and pollen striking back.
- 2.—Hair-like stamens bearing pollen-grains.
- 3.—Pollen-grains.
- 4.—Buds.
- 5.—Two leaves at end of tube for bee to alight upon.

Another plant with as many names as the locations in which it is found comes into bloom early in August, and continues until frosts

subdue it in October. It is here called camphor-weed, from its rank odor; but its true name is "blue curls." "Wild Flowers of California" says of it, "This species blossoms late in the summer, and grows upon very dry ground, where it seems almost a miracle for any plant to thrive."

It seems to grow upon portions of wheat lands where the sunflower will not, and is in bloom at about the same time. I have met this plant in all portions of the State. In the northern portion of the State the honey from it is dark and of rank flavor, but here in Central California it is of good flavor, with a dis-

exhibit one of the wonderful plans of nature for the proper distribution of pollen grains and the perpetuation of its species.

I noticed one day that the bees were coming in with their backs painted a dirty greenish hue, and the next time I was out upon a tour of observation I found the bees working blue-curl blossoms, and here was one of nature's paint-brushes. The blossom is in shape something like that of white-sage. The bee alights upon the curled-up corolla of the latter, and its weight opens, as it were, a trap-door, giving access to the nectar tube (see illustration in A B C, page 262, 1900 edition).

But the nectar-tube of blue curls has a sharp bend in it, and above are two long curved stamens, or filaments, with pollen-grains upon the extreme tips. The bee alights upon the edge of the corolla; its weight straightens the nectar-tube, giving it access to the tube. At the same time the two curved filaments drop down and strike the bee on the back of the thorax, and leave their mark. The illustration will give some idea of this language of the flowers:

To him who, in the love of
nature, holds
Communion with her visible
forms,
She speaks a various lan-
guage.

The bee and the grape have been under controversy for many years, and apiaries in this State have been burned by grape growers for the fancied injury to their product; but that happened in the southern end of the State. Here is a vineyard that corners right up to our apiary of 160 colonies. An eighth of a mile away is another vineyard of 35 acres; a little further along, another of 40 acres—vineyards and bees in all this region. The bee-men and the grape-men ought to be at perpetual warfare; but it is quite the contrary. They dwell in harmony.

Through the early portion of the grape season, not a bee disturbs the ripening grapes; and when the large clusters are spread upon the trays for drying, not a bee disturbs the raisins. The only time during the past season when the bees worked upon the grapes was late in the fall, and upon what is called the second crop. It is too late in the season to cure this crop. Birds, squirrels, and various insects, including bees, work upon it. Not much profit is expected from the late crop. A good share of the vineyardists get a little profit out of this crop by selling the grapes to the wineries. Mr. McCubbin, being a consistent Prohibitionist, will not sell to the winery.

EUCALYPTUS-TREE PLANTED 11 YEARS AGO, NOW 85 FEET HIGH AND 3 FEET IN DIAMETER.

tinctly acid quality, and almost water-white. It is in an extreme hurry to granulate, and will commence this process within three days after extracting. When secured in the comb it soon granulates there.

Although people apply vile names to the plant, and keep as far from the odor as possible, still it is a most interesting plant to visit; and the mechanics of the blue curl's blossom

in the fall, and upon what is called the second crop. It is too late in the season to cure this crop. Birds, squirrels, and various insects, including bees, work upon it. Not much profit is expected from the late crop. A good share of the vineyardists get a little profit out of this crop by selling the grapes to the wineries. Mr. McCubbin, being a consistent Prohibitionist, will not sell to the winery.

He thinks the juice of the late crop more useful to birds and insects than as an intoxicant, and upon that point Mr. McCubbin and the Rambler are in accord.

When bees store this juice in the hives, no evil effects follow. It seems to answer all the purposes of honey.

Peachtree Utter should come here and see the harmony between the peach-growers and the bee-men—no disagreements. Apricots, while drying, are badly infested by the bees; but the owner of a large apricot-orchard has a few colonies of bees himself. He is so much civilized that he thinks a few colonies placed in his fruit-orchard of prunes, peaches, and apricots, are more benefit than a damage.

The umbrella-tree, though not numerous, is a honey-producer, and the eucalyptus is in evidence in this portion of California, and it gives a good record as a honey-producer.

To give the reader some idea of the value of this tree as a wood-producer, I present the accompanying photo. This tree was planted eleven years ago by Mr. McCubbin, who, with his two children, Grace and Bruce, are sitting under it. It was about twelve inches in height, and as large as a wheat straw. By actual measurement when the photo was taken, it was 85 feet in height and three feet in diameter. The eucalyptus is planted here mostly for shade around the house, or in avenues along the highway.

There are but few plantations of it for wood. If the acreage of it were increased for this purpose it would have a happy effect upon the bee-keepers.

INCREASE AND ITS PREVENTION.

"Good morning, Mr. Doolittle. I came over to have a little talk with you on the swarming question, as some of my bees are becoming crowded so they hang out on the outside of the hives."

"Well, Mr. Brown, swarming is a large subject, and one very many bee-keepers have studied over; but up to the present time no one has fully stopped all swarming when working for comb honey. But I do not wish to stop all swarming, for I believe that swarms which issue previous to ten days before the honey harvest are a good investment; and to try to prevent such swarms as are disposed to issue at that time, or earlier, has proven nothing but vexatious with me, the result being a loss in honey—or, at least, I think so, and so I let all first swarms which come ten days or more before the main honey harvest commences be hived in a new hive."

"Very well. And how do you manage these swarms?"

"As soon as the hive is half to two-thirds full of comb I put on the sections; or where I furnish the new hive with empty combs, or

fill the frames with comb foundation, I put on the sections at once."

"I see you are pretty well posted in managing prime swarms; but what about after-swarms?"

"I have very little trouble with these, as I generally set the new hive with the swarm on the stand the parent colony occupied, placing the old hive on a new stand where I wish a colony to be. This draws the most of the field-bees in with the swarm so that the parent colony has little desire to swarm when the first young queen hatches, therefore allow her to destroy the other queen-cells."

"But can you depend on this always?"

"No, not always; and for this reason I look over the combs in the moved hives nine days after moving; and if the bees have destroyed the cells, and no piping is heard, I am sure that colony will not swarm. If I hear piping, or find the cells not torn down, then I destroy all but one myself, saving the best-looking one, unless I find a cell from which the queen has emerged, which I always do where piping is heard, in which case I destroy all. But what I wish to know is, what I shall do with such colonies as have not swarmed within five or ten days of the honey harvest. To allow them to swarm at the very commencement of the harvest spoils the old colony from doing any thing in sections."

"Well, so far you have been instructing me, and now I will try to see if I can help *you*. My plan to prevent swarming at the commencement of the honey-flow has been to stop them by way of a moderate increase, by the following plan: Shake all the bees and queen from a populous colony into an empty hive—that is, a hive having frames filled with foundation, and a super on containing sections filled with thin foundation, for this shaken colony will contain a half more bees than would a swarm from the same hive. The combs taken, freed from bees, but full of brood, are arranged back in the old hive, when I move another colony to a new stand and place this hive having the combs of brood in its place, giving them a laying queen. This last colony moved may be the weaker of those which have not swarmed, as any colony strong enough to think of swarming at all will furnish field-bees enough to care for the brood, providing the change is made at a time when the bees are flying freely. You will see that I make one new colony from two old ones, having all in the best possible condition to store comb honey by the time the harvest arrives."

"Yes, I think I understand the plan, and I will try it. But suppose that I have all the increase I desire from the swarms which issue previous to ten days before the honey harvest. Is there no way of stopping the rest from swarming, and still have them work to advantage in sections?"

"Do you clip the wings of your queens?"

"Yes, always."

"All right. Now, if we have decided that prevention of increase will be more profitable than further increase, when a swarm issues catch the queen as she is found running around in front of the hive, and place her in a wire-

cloth cage, kept on hand for this purpose; spread the combs a little in the center of the hive, and then by means of a wire attached to the cage suspend it in the center of the hive, and the bees will soon return. The first queen-cell will be due to hatch in seven days; but if we wait the seven days and cut off the queen-cells at that time the bees will have brood still young enough so they will start cells over the larvæ, and often cherish these cells, raising a queen from them and killing the old queen when liberated, thus destroying the usefulness of the colony, as a queen reared from such brood is practically worthless. So to overcome this difficulty I open the hive in four days and cut off all the queen-cells which are sealed, allowing the rest to remain, which satisfies the bees so they do not build any over brood. I now wait six more days, or ten days from the time the swarm issued, when all queen-cells are cut off and the queen liberated. The bees will now go to work in the sections, with a will that is almost surprising; and the honey that has been stored in the combs while the queen has been caged, together with that coming from the fields, makes an aggregate which booms work in the sections to the greatest degree."

"But suppose that I do not wish swarms to issue; what then? Can not the queen be caged without waiting for the swarm to issue?"

"Yes, I often hunt them up and cage them, putting the cage near the entrance in one of the frames, allowing it to rest on the bottom-bar to one of the frames not having the comb built fully down near one end. Where you cage in this way it is necessary to cut the queen-cells but once, unless you find some nearly ready to seal, for none will hatch from those built over brood before the eleventh to thirteenth day. Therefore, if we cut the cells on the tenth day and liberate the queen we are all right. But where a swarm has not issued, the bees will not always be satisfied without trying to swarm, if the queen is released in ten days' time, so on cutting the cells at this time I put a plug filled with queen candy in the cage, which is long enough to take the bees three or four days to eat out the candy to get to her, thus liberating her."

"This candy is put in a hole bored through the center of the plug?"

"Yes."

"How long a plug does it take for three days?"

"If the hole is only $\frac{3}{8}$ inch, 3 inches long is about right, as they eat out about an inch a day. But I hear a horn blowing up at your house. What does it mean?"

"It means my bees are swarming, and I'm off."

A MANIA FOR SUPERSADING QUEENS FOR THE WHOLE APIARY.

Honey is coming in at a good rate, and the bees are casting a few swarms. We are met with a condition that is causing us considerable trouble, for the reason we are not able to strike on any plan to prevent it. The condition is, the bees are possessed with a mania for supersading their queens. Queens of last season's rearing have been supersaded while keeping from four to six frames filled with eggs and brood in all stages. Often they will build queen-cells, and just a few days before hatching will tear the whole lot down, thus rendering themselves hopelessly queenless. At other times they will permit a queen to come out, become fertilized, and kill her before she begins laying; and, again, they will permit the queen to lay a few days, then start cells while the queen is yet laying; and about the time the cells are ready to seal, the queen is missing from the hive. The trouble is not with a colony or two in a large apiary, but we are finding about thirty such in one apiary of 250 colonies, and a neighboring bee-keeper reports over 60 in an apiary of 200 colonies. I noticed a little trouble of the same nature last season, but attached little or no importance to it; but this year we hear of several apiaries with the same trouble. We should like the opinion of bee-keepers as to what causes the trouble, for trouble it certainly is.

M. W. SHEPHERD.

Marchant, Fla., Mar. 26.

[The condition you describe is somewhat remarkable. I have known of colonies that persisted in supersading queens, but I never knew the mania to extend to any considerable number. It would almost seem as if there were some disease or trouble that the bees had knowledge of, which you as their owner could not discover. We lay it down as a rule that supersadure does not take place unless the queen is defective or is getting old. I should, therefore, be inclined to believe that there is some disease that attacks the queens, but which for the time being does not apparently cut down the egg-laying to the observer. If some one else is in position to give information on this question we shall be glad to hear from him.—ED.]

GOOSE WING FOR BRUSHING BEES.

If you have never tried a quill out of a goose's wing to brush bees off the comb, try one. I use them and think they are nice. When it gets sticky, throw it away and catch a goose and pull some more. One at a time is enough for a brush.

IRVING PIERCE.

Union City, Mich.

[I have used turkey feathers and chicken feathers, but I do not remember distinctly that I ever tried the big feather of a goose;

THE lawn-mower is now needed in the apiary to keep down grass. If the apiary is fenced in, try a few lambs or even sheep. It is not safe to turn larger stock into the beeyard. But it will not do to use sheep if there are grapevines for shade, for the sheep will eat the vines as well as all other vegetation.

but I know that such devices for brushing bees off the combs are very generally used by bee-keepers, especially if they are located on a farm where feathers are plentiful.—ED.]

BEE-KEEPERS who expect to attend the convention of the National Bee-keepers' Association at Buffalo next September are requested to prepare questions and hand them in. The committee, however, would be glad to have these questions sent by mail in advance, so that all duplicates may be stricken out. Send questions to Sec. A. B. Mason, Station B, Toledo, Ohio.

ROBBING is dreaded by the beginner more than by the veteran, generally. If the colony being robbed is weak, and has little honey, it might as well be left to its fate: If it has much honey it will be best to remove the bulk of it to safer quarters. If the attacked colony is worth saving it might be best to take it to the cellar for a few days till things have become quiet and the robbers have taken to a more legitimate business.

THE W. T. Falconer Co. and The A. I. Root Co. will have exhibits at the Pan-American exposition, in the Agricultural Building. These exhibits will be conspicuously placed in the gallery, this gallery being reached by means of a traveling sidewalk. The two exhibits are placed together in the same booth, as it were, facing each other. Huber Root, youngest son of A. I. Root, will be in attendance on our exhibit a good portion of the time, to explain the goods and answer questions. He is at present attending school at Oberlin, O.; and when he returns, after a little "coaching" in Medina he will probably be able to receive bee-keepers at the Root Co.'s exhibit at the Pan-American.

AN IMPORTANT DECISION FOR OHIO; HONEY-BEES NOT A NUISANCE.

THE following letter contains a piece of news that will be read with much pleasure, not only by the bee-keepers in Ohio, but by those in every State where this question comes up, or is liable to come up, as to whether bees are a nuisance or not. Here it is:

Mr. Root:—C. W. Carr, of this county, was indicted for maintaining a public nuisance, in that he kept and maintained a place for the raising of honey-bees. We defended Mr. Carr, and know that you will be interested in the outcome, as we have talked with beemen considerably, and read your article on the Utter trial.

We have just argued a demurrer to the court, and the court held that it was not a public nuisance to keep and maintain honey-bees in this State.

It was the same old story of jealousy and malice. Mr. Carr is a young man, and the head of a family consisting of his widowed mother and young brothers and sisters. His health is such that he is unable to work at hard labor, and he has managed to keep

the family together by raising chickens, keeping bees, and a small garden-patch. His neighbors, unfortunately, were men whose business was in the use of a jack-knife upon dry-goods boxes, and grumbling. Wauseon, O., May 10. HAM, HAM & HAM.

This is a case that had not, if I am correct, been referred to the N. B. K. A. If so, I had no knowledge of it. At all events, a victory has been won. Mr. Carr has been vindicated, and the bees declared to be not a nuisance. This decision, coming as it does, will have important and far-reaching results; and I have no doubt that General Manager Secor will secure a copy of the decision so that it can be used in other cases that may come up in this or other States. The attorneys who defended the case so successfully deserve the thanks of all bee-keepers.

SNAP SHOTS ON THE FLY.

Pullman car, en route to New Orleans.

I have just come from a delightful visit with J. M. Jenkins, at Wetumpka, Ala. Yesterday, May 21, he met me at Montgomery, and then behind his little pony we drove 14 miles across the country through the pines and over the cotton-plantations to Wetumpka.

For the first time in my life I saw the cotton-fields being plowed and cultivated by the black man and his family in the good old-fashioned way. Regarding the colored race, I plied friend Jenkins with a thousand and one questions; but of these and the replies I shall perhaps have more to say later.

We stopped at one of Jenkins' out-yards, took some pictures, and drove on. Later in the day we "changed horses," this time taking one of Jenkins' mules, and started for the out yard among the pines. On the way the aforesaid mule entertained us (or me, rather) with several characteristic solos. Say—he could beat all the mules I ever heard in running up and down the scale. Such beautiful zigzag trills I never heard before. You just ought to have seen the black faces pop out of the cabin doors. You see they (the owners of the faces) knew it was Jenkins' mule, for they know Jenkins and his mule all over that country. Well, on arriving at the yard I took some more views and some more notes, and then we started back.

Strawberries, blackberries, and dewberries were in full bearing, although the season was a month late. In Mr. Jenkins' orchard were several peach-trees that would have some ripe peaches within a week, and—

Say—this train joggles my elbow so that I shall have to give up writing for now; but as soon as I get my pictures developed and engraved I'll have more to say about the visit to Mr. Jenkins.

Later.—I'm taking some snap shots with my little pocket camera. We are crossing bridge after bridge, and such beautiful scenery! I wish you could see what I see as the kaleidoscope changes.

A NEW BEE-BRUSH.

MR. JOHN HAMMOND, of Buena Vista, O., a manufacturer of brushes of all kinds, and also a bee-keeper, has sent us a sample of his

double brush for brushing bees off the combs. It is very unique in principle; and in practice, from the limited number of tests we have been able to give it this spring, it is all it seems to be in theory. Both sides of the

comb are cleaned with one or two sweeps. In the average extracting apiary a large number of bees can be driven off the combs by the right use of smoke. Some little time ago I described how, by the use of a quilt or cloth laid over the top of the frames, one could

cause the smoke to be sucked down into the brood-nest by an alternate succession of flops of the quilt, producing a suction, such suction causing the smoke to go down into the extracting-combs, driving the bees before it into the brood-nest. In the Cogshall apiaries I

have seen combs so treated taken out of populous colonies, almost free of bees. Well, suppose there were quite a number on each side. Just imagine how quickly one could disengage every bee with a double brush like the one shown in the illustration.

We have been so well pleased with these brushes we have decided to catalog them next year, and in the mean time we will furnish them to those who desire them, at the prices mentioned elsewhere under the head of Special Notices.

IS THE TRADE IN LONG TONGUED BEES ALL RIGHT?

In *The American Bee Journal* for May 9 appears an article written by G. M. Doolittle, with the heading, "Long-tongued Bees—Fad or Fallacy, Which?" which is somewhat of a surprise. Mr. Doolittle says he feels it his duty to call a halt, "that too much money need not be sunk on this latest fad, even if we do not call it a fallacy." There is some danger that too much may be expected, and that disappointment may result, hence the propriety of some words of warning, or, as Mr. Doolittle expresses it, of calling a halt; but Mr. Doolittle is in error when he says "no one has seen fit to do this," for such words of warning in very distinct terms have more than once been given in these columns.

Mr. Doolittle speaks of the search for long tongues as a fad upon which money has been wasted, and he wants to ask about it "before more money is wasted on the fad." The attempt to secure in some way the crop of red-clover honey is no new thing. For many years there has been a longing to secure it, either through a change in the bees or in the clover. E. E. Hasty and others have made commendable efforts to obtain a strain of red clover with short tubes. At different times red-clover strains of hive bees have had much said in their favor, and earnest effort has been made, especially by bee-keepers of Mr. Doolittle's own State, to induce government to introduce *Apis dorsata* for the sake of its longer tongue. Petitions to this effect were printed and circulated. Why did not Mr. Doolittle call a halt while this expenditure of time and money was going on, instead of waiting till the object of search was believed by many to be just within reach?

Mr. Doolittle objects to the claim for superiority of long-tongued bees in New Mexico and elsewhere where there is no red clover. If such superiority has been observed, why not report it? Whether it be that other good qualities are found closely connected with long tongues, or whether it be that there may be other plants from which the nectar can be obtained only by tongues of unusual length, if the fact remains that, in more than one instance in regions without red clover, when a colony was found to have distinguished itself in the matter of honey-gathering, measurement has shown tongues of unusual length, is there any impropriety in making such fact known?

The chief charge seems to be that, when any thing has been said in favor of long

tongues, it has not been accompanied by the statement that long tongues were of value only in red-clover regions. Was there any necessity for such accompanying statement? Has it not been so generally understood that it did not need mention? If, however, it turns out that the value of long tongues is not restricted to red-clover regions (and testimony to that fact is not wanting), then still less is it necessary.

Numerous quotations in favor of long tongues are given, and then Mr. Doolittle says:

"And so I might go on, giving quotation after quotation of statements made along this line, without any special qualification, or, if any qualifications have been made, they have been so hidden under a lot of rubbish, or so twisted that the reader is led to believe that long-tongued bees are just the thing he should have if he would succeed, no matter about red clover, or in what portion of the country he resides.

"Now, as I hinted in the start, long-tongued bees *do* have an advantage outside of the red-clover districts, or they *do not*; and to give misleading statements, or those actually false, is something that our bee-papers of the present day should not stoop to doing, not even when the motive of gain prompts its advertisers."

As all the quotations immediately preceding these two paragraphs are from GLEANINGS, there is no blinking the fact that GLEANINGS is the paper meant. It is true the words "bee-papers" are used; but it seems evident that Mr. Doolittle had only one paper in mind, for, immediately following, in the same sentence, he speaks of "its advertisers."

The direct charge of hiding under a lot of rubbish and twisting the truth, and the scarcely veiled charge of giving misleading statements, or those actually false, is a somewhat serious one, and GLEANINGS promptly enters a plea of not guilty, and asks Mr. Doolittle to be specific and give an instance of either of the things charged, in which case prompt retraction and apology will be forthcoming. The quotations given do not substantiate the charges. The rubbish under which the truth is hidden is not shown; nor the twist given to it; and the statements quoted are not such as to mislead.

There seems a degree of inconsistency in making the charge that the attempt has been made to cover up the fact that red-clover regions only could benefit by long tongues, when immediately preceding the charge Mr. Doolittle makes a quotation from GLEANINGS which, if correctly attributed to the editor, would distinctly disprove the charge, capitalizing and italicizing it as follows: "The movement for longer tongues is simply to get the red-clover crop of the North, which now is practically all wasted. The bees, NO ONE CLAIMS, would be any better except on that account."

Mr. Doolittle is hardly justified in making that quotation in such a way as to give the impression that the editor holds the opinion expressed in the quotation. Many times a view of a correspondent is not held by the editor. Neither does the editor necessarily hold the views given by one who conducts a special department in GLEANINGS. This is frequently seen in Dr. Miller's department of Straws, and might happen in Mr. Doolittle's department, or in that of Stenog, from whom the quotation was made.

It is not very strange that Stenog should so express himself, for it is probably true that the majority of bee-keepers, especially until lately, have had in mind red clover when speaking of long tongues. But the editor by no means holds it as proven that red clover is the only honey-plant with flower-tubes so deep that bees with ordinary tongues can not reach to the bottom. All the same, the inconsistency is, none the less, to be charged with hiding a thing while at the same time holding it up to view.

It is mentioned as not just the right thing that advertisers from Florida and Texas commend their bees with long tongues. Suppose their *is* no red clover in Florida and Texas; does not Mr. Doolittle know that such advertisers expect to find customers in the North, where there is red clover? In any case, if an article is offered for what it honestly is, is there any thing wrong in that? Is a man to be considered a cheat unless every long-tongued bee he offers has a tag attached, reading, "Good in red-clover regions only"?

GLEANINGS has tried, and will continue to try, to give the whole truth about bees with long tongues. If measurements show that a large number of the best bees have long tongues in regions where red clover is not grown, then there will be ground for believing that there may be some advantage outside of red-clover regions, in having bees of that sort, whatever the explanation for their superiority may be. Bee-keepers are an intelligent lot, each one capable of judging for himself whether bees with a certain characteristic will be an advantage in any given case. Nor will they relish as a compliment being told that they do not know enough to judge for themselves whether they want long tongues or not.

It might be in order to ask why, if it is Mr. Doolittle's duty to call a halt on the long-tongued fad, it was not an equal duty to say something about the fad for five-bands. In that there could be no gain in the honey-crop—the only money gain being to those who had queens to sell; while it is a certainty that a sufficient length of tongue will bring an increase of honey wherever there are flower-tubes of honey-plants just beyond the reach of tongues of ordinary length. Did Mr. Doolittle ever call a halt with regard to the chase after color? Did he not, indeed, promote it? and does he not claim to be one of the chief agencies, if not the chief agency, in establishing the five-banded bees? If it was right to have a prominent part in a fad that could bring money into the pockets of only a small number engaged in queen-rearing, it hardly seems necessary to be so intensely severe upon a fad which seeks to put money into the pockets of many times that number through extra gains in crops of honey.

OUR METHOD OF MEASURING ILLUSTRATED; SOME INTERESTING OBSERVATIONS.

IN spite of all I have said on this subject, there are still a good many who do not seem to understand our method of measuring. At several of our bee-conventions last winter I

threw on the screen a picture of our Mr. Wardell, who has charge of our apiary, in the act of measuring a bee's tongue, and I now show the same thing in half-tone. A queen-cage is shown near the left hand. Between the two hands is a steel rule having hundredths of an inch graduated off on one side. In the left is a pair of tweezers, and in the right a knife-blade. In front of the right hand is a bottle of chloroform and a handkerchief. Mounted on a standard, standing directly over the rule, is a magnifying-glass.

The cage of bees is chloroformed by putting the spot in the handkerchief, dampened with a few drops of the anesthetic, over the wire cloth. In a minute, more or less, the bees will be "laid out," but still quivering with evidences of life. In this condition the wire cloth is prised back. With the tweezers the

as fruit-bloom is beginning, they show $\frac{20}{100}$. It would appear that the tongues of the bees, in order to show their greatest length, must be developed by *straining* to reach the depth of certain flower-tubes. Use has a tendency to develop any organ among the *vertebrata*, and why should it not in the case of the *insecta*?

And, again, it seems possible and probable that bees that have been sent through the mails will not show as long a tongue-reach as before they started.

We shall shortly conduct some experiments that will either prove or disprove some of these propositions.

In the mean time let us not jump to the conclusion that long tongues inevitably mean large crops of honey. We must not forget that long tongues constitute only one factor.

MR. WARDELL MEASURING A BEE'S TONGUE.

operator takes out one bee, and holds it while the head is removed with the knife-blade. The head is then laid on the steel rule, directly over the hundredths marks, *face upward*. A needle combs out the tongue, which the chloroform has caused to be extended, and lays it carefully in a straight line. The operator then counts off the hundredths with the glass, beginning from the end of the tongue and ending at that point at the end of the mandibles.

A good deal of evidence has come in of late, going to show that the length of tongues of any particular colony of bees varies according to the season, and also according to the age of the bees themselves. Early in the spring, mature bees will show from $\frac{1}{100}$ to $\frac{1}{300}$ shorter tongue-reach than they will later in the season. Bees that last year showed a reach of $\frac{2}{100}$ during the height of the honey-flow, early this spring showed only $\frac{1}{100}$ and $\frac{1}{100}$. Now, just

A tall man has the advantage of seeing over his fellows, and of being able, perhaps, to take longer steps, but he may not be able to "get there" as soon as his shorter brother.

STRONG COLONIES ONLY ARE PROFITABLE AS HONEY-GATHERERS.

THE buckwheaters do not need to have their colonies in working order till the month of August, and there is no use in having them overflowing with bees in June. Colonies just arriving at their maximum strength at the beginning of the honey-flow will accomplish much more than other colonies having reached that state a month or two sooner. The buckwheaters would do better to divide the strong colonies in the early part of the season. With doubled stock, and all just coming into their prime, the honey crop can be doubled.

Thou shalt love thy neighbor as thyself.—MARK 12:31.

These are the things that ye shall do: Speak ye every man the truth to his neighbor; execute the judgment of truth and peace in your hearts; and let none of you imagine evil in your hearts against his neighbor; and love no false oath; for all these are things that I hate, saith the Lord.—ZECH. 8:16, 17.

You will notice from my texts that I am to talk about "neighbors" this time, rather than "our homes;" and the matter has come up especially as I am starting a new home—that is, a new summer home—among new people. You have probably all heard the story of the hotel-keeper. I think he must have been a Yankee as well as a philosopher, for he was much in the habit of getting acquainted with all his guests. Well, a man came along with his teams and family to stop with him over night. He was moving to a new locality. He gave, as a reason, that he had always been unfortunately located among the meanest set of neighbors to be found on the face of the earth, and therefore he was going to try to find a better place. Our philosophical host informed the man, however, that he would find exactly the same kind of neighbors around his new home that he had left behind. There was no difference. Next day another mover came along, who explained in his talk that certain circumstances made it advisable for him to leave his old home, but he greatly regretted being obliged to leave, because his neighbors had always been so exceedingly *kind, fair, and friendly*. He said it almost broke his heart to think about breaking the ties that bound him to each and all. Well, our wise friend replied to this man much as he did to the other, saying something like this: "My good friend, I am happy to tell you that you will find just as good neighbors where you are going as you have left behind. You need not feel troubled nor worried."

What a wonderful truth this story illustrates—that is, if it indeed be true, and I rather suspect it is! Can it be true that it is not so much what the people are as what we make them? or, in other words, the state of your own heart has more to do with the neighborhood than any thing else. I suspect this hotel-keeper must have been a Christian, although the story did not say so. He had discovered the real *philosopher's stone*, the source of joy and peace and happiness in this world of ours.

I thought of this little story when I managed to secure a dozen days of absence from business during the busy fore part of May. In fact, I set foot in Leelanaw Co., Mich., on the first day of May, and I remained there eight days, Sunday included. I thought of the neighbors, especially as I wanted to go around among them and employ men with their teams to help me during my brief stay, and start a very humble home out in the woods. Yes, I knelt and prayed for these

neighbors, even before I had seen them. I do not think they will feel hurt if I call them by name; for, although I am going to give you a picture of a special locality, I have prayed that God shall give me grace and wisdom not to find too much fault, even if I touch upon the weaknesses and frailties of average humanity.

The first day we had only two men and a team, not counting myself. We made quite a clearing by hauling away the logs that cumbered the ground three or four deep in some places. The timber had been previously cut down, and was mostly in lengths so that a team could move it. The next day we were to grub, get out stumps, and plow. I had made arrangements to have several good men, some boys, and a team. A man living very near me had promised a team, or at least I supposed he had. He said if he could not arrange to go himself with his team and plow he would get his brother-in-law, and that I could depend on having one or the other—at least so I understood it. But when I was on the ground in the morning, I waited and waited for the men, boys, and team to show up. For a good while (so it seemed to me) nobody was visible. Finally the man who lived furthest away came with his ax. After waiting till the forenoon was pretty well spent I put off on foot to hunt up my helpers. I found the man with the team, who had promised so fairly, plowing his own field. I asked him why he was not on hand as he agreed. But he did not remember that he had made any positive promise. He said he was working for Mr. Oberlin, and must get in the oats. When I asked about his brother-in-law he said the boat had come in at the dock, and they all had to load it up. I remonstrated, and explained the circumstances. I offered to pay him extra if he would drop his work there and come and help me. But he said he could not do that at any price. He was at work for Mr. Oberlin, and Mr. O. was a very particular man.

"But, friend Burdo, I saw Mr. Oberlin last evening, and arranged to have the lumber delivered at my place, and he said they would furnish me any thing I wanted. He said that was their business, and he was glad to help me locate in the neighborhood. Now, Mr. B. I will stand *between* you and Mr. Oberlin. I know by the talk I had with him he will not charge you very heavy damages for stopping and helping me for half a day."

But I could not move him. He reasoned like this:

"Mr. Root, suppose I should hire out to work for you, and somebody else should come along, and I should go off and work for him. No, I can not work for you this afternoon, not if you were to give me \$25, unless you first see Mr. Oberlin and get permission for me to stop putting in oats."

Now, this is good square common sense; but why did not my "neighbor" apply the same common sense to our talk the evening before? I expostulated, on the ground that Mr. Oberlin was three miles away, and no telephone wire. I told him I could get permis-

sion in a minute, but I should have to take a three-mile wheelride and back again before we could get to work. As there was no help for it I started to make the trip. Then he told me to go down to the dock and see his brother-in-law, Mr. Weisler. Mr. W. said he could not possibly come before afternoon, but he would come then, sure, and bring a stoneboat, plow, and harrow. Mr. W. further told me that Mr. Henshaw, the foreman of the dock, was invested with full authority to manage Mr. Oberlin's men and teams. Said he:

"You go to Mr. Henshaw and tell him how you are fixed, and Mr. H. will take the responsibility of directing Mr. Burdo to stop on the oats from now till noon."

You see I was to have Mr. Weisler's team after dinner. Mr. Henshaw very courteously declared it would be all right for Mr. Burdo to stop the rest of the forenoon, and he did so. On my way back to the ranch I thought of my boys. Pretty soon I heard some boys in the thicket; and there I found Orville, who had promised to help me the afternoon before, but he did not show up. The mother also promised he should come. But she said, when I asked her why he did not come, that they had to have him help load the boat.

Orville and his companions were making whistles out of basswood sprouts. The basswood was just leaving out. Now, I am always glad to see boys make whistles, providing they can make them with a clear conscience; but Orville had hired out to me, as I understood it, and his mother said he was down helping them load the boat. Perhaps I had better explain here that, when a vessel comes into the dock, it must be loaded, whether or no; and for this work the men and boys get much higher prices than they get for ordinary farm-work, so every thing else has to stand aside.

"Why, Orville, your mother said you were down helping load the boat, even though you had promised fair and faithfully to work for me; and here you are, sitting in the shade, making whistles."

He hung his head down, but ventured as an excuse that they found out they did not need him at the dock.

"But why in the world did you not hustle up at once to meet your appointment to work for me? You know you promised to be there yesterday afternoon."

"But, Mr. Root, I did not know that I promised to work for you to-day."

To tell the truth, he had not exactly promised to work for me any longer than that afternoon. But I told him I wanted him badly right along, and I expected, of course, he would help me right along. This was only a sort of boy's philosophy. I have learned by experience with boys that they have sometimes queer ideas of things; and it is not best to expect too much of them, either physically or in the way of keeping promises. Let me say right here that Orville helped me right along after that, and proved to be an excellent boy in almost every respect. He and I are the best of friends, and I hope we shall be as long as we live. Mr. Burdo came with his big team, and did a tremendous lot of stump-pull-

ing, plowing, and removing big stones for the rest of the forenoon, about 3½ hours.

After dinner my men were on hand, but no team showed up. Mr. Weisler's boy was soon there. He said his father was surely coming, for he saw him start off with his team; but when the afternoon was a good part gone I sent Charley to see what the matter was. He said the wind changed, and the vessel could not get under sail without assistance from all the men and teams in the neighborhood. I did not learn how they use teams to move a vessel out in the water; but that is the way I understood it. We had to get along the best we could, and I managed to keep my men busy, though not in a profitable way, without any teams.

Mr. W. promised to be on hand early next morning. Sure enough, he did come; but instead of having a plow and stoneboat he had nothing but a harrow. He explained that the stoneboat was a mile away from home, and he had not had time to go for it. The plow was all broken to pieces, and therefore he could not bring one.

Now, I had made up my mind to make friends with the people all round about my home, no matter what it cost. I was going to have their good will and co-operation; and I knew by past experience that finding fault and blowing a man up would not help—well, let us say it does not help one to sleep well nights, and get along nicely with those who live around him. Some of you will understand me if I tell you that I not only prayed for all these people, but I prayed that God would give me grace and wisdom and understanding to help me build something of a thousand times more importance than the garden and the little home out there in the wilderness. When I saw my friend and neighbor come up with nothing but a "drag" in place of the plow and stoneboat, I prayed the great Father above to help me get along profitably with just the drag.

I think I will not tell you of any more of my disappointments and troubles in consequence of broken promises. When I found I could not have the plow I set the big team to moving rocks without a stoneboat, getting out stumps, snags, etc. I had the big rocks located for the foundation of my building, and then I remembered three hewn timbers, forty feet long, that somebody had cut out and left in my woods. You see, while I was far away, and paid no attention to my property, my neighbors sort o' helped themselves to my timber. My conscience did not trouble me for appropriating these forty-foot sticks. I cut each in two in the middle, and then placed them on top of the big rocks we had placed for the foundation, nailed some boards across them, and there was the foundation of our new home—a good solid one too.

We used the team and drag all that afternoon to very good advantage; and after overcoming all my perplexities one by one I began to get very happy. I worked very hard—perhaps as hard as I ever worked in my life; but I rarely if ever have passed a happier eight days, and I was happy when Sunday came.

The boy who was helping Orville make bass-wood whistles came along with us. We called him Earl. Pretty soon another friend of the two boys, named Thomas, came and proffered his services. Well, when I could not secure any men or teams to help me work I had just these three boys—sometimes four of them; and I tell you we did a lot of work. I know there is an old saying that "one boy is a boy; two boys are half a boy, and three boys are none at all." I had some experience with this trouble. So many boys together would have fun and play more or less in spite of anything I could do. If a chicken-hawk soared overhead, they had to stop and look at it. If Earl's puppy got a woodchuck in a hole it was boylike to want to see the fun. Sometimes I became discouraged; but when I did so I prayed, and then the boys all of a sudden did a man's work for quite a little spell. Toward noon they would get pretty tired; and when I stopped to take my nap on my big blanket on a pile of leaves I suppose they took things pretty easy, and I don't care if they did. May God bless and guide those four boys.

One afternoon when they were pretty tired, and did not seem to feel like working at any thing much longer, I told them I had got to go to Bingham on my wheel to order lumber for the building. I suggested to them that there was not a very good wheel-path through the thicket in the corner belonging to Orville's mother. I asked them if they would not cut away the briars, and fix it so we could get through easier, back and forth. Then I went to Bingham. When I got back it was about dusk, and I was surprised to find something like half a day's work done in fixing up a very nice little roadway through that troublesome thicket.

"Why, Orville, you boys did a tremendous lot of work after I left. You must have worked after quitting time, didn't you?"

Then his mother suggested that they did not get around till after 7 o'clock. Now, you see boys sometimes give us pleasant surprises, especially when they take a *notion* to a job; yes, and after they are apparently tired out with a hard day's work they will jump and run as if they had not done any work at all. Oh how I do love nice clean pure-minded boys! Even if they do vex and try us at times, God knows we can well afford to overlook a great deal.

Right in this line let me give you one more experience. I had been delayed and disappointed so much in getting the ground ready for those peach-trees that I had about given up thinking they would amount to any thing. Finally, one day after we had got the ground all slicked up in pretty good shape, and I was just about ready to think of sending for trees, friend Hilbert drove up with his ponies and spring wagon, with all my stuff. Sure enough, some of the peach-trees were budded, and almost in bloom. I told the boys how anxious I was to get the trees out, even if it did rain, and we kept right at it except when it rained the hardest, and got them out in good order. Of course, we stayed in the building when it rained the most.

About five o'clock one of the boys said he had to go home early that night. As it was his last day with us, I paid him off. When he objected to receiving full pay for the rainy day, I told them they had shown their good will by working out in the wet, and so I did not take out any thing for the time it rained. At this all the rest of them set up a "hooray." Then one of them volunteered, "Mr. Root, is there any thing else you would like to have us do before we quit? If you are going to pay us wages for the time we sat still when it rained, we will try to make you out a better day's work."

Well, I had almost given up clearing up my ravine. I wanted it done badly, for I thought it was about the best ground I had on the place. The raspberry-bushes down in that dark place last fall were toward ten feet high, and there were luscious berries on them almost up into November. I knew the ground was very rich, and I wanted to use it for some of my choice varieties of fruits and vegetables. I told the boys I should be very glad to have that ravine cleared out of rubbish, and every thing that would be in the way of working on it, the next day. They went at it with another hooray, and an hour later I could hardly believe it possible that those boys alone could have done so much work. Most of the stuff had to be pulled down hill; and they would all together get hold of some tree or log, and down it would go on the fly. I had brought with me a Daisy wheelbarrow, and the most approved spades, shovels, hoes, mattocks, etc., that could be found in the market; and the boys seemed to take to those nice new tools almost as ducks take to water. In just a few days they became very expert with them.

I had almost forgotten to tell you about building the house. The boys and I fixed the foundation and laid the floors, as I have told you. I engaged two carpenters, but they could come only one day. I could not possibly manage to get them any longer. I had, however, four boys to wait on them, and a very good man who is handy with tools, even if he is not a carpenter. By noon we had the walls up, and a little after noon we were ready to begin shingling. I asked the carpenters if they could not each take a boy, one on each side, and keep watch so that they would lay the shingles and make a tight roof. The four boys were all ambitious to help in shingling; and you ought to have seen that roof go on. Of course, the boys were expected to wait on the carpenters; but once when he thought I was not looking I saw the boss carpenter carrying shingles from the ground up to the roof, and he put up quite a lot of them too. He said he would rather do it himself than to urge the boys to get more. The roof was on, the door was made and hung, even to the lock and key; and all the windows would have been in, but the teamster who was to bring them over from the store at Bingham forgot to put them on top of his load of lumber. I wonder if this fashion of forgetting things, that throws expensive men out of a job, and costs people sums of money untold, is preva-

lent *all over* the world. My dear friend, in the neighborhood around your home is it customary to have a builder, or, say, a crowd of men stopped in their job because some carrier "forgot" to load on all his stuff? There, there! if I do not look out I fear I shall be finding fault again.

In our hurry to get the logs out of the way, we piled them up just back of the house. I did not set fire to them—first, because they were too damp to burn well; and, secondly, if the wind were to change I knew it would greatly annoy us in our work. As soon as we got the shingles on, several of the older men began shaking their heads, and looking at that log-pile almost as high as the house. They said if a fire got into the woods, and the wind were in the right direction, the house that was built in just one day would burn down in a good deal *less* time. The log-heap would have to be burned up before I went home. I started it going one night just after the men left, and I spread my blanket in the new house, and proceeded to watch. Even though the wind was away from the house, the heat was so great that it almost scorched the boards. There was no water nearer than twenty or thirty rods, and I was alone in the wilderness. If the wind were to change, my house could not stand a minute. A little after midnight it did change, and the sparks fell on that roof for a little while in a way that was fearful. I had a ladder and one bucket of water. Of course, it was not a very serious matter; but it was dear to my heart, even if the whole thing was not worth more than forty or fifty dollars. Just as I began to fear trouble the raindrops began to patter on that roof. What a joyous thing it was just then to thank God for having answered my prayer in this strange and unexpected way! The contrary wind that came up all of a sudden was probably brought on by the rain that was just behind it.

Just one more little circumstance. After the boys and I had cleared off the ground where we were to plant our peach-trees, somebody suggested we ought to have a floater to make the ground smooth. I suppose I need not tell you what a floater is. There was nothing on the premises that we could draw over that ground, to scrape off the high places and fill up the hollows. Oh! yes, there was. When the carpenters needed a ladder badly I took two light sticks of timber and nailed boards across, making a rough but strong ladder. I told Orville to get his team, and another boy to get the log-chain; and then I hitched the chain so the ladder would go forward with a slant, enabling it to slip by the stumps and obstructions; then I loaded the boys on the ladder, and told Orville to start up. It did beautiful work; but the ground was so uneven and rough, and there were so many roots, it went by jerks, especially when going down hill. Of course, we might have piled logs on the ladder, but we wanted it weighted down in such a way we could take off the weight in going up hill, and put it on in going down. We wanted it weighted down with something that had sense and intelligence. I explained the matter to the boys,

and distributed them along the ladder, and then—what do you suppose? We not only made that orchard look like an onion-bed, but those four boys hal—well, something I should call *better* than a circus. Sometimes the whole four went over backward in spite of all they could do to hold on; and about as soon as they got back, the next tumble was over in front under the horses' heels. I kept telling them they must hold on tighter. The boys laughed and hurrahed till they made the woods ring; and I finally laughed till the tears ran down my cheeks, making furrows, I suppose, through the dust and grime. Oh, yes! when I went up to Michigan I had to wear an overcoat and a muffler and my winter flannels. I had the grip across my chest, rheumatism in my leg, and a cold besides. When I got to work with the boys, after three or four days I was bareheaded (barefooted a part of the time), wore neither coat nor vest, and some of the time I had to remove some of my underclothing. When my feet got sore I bathed them at night in cool running water from that spring, and did not catch cold. I boarded at a farmhouse, and had farmers' fare; was happy and well, without any beefsteak or other things that we get with so little trouble when we live in a town or city.

On Sunday I found a churchful of people, young and old, in Sunday-school. There was no preaching in the middle of the day at Bingham, and not every Sunday in the evening; therefore they generally have an excellent turnout at the Sunday-school, and it rejoiced my heart to see them come from miles around. Yes, and it rejoiced my heart again when the superintendent asked me if I would talk to the children at the close of the lesson. I told them I wanted to talk about two things—fishing and swearing. I asked how many had ever been fishing. In response the boys pretty much all raised their hands. Then I asked how many knew *how* to fish, and the hand of pretty nearly every one in the room went up. Then I told them something about fishing in olden times, and the cast net that Peter was requested to throw on the other side, and which I described on page 355. Then I spoke something as follows:

"Children, I might now take up the other part of my subject and ask how many of you have ever heard swearing. But I do not want to do this. I do not want to know how much swearing there is in this community, for I am almost a stranger. I might ask all those who have ever been tempted to swear to raise their hands; but, God forbid. The subject is too serious and sacred a matter to even ask questions about in this way. Peter was an expert fisherman. It was the business of his life before Jesus found him. The Bible tells us that Peter knew how to swear as well as how to fish. Can anybody tell me how Peter probably learned these awful bad words?"

Somebody replied that Peter had most likely heard *others* swear. And, dear friends, this is the way swearing comes about. The little boys hear the bigger ones swear, or the old men, or the "neighbors." If everybody would stop it, the little boys pretty soon would

not know there was any such thing as swear words. I have been here only four days, and yet I have heard some terrible swearing. A young man was drawing off stones on a stoneboat. He was on a side hill, away up in plain sight, and where everybody could hear him. He drove his team over where the bank was so steep the stoneboat tipped over, and the stones all went rolling to the bottom of the hill. At this he swore just awfully. He seemed to want to let everybody *know* what a bad and wicked heart he had. Now, pretty nearly at the same time, and not far away, another boy (or young man) was also drawing stones and logs and stumps. When he was going after a log, the log-chain caught in a stick, and he called to his horse to stop, and then stooped down to get the end of the stick out of the chain. But the horse started suddenly, without orders. The stick flew up and struck him under his chin, and knocked him down flat in the dirt. I think it must have hurt him considerably. Now, it would have been quite natural for this boy, angered by the pain, to scold at the horse—may be to swear—that is, if he was in the habit of swearing, because the horse started without orders. But this last boy is not a swearing boy. He just looked pleasant and good-natured, and laughed about it. I saw him sprawling in the dirt, and asked him what the matter was, and he told me how it happened. He did not "yell" at his horse, and he did not even talk loud. He took it all as an accident. "Now, children, let us consider a little about that other boy. Whose fault was it that his stoneboat tipped over? Was it the fault of the horse?"

"No, sir."

"Was the *stoneboat* to blame?"

Some of the children smiled at the idea of a stoneboat being to blame for an accident.

"Well, children, a good many people swear at stoneboats and other inanimate objects. They seem to think it is sensible, and may be smart, to curse things that have no sense or responsibility. You have told me the horses were not to blame for this accident, and the stoneboat was not to blame. Then who was to blame?"

"The boy himself."

Another answer came from another part of the house:

"Mr. Root, the accident was the result of his own carelessness or stupidity."

Then I added:

"Children, people sometimes say swearing does not hurt anybody. It *does* hurt people. It pains everybody who loves righteousness and hates iniquity. It sets a bad example for the younger ones. It is catching, like smallpox and cholera; and I am inclined to believe it is worse than either. It worries the horses. You watch the horses, and see how they look when somebody swears at them. *They* know what swear words mean. More than all, it harms the man who allows himself to yield to the temptation to use such words. First he swears at his team, then he whips and pounds them. Then they get contrary and stubborn, and work is interrupted and hindered. I have sometimes thought that the man who swears

at his team was worth only about half as much as the man who does not swear; and there are some owners of horses who will not have a man on the premises who swears and gets mad at his team, at his stoneboat, or at his work."*

You may urge it is not so bad to swear at a stoneboat, for that has no feelings; but there is less sense and reason in it than swearing at horses. It is a very bad plan to swear at horses, but not nearly as bad as to swear at your neighbors. The last of our texts says, "Let none of you imagine evil in his heart against his neighbor;" and then it adds, "Love no false oath, for all these are things that I hate, saith the Lord." The man who swears at a stoneboat and at horses will soon swear at his neighbors, especially if he has difficulty with them. Then come blows, lawsuits, penitentiary, and sometimes death. A man not far from where I live quarreled with his neighbor about a division fence. One of them was killed, and the other is now in the penitentiary. Very likely it commenced by the foolish habit of swearing; but before swearing comes, there must be "evil imaginations" in the heart. The swearing only tells to the world, and publishes abroad, the badness of the man's heart. Where the spirit of Christ Jesus rules, there can never be any thing of this kind.

Poor Peter! It may be that he would have never used those very bad and awful words had he not been around where he heard somebody else use them. May God help you, dear children, to keep from this terrible habit. Keep away from it; let it alone just as you would smallpox, cholera, or that terrible malady known as the "black death."

FLORIDA TRAVELS, CONTINUED.

My trip *down* the coast was in the night, so I could not get a glimpse of the towns in the vicinity of Miami. Going back, however, I had a better opportunity for doing so. All along the railway from Miami to Palm Beach there are acres and acres of pineapples. These require no sheds—that is, so far as frost is concerned; but they did not show the luxuriance and thrift that we find in smaller plantations, especially those under sheds.

* It so happened, strangely enough, that, during the week following my Sunday talk, the young man who swore at the stoneboat came to help me. I did not send for him, but a neighbor for whom he was working sent him. He began to swear before my four boys. I remonstrated; but a little later I saw him offering one of the boys some tobacco, telling him he would "never be a man" until he could use tobacco. Do you see, boys, how these things go together? It seems as if each one of you must sooner or later make a choice—a choice either for righteousness or iniquity. Which shall it be? Almost every thing depends on the way you start out. May God help you to choose rightly.

My first stop on my return was at Fort Pierce, the home of Harry Hill, editor of the *American Bee-Keeper*. Friend Hill has been so far away from the editors of the other bee-journals that we have not become acquainted with him, for, as a matter of course, he can not well attend our annual conventions. I found him at work at his hives, and greatly enjoyed talking over the bee-journals, our special industry, and other things. When I got off at Fort Pierce I inquired at the hotel for a bee-keeper named Perry Saunders. The lady at the desk said she did not know any *man* by that name, but there was a little boy there by that name who went to school. A juvenile near by replied, "Oh! that's him, ma. He's got bees and rears queens, and makes lots of money."

When I found friend Hill in his bee-hive workshop, Perry Saunders was also present. When I was introduced, friend Hill remarked that he wouldn't wonder if that boy was the youngest subscriber to GLEANINGS, out of the whole 12,000. Sure enough, he was a little fellow in short pants, but full of enthusiasm. He subscribed for GLEANINGS with his own money, has bought the A B C book, and read it over and over. Just when I met him he was directing his father and a neighbor how to cut the boards for some hives. It was amusing indeed to see this little fellow giving directions to a couple of gray-haired men. Perry had, last season, half a dozen colonies of bees. He has raised queens successfully, and produced quite a crop of honey, and is full of enthusiasm in planning for a larger apiary and more extensive operations during the coming year.

Mr. Hill (like a good many other bee-keepers) is quite an expert in photography, and he has sent us some views of branches of orange-trees, with the foliage and the fruit in natural colors. I believe it was his own coloring. The world has not yet got up to the point of giving us a picture in natural colors that can be printed in bee-journals. When it does, friend Hill will have something rare and fine to show us.

Gifford Station was my next point, and I was pained to find my old friend Harry Gifford suffering from the effects of a gunshot wound. A brief notice of this sad affair is given on page 294. Fortunately, however, friend Gifford was recovering rapidly, expecting to be around again in a few days. He has done quite a little in the way of Florida fruits during the past six years, and is also getting to be quite an extensive bee-keeper, having about half a dozen out-apiaries. Like most bee-keepers he has some peculiar notions of his own. For instance, he says queens should always be sent by mail just as soon as possible after mating, and *before* they begin to lay. He firmly believes that a queen is more or less injured by taking her out of the hive when she is doing her best at egg-laying during the middle of the season. To prove his position he purchased, during the season of 1900, 200 queens of H. G. Quirin, of Parkertown, Ohio. The understanding was that these queens were all to be shipped as nearly as possible before

they began to lay; and he says they gave him better results—that is, considering such a long trip from Ohio to Florida, and that he was satisfied that that is the right way to send queens. This makes a pretty heavy testimonial in favor of my suggestion of several years ago, that all queens should be shipped to purchasers at a low price before they are tested, letting each individual do his own testing.

Friend Gifford furnishes us a fact in bee culture that, so far as I know, has never been recorded before. When saw-palmetto was in full bloom, his whole apiary started off *toward midnight* by moonlight, and actually did a large business for several hours in gathering honey. I forgot to ask him at the time if they labored during the day as usual. There has been quite a little speculation as to whether bees sleep or not. In this case they actually worked both night and day. Perhaps the moon did not come out in full splendor until toward midnight. At any rate, he says they stopped work at dusk as usual; but along toward midnight on two separate occasions, when the honey-yield was very large, the weather sufficiently warm, and the moonlight at its very highest splendor, they actually stored honey by night as well as by day.

The little postmistress that I mentioned on my trip six years ago is still postmistress; but now she is a blooming maiden of 18. I did not find her quite as sociable and communicative at 18 as she was at 12; but she not only knows how to manage Uncle Samuel's business, but she makes such beautiful nice biscuits that they have a reputation in the neighborhood under the name of "Ruby" biscuit. With fresh fish, such as only the Florida homes can furnish, we had a little "spread" that was fit for a king. Her brother, his wife, and Ruby, made up the company. If I am correct, it was here I met another of my happy surprises. Some beautiful-looking sauce was dished out and passed around. It looked a little like cranberries. When I tasted it I uttered an exclamation of surprise and delight.

"Why, what is this new and delicious fruit?"

"Well, Mr. Root, since you seem to like it, suppose you *guess* what sort of fruit it is."

"Why, it looks a little like cranberries; but there are no seeds, and it is certainly more delicate and enticing than cranberries or *any other berry* I ever tasted in my life."

"Mr. Root, it is not a fruit at all, and it is not a berry at all."

You may be sure my curiosity was aroused when they told me it was what is called Jamaica sorrel. It is a plant that is known in catalogs as "Roselle." It is quite common in Florida. The part that is used as a sauce has a sort of fleshy husk inclosing the immature seeds. We gathered some seeds, and I sent them home and had them planted in the greenhouse; but at the present writing only two of them have come up. I feel sure it can be grown all through the North by starting the seeds in a greenhouse (exactly as we do tomatoes, peppers, etc.), and possibly by planting the seeds now in the open ground.

SOMETHING ABOUT THE FLOWERS IN THAT
LITTLE GREENHOUSE.

Quite a few have been wondering if I was not going to have something more to say about "posies." Well, dear friends, I have had a lot in mind to say; but this world is so exceedingly full of wonderful things our journal

with mixed colors (unnamed) for only 20 cts. each, or 3 for 50 cts. I sent for three of them, and along in March they began to bloom. I had no idea these little bits of plants would blossom the first year; but I was greatly surprised—yes, agreeably astonished—to see what even one little azalea could do. I carried one of them all around the factory, and it made about as much excitement (just because it was so little) as the big one did. I asked Ernest to take a photo of it as it stood in the greenhouse in one of the beds. Below is the picture.

A 20-CENT AZALEA, FROM JOHN LEWIS CHILDS, FLORAL PARK, N. Y.

is not half large enough to even hint at them all. A year or more ago I told you about some azaleas growing in pots that I carried around the factory, and made such a breeze among our people, and especially among the girls and women. The azaleas I then mentioned cost about 50 cts. each. They generally sell, in full bloom, for 75 cts. up to \$1.00. Well, last fall, when I got John Lewis Childs' catalog, I was pleased to note that he had azaleas as low as 25 cts. each; yes, and some

Ernest threw his handkerchief over some of the other plants so as to make a background for the azalea. The pot is a three-inch one. The plant has very little foliage, as you will see; and what there is, is almost hidden by the immense flowers. I think there were four on the one little plant. They are larger than a good-sized rose. The delicate coloring and penciling, it seems to me, outrivals the most beautiful rose, and they remain in bloom from ten days to two weeks. I do not know of a

more beautiful plant in the whole floral kingdom than a penciled azalea. It looks as if one had taken a delicate brush, and, with more gorgeous colors than any painter ever mixed, wrought forms of tantalizing beauty. Yes, I could honestly say to the children that this kind of painting and coloring was God's own handiwork. I asked Ernest to take a picture of the azalea alone, but he took in also a magnificent brughmancæ; and after I had gone he turned his apparatus on the greenhouse in general, and here it is.

The picture shows you how cheaply the beds and paths are constructed. At the left, overhead, you get a glimpse of the annex we put on last winter. Right below the annex there is a golden-leaved salvia that has been

are six or seven kinds, and all different. Over in another bed, off to the right, not shown, we have a lemon-tree with half a dozen nice lemons on it. A guava from Florida is just full of bloom. It bore one nice fruit that Mrs. Root sampled when I was in Florida. She said it was splendid. In this bed are a great lot of pelargoniums. Our friend Pike, of St. Charles, Ill., sent us an assorted lot of rooted cuttings about a year ago. We planted them outdoors, and got a lot of strong vigorous plants a foot high or more. They were put in the greenhouse last fall, and just grew and grew, without showing any signs of bloom until along in April. Then they just outdid themselves in the multitude of blossoms. They are not only of all colors of the

A GLIMPSE INSIDE OF THE LITTLE GREENHOUSE IN MARCH.

bearing scarlet blossoms, and loads of them, for one whole year continuously, and each blossom contains quite a little drop of honey. Beyond the salvia there are tomatoes. Away over in the corner, at the end of the path, are roses. Right near the roses you can get a glimpse of one of the tiles where we let in water for sub-irrigation. The beds are all watered in the same way. Just beyond the brughmancæ there is a clematis that has been bearing beautiful clusters of white flowers all winter. At the right of the big plant, just under one of the great blossoms (nearly if not quite a foot long), there is a bed of fuchsias. These fuchsias have been blooming and blooming all through the latter part of the winter. There

are rainbow, but many of them are spotted, speckled, splotted, and penciled, with such a wildness of beauty as to almost be "wilder" one.

In the cut showing the azalea, at the right, you can get a faint glimpse of some of the large pelargonium-blossoms. The penciling is so faint, however, that it does not show in the half-tone, although it can be seen very plainly in the photo. They grew in very rich soil with sub-irrigation, and the plant made such a rank growth I presume the blossoms are unusually large. Some single blossoms are an inch and a half across.

The front of the greenhouse is now raised up. When the women-folks go along the

stone walk in front, it is just fun to hear their exclamations at such a variety of new and startling "Lady Washington geraniums" as a good many persist in calling them.

Do you wish to know what is in the annex? Well, we have been so busy that we could not attend to it, and a lot of things came up themselves. Last year we had Burpee's dwarf nasturtiums, and they had their own way, and went to seed. This year the "stertians" came up like weeds all over these beds. The boys pulled up a great lot of them, but some of them escaped long enough to get into bloom, and then they were so pretty the boys hadn't the heart to pull them. Well, they just clambered all over the annex, and now it is just a bank of nasturtium-blossoms.

Now, isn't this enough about the posies for one issue? But it isn't all. I will, however, tell the rest of it in another column, that is, unless the boss printer says he can not possibly find room for any more of my talk about chickens, posies, and gardening.

TRAP-LANTERNS, ETC.—A WARNING.

Just now there are several vendors of patent moth-traps (for orchards) trying to make out that their trap will take the place of spraying. They even go so far as to tell how inefficient spraying is, how it kills domestic animals, etc., in order that they may better show up the advantages of their trap. I came pretty near saying worthless trap, but it does destroy some insects; but it is just as likely to destroy insects that are a benefit to the farmer as the other kind. Unfortunately these fellows have got one experiment station to give a sort of recommend. See the following, which we clip from the *Country Gentleman*:

Information has just come to me from a fellow-entomologist to the effect that a certain manufacturer of trap-lanterns secured his partial indorsement of his apparatus in a letter which was properly quoted at first; but now, I am informed, the restrictive phrases have been omitted, and the professor is made to appear as though recommending the device for all insects. I wish to state that money invested in trap-lanterns of various forms, including those which have attractive sweet or other fluids, phosphorescent paints and the like, to make them more effective, is a good investment only in a very few special cases; and before buying them, the advice of an entomologist should always be sought. Some of these trap-lanterns catch many insects, most of which, unfortunately, are of comparatively little economic importance, and the trouble is to get a device which will capture large numbers of the destructive species. Extensive experiments at Cornell University have shown that the trap-lantern can not be recommended as a practical means of controlling many insect pests. Beneficial as well as well as injurious insects are captured, and some pests, like the codling moth, are taken in very small numbers. Farmers are, therefore, advised to go very slow in buying trap-lanterns.

E. P. FELT,

N. Y. State Entomologist.

Prof. Felt is good authority, and he is, without question, right about the matter.

Humbugs and Swindles.

On page 410, May 15, 1900, we showed up Prof. Weltmer, of Nevada, Mo., and mentioned that the postal authorities had decided him to be a fraud, and refused to deliver mail to him any longer. I have also since mentioned that he simply started business again under

the name of Joseph H. Kelly, and kept right on. I forwarded several bundles of his advertising matter* to the Postoffice Department, at Washington, and now we notice by the Henry Co. (Mo.) *Democrat*, of May 3, that both parties are now arrested as frauds. See the following, which we take from the above periodical:

MAGNETIC HEALERS FINED.

Kansas City, Mo., April 27.—Stephen A. Weltmer and Joseph H. Kelly, who operated the "American School of Magnetic Healing," at Nevada, Mo., were fined \$1500 each in the federal court. The charge was using the mails for the purpose of fraud, by promising for a consideration to cure persons of poverty and all known bodily ills through absent treatment and mental suggestion.

ARE FINED \$1500 EACH; JUDGE PHILIPS MAKES IT LIGHT ON WELTMER AND KELLY.

Prof. S. A. Weltmer and Joseph H. Kelly, the Nevada "magnetic healers," who pleaded guilty in the United States Court at Kansas City to nine counts of using the mails for fraudulent purposes, were, on the 26th inst., fined \$1500 each by Judge Philips. The maximum punishment was \$5000 fine and a year's imprisonment. The Judge, it will be noticed, made the punishment very light, but the lesson will no doubt cause the "healers" to quit fishing for gullible people in this part of the country.

THEY PLEADED GUILTY; WELTMER AND KELLY THE MAGNETIC HEALERS OF NEVADA ADMIT THE GOVERNMENT'S CHARGES.

The trial of Weltmer and Kelly, the Nevada Magnetic Healers, took place in the United States court in Kansas City this week under the charge of obtaining money through the mail by fraudulent pretenses, to heal by absent treatment, etc.

They plead guilty Tuesday on nine counts, charging violation of the postal laws, and threw themselves on the mercy of the court. Sentence was deferred. It will probably be a heavy fine.

Weltmer and Kelly were doing a business of \$250,000 a year, when the postoffice department issued a fraud order against them, because they advertised to cure by "absent treatment." Their business was so enormous that it raised the Nevada postoffice to first class and made it the best paying office for a town of the size in the United States. Their mail, held up for three weeks, was found to contain \$30,000.

United States Senator Burton, of Kansas, who appeared for the healers, admitted that they had violated the law, but declared their motives were good. "They are on a par with Christian Scientists and divine healers, who cure by suggesting health instead of disease," he said. Senator Burton pleaded for leniency for his clients, on the further ground that the advertisements on which they were convicted were written by a St. Louis agency, without suggestion by Weltmer or Kelly, which, to say the least, smacks of downright prevarication, and is too contemptible to deceive any one. Such talk shows a disposition to crawl through a very small hole.

It seems to me this is a very light sentence. What is \$1500 to a fraudulent institution that is swindling people to the extent of \$250,000 a year? It reminds me of the way the saloon-keepers are fined. They simply laugh at the matter, hand over the cash, and go right on doing business. I hope, however, the United States courts will give these fellows to understand that they are no longer to be trifled with.

* Perhaps I might explain that I corresponded with the "American Institute of Science" at Nevada, Mo., in regard to terms for being taught "magnetic healing." At first they wanted quite a sum of money for teaching this wonderful art. After a little time, as I did not reply (I sent them no money), they offered to come down a half, owing to some peculiar circumstances. Later still there came another proposition to the effect that, if I would send them the money before a certain date, they would make a still further and most wonderful concession, telling me I could easily make from \$5 to \$25 a day, etc. Many of you probably know the lingo.

NO CHANGE IN CLASSIFICATION OF COMB HONEY.

We learn just as we go to press that the Western Classification Committee, at their recent meeting in Monterey, Cal., after full consideration, made no change in the classification of comb honey.

BEESWAX MORE PLENTIFUL.

As we have a good supply of beeswax, and it is being offered more freely, we mark down the price we pay one cent a pound, and will likely reduce further by the middle of June. Price we pay now will be 27 cents cash, or 29 in trade for average wax delivered here.

NEW ROOT ZINC.

We have been making new dies and punches for our Root zinc-perforating machine during the past few months, and are just starting them in operation. The perforations have round end holes like the Tinker zinc, and the holes are a little longer than the Tinker and almost as close together, so that our new Root zinc will be just as accurate and perfect as Tinker zinc. Send for sample if interested.

GERMAN WAX-PRESS.

We are bringing out a new wax-extractor which we shall call the German wax-press. We hope to have an illustration to present in next issue. It is very strongly made of No. 20 galvanized iron, 16 inches diameter, 24 inches high with heavy wire-cloth basket, holding about a bushel of combs, and with galvanized cast-iron cover, plunger, and basket-support. Price for introduction, \$7.50.

HAMMOND BEE-BRUSHES.

On another page we illustrate a new bee-brush manufactured by a bee-keeper in Southern Ohio, who is also a brush maker. We have for the present three grades of material in these brushes—tampico at 50c.; horsetail hair at 65c.; Russian bristle at 80c. By mail, 10c each extra for packing and postage. After testing them this season we shall no doubt decide upon one grade only. The hair or bristle brushes will probably be much more desirable than the tampico.

Special Notices by A. I. Root.

JAMAICA SORREL—THE NEW FRUIT.

We have just received ½ lb of good seed from a seedhouse in Florida, and are going to give it a good test; if you want to help us make the test, send for a five-cent package. See p. 484.

BOOKS ON GINSENG CULTURE, ETC.

If any of our readers sent \$1.00 for the book on ginseng culture, advertised in our last issue, we will make good what they are out of pocket if the advertiser refuses to take the book and refund. The advertisement would never have been received had we seen the "book" before inserting it.

NICE SEED POTATOES TO BE GIVEN AWAY TO THE READERS OF GLEANINGS.

We still have about 300 bushels more than we shall need to plant, to be given away to our patrons, as described on page 452 of our last issue. The greater part of them are Early Ohio, celebrated Red River stock. Our own potatoes, most of them, will be planted during this month of June; and we rather prefer the latter part of June to the fore part. We still have every thing in the table except Early Trumbull, New Queen, Lee's Favorite, Twentieth Century, and New Craig.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. LEY'S POULTRY CONDITION POWDER puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls—big and little get all there is in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. Ley's Thoroughbred Minorca eggs, \$1 for B. Thoroughbred Belgian Hares, Geo. J. Ley, Florence, California.

Tar Heel Apiaries!

THE BEST BEES KNOWN
IN : AMERICA : TO-DAY.

American Albino Italians.

They have no superiors and few equals, as hundreds of bee-keepers testify. Untested queens, \$1.00; 6-\$5.00. Tested queens, \$2.00 each. Choice breeders, \$5.00 to \$10.00. Nuclei, 75c per L. frame—add price of queen 200 3-frame (L.) nuclei for sale in May and June. Safe delivery insured always.

Swinson & Boardman, Box 358, Macon, Ga.

FRUIT-CANNING made easy and sure by using Coddington's Self-melting Self-sealing Wax Strings. Very convenient and economical. Inquire of your dealer or send me his name and 45c in stamps for 100 strings, by mail. Mention this paper. C. C. FOUTS, Middletown, Ohio.

For Sale. Choice prolific Italian queens—granddaughters of a queen of which Doolittle wrote me, "100 will not buy her"—mated with drones of Hutchinson's Superior Long-tongue Strain. Warranted queens, 75c; tested, \$1.00 and up. Good references, and satisfaction guaranteed.
EARL Y. SAFFORD, Salem, N. Y.

FOR SALE.—20 strong colonies of long-tongued strictly pure Italians with tested queens, and in new light chaff eight-frame hives, combs in Hoffman wired frames. Price \$6.50 including hive; \$5 per colony without hive, or five colonies at \$20.
W. C. KISTLER, Rutherford, N. J.

FOR SALE CHEAP.—California bee ranch and 500 colonies of bees. Write for particulars, price, and easy terms. I. A. KING, Almond, San Diego Co., Cal.

WANTED.—A purchaser for a second-hand ten-inch Root comb-foundation mill in good condition. Price \$10. Also for sale about 50 second-hand hives, 10 L. frame. Also many other fixtures for an apiary.
W. H. BIRNEY, Nelson, N. Y.

Wants and Exchange.

WANTED.—To exchange 50M polished sections (No. 1, nice) for beeswax, at a bargain.
W. H. NORTON, Skowhegan, Me.

WANTED.—To exchange two ladies' bicycles—but little used and high grade—for offers.
J. W. PROVAN, Traer, Iowa.

WANTED.—To exchange first-class bee-keeping supplies for 2000 lbs. beeswax. Will allow 32c for nice wax.
W. H. NORTON, Skowhegan, Me.

WANTED.—To exchange a 100-chick hot-air brooder—in good condition, used only once—for three colonies of Italian bees in 8-frame dovetailed hive, on wire Hoffman frames. Also 350-egg incubator for Cowan extractor.
M. M. WYGANT,
18 Bergen St., Hackensack, New Jersey.

WANTED.—To exchange Japanese buckwheat at 80c per bu.—sacks, 15c extra—for bees in shipping-boxes, if not too far away.
ALBERT L. MARTIN, Leonardsburg, Del. Co., O.

WANTED.—To exchange a \$50 Columbia bicycle that has not been ridden 100 miles; never been rained on; out of the factory only about one year. I will sell it or exchange for clover honey, or two-frame Cowan extractor and new Dovetailed hives, to the value of \$35.
A. H. KANAGY, Milroy, Pa.

WANTED.—A young man or married man, to work with 50 to 100 colonies of bees, and work on fruit-farm the rest of his time. Good position to right man. Want one that likes to work with bees; don't care if he doesn't know so much about them, as I have my own method. Good house and plenty of fruit free to married man.
J. A. TAYLOR, Wynnewood, Ind. Ter.

THE HIVE

as much to do with your profit in handling bees.

Our Dovetailed Bee-Hives include all the modern improvements, and are designed to produce the most honey in the best marketable shape.

They are made of first-class stock, excellently finished, and the absolutely perfect fit of all their parts makes these hives the most convenient and satisfactory on the market.

We are headquarters for everything used by bee-keepers in the management of their apiaries.

Orders for Sections, Comb Foundation, and other bee-supplies also receive immediate attention.

A sample of the Weekly AMERICAN BEE JOURNAL and illustrated Catalog of bee-supplies, sent free on request.

G. W. York & Co.
144 & 146 Erie St.
CHICAGO, ILL.

Long-tongued Golden.

According to E. R. Root's measurements our breeders' bees show a reach of 20 and 21-hundredths inches. We are booking orders for breeders, to be delivered in August and September. These queens will produce bees showing 95 per cent (or better) straight 5-banders, and have a guaranteed tongue-reach of 19-hundredths or better; all queens large and prolific. Price \$5.00; orders filled in rotation. Untested ones, this stock, ready June 1st, each 75c; 6 for \$4.25; 12 for \$8.00. Select warranted, \$1.00. Tested, \$1.25. Select tested, \$2.00. Also have a fine stock of three-banded Italians at the same price. Give our stock a trial. Our motto—good queens and prompt attention to business.

O. P. Hyde & Son, Hutto, Texas.

Your Order for Queens

—Tested and untested—will be promptly filled by return mail. Our strain of Italians is unsurpassed as honey-gatherers. Every queen guaranteed. Choice tested queens, \$1.00 each; \$12.00 per dozen; choice untested, 75c; \$8.00 per dozen. Send for price list. Address

J. W. K. Shaw & Co., Loreauville, La.

1901====Golden Italian Queens====1901

Untested—April, May, and June—\$1.00 each, or \$11.00 per dozen; after June, 50c each, or \$5.00 per dozen. Tested queens, half more. Breeding queens \$3.00 and \$4.00 each. W. P. Rock eggs from 91-scoring birds at \$1.00 per 15. Springs, \$1.00 each.

GEORGE W. COOK, - SPRING HILL, KANSAS.

FOR SALE. One 10 h.-p. engine and boiler (up-right boiler), one 18-inch planer, one Root saw-table, 30 ft. line-shafting, hanger pulleys, and belting. Will take \$250. J. W. Bittenbender, Knoxville, Ia.

STEEL WHEELS

for your **FARM WAGONS**

any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address

Career and Character of Abraham Lincoln.

An address by Joseph Choate, Ambassador to Great Britain, on the career and character of Abraham Lincoln—his early life—his early struggles with the world—his character as developed in the later years of his life and his administration, which placed his name so high on the world's roll of honor and fame, has been published by the Chicago, Milwaukee, & St. Paul Railway, and may be had by sending six (6) cents in postage to F. A. Miller, General Passenger Agent, Chicago, Ill.

The Breeding of Bees.

Also Something about the Review's Latest Correspondent.

Little has been done in the scientific breeding of bees, compared to what has been done in the breeding of other domestic stock. Some of us have bred our queens from those queens whose colonies have given the best results. So far, so good; but regarding the effects of inbreeding or outcrossing, most of us are woefully ignorant. This whole question of heredity, the laws of breeding, etc., is a broad one, but the Bee-keepers' Review is going to tackle it; and, by the way, it has been fortunate enough, at the very outset, to secure the services of a very competent man—Mr. Frederick B. Simpson, of Cuba, N. Y.

I must beg Mr. Simpson's pardon for what I am about to say, for praising him to his face, so to speak, but, as a new-comer in the field of apicultural literature, I feel that it is no more than fair to mention his qualifications for writing upon that subject.

Even though I am not particularly interested in stock, I have for years heard of the Simpson herd of Jerseys. For years it was headed by the famous bull, Mercury. Not only has Mr. Simpson been interested in the breeding of Jerseys, but trotting stock has occupied his attention; there being from 150 to 250 horses always on hand. There is a 1200-acre farm at New Hudson, 100 acres at Hunt's Point, New York City, and a mile track at the home farm at Cuba. It was amid such surroundings that the younger Simpson (the Review's correspondent) was brought up. He has the advantage of a college education, having taken a degree in civil engineering, which taught him

to do everything with great accuracy. He was always passionately fond of natural history, and studied it and biology quite extensively, being familiar with the writings of such men as Darwin and Spencer. He has an extensive collection of insects, many of which he had the pleasure of rearing from the egg to the perfect insect. During the past seven years he has devoted his entire time to the management of his father's trotting-horse interests—especially to the studying of breeding problems. By the way, although so much of a horseman, Mr. Simpson never bets, gambles, swears, nor indulges in liquor or tobacco, or other dissipations. Of late he has taken an interest in bees, and is going at it with enthusiasm, aided by his vast and varied knowledge on the subject of breeding, to try to solve some of the problems regarding the scientific breeding of bees. Space forbids my telling the start he has made, and the plans that he has for the future, but I feel sure that I have told enough to show that the four pages that he contributes to the June Review will be read with interest by every bee-keeper.

Neither must I forget our old friend Arthur C. Miller, who first stirred up this subject in the bee journals, and who has an article in the June Review on "Variations, how they are Started, Intensified, and Established."

The Review is \$1.00 a year; or I will send it for 1901, and a queen of the Superior Stock, for only \$2.00. Queen alone is \$1.50.

W. Z. Hutchinson, Flint, Michigan.

I. J. Stringham, 105 Park Place, New York City.

Keeps in stock a full line of modern appliances for bee-keepers.

SILK-FACED VEILS.

As good as any made; 35 cents postpaid. Catalog free. Full colonies Italian bees, \$6.00. Apiaries, Glen Cove, Long Island.

Marshfield Manufacturing Company, Marshfield, Wisconsin.

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a *select daughter of their \$200 queen that they refuse to quote me prices on.* This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

Prices: Untested, 75c; 6, \$1.25; 12, \$8.00. Select untested, \$1.00; 6, \$5.00; 12, \$9.00. Tested, \$1.00; 6, \$6.00. Select tested, \$1.50.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20-100, \$3.00. Breeders, whose best bees show 21-100, with an average of 20½-100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100, \$7.00.

I have discovered 2 breeders whose best bees show 23-100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2. Imported queens, daughters and grand-daughters. Have just received an importation direct from Italy which has been introduced into this apiary.

Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldenes, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper. \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

KRETCHMER M'F'G CO., Red Oak, Iowa.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop ink drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

ALBANY.—Honey market very quiet now, with no stock on hand and no call. It is between seasons now. Beeswax wanted at 30 cts. MACDOUGAL & Co., June 9. Albany, N. Y.

DETROIT.—Strawberries are taking the attention, and very few sales of honey are made, but prices seem to keep up on good lots. Beeswax in fair demand at 27@28. M. H. HUNT & SON, June 8. Bell Branch, Mich.

NEW YORK.—There is some demand for white comb honey; and while the old stock is well cleaned up, new crop is beginning to arrive from the South, and receipts are sufficient to supply the demand. We quote fancy white, 15; No. 1, 13@14; No 2 white, 12; amber, 11. Extracted honey is dull, and while there is more or less moving there seems to be no settled market for the time being. We quote white 7@7½; light amber, 6; dark, 5@5½; Southern, in barrels, 55@65 per gallon, according to quality. Beeswax firm at 28@29. HILDRETH & SEGELKEN, June 3. 265 Greenwich St., New York City.

BUFFALO.—Honey is selling very slow now. Fancy white comb, 14@15; A No. 1, 13@14; No. 1, 12@13; No. 2, 11@12; No. 3, 9@10; dark, 8@10. Extracted, white, 6@7; dark, 5@5½. Beeswax, 28@30. June 8. W. C. TOWNSEND, Buffalo, N. Y.

NEW YORK.—There is no comb honey to speak of on this market at present. Our prices for comb given you in last issue, represent nominal market prices at present. Extracted honey will be very much lower than last year. California and Florida are offering at very much lower prices. Beeswax is in good demand, and sells readily at 28.

FRANCIS H. LEGGETT & Co., Franklin, West Broadway, and Varick Sts., June 7. New York City.

DENVER.—Stock of comb honey all cleaned up now. Extracted, white, 6½@7½; beeswax, 22@25. THE COLORADO HONEY PRODUCERS' ASS'N, June 10. 1140 Market St., Denver, Col.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHBIM, 1318-1324 Union Avenue, Kansas City, Mo.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co., 163 South Water St., Chicago, Ill.

FOR SALE.—Extracted honey from alfalfa; 60-lb. cans at 7 cts., and smaller cans. D. S. JENKINS, Las Animas, Colo.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm if attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

CHICAGO.—Not any new comb honey has come to this market up to date hereof, but promises are being made for some before the month closes. A little good white comb still on sale which easily brings 16. Not any other kind here. Extracted very dull; practically no sales made. Beeswax firm at 30.

R. A. BURNETT & Co., June 7. 199 South Water St., Chicago, Ill.

THE PRIZE WINNER.

My breeding queen has been awarded the \$25.00 prize offered by The A. I. Root Co. for the longest-tongue bees bred from their celebrated queen, producing bees with a TONGUE REACH OF 25-100. This is not the whole length of tongue either. Do not fail to notice this. The demand is so heavy for daughters of my 25-100 breeder that I have been obliged to make another large addition to my queen-rearing apiary in order to accommodate my increasing trade. Untested queens, \$1.00; six, \$5.00; dozen, \$9.00. Select untested, \$1.25; six, \$6.00; dozen, \$11.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. Address

J. P. Moore, Lock box 1, Morgan, Pend. Co., Ky.

(Mr. J. P. Moore is entirely reliable.—A. I. R. Co.)

Albino Queens. If you want the most prolific queens; if you want the gentlest bees; if you want the best honey-gatherers you ever saw, try my Albinos. Untested queens, \$1.00; tested, \$1.50. J. D. GIVENS, Lisbon, Texas.

QUEENS! Fine, large, gentle, and prolific; long-tongue reach; either 3 or 5 banded; 75 cents each; six for \$4.25. Try them and be pleased. CHAS. H. THIES, Steeleville, Ill.

Notice!

THE A. I. ROOT CO.

wish to announce that they have from their branch at 10 Vine St., Philadelphia, Pa., direct steamboat connections and very low rates of freight to the following States: Massachusetts, Rhode Island, Connecticut, New Jersey, Delaware, North Carolina, South Carolina, Georgia, Florida. As this is a branch of the factory, prices are the same. Full colonies of Italian Bees, \$6.00. Special discount in large quantities.

GLEANINGS

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

BEE CULTURIST

ILLUSTRATED
EACH MONTHLY

Published by WEAVER FOOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

JUNE 15, 1901.

No. 12.

In *Centralblatt* it is reported that, when honey is used as a lubricant in making foundation, bees take more readily to such foundation than to others.

HONOR to whom honor. *Le Progres Apicole* gives a picture of a cell-protector it says I invented. Sorry to say I wasn't smart enough to do so — it was our good friend N. D. West.

THE USE OF HONEY is recommended in *L'Abeille de l'Aisne*, for insomnia, when it proceeds from indigestion, and in some cases when it results from a wearied brain or muscular system.

TO REAR A DRONE costs .0141 oz. honey; and after it is reared it will consume .00635 oz. of honey daily.—*Bulletin Alsace-Lorraine*. [This is splitting hairs; but I believe it is not far from the truth.—ED.]

A BLUER SEASON up to June 3d I think I never knew — so cold that fire is needed yet, and many colonies have not held their own. A severe drouth is now on, which has obliged some to plow up their fields of oats. I made a mistake in taking bees out of the cellar too early. There is a big show for white clover, but a small show of bees to work it.

M. A. GILL may be right, page 467, in preferring starters to full combs for swarms, and certainly he is not alone in that view. But in my own practice, if I had the full combs I do not think I'd melt them up and use foundation. With only four combs in the brood-chamber and a lively queen, I should expect her to hold her own against the honey-storers. To give a whole hiveful of full combs would be another story.

"THE PERFECT HIVE-COVER for Colorado is yet to be made," quoth ye editor, page 468. I wonder how mine would work. It is much like the one described, with dead-air space, but covered with tin. Possibly paper would do as well. Out of the fifty in use for two years, not one has twisted, the only flat cover

I've ever tried of which that could be said. It is essential that the grain of the two thicknesses of boards shall run in opposite directions. That prevents twisting.

MANY A POUND of pollen is allowed to go to waste by those who would not think of wasting that amount of honey. Yet in some regions a pound of pollen may be worth as much as a pound of honey. Dr. Planta's analysis showed the pollen of the hazel to contain 5 per cent nitrogenous material, 8 per cent cane sugar, and 5 per cent starch.

BEEs IN WINTER, when short of stores, have the same appearance as bees that die of starvation in summer. But death is not real, only apparent. Bring them into a warm room; and if the apparent death has not been too long continued they revive. So starvation in winter, properly speaking, is not starvation, but death by freezing.—*German Journal*.

THE *Rocky Mountain Bee Journal* seems to have sprung out of the ground. Who knew they had a man out there by the name of Morehouse who could get up so beautiful a publication, and edit it like a veteran? Lovey, Rauchfuss, Thompson, and the other sages on the western frontier, know a lot about bee-keeping; and if that journal doesn't live it will be a wonder.

THE COLDER the weather in winter, the warmer the center of the cluster. That being the case, theory would lead us to expect brood-rearing earlier in cold than in warm winters. I've often wondered whether that theory was indorsed by practice. Now comes L. Stachelhausen, in *Southland Queen*, and says: "When I kept bees in a cold climate, more than 30 years ago, I observed in outdoor wintering that, the colder the winter, the earlier brood-rearing commenced."

"LEST WE FORGET," Editor Wathelet, of *Le Rucher Belge*, expresses the hope that the eminent editor of GLEANINGS will do his best to learn and make known Swarthmore's plan of wintering 75 queens in one colony. [Those Frenchmen are great fellows in the use of adjectives. "Eminent" doesn't fit me, and never will. However, I appreciate the motive back of it, and hereby ask Swarthmore to tell how he does it before he forgets it.—ED.]

I MOVE a reconsideration of a Straw and its footnote on page 80. Sylviac scouted the idea of a bee carrying a load weighing more than its own body. I suppose I should have said a load of *nectar*, and ask Sylviac's pardon for the omission. But the rest of the Straw shows that he meant only what was carried *in its sac*, and Sylviac is right to rail at the idea of a bee carrying in its sac enough nectar to weigh more than its own body. [I stand corrected with you.—ED.]

SCHACHINGER's investigations showed that, when 20,000 bees stored daily $\frac{1}{2}$ lb. honey,
 30,000 " " " $1\frac{1}{2}$ " "
 40,000 " " " 4 " "

It's well to repeat this occasionally, to show the importance of having strong colonies. In the stronger colony a larger *proportion* of the bees go afield, and a smaller proportion of the product is used for daily consumption. [This is according to observation and experience. I have seen many colonies on this, my western trip, but many—too many—are too weak to get the best results in honey.—ED.]

IS THE LARGE INTESTINE of a bee large enough to contain all the feces that will be stored in it during four months' confinement? There ought to be less undigested remains of a bee's food than of a man's food proportionally; but if it is counted the same, there will be $\frac{1}{15}$ residue or $7\frac{1}{2}$ mg. in four months. Prof. Fisher's many weighings of bees before and after a cleansing flight showed that the excrement discharged by each bee was 15.86 milligrams, showing that, under good conditions, a bee can stand not only four months but eight months without emptying itself. So says *Illustrierte Monats Blätter fuer Bienenzucht*.

ACCORDING to a writer in *L'Apiculteur*, bees in summer do not stay in the hive on certain days because it is too cold, but because there is no nectar to be had. He finds that the secretion of nectar has direct relation to the amount of light and heat. Some plants secrete nectar in partial shade; but the rule is, that nectar secretion ceases, even with partial shade—the brighter the sun and the stronger the heat, the more nectar. That agrees with my observation that the days when one is afraid of the sunstroke are the ones when the honey rolls in. [This agrees very well with what the bee-keepers in the Salt River Valley, Arizona, have been telling me. But they want the heat to be from 95 to 110 in the shade, to get the best results. When the temperature is below 90 there is quite a perceptible decrease in the inflow of honey. Apparently the Arizonians want more heat than we of the North.—ED.]

THE BLUE-HEAD, mentioned on p. 465, Mr. Editor, you think the same as "bareheaded" bees which hatch out all right. If you will read again you will hardly think the bees in question will hatch out all right, for "the pupæ are dead." Possibly the observer may be mistaken as to their death. [Years ago, just before this matter was considered in the ABC book, bee-keepers kept writing in to know what disease was in their brood. Some of

them thought it was foul brood; but I had been studying the same thing, and told them they were mistaken—the brood was not dead; and that, even if the pupæ were so loose as to shake up and down in their cells when the comb was tipped, they would hatch out all right. I watched them daily, and sometimes almost hourly, for a good part of a season. Now, I do not wish to be contrary; but I do not believe those bareheaded pupæ were dead. At any rate, *ours* did not appear to be "sinsible of the fact," for they hatched out into perfect live bees.—A. I. R.]

Propolis dissolved in alcohol, with linseed oil added, is said to give a durable red paint for hives, says the *Leip. Bienenzeitung*.

F. Mehring, of Germany, the inventor of comb foundation, is also the first one who ever transferred larvæ. He described the method and his experience minutely in the *Dorf-Zeitung* for 1866.

Hives were made of plaster of Paris in Germany years ago. The latest is a hive made of cement mixed with cut straw. It receives a glazing on the outside which would be the equivalent to paint on wooden hives.

W. Wankler, of Germany, makes the claim in *L. Bienenzeitung*, 1893, page 112, to have invented and used an implement of his own for measuring bees' tongues, in 1882. He says he exhibited the same at a bee-keepers' meeting and exhibition in Frankfort in 1883, where he sold the instrument to Frank Benton.

"Received his just dues," as reported in *Centralblatt* and *L. Bienenzeitung*. A grocer in Cologne, Germany, has been convicted of having adulterated honey. For several years he had been carrying on a business of manufacturing and selling a 20-per-cent honey mixture. Sixty witnesses and nine experts were present at the trial. The enterprising grocer received one month's imprisonment, and was fined \$150.

The following, from the *Rural New-Yorker*, is good advice:

Although the time of applying Bordeaux depends upon circumstances—the locality, the condition of the weather, and the kind of plant treated—a general practice may be followed of first spraying just before the fruit-buds appear; next, just after the blossoms fall, and again about two weeks later. If the season is unusually wet a number of other sprays should be practiced. Under no conditions should the spray be applied while the plants or trees are blooming, as pollination may be seriously affected.

Charton Froissard, of France, made use of an implement which he invented for measuring bees' tongues. He is reported in *Leipziger Bienenzeitung*, 1893, as having conceived the same idea the American bee-keepers are bent on at present; viz., breeding long-tongued bees able to secure the honey from red clover. It is not stated what success Mr. F. has had in improving his stock in the line of long tongues. Perhaps our friend Daudant, who is at home in France, might tell us or trace the matter up.

E. Reidenbach, editor of the *Pfalzer Bienen Zucht*, writes in regard to the use of old brood combs; "Long-continued breeding increases the thickness of the midrib very materially—sometimes up to 5 millimeters. The cell walls of old combs, however, are scarcely perceptibly thicker than those of new comb, because the bees have ways of gnawing away the silken cocoons. The cell walls of brood-combs are probably lengthened according as the midrib thickens from the accumulating deposits."

N. Ludwig says to this, in the *Leipziger Bienenzeitung* that his own observation coincides with Reidenbach's, and claims that, after making exact measurements, there exists no difference in general roominess between the brood-cells of old and new comb.

SEPARATORS.

Early History of; why it is Not Wise to Dispense with them.

BY F. GREINER.

The subject of separators versus no separators has been gone over a number of times during the past 25 years, and the evidence has always been greatly in favor of separators. The reason why a small minority of our bee-keepers still cling to the open or undivided super lies in the fact that there exists a great difference in people. Some are satisfied if they produce an article that will just pass, while others do not rest easy until they have reached actual perfection. This difference may be noticed everywhere in life. For instance, in planting a field to corn, some farmers have the rows as crooked as an old-fashioned rail fence, and in planting out an orchard the trees are put in haphazard fashion. Other farmers will have the rows as straight as a string. The crooked rows would be an eyesore to me, and trouble me nights. The imperfections in the out-of-date section honey would produce a like effect upon me. As to how we came to use separators, there is a little history connected with that. It might interest some.

When we first commenced keeping bees on a more scientific basis, i. e., using frame hives, our super made no use of separators in any form. For several years—and as beginners, mind you—we produced comb honey for the city market without separators, and without the use of comb foundation, not even for starters. Comb foundation was not commonly used, as now, and we always tried to collect enough newly built comb during the season to start our boxes.

Some well-known honey-producer once expressed his sentiments thus: "The success to produce comb honey without separators depends upon the skill of the apiarist," although it appeared later that it would be desirable, if not necessary, to crate such non-separator-raised honey in the order it had been built by the bees, and that a certain per cent of the section honey could not be crated at all. I consider it of great importance to be able to crate our honey just as it happens, or as we think best—a grave disadvantage if we must crate in the same order as the sections came out of the super; the matter of uncratable sections perhaps amounts to but little.

As that beginner in keeping bees, I certainly did not pretend to be skillful; still, I found very little trouble to make a success in raising comb honey in open supers. At present, with the comb foundation to use for starters or in full sheets, it would indeed be easy enough to raise a fair or at least a salable article.

There was, of course, a reason why we did not continue the use of undivided supers. We were using a shipping-case with two glass fronts at that time, and it required six nice straight combs for facers to each 15 sections. While we could crate very nearly all the combs built in the open supers, it was, nevertheless, a fact that they were lacking that uniformity equally desirable to the grocer and to the apiarist; in particular the faces were not perfectly on a level, but were wavy in nearly all cases. The most desirable face combs we often found in the outside rows, the face next to the hive-wall being perfect. The thought occurred to us, "Why not have more hive-walls?" So, sure enough, we did just as friend Gill did (see page 335, Apr. 15th GLEANINGS), and put in some dividers. First we used but two; and as that particular honey season advanced we fitted other supers with more. We were so well pleased with the looks of that honey that we adopted the separator to be used between all combs, and we have never had reason to be sorry for making the change.

Tin and zinc were the materials of our first separators. The supers we used at that time were such that a stiffer divider seemed much more desirable; and since the wooden side of the hive answered quite well to produce a perfectly smooth face on the outside comb, we saw no reason why the same material should not answer the same purpose in the middle of the hive. We brought the matter up for discussion. Mr. A. I. Root and Mr. James Heddon somewhat discouraged us as to the adaptability of wood for separators. I think you will find some of these things recorded

in GLEANINGS and *American Bee Journal* of 1878 and '79. Notwithstanding, after testing paper and other materials we changed all our supers at that time, adapting them to wooden separators.

The comb surfaces of our honey since have been so perfect, the weight of the sections so uniform, that I should be very unwilling to go back to the open super. It would certainly be a step backward. I can see no material advantage in dispensing with the separator. As to getting along without them when trying to produce honey in no-beeway sections, that simply is out of the question. What looks better than a no-beeway section brimful of honey?

Naples, N. Y.

[I once heard an extensive bee-keeper get up in convention and say he had no use for separators—that he could and did dispense with them; and, what was more, he got just as good prices for his non-separated honey as he did for that produced with them. It so happened that, months afterward, I ran across some of this man's non-separated honey; and, of all the "kicks" I heard from the buyer! The long and short of it was, he would never buy any more of that honey again. It was too crooked, too bulged, too every thing; so when I hear a non-separator man talk I wonder whether he holds his trade.—ED.]

lay the back lid on the grass, inside up, then carefully remove the front lid with the box in hand. When you see the queen, place the front lid crosswise on the back lid, always inside up, and then lift your queen up quickly but gently. Then, lastly, stand the little frame directly across the lids, and cage the queen. Now put the box together once more, and proceed to examine the lower box in the middle row. After the middle row has been removed, the side boxes will easily draw from the frame.

If any of these little colonies are found queenless, and too weak to care for themselves longer, they should be doubled with

SWARTHMORE'S SYSTEM OF QUEEN-REARING.

How to Maintain and Handle the Miniature Nuclei in Brood-frames, Described on Page 434.

BY SWARTHMORE.

When the little combs are heavy with brood and honey it has been my practice to bind the boxes (described on page 434 of our issue for May 15) snugly together with three strands of cord or twine after the lids have all been adjusted. Pass the cords around each row of boxes longitudinally, and tie a slip knot at one corner of the top-bar. Any rough handling can not then loosen the lids.

A piece of water-proof (not tar) paper folded neatly and tied securely over the top of each frame (as illustrated at the bottom of page 436), when set out on the stakes will prevent rain from entering the compartments. It will also protect the frame and boxes from the sun's rays, and will give more comfort to the bees occupying such close quarters. If possible, place the frames where they will be shaded the greater part of the day, and let them stand high enough to get what air there is stirring.

When the time comes for caging the queens, just untie the middle cord first, and then remove the top box by tilting the tier toward you. Remove the back lid and keep a sharp eye for the queen. If not found on that side,

the one in the same row by placing them back to back. The feeder (Fig. 2, p. 436) is then placed on one of the two front lids. Tie all snugly together with the cord that was used about the frame, and in three days another virgin can be run in, as Alley does it, with tobacco smoke, or a hatching cell may be given as shown in the illustration above.

Fig. 1 is one of the section-box frames, shown on p. 435, May 15th issue, with a $\frac{3}{4}$ -inch hole cut through its top bar for the insertion of a liquid feeder (salt-shaker), or a shell containing a ripe queen-cell. Fig. 2 shows the manner of inserting the shells; and just below this may be seen a fully developed queen-cell built from a shell cup which will hereinafter be described.

Some time previous to the introduction of the second young queen, the back lids coming together may be removed, and in their stead may be placed a rim of half-inch stuff between the boxes, to give the necessary bee-space. This will give the new queen the range of both combs, much to the advantage of the little colony.

It should be understood that the doubled nuclei are not again put back into the frame, as illustrated at the bottom of page 436, May 15, but are placed directly on the grass, with a piece of board under them to keep them out of the wet; or they may be hung on a single stake a few inches from the ground.

If these little colonies are kept well fed with

sugar and water they will last the season through, and will also turn out just as many queens as any nucleus hive.

As the season nears its close, gradually double all nuclei down until none are left. Carefully preserve the little combs for another and yet another season's use.

We have formed as many as 40 of these miniature colonies from a single full stock, and once we took a young laying queen from all but two on the first round. One must leave

plained in the first part, and adjust the lids. Expose the zincs on all sides, and cork the flight-holes. Run a young laying queen into each compartment, and hang the frames forthwith in a hive containing bees that have been queenless three days. No unsealed brood should be allowed outside the compartments; and, to make assurance doubly sure, use a little tobacco smoke as you hang in the frames containing the queens. To keep up the full strength of such colonies, a frame of hatching

the young laying queens in these section-box fertilizing-hives long enough for them to restock the combs with brood, or they will soon dwindle down to almost nothing.

METHODS OF COLLATING.

Young laying queens may be preserved an entire season, each in a compartment by herself, by proceeding as follows:

Secure frames of brood and honey, as ex-

brood should be given occasionally. Feed thin sugar syrup flavored with a little honey, or frames of capped stores may be put into the hive.

The secret of success in the introduction of a plurality of queens lies in the giving of them all at one time to bees that have been queenless but three days. An indefinite number of queens may be confined in boxes or cages arranged in such a way that none can

come in contact, yet allowing the bees freedom to go and come, to do as they will.

If one has to draw often from his "magazine of laying queens" it is much handier to tie each box separately with tough cord, and place them in the hive, without frames, arranged in tiers. Magazine hives should be kept in a cool shady place.

THE GRACE CELL-COMPRESSOR; A SIMPLE HAND TOOL FOR RAPIDLY FORMING QUEEN-CELL CUPS IN SOLID PLUGS OF COOL WAX BY PRESSURE; SHELL CUPS AND IMPROVED HATCHERY.

The cut on the preceding page is an excellent and most comprehensive illustration of a very handy little machine for making compressed queen-cell cups or goblets into wax plugs for queen-rearing.

A brass die, F, is screwed fast to a plunger, as shown at B. This plunger is jointed to the handle, A, and the handle is pivoted to the two uprights, bolted fast to a rigid frame, thus forming a lever; and when the handle is brought down from the point indicated by the

it is moistened, each time the handle is lifted up, either by the tongue of the operator or with a sponge saturated with castile soap and water, or olive oil.

Down at one side of the machine will be noticed little wooden shells into which some cups have been compressed. These "shell cups" are to render queen-cells more easily removable or separable, which will be hereinafter fully explained.

The machine does most excellent work in these shell cups, at the rate of from 10 to 15 a minute—all perfectly formed and partially drawn, so that the bees will accept them quite readily.

The cut below is a perfect drawing of an improved queen-nursery cage for the incubation of cells and the confining of virgin or laying queens.

The top-bar has a series of eight $\frac{3}{4}$ -inch auger-holes, one inch apart, along its entire length, into which wooden shells fit snugly. A, A, are shells removed entirely from the holes. B (1) is a shell in place, and B (2) is a sectional view of the same. G shows how the cells appear when fully drawn out by the

THE SWARTHMORE QUEEN-NURSERY CAGE IMPROVED, SHOWING THE APPLICATION OF SHELL CUPS.

dotted lines, the die is forced into the center of the wax plug, forming a perfectly smooth indentation, like the base of a natural queen-cell, into which indentation larvæ may be afterward transferred or grafted, and from which bees will construct queen-cells.

The pressure not only makes a cavity in the wax, but it forces out the edge of the cell to a certain extent, which is very acceptable to the bees because of its natural form and appearance.

A Swarthmore nursery-cage top-bar is shown under the die, ready for compressing. To the left are the finished cups, and to the right are plugs of wax yet to be pressed. These bars are placed to accurate gauge upon the table. Each time the handle is brought down the bar is slid one notch further. In this way very rapid and perfect cell-work can be done with little or no exertion. Dies for the transfer of "cradle and all," by the Pridgen method, are made pointed at the end, and work well in the compressor.

To prevent the die from sticking in the wax

bees. Along the bottom-bar is a corresponding row of half-inch holes to receive bits of sponge for the purpose of feeding the young queens when confined entirely with wire. A sponge in place, and a sectional view of the same, is shown at E.

Between the holes in each bar is a saw-cut for receiving the division-tins, F, F, which are easily slid in or out at will.

Perforated zinc covers the front side, and wire netting is placed over the back side of this cage. The zinc is removable. The netting is nailed fast to the cage by means of thin strips at top and bottom. These strips, also the netting, D, D, are shown torn away in the drawing.

The top-bar is removable, and may be used in a frame as recommended by some of the leading breeders of the country.

These cages fit six to the Hoffman frame—two across and three to the tier, thus forming compartments for 48 queens to the frame—a great saving of space in the incubation of cells or the storing of virgin or fertile queens when

rearing on a large scale. In a booklet soon to be published I shall endeavor to explain fully the details of the storage of numerous queens in a single colony, with much other matter as yet unpublished.

MODERN METHODS OF QUEEN-REARING.

The Progress Made During Late Years.

BY W. H. PRIDGEN.

Since the dawn of modern apiculture there has not been a time when there was the same interest manifested in queens and queen-rearing as now. The tendency on the part of the honey-producers is, to a greater extent than ever before, to rear their own—not only because a larger per cent of those reared at home give better results than those transmitted through the mails, all else being equal, but because the essential conditions necessary for the production of those of the highest type are more generally understood.

The cardinal points were given to the public years ago by men who spent much time and talent in experimenting; and by their persistent efforts the foundation was laid, not only for the most fascinating branch of our pursuit, but the most promising field in which to spend our thoughts and energies.

Bees are no longer looked upon as bees without considering their qualities; but each progressive bee-keeper is continually on the lookout for superior honey-gatherers and other desirable traits shown by individual colonies.

The ability to rear our own queens from the best mothers, and control their mating to some extent by weeding out and preventing the production of objectionable drones, and thus, step by step, make permanent improvements in the working qualities of our bees, not only increases our profits, but lends enchantment to pleasure.

We are indebted to Messrs. Doolittle and Alley for the fundamental principles of what is termed artificial or scientific queen-rearing, who differ in some of the minor details.

For instance, Mr. Doolittle uses artificial queen-cups to which he transfers the larvæ with a toothpick, while Mr. Alley prefers strips of worker comb containing eggs ready to hatch, over which the bees fashion the cells to their own liking.

As these veterans differ on some of the less essential points, so also do others differ with them, and consequently the subject is kept alive—short cuts devised, and modifications made by the lovers of the art.

In some of the manipulations, as much is accomplished in a few hours now as was formerly done in as many days; but what works perfectly in the hands of those who conceive new ideas and adopt measures to carry them into effect are often considered to be failures by others who have become proficient in more faulty methods with which they are acquainted; and hence the diversity of opinion as to the best or easiest way to accomplish certain ends.

Without these differences of opinion and

failures that lead to investigation, new ideas or the different ways of accomplishing the same thing, would not come to light; and in going over the ground that has been covered by those who have contributed toward the success of modern queen-rearing, the object is to lend a helping hand toward a further advancement of the industry.

As a rule, the reader cares but little how, when, or from whom the writer gained his information, but generally prefers the part relating to the object in view; and inasmuch as it is generally known who advanced the different ideas that make up our queen-rearing system, in complying with the request for a more elaborate treatise on the subject these explanations will be omitted to some extent, without any intention of doing any one an injustice.

Creek, N. C.

CAPPINGS.

Bees that are Rustlers; Covers adapted for Warmer Climates; Comb Honey in Two-pound Sections; Straining Preferable to Settling Extracted Honey; Fertilizing Queens in Confinement.

BY E. H. SCHAEFFLE.

At present the efforts of the queen-breeders seem to be confined to stretching the tongues of their stock to the utmost limit. While this elongating of the bee's tongue may be of benefit to those bee-keepers living in red-clover sections, to the average apiarist the working qualities of the bee are of far more importance. It is a well-known fact that some stands of bees will put up several hundred pounds of honey in a season, while others in the same apiary will not give a pound of surplus. I hold that the bee wanted is one that will give the most honey under average conditions. When I sit down by one of my best colonies and compare their movements with that of the average hive I find that the rustlers come out of the hive on the run, stop an instant to gather themselves for the spring, and then are away like a bullet. Turning to the average hive I see that the bees come out leisurely, slowly crawl half way up the front of the hive, stop for the spring, and then spring out slowly, circle and leisurely wing their way to the fields. Returning, the rustlers come down on the alighting-board with a bounce, and rush into the hive as though the queen's business could not wait, while the bees of the average hive drop on to the alighting-board exhausted, rest there for several seconds, and then slowly crawl into the hive.

Now, I can not go with the bees to the "fields and far away," but it is safe to assume that they work in the field as they do at the hive. If this is the case, the rustlers will make two trips to the sluggards' one. I believe we can, by careful selection, produce a strain of rustlers just as the fast trotter has been developed.

A non-warping top is a desirable feature in this hot climate. Last season I set out in the blazing sun three ten-frame hives. One of

these had a cover of $\frac{1}{2}$ -inch stuff; another the usual flat cover, and the third a ventilated cover. The thin-top hive got so hot along the top that the combs all melted loose. The single flat cover warped, while the ventilated cover retained its shape. This ventilated cover is made of a thin board, flat, over the hive. This is let into a strip, at each end, and has in addition a $\frac{1}{2}$ -inch strip nailed across the center to prevent warping. The cover is a half-inch above, and is the usual three-piece cover, extending $\frac{1}{2}$ inch beyond the sides, to shed rain. It will be noticed that this test was on the wide ten-frame hive. The usual eight-frame hive is not so apt to warp its covers.

For twenty years past I have been producing comb honey in two-pound sections. My experience has been that I could secure 50 per cent more in this size than in the usual one-pound size. At the same time I have had a number of one-pound hives in operation; but, with the exception of two boom years, I have been compelled each year to take the sections off and put on extracting-supers in order to get some honey from these hives. The usual one-pound section with its separators compels the bees to cluster in small bunches of a half-teacupful each; prevents sociability and the massing of large numbers of bees to make comb. This season I have gone back to an old style, and made frames to take (two deep) Danzenbaker sections. These frames each hold 8 sections, or 64 to the case, using a ten-frame hive. Now, in this super there are no separators, the bees hanging in one sheet from the top of the upper section to the bottom of the lower, and filling all of the space between two sections. By this arrangement I get about four times as many bees to work in the same space. The bees take to these sections kindly, and I expect good results if the season continues favorable.

It is not always convenient to have to wait for the particles of wax and pollen to rise to the surface before canning. I can all of my honey as fast as extracted. First the honey is allowed to ripen on the hive. If in shaking off the bees the honey flies out of the comb, that comb is returned to be ripened up, and only those taken that hold their honey when shaken. When the honey is extracted it is run into a wire-cloth strainer that catches all the small particles of wax, bees, and grubs. From this strainer it flows into another, made of cheese-cloth. When the honey leaves this it is free from all particles of pollen, bright and clear, and ready to go direct to the hive. Where honey is not remelted the presence of small particles of pollen may not injure the honey; but if it is remelted it will color the honey. Some object to the cheese-cloth on account of its being a slow way of straining; but this depends entirely on the size of the strainer. Mine is 8 inches across and a foot deep, reinforced by strips of cloth sewn over the sack. This will allow the warm honey to flow as fast as the gate on the extractor will deliver it.

I find that dark combs color honey. Californians allow the queen access to the supers in the early spring. In consequence, many of

the combs are dark, and the honey from them a shade darker, so that, to get a shade lighter honey, it will pay to soak these combs in water before using, and have the water dissolve and take out the color that would otherwise go into the honey.

Some fifteen years ago I tried fertilizing queens in confinement. I found the queen more than willing, but I could do nothing with the drones. Mr. Davitte has succeeded by first accustoming the drones to confinement before liberating the queens, and, second, by using drones that are from queenless hives. It is essential that the drones be content, and that they be from hives which, being queenless, have their drones "fertilized."

Murphys, Cal., Mar. 20.

ARE LONG TONGUES OF VALUE ONLY IN RED-CLOVER REGIONS?

BY DR. C. C. MILLER.

In the *American Bee Journal*, page 293, G. M. Doolittle enters a protest against the fad for long tongues because they are not of special value where there are no flowers with tubes too long for the reach of ordinary bees, and quotes a remark from GLEANINGS which he puts in capitals and italics as follows: "The movement for longer tongues is simply to get the red-clover crop of the North, which now is practically all wasted. The bees, NO ONE CLAIMS, would be any better except on that account."

Now I want to know who authorized either Stenog or Bro. Doolittle to say that red-clover blossoms are the only ones with tubes too deep for ordinary bees, and yet not so deep that they can not be utilized by some of the bees now in existence that have tongues of unusual length. Are you sure that there are never white clover blossoms so deep that some bees can not reach clear to the bottom?

In one place Mr. Doolittle is not quite so bad as Stenog, for the former does not leave red clover as the solitary example of a honey-plant that keeps its nectar tantalizingly near the reach of ordinary bees, and yet just beyond that reach, for he says, "Long-tongued bees would be an advantage only to those residing where red clover and other long-tubed flowers abound." That's as much as to say that, if there would be a gain from red clover through long tongues, there might also be a gain from other plants with long tubes, while Stenog bars out all but red clover. To be sure, Mr. Doolittle does seem to do the same barring-out in another place, where he says: "I am satisfied that long tongues are of advantage only to those in red-clover districts," and then he immediately hastens to throw some doubt upon the red-clover gain by adding, "if they are of any special advantage anywhere," which seems to throw doubt upon their special value in any case.

Mr. Doolittle calls attention to the fact that in New Mexico and elsewhere, where no red clover grows, there come reports that the bees that do the best are those with long tongues.

I do not deny that it is possible that long tongues may be generally accompanied by other good qualities, thus accounting for the superiority of long tongues where no red clover is found; but it seems to me more reasonable to suppose that the extra gain is made on flowers with tubes longer than ordinary. Why should it be considered a strange thing that other flowers should have tubes of the same depth as red clover? It is possible that many of the flowers commonly visited for nectar have tubes of different lengths, some of them accessible only to tongues of unusual length, thus giving long tongues the advantage aside from red clover. Again, a flower-tube may be of such a depth that only part of its contents can be reached by a tongue of ordinary length, while one a little longer may drain it to the bottom.

Please don't understand that I believe that length of tongue is the only thing to be considered. I should prefer to make selection by noting the amount of stores gathered rather than by measuring tongues. It is possible that, among several colonies, the one with longest tongues may be the poorest. One colony may excel it because of greater diligence. Another may work earlier in the day. Another may excel because of greater longevity. So I think it would be unwise to depend upon tongue-length alone. But I do insist that the advantage of long tongues has not been proven to be exclusively associated with red clover; and it is possible—not probable, I think—that the gain from other flowers with long tubes may be even greater than from red clover.

Marengo, Ill.

[It is true that a colony, A, with long tongues, may do less execution than another colony, B, with shorter tongues. But that is no argument against the value of long tongues. If B, because of its superior industry, does better than its longer-tongued neighbor, A, might it not do *still better* if it had the same length of tongue as A? The truth in a nutshell is about this: In any case where there is nectar to be found in flower-tubes beyond the reach of ordinary tongues, if two colonies are alike in all other respects, the one with the longer tongue-reach will have the advantage.—Ed.]

FASTENING FOUNDATION IN BROOD-FRAMES AND SECTIONS.

A Unique and Simple Plan; How to Make the Tool; How to Prevent Foundation in Brood-frames from Sagging, without Wires or Wooden Stays.

BY C. DAVENPORT.

I have noticed that, in most improvements (or shall I say changes?) made in our fixtures, the firm GLEANINGS represents leads, and the others all follow in time. I am willing to concede, and know, that most of these changes have been real, and some of them great improvements over what they supersede. This, for instance, will apply to the present styles

of self-spacing brood-frames over the old loose hanging or unspacing kind; but I consider a molded top-bar, or one that has a crease or groove cut in the center of it to receive the foundation, inferior in many ways to one that is simply flat on the bottom side. It is, for one thing, much more work to clean them of wax and propolis if, as is always the case to a greater or less extent, this has to be done after they have been used; and the foundation, either full sheets or starters, can be fastened to a flat top far quicker and easier than it can to either a molded or grooved one in the usual way.

I will here describe my method of doing this, for the principle will work with either molded or grooved bars; and starters or full sheets can be fastened in sections by this plan nearly as fast as with a hot-plate machine; in fact, I often use it when putting full sheets in sections, although I have two machines for this work. The whole apparatus costs but a few cents aside from a small amount of work. One of the implements required is a small instrument made on the same principle as a medicine-dropper. Mine is made of a tin tube about 4 inches long, and not quite $\frac{1}{2}$ inch in diameter. The lower end of this tube is gradually tapered down to a point, so the hole at the extreme end is a little less in size than what it would be on an ordinary lead-pencil if the lead were removed to the upper part of the tube. A rubber nipple or bulb is attached, and it is important to have this rubber fit over the tube tight enough to exclude air. When the lower end is placed in melted wax, or any other liquid, with the rubber bulb compressed between the thumb and finger, as soon as it is allowed to expand, by air suction it draws some of the liquid up into the tube. By allowing the rubber to remain expanded the tube will not leak when withdrawn, no matter what position it is held in. Pressure on the rubber forces the liquid out slowly or fast, just as desired.

For fastening the foundation in brood-frames I have a board a trifle wider than a frame is deep, and a little longer than the length of four frames. Along one side of this board are fastened four pieces that are $\frac{1}{4}$ inch smaller than the inside measurement of the frame, and these pieces are just half as thick as the top-bars of the frames. It is on the same principle as the piece on the Daisy foundation-machine, over which the section is placed, so that, when a frame is placed over one of these pieces on the board, the foundation, when placed inside the frame, will be held perfectly true and straight, exactly in the center of the frame. When used, this long board is set up edgewise on a bench or table, and propped up so it will lean over from the operator. A frame is placed over one of these pieces, with the top-bar down on the lower side next the bench. On the lower side of the long board, under each piece over which the frames fit, is nailed a narrow strip on which the top-bar rests. With the board in position a frame is placed on at one end, the foundation placed in, and, if I have made my description plain, it will be seen that the foundation rests exact-

ly in the center of the top-bar, and is held there by the piece over which the frame fits, and the angle, or leaning way, at which the long board is placed. A dish of melted wax stands over a small lamp at one end of the table. Some is taken up in the machine I have described, the point held close to the edge of the foundation where it rests on the top-bar. As the dropper, or whatever one likes to call it, is moved slowly along the top-bar, a very small but continuous stream of melted wax is dropped between the edge of the foundation and top-bar. Then another frame is laid over the next piece on the board, and so on until the foundation has been fastened in the four frames.

By this time the melted wax on the first one has set enough to allow the frame to be hung in an empty hive near by; then by the time another frame is filled, the second frame on the board can be removed, and so on as long as there are frames to fill. After things are in place, and the wax melted, either full sheets or starters can be fastened in frames very rapidly by this method. But speed is not so much the advantage of this plan as the fact that the foundation is fastened so it hangs perfectly true and straight in the frame, and can be pulled in pieces without being loosened from the top-bar. Of course, this method will work just as well if the frames were wired. For fastening full sheets in sections I have a board similar, except in size.

The great superiority of the wax-dropper I have described over any I have seen mentioned, is the absolute control it gives the operator of the melted wax, which can either be dropped slowly or rapidly, or a small continuous stream can be forced out; even the size of the stream can be regulated by the pressure on the rubber. It is very easy to operate it, and the only difficulty one can have with it is in drawing too much wax up into the tube so some gets in the rubber. The rubber on mine has too much suction; and unless care is used when the wax is drawn in, some may run up into the rubber. When this is done the hot wax does not, as one might think would be the case, injure the rubber, for, after the wax is removed, it works as well as ever. But if care is used, or with a bulb the right size, no wax will be drawn into it.

In this connection I will describe a plan I have practiced somewhat to prevent full sheets in unwired frames from sagging. This sagging or stretching of the foundation, as those who have had trouble in this respect know, is next to the top-bar, a strip two or three inches wide. After foundation has been fastened in a frame, and while it still remains in position on the board, the point of this wax-dropper is held close up to the foundation, two or three inches above the top-bar; then a small stream of wax is forced out. As the point is lowered to the top-bar, this adheres to the foundation; and if the operation is repeated at intervals the whole length of the top-bar, it will prevent the foundation stretching when the bees first get on it; and by the time they do, these strips of wax off the foundation are usually drawn out enough to hold it from sagging.

This wax-dropper is also very handy in fastening pieces of comb in sections, and in patching up combs by cutting out patches of drone comb, and replacing with pieces of worker comb or foundation. But a board such as I have described is essential when fastening full sheets in brood or full-depth frames.

In reading this over I see that I forgot to say that, if the wax is heated to only about the melting point, when commencing to use the dropper it may, unless one works fast, harden and adhere to the sides of the tube, or even clog it up. In this case, or if for any reason work is suspended, and the wax is left in the tube until it hardens, all that is necessary is to hold the tube in the melted wax an instant, then what is in the tube melts and can be allowed to run out; but with the wax hot enough there will not, unless wax is left in the tube, be any trouble in this respect. I explain this matter in detail because, if one tried a dropper of this kind with the wax at only the melting-point, some might consider it a failure. After the wax is heated quite hot it remains liquid in the tube much longer than is necessary.

Southern Minnesota.

[Your device is nothing more nor less, if I understand you, than a large-sized medicine-dropper, or what druggists call a pipette. A device quite similar has been illustrated in our columns, without the rubber bulb. It was simply a tin tube $\frac{1}{2}$ or $\frac{3}{4}$ of an inch in diameter, tapered at the point to a small hole. This was partially submerged in hot wax, and allowed to fill. It was next removed, and the point was then drawn along the edge of the foundation, gravity forcing the wax out in a fine stream, said stream forming a bond of union, when cold, between the foundation and the top-bar. But one difficulty with this device was that it fed the wax too fast, and at other times not fast enough. This rubber bulb would overcome this difficulty, giving a perfectly regular feed and stopping it at the moment desired. These bulbs can be purchased, probably, at the drugstores; at any event, they can be obtained of any of the large rubber concerns; for example, the Hartford Rubber Works, Hartford, Ct.; the Goodrich Rubber Co., Akron, O.; the Diamond Rubber Co., Akron, O. After getting the bulb, make the tin tube, or get your tinner to do it for you. To overcome the difficulty of the wax being drawn up into the bulb spoken of by Mr. Davenport, make the tube a half longer, and then always hold the bulb "this side up with care," or bulb upward.—ED.]

.....
 SHALL WE WORK FOR COMB HONEY OR EXTRACTED, OR BOTH?

BY WM. A. SELSER.

The paper written a few weeks ago by our good old friends in New York city has no doubt been read very carefully by a large number of honey-producers. The writer having had a large experience in the Eastern markets,

feels that there are some exceptions that should be taken to this article. It reminds me very much of one ascending Pike's Peak, in Colorado. After ascending two-thirds of the way up to the peak, one looks across a beautiful stretch of country, and certain impressions are formed; but on reaching the top, and getting that grand extended view for many, many miles, quite a different impression is formed. In looking over the city of New York in reference to the honey-producing capacity, our friend's conclusions are correct, and especially so with regard to the buckwheat honey, of which Northeastern Pennsylvania and New York produce over half of the United States supply. The reason why extracted buckwheat honey is not profitable to produce any more in the Eastern markets is because, first, the biscuit trust can buy a better grade of honey, for the same price, than buckwheat has always been sold for in the past. Second, two years ago a patent discovery was made by which large producers in New York city can turn out an adulterated article by the carload, and make it sugar in four days after it is manufactured, which looks and tastes exactly like the genuine buckwheat honey, and can be told only by chemical analysis. Therefore, it follows that buckwheat comb honey is the only way that buckwheat honey will sell at all, unless at very low figures.

Now, then, ascending the mountain a little bit higher, on looking over the vast area of the United States in reference to its honey production in relation to comb and extracted honey, we advise the bee-men to go on just as they have. About four years ago this summer, Wisconsin had hard trouble to dispose of its crop of comb honey at 8 cts. a pound, and it was very pretty at that. Since Colorado, Utah, Arizona, and other new places have come to the front in producing alfalfa comb honey, there has always been sufficient comb honey to go around. With all the human cry last fall of a short crop, the writer knows of two cars, one sent to Philadelphia and the other sent to New York, that could not find buyers, and had to be stored for future offerings.

One reason that comb honey has been scarce with the dealers is because they were not willing to pay the price. This year, with the prospect of an immense crop from California, and these new places heretofore mentioned, that seldom fail with an average crop, the prospect is that comb honey will be a drug on the market; and the bee-man should remember that comb honey, if not sold before the following season, is not worth very much. The average price for which California comb honey has sold on the Philadelphia market with a good yield, has been 7 and 8 cts., a comb running a little short of a pound. Now, then, how should bee-keepers fare who have always been able to get on the average 7 cts. per lb. for fancy white-clover extracted honey, and some years even more, if they turned around and changed their hives to produce comb honey, and we should have a big season, and they could not sell it at an average price of 10 cts., and would have to carry it over,

and probably realize about 4 cts. per lb. for it? I would say in conclusion to our fellow honey-producers, do as I propose to do—raise comb or extracted honey in proportion as they have in the past years, and not be carried away with the high price comb honey would bring one year in ten.

Jenkintown, Pa.

RAMBLE NO. 187.

An Experience with the Ferris Wax-extractor.

BY RAMBLER.

"Good morning, Mr. McCubbin; glad you came around. I've just been over all of our colonies of bees, and cleaned house, as I call it. There was an everlasting amount of brace-combs and bits of comb at the ends of the frames. Why, it seems to me there was a pound of wax daubed around in useless places inside those hives."

"And, Rambler, you have got all these boxes full—had no idea there was so much. I suppose you will now render it out."

"Well, no; not just yet. I think I will wait until I can use the sun extractor. I notice an April sun is not a good wax-worker."

"But, Rambler, why not use my Ferris wax-extractor? You know there is one in the back room."

"Yes, yes. I have noticed your old Ferris concern; but, I'll tell you right now I wouldn't give a row of pins for it."

"You wouldn't, hey? Say, Rambler, did you ever use one?"

"No, and I don't want to. Why, I have used no end of these steam wax-extractors. If a man has just one swarm of bees and a milk-pan full of combs it might be of use, for the women-folks could put it on the stove and then it would take all day to render it."

"Well, Rambler, you have a great amount of prejudice. I don't see that this Ferris extractor is any slower than any other way of boiling in water. Then you must know that mine is the first one sent to California."

"Is that so, Mr. McCubbin? Ha, ha! Well, it ought to be the last one. No, sir; you can't fool me on these steam wax-extractors; besides, I have a brand-new way for rendering wax, that will just paralyze Ferris and his extractor. I don't mind if I reveal the plan to you. You know when we boil all this stuff in an open boiler, the refuse, instead of staying at the bottom, where it ought to, comes to the top, and wax and refuse have a remarkable affinity for each other; and, even in your much-vaunted steam-extractor, much wax goes into the slumgum. Now, my plan is to put all of that refuse into the bottom of the boiler, leaving nothing but wax on top. The boiling water will eliminate every particle of wax from the refuse, and there is absolutely no waste."

"Well, Rambler, that is a very pretty theory; but did you ever make it work?"

"No, but I am just ready to. The plan is very simple. I place a roller, or, rather, a large tin spool, in the bottom of the boiler. I

attach to this a long strip of cheese-cloth with pockets across it. Now actuate the roller; and the breadth of cheese-cloth rolls down, the pockets have the openings downward, and gather in all the slungum, and the latter is all wound up on the roller under the water. You see it strains and compresses it all at once. Remove the clear wax, and then the roller with its load of refuse can be removed. You see it can be put into a common wash-boiler, and need cost not over one dollar. Oh! I'll show you and Ferris which shank of a razor-back hog has the most fat on't."

"Well, Rambler, your plan looks reasonable. Go ahead with it, and success to you; but I must be going. I have a thousand acres of land to sell this week. I'll be around again in a few days. So long."

A week later.—"Hello, Rambler! Well, I'm around again; how is that razor?"—

"So I observe, Mr. McCubbin. Did you sell that thousand acres of real estate?"

"I did not; but, see here. I am interested in wax-extractors just now. How did your new-fangled roller-me-jig work?"

"Sit down here, Mr. McCubbin, and I will unfold to you a story of bright hopes, of disappointment, and of conversion. Well, sir, I tried that roller-up plan, and somehow the pressure was not strong enough to eliminate all of the wax, and it appeared in little granules all through the mass. It is possible that the thing might work after a few improvements to increase the pressure; but I have not the tools for making the thing as I want it. I therefore fell to considering your charge of prejudice; and if I had any I cast it aside and resolved to try the Ferris extractor. I set it going properly on the stove, got a *McClure's Magazine* and the *Examiner* to help while away the time, for I expected a whole day's job at rendering a sack of old combs and scrapings. Just as I had gotten the fire to going nicely Mr. Wescott came along and we talked a while about his mowing the alfalfa near the apiary. I started back to the stove, and was a little surprised to see something trickling from the spout of the extractor. 'Nothing but water,' said I; but a closer view revealed quite a little wax with it, and it was running on to the floor. Well, I hustled around to get a dish, and by that time quite a respectable stream was running. Then I had a curiosity to see the inside of the extractor. The removal of the cover let into my face a great rush of steam, and I was really surprised to find the baskets nearly empty. I filled them again, and crowded down some hard lumps; and, though I had to poke my nose into the extractor several times just to see how it was working, those lumps melted away in a perfectly satisfactory manner. I looked at the big letters 'FERRIS' stamped on the front of the machine, and gracefully took off my hat to Mr. Ferris, inventor of the first satisfactory steam wax-extractor. I soon had occasion to melt and recake quite an amount of wax, and I put in some quite large chunks just to clog it if possible; but it was no use; it seemed as if something was 'chawing' it down at the bottom. Yes, sir; I will indorse

the Ferris; and his later machines, with the pressure principle, must be near perfection."

"Well, Rambler, I am pleased to know that you are liberal enough to throw aside your prejudice and indorse a good thing when you try it. But, see here—what are those wooden boxes for?"

"Those are for molding wax. The usual plan, you know, is to mold in an old five-gallon can; but such vessels are as small at the top as at the bottom, and often the can has to suffer before the cake of wax can be removed. Now, my idea of the matter is that every well-regulated apiarist should have three or four square tin dishes made with the tops about an inch larger than the bottoms, and large enough to hold 20 or 25 lbs. of wax. Not having such vessels, and not having even old rusty tin cans, I made these wooden boxes. They hold 20 lbs. of wax; and I want to know, Mr. McCubbin, if you can make a wooden box, that will hold water or melted wax, with a saw and hammer."

"Well, no, Rambler. I am not much of a mechanic. I think you must have some kink about the way you do it. Or, say—I might possibly make such a box if you will allow me to nail it up with a harrow-tooth."

"Well, I can tell you how to do the same trick, harrow-tooth or not. Get your boards the proper size for the box you want. These three boxes are made of $\frac{3}{4}$ -inch boards, 12 inches square at the top, 9 inches deep, and $\frac{1}{2}$ inch smaller at the bottom. When you get the pieces of boards ready to nail up, put some beeswax into a shallow tin dish—an old bake-tin will do. Next get some strips of heavy woolen cloth; cut them from an old pair of pants, before nailing up the sides of the box. Cut the woolen strips one inch wide, and a little longer than the depth of the box. Let your wax get boiling hot; thoroughly saturate a strip of cloth, and quickly lay it on the joint to be nailed, and quickly nail the other piece right down upon it. So continue for all four corners; then put the bottom on in the same way. Those strips of cloth saturated with boiling wax, nailed firmly into every joint, fill up all of the pores and inequalities; and if the boards have been gotten out with reasonable care your box will not leak. But, to be doubly sure, after the box is nailed up and the edges all trimmed down smooth, another set of waxed cloths can be nailed down with cleats over the cracks."

"That seems to be a nice way to do it, Rambler; and your cakes of wax all look so nice and yellow; free from those discolorations that are sure to come from old tin dishes. But does not the wax stick to the wood?"

"It did not in the case of these 12 cakes; but I had to exercise some care toward the last caking. No, wood is not so good as tin; but this way to make boxes is worth knowing. You can make a nice tray for developing photographs, by this method; or by lining the tray with a piece of flannel saturated in beeswax; or you can make a very good and serviceable bachelor's wash tub. Here is a photo of our waxworks for the season. The Ferris has the post of honor in the center. In front

of it is an old five-gallon can that has seen rough usage in the removal of a cake of wax. The 12 cakes of wax run about 20 lbs. each. The molding-boxes are, one on top of the extractor, the others at the ends; the one at the left shows the doubly sure box with the extra cleats. Then this wax was all strained through that endless strainer hanging in the center."

"You are all right on the wax question, Rambler; but here is one small cake that is darker than the rest, and it has a peculiar odor."

"I can account for that only from the fact that, in caking a quantity of wax, I shave off the bottom of the cake clear down to the yellow wax; and, by the way, a drawshave is the best tool for that purpose. Next to a drawshave give me a hatchet. When we take all of these shaved portions, and cake them, it is darker than the rest. I believe there is a goodly amount of bee-glue in it. I 'dunno'—do you?"

"Dunno me too, Rambler. Well, I must be off. Real estate is on the boom. I've just

RAMBLER'S WAXWORKS.

bought a choice eighty myself. I will put it all out to alfalfa—several thousand acres more just as good for sale."

"Why, Bro McCubbin, you will be as bad as the old woman, and sail yourself one of these days. You see, this woman put up a notice on her house, 'This place for sail.' A wag saw the notice, and immediately sought the woman, and, said he, 'Ma'am, when does this place sail?' 'It will sail, sir,' said she, 'just as soon as the person comes along who can raise the wind.'"

"Well, Rambler, that's where we must know the difference between sail and sale. But I am like the old woman—ready to sale either way. All that is necessary is the raising of the wind. But I must be off. Get up, pony. So long."

"So long."

Since writing the foregoing, GLEANINGS for April 1st has arrived, wherein the steam and press methods are quite thoroughly presented. From my experience I think better results are attained by pressure under boiling water. Parties in this State have, during the

past three dry seasons, made a business of purchasing old combs, and even old slungum, and have made a good thing from the wax rendered. They used some sort of press under water, and the refuse is put under such pressure that it comes out as hard as a brick, and every particle of wax out of it.

It would be impossible to apply such pressure in the Ferris extractor; but I believe that the pressure, such as it is, should be applied under water. The Ferris should have some sort of faucet on the outlet to enable the can to be partly filled with water. But I am judging much from the old two-basket extractor here, and have no doubt the present improved extractor is the best all-round machine on the market.

COMB 40 YEARS OLD.

BY GEORGE W. ADAMS.

I was much interested in the article on p. 332, 333, on the size of bees from old combs.

One of the best colonies for work I ever saw was put into a hive made by a neighbor, between 1850 and 1853, the swarm being hived the same year. This is not "tradition;" but I think that, with a little trouble, the month and year can be definitely fixed. For over 40 years this colony did good work; but two years ago, the old hive having become badly decayed, they were transferred. I did not hear of it in time to be present, but made careful inquiries, and learned that the comb "was very black," and had very few drone-cells, the owner describing the drone comb as "a patch about as big as my hand only." The old comb was carefully preserved, and I will send you some if you like.

The owner is one of our leading citizens, a man of intelligence, and a close observer and keen reasoner. He is very decided in his opinion that the bees grew no smaller, and now has most of the comb in the new hive. He certainly would not have used it if he had any idea the bees were growing smaller.

I don't believe you will find much older comb where the age can be definitely proved, and this can certainly be done.

South Byfield, Mass., April 25.

[If those are correct who claim that the cells fill up with cocoons, and become so small that the comb ought to be renewed in five, four, or three years, and that it is easy to recognize the smaller size of bees reared in comb ten years old, then bees raised in this forty-year-old comb ought to be pigmies indeed. But they were not perceptibly smaller, and the colony was one of the best. Incidentally it might be observed that the good reputation of the colony was to some extent due to the fact that very little drone comb was present.—ED.]

AN OBJECT-LESSON IN BEES AND GRAPES.

BY J. B. HAINS.

I send a photograph of grapes, part of them punctured and part of them sound, which I placed in the upper story of hives, together with other fruits—peaches, pears, etc.—last summer, by request and co-operation of C. A. Ennis, justice of the peace, and ex-mayor of Bedford. We examined them from time to time as long as they would keep without rotting, and found all that we punctured entirely consumed except stems and skins; while every specimen not punctured was untouched. We placed them in a portico outside the hive, and in a few minutes we discovered yellow-jackets on them. Then we removed them to the inside of the hive to protect them from wild bees, and possibly from birds, which we believed to be the really guilty parties.

Bedford, O.

es they *guess* they make the holes, when we have shown over and over again that bees do not make the holes unless the skin is affected by rotten spots at first invisible to the naked eye.

I wish to call particular attention to the fact that there seems to be *one* large puncture in each grape of the shriveled specimen, and only one. In one or two specimens it will be seen the large hole is made larger by the constant twisting, squirming, and struggling of the bees. In the name of common sense, if bees can do their own puncturing why does not each bee make a hole for itself? But, no; you will see them all struggling at one hole—a hole that has been made previously by some other insect, or, as in this case, by man.

We shall have some of these struck off so that our friends who are met by the statement that bees puncture fruit will be in a position to give ocular proof that they do not; for, as

GRAPES HAND-PUNCTURED, AND AFTERWARD SUCKED DRY BY BEES.

[This is the old, old story. But here is a very good photo, and photos do not lie, showing that sound fruit, when placed right in among the bees, will not be molested, while that which has been punctured by outside agencies they will suck dry; and yet there are some, even among bee-keepers, who insist that bees do puncture peaches. They admit that they have never seen them do it; but from the fact they see them working on the peach-

I understand it, the sound specimens shown in the picture were put right among the bees and left there, with the result that they were untouched. Those that were punctured in the first place, and that had been subsequently sucked dry by the bees, would have been of no value, and therefore no financial loss would have been sustained. It is sound fruit in every case that is of value, and this the bees do not pretend to molest.—Ed.]

HOW SWARMING IS CONDUCTED.

"Here I am, down again to bother you with some more questions."

"Well, what is it this morning, Mr. Brown?"

"You will remember that, when I left you the other day, I went in a hurry because the blowing of the horn told me my bees were swarming."

"Yes, I know you got off about as lively as any fellow I ever saw, except one who has some bees in his hair. You left me without even saying why you were going."

"Well, after I had hived that swarm an old farmer bee-keeper came along and told me that, as only old bees went with the swarm, it was always best to give each swarm a frame of hatching brood on hiving them, so they could have young bees coming on as the old ones died off. Then he told me other strange things, among which was that the young queen emerged from her cell within 24 hours after the swarm left, so the young bees, left behind, would have some one to rule over them before they got wild."

"Did you believe him?"

"Well, hardly; but as I could not answer him to my satisfaction I thought I would run down a little while this morning and see what you thought in the matter."

"Up to within a few years I allowed natural swarms to issue as a means of increase, and have experimented largely during thirty years to know under what conditions swarms issue, as a rule, and have found, as regard to age of bees, that bees of all ages, in about equal proportion, leave the parent hive, from the old forager to the bee that has been out of its cell but a few hours."

"How do you know a bee which is an 'old forager' as you call the old bees?"

"They are very easily told by their lack of hair, darkness of color, and their jagged wings. Did you never look close enough to discover such in your hives?"

"Yes, I have often seen such bees with torn and tattered wings, and have often seen them with the swarm, but I had supposed that something had happened to them."

"There undoubtedly had, but nothing only what is the rule with old field bees during June and July. Very much of our white clover grows with other grasses; and in searching for the honey the bees hit their wings more or less against this other grass, so that, soon after beginning gathering clover honey, the wings of the older bees begin to be torn; for, the older the bee the more easily torn are the wings—very much on the principle that it takes a much less blow to bruise or break the skin on an old person's hands than it did while that person was in youth."

"I see; but how tell the young bees?"

"They are more easily told than the old

ones. Young bees, when they first emerge from their cells, are light-colored, from their being all covered with fine hairs, or down, which wears off and changes color as they grow older. Many and many times have I seen the ground in front of the hive nearly covered with bees so young as to be unable to fly, after the last of the swarm had got in the air, looking so white and feeble that a feeling of sympathy would come over me, and I would try to gather them up and put them back in the hive; but a little watching soon told me that they would all get back themselves, if a proper alighting-board were used so that they could travel back on foot."

"Since you speak of it, it reminds me that I have seen the ground covered with bees in the same way; but I thought that such bees had loaded with honey so heavily that they were unable to carry their load."

"If you had looked more closely you would have noted that they were not loaded nearly so heavily as multitudes with the clustered swarm. I am very sure that bees of all ages go with the swarm, so that each swarm is composed of field bees, wax-workers, and nurse bees, in about equal proportions, this showing that the allwise Creator knew how things should be when he pronounced good all which he had made."

"Then you think that a prime swarm needs no frame of brood to give them young bees?"

"Of course, the young bees from a frame of brood would materially strengthen the swarm; but such strengthening is not necessary; for, had it been, the swarms of our fathers would have perished—yea, and those since the foundation of the world, for no one ever thought of giving brood to prime swarms before the latter half of the last century."

"I guess you are right."

"Well, if you are satisfied on this part, let us suppose we are looking inside of a hive when preparations for swarming are being made, and see if we can not arrive at the truth in the matter as regards the conditions under which swarms issue, when the first queen hatches, etc."

"Can you tell any thing about such things?"

"Certainly; and so can you, if you study these matters. The first indication of swarming is the laying of eggs in the drone-cells. While eggs in drone-cells are not a sure sign that swarms will issue, yet, so far as I have observed, swarms never do issue without eggs laid therein. If the weather is propitious, the next step is the building of queen-cells, soon after which the queen deposits eggs in them. In about three days these eggs hatch into larvae, and said larvae are fed an abundance of food by the nurse-bees for about six days, when the cells containing the embryo queens are sealed over. If no bad weather has intervened, the swarm issues the next day, the old queen going with the swarm."

"Is this always the case?"

"Not always. But this is the rule with the black (or German) bee, and generally with the Italians; still, the Italians often swarm when the eggs are first laid in the queen-cells,

and sometimes without the least preparation at all except for drones, although this last is something very rare indeed."

"You spoke of the swarm issuing on the sealing of the first queen-cell. Surely she could not emerge from the cell 24 hours later, as the bee-keeper told me, could she?"

"All good authorities say that the queen larva remains seven days in the cell, as my experience also proves, and I can not conceive how any could make a mistake of six days, unless the swarm was held back by bad weather for six days from the time the cell was sealed. Should it be possible that any swarm was thus held back, then there might be such a thing as a young queen emerging from her cell 24 hours after the first or prime swarm issued."

"That seems plain."

"Yes. And that you may understand a little further I will say that I have found, as a rule, that the first queen emerges from her cell from six to seven days after the first swarm. If more swarms issue they usually come out two days after, or from the eighth to the tenth day after the first, and never later than the sixteenth day. As soon as the bees decide that no more swarms shall issue, all queens in their cells are destroyed, when in from five to nine days the reigning young queen goes out to meet the drones—two days after which, she commences to lay."

"I think I understand natural swarming much better than ever before, and I'll be going, as I see you are very busy."

STRAINING EXTRACTED HONEY; FOX'S METHOD.

Friend Root:—In reply to your request, p. 240, relative to clarifying honey, I beg to say I am not one of the *large* producers, but will compare my honey with the *largest* or the *best*, and, if agreeable, will give my method of straining and clarifying.

I have six large barrels holding about 600 lbs. each, arranged around my extracting-room on a strong bench, with heads out, and molasses-gates near the bottom. Each barrel is supplied with a *fine* cheese-cloth strainer tied securely over the head. I draw the honey from the extractor into an ordinary water-pail and transmit to these barrels through the strainers. This takes out the minutest specks. It is left in these barrels from one to six weeks according to the time in the season of extracting), when it is drawn off into 60-lb. cans, caps screwed down *tight*, and placed in cases, and securely nailed, ready for shipment. I have practiced this method for the past 18 years, and have never had a *word* of fault found.

A while ago I noticed quite a little in GLEANINGS relative to drones produced by virgin queens and fertile workers. Of course,

all bee-keepers know this to be a fact; but does any one know that such drones are fertile? I have never seen a word in print in regard to it. I am of the opinion that they are no nearer perfect than their mothers.

Hillsboro, Wis., Mar. 25. ELIAS FOX.

[I had the pleasure of meeting Mr. Fox at the last Wisconsin convention. For one who has been so extensively engaged in the business, and who knows so much about bees, he is very modest concerning himself. His method of straining his honey, and allowing it to settle, is not only simple but very effective, if I may judge from the reputation of the Fox honey. Your question in regard to drones is considered on the last page of our little book, the Dzierzon Theory. Since that book was written, others as well as Dzierzon have decided that such drones are virile males.—A. I. R.]

OLD COMBS FOR BROOD-REARING.

I think that, while W. T. Stephenson is sincere in his remarks, careful investigation will show him wherein he errs.

The idea that the cells get too small to raise full-sized bees is as absurd as it is erroneous. I can trace some of the combs in my yard, and in my best colonies, that are over 20 years old, and I do not know how much older. Are those bees any smaller than the other stock? No.

Now, I think there is one fact about bees that neither you nor Mr. Stephenson has observed. Bees, like all other creatures, change their physical condition and get "fat" and "poor" (thin) according to food conditions, and this fattening process does not necessarily enlarge the thorax. In going through my apiary when honey has not been gathered for a month I have often been struck with the thought, "Are my bees degenerating?" they seeming smaller in appearance than usual; but after a week's run of honey I am struck with the thought, "What fine, large, sleek-looking bees they are!"

I think friend Stephenson's bees, when they appeared larger, were working better than when he thought them undersized.

Baptisttown, N. J. W. W. CASE.

[I had not thought of the fact that there are times when bees appear very much smaller than at others; but repeatedly have I noticed that when bees were put into a mailing-cage they look large and beautiful; yet when those same bees have been confined for four or five days, or a week, they would look small and insignificant.

No, I can not believe that Nature has made such an egregious blunder (indeed, she does not make such blunders) that, in the process of time, the bee-cradles will become so small as to dwarf the size of the infants during their period of growth under the coverlet—the capping. I shall be much obliged if you will send me one or two samples of comb which you know to be at least 20 years old. These I shall be pleased to examine closely; and in the mean time I hope you will conduct this experiment: Put one of those 20-year-old combs in a brood-nest, and alongside of it

another comb one year old. Allow each to remain in the brood-nest until they have capped brood almost ready to hatch. At this time put each in a wire-cloth cage in the upper story of a strong colony, shutting out all the bees at the time of caging the combs. Now wait for the bees to hatch out. Keep the bees confined in those combs, and then ask an unprejudiced bee-keeper, who does not know any thing about the controversy, to give his opinion as to which bees are larger, if any. Let us put this matter clear beyond the possibility of guesswork or prejudice. After you have called the attention of various persons to the matter, send samples of each lot of bees in a mailing-cage to me, and at the time of sending these bees mail a card referring me to this issue and this page. We have micrometers with which we can measure to the ten-thousandth part of an inch. I will ask one of our men, who does not know any thing about this controversy, to measure the bees and see if he can detect any difference in the size of the thorax, or waist. I should be pleased to have any others who have any combs that they *know* to be 15 or 20 years old make similar experiments, and then send the bees on to me for measurement. At the time of sending the cages number them, but do not tell which bees are which. If I have any prejudice at all (and I think I have not) I wish to be in position to give the facts just as they are.—ED.]

TAKING ADVANTAGE OF THE SITUATION TO MAKE SALES.

A certain portion of J. C. Wallenmeyer's article on page 189 is open to criticism. If Mr. W. means his advice for just this season only, it does very well for those who actually have a short crop; but one would naturally suppose he meant it for all seasons and all places. You will notice Mr. W. says, "Tell the would-be buyer that the crop is very short, and that you would not have much to sell." I wish to say to Mr. W. that you can't catch birds with chaff. I have been a commercial traveler some six or eight years, and let me tell the bee-keepers the best way is never to misrepresent in order to make a sale. If Mr. W. would tell his customers his crop was short when, in fact, it was not the truth, he is not worthy the name of bee-keeper, saying nothing about being a salesman. AARON SNYDER.

Kingston, N. Y., Mar. 7.

[Mr. Wallenmeyer says:]

The above criticism certainly displays Mr. Snyder's wonderful ability as a sophist in thus construing (or misconstruing rather) such a plain statement as the one referred to. The readers of GLEANINGS can rest assured that the editor would never allow any article containing even the slightest fabrication to enter its columns. In proof whereof I will state I was asked, in 1895, by the editor to submit an article on making and selling honey lemonade at fairs. The same was rejected because I advocated the use of "large, heavy, 10-oz. thick-bottom glasses." Mr. Snyder has simply set up a "man of straw" and administered

"knock-out drops." Is there not a short crop in every State in the Union (except two) *this year*? Is not the article written for the present time? and does any one suppose it would stiffen prices, or increase the tendency to buy, if you inform the "would-be buyer" you have 5 *lons* of honey? If I have a large crop I keep mum; if a small crop, I use that information to advantage. J. C. WALLENMEYER.

Evansville, Ind., Mar. 20.

[I think Mr. Snyder, in view of Mr. Wallenmeyer's statement, will be very ready to acquit Mr. W. of any misrepresentation. Certainly we have a right, when the crop is short, to make as much of a handle of the fact as possible, and a bee-keeper would be a fool if he didn't. When there has been a short crop the price *ought* to be higher, and the only way to get it higher is to impress on the consuming public that what little there is must be sold at an advanced price.—ED.]

SWARMING WITH DEEP FRAMES.

My experience with the Jumbo hive last season was exactly the same as Dr. C. C. Miller's. My first swarm came from one of those hives. I have two of these hives I made myself. The only difference is, I made them eight frame instead of ten. Neither of them gave me any surplus. I experimented with two Dovetailed hives, one on top of the other, last season, with good results, one of them giving me 66 lbs. of comb honey.

Mineral Springs, O. J. L. ELDRIDGE.

[Evidently it is not an easy matter to draw definite conclusions where results seem so contradictory. Possibly, advocates of large hives might say something like this: "Your eight frames with increased depth still left your hive quite too small to prevent swarming; for your hive was only about the same size as a ten-frame hive with the regular Langstroth frame. If you have a hive small enough, it will be difficult to get the colony strong enough to swarm; and this hive, being a little larger than the other eight-frame hives, allowed a stronger colony to winter in it, thus being sooner ready to swarm. If you want a hive large enough to prevent swarming it must be still larger."

If two stories did better than one, it is hard to see any reason why a hive having a capacity between the two would not be better than the one-story hive.—ED.]

A REMEDY FOR FERTILE WORKERS.

Last spring I found one colony queenless, and with one or more laying workers. I read all I could find on the subject, hunted for the pests, gave the colony frames of brood, young larvæ, and eggs, from other colonies, and also those containing queen-cells, but got only drones, drones, drones.

On June 19th I found an after-swarm bunched on a tree, and, not knowing where they came from, I removed the cover from the queenless colony's hive, turned up one corner of the quilt, exposing space between frames about equal to a hive-entrance, placed an

empty hive - body (without frames) on top thereof, and shook the after-swarm therein. Result—in two days the bees were all in the queenless hive—no fighting—removed empty body, and put on super. Later I took off 20 lbs. of surplus, and put a good colony away for wintering.

W. H. REED.

Canton, Minn., March 28.

[Shaking large bunches of bees from a strong colony into a hive of fertile workers would have practically the same effect. This can be done at any time here.—ED.]

BEEES AND GRAPES.

In your footnote on the above caption in *Beginners' Questions*, page 244, March 15, you offer the clearest and strongest evidence in exoneration of bees that I have ever seen. Let me quote: "Now, to convince yourself that bees do not make fresh incisions, I would call attention to the fact that three or four, yes, five or six, will be circling around one hole, sometimes standing on top of each other, all running their tongues down into the same hole. If they could make fresh incisions they would not crowd and jostle each other as they do; but each bee would make for itself a hole where it could work without being hampered in its efforts to extract the juices."

If any "candid man" will take pains to observe the operation to which you call attention he will surely be convinced that the bees are not guilty of puncturing grapes. The trouble is, people are so apt to jump at conclusions without sufficient (or any) investigation.

Birds, nearly all kinds, but especially English sparrows (and are they not found everywhere?) are the guilty parties. With us, catbirds and robins do a good deal of mischief, but they give us in return some very sweet music, while the English sparrow has no redeeming qualities at all. Better devote them to destruction, and protect the innocent bees.

JOHN T. SILER.

Berkeley Springs, W. Va.

OUR PREMIUM QUEENS, HUSTLERS.

Mr. Root:—You will remember my telling you last summer that one of my premium queens was superseded. The young queen proves to be an exact duplicate of her mother. I was looking the hive over to-day, and found brood in every one of the eight frames, every available cell being occupied, and without any spreading of brood, and plenty of bees to begin business in an upper story, which I added. I would not take five dollars for her to-day. She and her bees are "hustlers." They are all three-banded, yet slightly on the leather-color order.

ELIAS FOX.

Hillsboro, Wis., May 4.

THE ECONOMY IN THE USE OF A WAX-PRESS.

Your articles and illustration on the Hatch-Gemmill press, I think, are the best that have ever appeared in your journal. Six

years ago I rendered 100 lbs. of clean wax from 300 old and promiscuous combs. I pressed the wax out on a cider-press. Shortly afterward the question was asked in *GLEANINGS*, "How many Langstroth combs does it take to make 1 lb. of wax?" As nearly as I can remember, your correspondents made 1 lb. of wax from five to eight combs. I then was satisfied that they did not press their refuse, or made a very bungling job of it. I think the Hatch-Gemmill press is altogether the best and cheapest apparatus made for securing the largest quantity of clear beeswax.

West Bend, Wis.

H. P. AHLERS.

PROPORTION OF WAX OUT OF OLD COMBS.

From 15 lbs. of comb out of box hives I made 8 lbs. of wax; and from 8½ lbs. of refuse (out of which a neighbor had taken all the wax he could get) I secured 1¾ lbs. of beeswax. If the editor would like to see samples of wax and refuse I will send them to him free by mail. I do not know how old the combs in box hives were. The man who brought the combs to me got them when his father died in 1897, and his father kept bees for many years. I have been in the bee business nearly ten years, and I haven't any combs as heavy and black with cocoons as those were.

St. Anns, Ont.

HERBERT TREAS.

[You do not say how you rendered this wax; but I would assume that you used a press of some kind.—ED.]

UNITING BEES WITH PEPPERMINT.

Old bee-keepers will smile, I dare say, when they read how I unite two colonies. I just remove the cover from each hive, pour in a few drops of peppermint essence, cover up for 15 minutes, then remove the cover from the one I want vacated, and set the other on top; then I find them all in the upper hive in two or three days, and no dead bees.

Davenport, N. Y.

E. E. STEBBINS.

[But if I am correct old bee-keepers seldom have trouble in uniting, even without the peppermint. If there is any trouble, or liable to be, smoke will answer as well.—ED.]

C. W. C., Iowa.—Glucose is a very poor food for bees, and it is very seldom they will take it. It would be better and cheaper for you to give them sugar syrup, as described on page 28 of our catalog. There is more nutrient in syrup made from granulated sugar, for the money, than any glucose made, no matter what the price may be.

C. C., N. Y.—You ask how you can tell whether your box-hive colony is queenless; and, unless you are a pretty expert bee-keep-

er, you can not tell ; but you could do this : Turn the hive upside down, and then smoke down between the combs. If you can not see any capped brood, then the colony is possibly queenless. The better way would be to transfer this colony into a modern hive with movable frames. For particulars see our A B C of Bee Culture.

R. C., Mich.—In reply to yours of April 29 I would state that, in my opinion, you did not have foul brood, especially if the dead larvæ were white. This would likely be a case of chilled or overheated brood, or possibly poisoning. I should hardly suppose that the onion pollen would be detrimental ; if so, it would be the first case of which we have ever heard. Bees have been kept within the vicinity of onion-farms for many years, without any bad effect.

A. J. B., Texas.—I do not quite understand your question ; but if you mean that the bees cluster out too much in front of your hives, and you desire to get them to work, we would advise you to see that such hives are properly shaded, and that they be also given a good wide entrance—one inch deep at least, by the full width of the hive. It is sometimes a good practice to lift the hive clear off from the bottom-board, and put between the four corners of the hive and bottom-board a block $\frac{7}{8}$ inch thick, thus raising the hive $\frac{7}{8}$ inch higher on the bottom-board than it was before. This would make the hive cooler, so the bees will go in.

G. W., Fla.—Bee-paralysis is a disease that is very hard to cure. I would advise you to take all colonies that are thus affected and move them at least a mile and a half from the healthy bees. Remove the queen from each of the affected colonies, and give them a virgin from some healthy stock. If you have the bees to spare, and have only two or three diseased colonies, unite a healthy stock with every diseased one. The healthy bees will carry off the dead and dying, and in time may possibly effect a cure. But bee-paralysis is a very stubborn disease, and you should by all means get the affected bees away. For further particulars, see Diseases of Bees, in the A B C of Bee Culture.

W. T. G., Ohio.—To kill ants we do not mix any thing in molasses, as whatever is poisonous to the ant would be poisonous, also, to the bees. The method of destroying ants, recommended in GLEANINGS, is this: Find the nest, and, with a crowbar, make a hole right through the center of the hill, about a foot deep. Pour into this a teaspoonful of bisulphide of carbon, and then stop the hole with a plug of earth or sod. It is the gas permeating the galleries of the nest, that does the destructive work. This chemical you can get at the drugstore. A ten-cent bottleful will destroy a dozen ant-holes. If you can not get the bisulphide of carbon, use gasoline or coal oil ; but in that case use a larger quantity, perhaps a gill ; but the bisulphide of carbon is the best, for it destroys the ants, eggs, and every inmate of the nest. Be careful in handling this drug, and do not get it near the

fire, as it is very explosive. It should not be stored in a building where there is likely to be a lighted lamp.

ON THE USE OF VEILS IN THE APIARY.

R. C. M., Fla.—It is evident that you do not understand the position of ourselves and Dr. Miller. The writer very seldom puts on a veil when he goes out among the bees. There are only a very few of our colonies that will offer an attack ; but in the production of comb and extracted honey, a great many bee-keepers believe that a cross between the blacks and Italians is superior. Such bees are much crosser than the pure yellow stocks direct from Italy. It is always better, in such cases, to wear a veil, as one can work more rapidly, and with more comfort. But any one of these bee-keepers may work among the bees without smoke and without veil, and for hours and for days, sometimes, at a time ; and when bees are working strong in the fields it is sometimes a common practice to lift the veil up, and pull it down only when an obstreperous colony is encountered.

P. T., Iowa.—1. I can not explain why bees sometimes die in the hives, leaving plenty of good stores. As a general thing we may say the cause is too much cold or lack of protection. Sometimes a colony will eat all the food around it, or around the cluster, rather ; and, if the weather continues cold, they are not able to move the cluster over to the food, and, as a consequence, starve to death.

2. Moth-worms do not trouble strong colonies in modern apiaries. If you use modern hives with a dash of Italian blood in the bees, you will not be troubled with moth-worms.

3. Bees do not die for want of bee-bread in winter.

4. A good judge can not tell by the looks of a queen whether it is a good or poor one, although an experienced man can often tell an old queen from a young one. We can, however, very often judge of a queen by a glance at the comb that she has been laying in.

5. Queens often die without leaving a young queen. In that case the bees usually rear cells from eggs or larvæ left by the old queen.

6. Artificial swarming pays under some circumstances, but not when one desires to produce comb or extracted honey, and does not care for increase.

7. Yes, one can feed common sugar syrup—that made from granulated sugar is best.

8. There are some localities in the United States where bees do not have to be fed, as a rule ; but any locality is liable some years to have a scarcity of honey. In such a case the bees require to be fed.

9. As to the different kinds of honey-bees I would name a few of the most prominent : Blacks, Carniolans, Syrians, Cyprians, Holy Land, Tunisians, Egyptians, Italians.

10. The sugar honey, so called, tastes a little different from real honey from the fields ; but sugar honey must not be put on the market as honey, nor is it profitable to produce it. The nectar from the fields costs nothing, while the sugar itself does cost something.

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchison, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chappinville, N. Y.; J. M. Hambaugh, Escudido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marenco, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

LET us not forget that the Italian bees seem to resist the attacks of black brood very much better than the native stock. Better make an effort to supplant the blacks by the yellows.

ON THE FLY.

As you will see, I am "outing" it among bee-keepers of the great South and West; and while on the fly I am trying this editing business "at long range," a la Hill. And speaking of *hills* reminds me that it is rather up-hill business writing copy with a pencil on my grip, and grip on my slippery lap. Then when the train at a 40-mile speed jerks and lunges this way and that, my copy is more horrible than can be explained.

HONEY-PLANTS BY THE MILE.

I HAVE been riding all day in Texas at the rate of 40 miles per hour, and yet I can't get out of sight of some of the great honey-plants of the State. First and foremost for quality and quantity is the guajilla, pronounced *wawhea*. The honey from this, so they tell me, is literally water-white. Next is the cat-claw, a low tree that looks like the northern thornapple. The honey from this is very fine and white. The mesquite is another honey-tree that looks like our willows at a distance. It furnishes a sort of amber honey, and would rank favorably with any Northern amber. But I'll tell more about these plants later.

A BEE-KEEPER'S PARADISE.

En route to El Paso.—I have just come from a county about 40 miles square that has more bee-keepers to the square mile than any other locality of its size I ever visited. The inhabitants talk bees at the hotels, on the streets, and everywhere, just as farmers talk crops and business in the North. This county produces more honey than any equal area, I believe, in the United States. Some say that its yearly output is a *whole trainload of honey*; but many aver that this is too low, and that two whole trainloads would come nearer the truth. Of course this great amount doesn't go all in one lot, but in large and small shipments.

The average per colony is high, and there

is a honey crop every season. It is estimated that in this one county, outside of the towns, nearly one-half the population are bee-keepers.

The great bulk of the honey is of the very finest, and some of it is literally water-white. There are thousands and thousands of acres of honey-plants on cheap land; and bees—there are not enough to gather it all.

The bees commence swarming early in the spring; and, *when the main honey-flows commence, actually stop swarming*, destroy cells, kill off the drones, and commence business. Did you ever hear the like of it before? You say, "No, and no one else." Well, I think I can prove every statement; but for the present I am not at liberty to give the place or other details; but very shortly I'll tell the whole story, with some fine pictures.

LONG-TONGUED BEES FOR THE SOUTH.

DURING my short visit through Texas I have run across two prominent honey-plants that have deep flower-tubes; viz., horsemint and the buffalo clover. Either one has longer tubes than those of the red clover of the North. If long tongues are an advantage on red clover, they certainly would be on the plants above named. Nearly all of the small bell-shaped flowers of the Southland (and there are myriads of them) have long tubes. Mr. Doolittle's implied assumption, or one he apparently tries to bolster up, viz., that long tongues would amount to nothing in the South and a large part of the North, simply because they have no red clover, seems to one who is making a tour of five or six thousand miles through the greatest bee sections in the United States as a little queer. If long tongues are an advantage to the bees in getting the nectar in deep flower-tubes (and I have not yet positively affirmed that they were) then the great Southland (and it is truly great), and the whole of the north country, so far as bee-keeping is concerned, will have made one step forward.

FOUL BROOD IN MICHIGAN.

The following from Geo. E. Hilton, the man who, more than any one else, got the Michigan foul-brood bill passed, will explain itself:

To the bee-keepers of Michigan.—So many letters are coming to me regarding the foul-brood law in Michigan that I will try through the journals to answer in a general way, and save myself valuable time at this hurrying time of year.

First, the law is in operation to-day, the inspector is appointed, and I feel very much relieved. I have made four trips to Lansing in behalf of the measure, and it required all the influence myself and others could bring to bear to secure its passage, its importance was so little understood. I have paid out about \$50.00 in expenses, to say nothing of the time I have donated, which would amount to as much more. And now I want the bee-keepers of the State to take advantage of and receive the benefits that may come from our efforts and the bill. I went to Lansing last week, spending a portion of three days, and succeeded in having John M. Rankin, our State Apiarist, appointed as our inspector, and I know of no one who can better attend to the work, or who is more worthy of the position. The work is under the management of the State Dairy and Food Commissioner, Hon. W. B. Snow, Lansing, Mich., to whom all communica-

tions should be sent. He is in direct communication with the Agricultural College, and will inform Mr. Rankin what is expected of him. We have but \$500 to use this season; but as the necessity of the work becomes apparent we shall be able to get more. The disease has an alarming foothold in our State, and it behooves every bee-keeper here to do his whole duty in assisting to exterminate this dread malady.

Trusting the above will make every thing plain, and save me many personal letters, I am

Very respectfully yours,

May 20.

GEO. E. HILTON,

Pres. Mich. State Bee-keepers' Ass'n.

Just after the above was put in type we received the following:

To the bee-keepers of Michigan.—I take this method of informing the bee-keepers concerning a few points in regard to the Michigan foul-brood law. A locality must be reported to the Dairy and Food Commissioner, Lansing, before it can be inspected; and as our funds are limited it would be a great saving if the bee-keepers would work with the Inspector by reporting all localities where foul brood exists, or where it is thought to exist, as soon as possible. If this is done it will enable the Inspector to plan a trip through the State, and cover the whole territory to be inspected at a much smaller traveling expense. Localities first reported will receive first attention; and those who neglect to report their localities until late will, in all probability, be obliged to wait until next year for assistance. J. M. RANKIN.

COST OF DRONE COMB.

PROBABLY the majority of bee-keepers discourage the presence of much drone comb. Just as probably the majority have a good deal more drone comb than is profitable. The bee-keeper who has supplied his bees with full sheets of worker foundation is not safe for all future time. Here and there a mouse will nibble a hole in a comb in winter, and by one means and another there will be holes that the bees must fill in, which holes will almost invariably be filled with drone comb. If no attention is paid to the matter this will increase from year to year, but the bee-keeper perhaps gives it little thought. If his attention is called to it, he will say, "Yes, there is some drone comb in most of my hives that have comb of any age, but it doesn't amount to much. There isn't an average in each hive of more than enough to fill a pound section."

Let us figure up the cost of a piece of drone comb of that size—4 inches square, or 16 square inches. Counting 18 cells to the square inch, or 36 for the two sides, 16 square inches will contain 576 drone-cells. Suppose only one brood of drones is reared, and that each drone lives 60 days: what will be the cost of those 576 drones? Taking the estimate that it costs .0141 oz. of honey to rear a drone, and that it consumes .00635 ounce of honey daily, it will consume in 60 days .881 oz. of honey, which, added to the cost of rearing, makes .3951 oz. of honey that each drone costs. Multiply this by 576, and you have 227.5776 oz., or 14.2236 lbs. of honey that it has cost to rear and support the drones from that piece of comb the size of a pound section.

"But," you say, "I don't stand all that expense, for I slice off the heads of the sealed brood every time I go over them, so I stand only the trifle that it costs to rear them."

Suppose we figure on that. Multiply .0141 by 576, and you have 8.1216 oz. of honey that each slicing has cost you. Remember that this cost has occurred before the cells are

sealed; and as fast as you slice off the heads of the brood a fresh lot will be started so long as there is a moderate degree of storing. Suppose you begin slicing June 1, and slice every two weeks, making the last slicing July 13. That will make four times, costing you a trifle more than 2 lbs. Don't you believe you could go over 25 colonies in a day, cutting out the drone comb and putting patches of worker comb in place thereof? That would give you a payment of 50 lbs. of honey for the day's work, to say nothing of the saving in future years. *Cut out the drone comb.*

DEEP FLOWER-TUBES — ARE THEY CONFINED TO RED CLOVER?

THE matter of the depth of the flower-tubes of honey-plants is an unexplored region. We know that red clover secretes a large amount of nectar, and we know that the tubes are too deep for the tongues of hive bees in general. That is about as far as our knowledge about deep flower-tubes goes. Without having made any investigation, there has come to be a general belief among bee-keepers that might be formulated in a few words: "All honey-plants have flower-tubes of such depth that bees can get all the nectar from them with the single exception of red clover." Red clover is set off in a class all by itself. Why is that belief so general? What ground is there for it?

Suppose one lived on a barren rock, who knew nothing of the vegetable world except by reading, and were told that some specimens of the vegetable kingdom grow to a height of 100 feet, and some are but an inch in height. Would he at once conclude that every plant less than 100 feet is only an inch high? Would he not be more likely to think that there might be specimens at different heights all the way from an inch to 100 feet? Why should he not judge the same way about flower-tubes?

We know there are flower-tubes within easy reach of bees, and we know of at least one kind beyond their reach. Why should we not expect to find every shade of length between the two?

These thoughts were suggested by the following, from Dr. C. S. Phillips, Waco, Texas, in *Southland Queen*:

At this writing they are bringing in some honey from primrose. The country is a beautiful carpet of it. We have examined it, and find that it secretes a great deal of nectar; but the shank is long, and the bees' tongues are too short to get much. So you see we need long-tongued bees.

In this case it seems that a large quantity of nectar is secreted, but the bees can reach only a portion of it. Is there any reason to believe that such honey-plants are confined to Waco, Texas? Is it not possible that there may be in most places, if not everywhere, some honey-plants with flower-tubes entirely beyond the reach of ordinary tongues, some with such tubes that only a small part of the nectar can be obtained, some in which occasional tubes are too deep, and some from which all the nectar can be easily gathered?

It would be unwise to make dogmatic assertions; but there may be nothing criminal in

asking the question, "Are you sure that the value of long tongues for red clover may not be less than their value for other plants?"

CLIPPING QUEENS' WINGS; WHY AND HOW.

ARE the queens all clipped? If not, why not? It's an advantage, particularly where bees are kept in thickly settled localities. Sometimes neighbors object to having the bee-keeper enter their premises when in pursuit of his bees. While he may lawfully pursue them, it will preserve better feelings if he has not go to do it.

HOW TO CLIP.

There are various good methods. A friend in New York says his hands are calloused, and it would not be safe for him to depend on the sensitiveness of his finger-tips to hold a queen by the thorax; so he picks her up by the wings with the left hand (thumb and fore finger); her majesty's wings are then in just such position as to be easily severed by a sharp knife, drawing it over the tip of thumb or fore finger, whichever way is handiest, letting her drop back on the comb or on the exposed frames.

By this method both or all wings are apt to be cut, and this friend cuts them quite closely, which has the advantage that such clipped queens can afterward much easier be found, having a snake-like appearance.

Another New York friend practices a different method. He picks up a queen by her wings as in the other case, but with his right hand, letting her grasp the thumb of his left hand with her feet. He then brings the tips of thumb and fore finger together vise-like, thus fastening or holding the queen by her feet. He then releases the wings and proceeds to cut any one wing or all of them, as he prefers, with a pair of scissors.

The writer has clipped a queen "on a run," sometimes; i. e., without holding her at all, simply by carefully lifting up one of her wings with one blade of a pair of scissors, and dropping it right there and then, while she was on the comb among her attendants.

When one practices clipping for a series of years he will be surprised how many colonies he will come across that have changed queens unbeknown to him. Half of the queens reared in 1899 were found superseded this spring in a large apiary in New York. We have had a similar experience in our yards. Unless a queen has been clipped, one can not be sure of her identity.

DR. MARTIN AND PAPER-COVERED HIVE-COVERS.

I AM pleased to introduce to our readers Dr. Martin, of Mercersburg, Pa. He is a bee-keeper who has been using paper-covered hive-covers for a good many years. One of these he sends that he has had in continuous use for 12 years. Although the paper is sound and good, some of the boards under it had rotted out. The paper he used in this case is what is known on the market as Neponset red-rope roofing-paper.

The secret of making this or any paper answer for covers, according to Dr. Martin, is cleating the cover all around where the paper is folded in such a way that the edges can not be torn up. On top are driven some large-headed tacks with washers. If such a cover

DR. G. M. MARTIN.

is thoroughly painted, at the start, and no sharp instrument is allowed to come in contact with the paper, it will probably last almost indefinitely.

A feature of the paper that is important is that it will take up a large quantity of linseed oil, and therefore paint applied to it will hang to it much more tenaciously than it would to the same surface of metal, or even of wood.

In the annexed engraving I present a sample of a cover made on Dr. Martin's plan. It is nothing more nor less than a flat cover made of one, two, or three pieces cleated all around at the ends and sides, as shown. Such a cover may also be made double (we have made them) that is, of two thicknesses, separated by quarter-inch strips of wood, dead-air spaces between, and then the whole covered with paper. I should imagine such a cover would be just the thing to suit another doctor, the M. D. at Marengo, Ill.

SWARMING PROBLEM SOLVED; THE INFLUENCE OF LOCALITY.

THIS trip, in many ways, has so far been a revelation and a surprise. More than ever I am impressed with the influence of locality. Some of the teachings in the ordinary standard text-books, viewed from the standpoint of some portions of this great, *great* country, seem more like idle tales than a sober statement of truth. Bees do many strange things in the "wild and woolly West" that they were never known to do down east. For example, what bee-keeper in the northern and eastern parts of our country ever knew his bees to commence swarming *before* the actual honey-flow, and then, when it did come on in real earnest, kill off their drones, destroy their cells—in short, stop swarming altogether, and get down to real business? Yet that is just what the bees in Uvalde Co., Texas, and Maricopa Co., Arizona, *do* do.

When Mr. D. M. Edwards, of Uvalde, Texas, told me of this as if it were a common trait among bees generally, I thought I misunderstood him. Said I, "Tell me that over again," and then he went on more elaborately to explain the same proposition. "Why," I exclaimed, with eyes all amazement, as if it were some sleight-of-hand trick, "tell me *how* you do it. I'd like to get hold of that trick," and I whipped out my note-book.

"No trick at all," he replied. "That's the way bees do down here."

"Wh-a-t?" I said. "How accommodating! Why, we poor fellows up north have been bothering our heads over this vexed and unsolved problem for years; and it is no nearer solution with us now than when we began. So it is literally true that you are not bothered with swarming when honey is coming in quite strong?"

He assured me for the third time that it was the fact. It appears that the early bloom yields just enough honey to stir up thoughts of increase among the bees, and then they swarm. When the heavy yields from mesquite, catclaw, and guajilla (pronounced *waw-hea*) come on, the bees conclude that they must quit their foolishness, and get down to business, which they do in two or three days, for they do not stop the swarming immediately. At this time it is not necessary to keep a man in the outyards longer.

When I got into Arizona I explained this queer phenomenon to the bee-keepers there, and was met with the calm statement that their bees were just as accommodating for them, "and," said they, "there's a lot more things in your text-books that won't work here at all;" and before I left the Territory I was convinced that they were right.

A good bee-keeper from the North, until he can unlearn some things and learn new ones, when he comes into these regions he is almost sure to meet with failure for the first year; and before he "gets on to" the Western notions, newly acquired, of *the very bees he brought south*, he is apt to be a sadder man, even if he is not a wiser one; and he is generally both before very long.

There is many another strange thing that I

have picked up that I will tell about in future issues; but for the present I must stop pushing my pencil, as the beautiful climate of Los Angeles that I have dreamed about these many moons is inviting me out—and, hark! I hear the footsteps of a bee-keeper just outside of my door. I gladly go to take in new sights, new beauties, and, perhaps, new and strange things.

RUNNING OUT-APIARIES FOR COMB HONEY.

THE principal difficulty in running out-apiaries for comb honey lies in the tendency of the colonies to swarm. This tendency is much stronger than when running for extracted honey. The greater amount of room, and the empty comb given the latter, seems to satisfy. Colonies run for comb honey must necessarily be crowded to produce best results, and swarms are likely to follow.

If we produce comb honey instead of extracted, as has been recommended, the apiarist must be prepared to meet the difficulty, and it will pay him to re-read the articles that have lately appeared on this subject in these columns.

It seems quite a number of bee-keepers in different parts of the land have hit on nearly the same method, unbeknown to each other, although, as Stachelhausen says, Gravenhorst, of Germany, was probably the first one who brought the method to a system and had it published. Gravenhorst's original management was, in brief, to draw on the weaker colonies for brood to make the already good colonies stronger; finally brush them from their combs, and give them empty hives. The gained brood-combs were used to make the next strongest colonies as populous as possible when they were brushed off also, etc. With a long continuous honey-flow this system may be all right, but *not so* with a honey-flow of short duration. As many colonies as possible should be brought into that prosperous condition, when they may be brushed off at one and the same time, and that time is at the beginning of the main honey-flow.

By the way, this method of brushing the bees from their combs, and putting them into empty hives (small brood-chamber) is a most excellent plan to treat such colonies as sulk or refuse to work in the sections. It seems to bring them to their senses.

Young swarms are nearly always fed for a few days after hiving, by the bee-keepers in Germany. We believe it is a good practice, particularly should it be rainy for a few days. Brushed swarms would come under the same head.

REPORTS that come from across the sea, from time to time, of bee-keepers' associations numbered not only by the hundred but by the thousands, make one wonder why in this regard the bee-keepers of this country should be so far behind. However, it is well to look on the bright side; and it is encouraging to know that there never was a time when the prospect was so encouraging for a large membership in the National Bee-keepers' Association. If not already a member, by all means send in your dollar.

What doest thou here, Elijah?—I. KINGS 19:13.

I pray not that thou shouldst take them out of the world, but that thou shouldst keep them from the evil.—JOHN 17:15.

I become discouraged sometimes. Several times of late I have had a longing to go away off to some other country. Yes, I have been so disheartened and discouraged that I have felt like saying to some of the people (I was going to say *good* people, but I guess I do not mean that), "If you are absolutely determined to have whisky, tobacco, gambling, and drinks all about you on every corner, I think we who love righteousness and hate iniquity had better go away by ourselves, and let you have things as you like them, without hindrance or restraint." And then I reflect that such things *have* been tried. People have gone off by themselves. They have put fences up, so to speak, to keep out the evil. But Satan gets through or over any fence that was ever constructed. The Christian people at Lakeside had quite a community where they could go and rest on the shore of the lake in their summer cottages; and that whole ground was under such strict police regulations that there was no profanity, no tobacco. They used to say with pride that no one could buy a cigar on the grounds. But pretty soon a fellow opened a cigar-stand on the other side of the fence, and did quite a trade by passing the cigars through the pickets and taking back the dimes and nickels. There *was* somebody who *wanted* cigars, even in that Christian institution. I do not know how it is going to be this summer, whether they will keep out the tobacco and such things or not. I hope they will not be weary in battling for purity and temperance, and I for one shall be glad to help them. Our own place of business is in many respects a model establishment. People come here and look us over, and sometimes they thank God for the privilege of even *looking* over a place managed with so much system and thoughtfulness for the wants and comforts of the employees. And yet sometimes I become impatient because things do not go on everywhere exactly after my fashion. May be I had better say after the *old* fashion. I hope the younger members of the firm will forgive me for just hinting at some of the things that are not just as *I* would have them—mind you, I do not *say* just as they *ought* to be, but because they are, perhaps, not just according to *my* notions.

It is customary of late for most periodicals to club with others; and publishers of magazines have been striving to outdo each other in their liberal efforts. Well, once when I came home from my travels I found the boys had remodeled the list of periodicals I recommended—yes, they had made startling offers to include some other periodical for the price of our own, or a little more than that. I remonstrated something like this:

"But, look here, boys; you have given great prominence to some periodicals that I do not consider at all standard, and some that I would hardly dare to recommend as home papers. Again, you have left out from your list entirely some of the agricultural papers that I read and endorse from beginning to end, week after week."

The reply was that they had made big offers on A, B, and C because they furnish them to *us* for premiums at an *exceedingly* low price, and that my favorite periodical was left out because it cost so much money.

There, friends, you see one of the prevailing errors of the present age. Even in the agricultural papers the cheapest is not the best by any means. No doubt merchants advertise certain goods extensively because they buy them cheap and can offer them at a low price and still *make money*, and so the regular standard goods (the *best* goods) are left in the background.

"But," said one of the boys, "what is your objection to *this* periodical?"

Then he unfolded its pages, showing me the pictures, clear print, etc.

"Is not that a nice paper? and is it not worthy of all the praise we give it?"

"Yes, boys, it is a nice-*looking* paper; but it contains articles on the cultivation of tobacco—tells young farmers all how to do it, *so as to make money*, without a single word in its pages in regard to the *terrible evils* that tobacco is bringing on us."

If I remember correctly, some of the boys laughed; but I think one of them said something like this:

"Why, father, you must not be so critical. It is a part of the business of an agricultural paper to tell how to grow all kinds of crops; and there is a great difference of opinion, you know, in regard to the use of tobacco."*

I presume he might have added, truthfully, that the majority of people—at least the majority of *men*, believe in tobacco, both in practice and theory.

"But, boys, *you* don't, any of you, believe in tobacco, either in practice or theory; and the paper I should have put at the head of the list, especially so far as recommending it as a *home paper*, you have not mentioned at all, just because it costs a little more money than the other." Now, I am going to speak right out in meeting just here, and say that the *Rural New-Yorker* will have nothing to do with the cultivation of tobacco; and, not only that, puts in wholesome cautions against things of this kind in almost every issue. I may be wrong in saying that the *Rural* is the *only* agricultural periodical that takes this stand. The Philadelphia *Farm Journal* comes pretty near it, and it is one of the cheap papers too. May God reward the publishers of these home papers, even if the farming people of our broad land do forget sometimes to give them

* At one time when this matter was up, one of the firm said, "Here is another thing: This paper you object to gives us more inquiries in response to our advertisement than any other one on the list." Then he picked up a record-book on a desk near by, that showed just how many inquiries each one of our advertising periodicals had brought in.

the encouragement they deserve in doing right.

Now, lest you think I am finding fault with the boys, let me say right here they always say, "Why, father, you go ahead and recommend any paper you think deserves encouraging words, and offer it to your readers at any price you choose." Our business is now getting to be so large that certain lines sometimes are neglected; and any one who notices the neglect sometimes takes the matter up, may be without inquiring about it of the one who formerly had it in hand.

This matter of periodicals is only one of several things that are not managed exactly as I would manage them if I had the strength of mind and body to take a bird's-eye view of *every thing* as I used to do years ago, but, as I have said or hinted, their way *may* be as near right, all things considered, as mine. Sometimes when I am very tired I begin to feel that, inasmuch as things will eventually fall into other hands, I had better not worry. And, again, it occurs to me that may be things might, in some respects, get on better if I were to go away, say to my Michigan ranch, and let the younger ones manage until they learn by experience, just as I have done.

Mrs. Root has sometimes asked, "Why can't the good people of a country have a nation of their own where they can put good men into office, and have the laws enforced, and keep entirely out those who love *only* iniquity?"

In the first place, dear friends, the very iniquity you seek in this way to avoid will very soon crop out in your own heart, especially when you get the idea in your head that, if you were alone on an island, like Robinson Crusoe, it would be an easy matter to have every thing pure and lovely. Jesus tells us in his own words, in the last text I have quoted, that it is not his will that we should retire from the world. I think he wants us planted here and there amid sin and crime, even though at times it does almost overpower us. A dear brother away off in California sends me a bright and encouraging letter which I wish to bring in right here:

Friend Root.—Long have I appreciated your efforts to make your journal a Christianizing influence in the homes of the bee-keepers of this country; but your article, "Traffic in Girls," which wife read to us last night, has stirred me up to do at once what I have long desired to do—that is, write and tell you about it. I feel like giving you all the help and encouragement I can; but all I know to do now is by way of offering a few suggestions.

In those cases of stealing, I fear you did not lay the ax at the root of covetousness as you might have done. It seems to me that no man will be in much danger of being robbed in the way you speak of if he lays up his treasures in heaven, and not upon the earth, as the Lord taught us to do. Was it not covetousness in one man that led him to hide his treasure? and covetousness in other men that led them to steal it? Had the good man spent his surplus time and money in a loving and faithful effort to convert those around him, might not the very ones that stole his money have been converted, and have become a blessing to society, instead of a curse? Or, perchance, it was the covetousness of this or some other man who stood high in the church, it may be, that was one of the causes that drove those men into a life of crime.

But, be this as it may, is it not true that a pure and united church is the only remedy for all these horrible evils of which you so justly complain? Our blessed Lord prayed for the unity of Christians that the world

might believe. To be united to each other, we must be united to God through Christ our Lord, the source of all power, to convert the world around us. Now, it seems to me that covetousness and other sins tolerated in the church prevent the unity, damage the salt, dim the light, and hinder the conquest of the world; and so much so that many seem disposed to abandon the church as the means to this end, and a multitude of societies have sprung up that propose to do the work that the church was designed of God to do; while many, like yourself, feel that the strong arm of the law should be invoked to arrest the tide of evil which the church seems powerless to contend with.

But, my dear brother, should not the child of God appeal to the Father rather than to the arm of flesh for help against the enemy of all righteousness? God is the author of all good, our refuge from the storm, the source of our strength, and should we not honor him before the people by looking to him in every time of need? Is not the church God's great life-boat? and is not the law for putting it in repair in all our homes? Should we not then repair it, launch it, and come to the rescue of a lost, ruined, and suffering world? Christian homes will save the girls. But while Christian evangelists have degenerated into professional revivalists, parents turn over the religious training of the children to the Sunday-school, and Christians are not united to one another in Christ their head, can we hope for much improvement in this poor sin-cursed world of ours?

Yours for a united church and a faithful membership,
H. H. HAWLEY.

Madera, Cal., May 24.

Amen, Bro. H. Most fervently do I unite with you in praying that God may give us a united church—a body of Christian people united as one through Christ Jesus, our Lord and Savior. You suggest that, if the good man had used plenty of money in trying to convert those about him (laid up treasures in heaven, instead of here on earth), there would have been no temptation to rob him.

Most heartily do I indorse your closing sentences, dear brother; right here comes that glorious promise, "Blessed are they which do hunger and thirst after righteousness, for they shall be filled." Surely we who do hunger and thirst after righteousness ought to be united; and we can be united through Christ Jesus. May God help us in working together for that united church you speak of.

When I read this, I had a longing to go back to pioneer times and live *without* money. God knows I do not want much of it any way—certainly not enough to tempt anybody to murder me for it. But, dear friends, people can not be kept from suffering if we go without money. The manufacturers of our land, where they pay people wages every Saturday night, are a great blessing. But *somebody* must handle quite a sum of money on pay-days, and the banks must take care of this money.† By the way bank safes are now being blown up, and the bankers and policemen killed and crippled for life, it would not be strange if every one should want pretty good pay for accepting these responsible positions.

† May be this is not just the place, but I wish to insist right here that everybody be urged to stop keeping money around the house. Think of the robberies and cruelties that have been inflicted just because it became noised abroad that somebody had money hidden on his premises. Do not keep your money in your house or on your person over night. Put it in the bank. If you sell property and take money, let everybody understand that it is taken to the bank at once. Many people are foolish in this respect. Even if banks do fail once in a great while, it is a thousand times better to lose money in this way than to have some of the family murdered because of the folly of keeping money in the house.

Then another thing, my good friends: We must face the fact that *money* is not at the bottom of *all* these evils. It is painful to me, at least, to be obliged to revert to the subject I spoke of in my article—the traffic in girls. You may say, "Let these fiends in human form have the money." Shakespeare said, "He who steals my purse steals trash." You may let it go that way if you choose. You may say the loss of a little money does not disturb your tranquillity or peace of mind, and perhaps you have a right so to do. A few days ago \$20 worth of postage-stamps was lost, and I made quite a little stir about it. Finally it occurred to me I was making too much fuss about the loss of a little money; and so after having done all I could to locate the loss I dropped the subject and trusted God for the outcome. I did not care so much about the money. I cared more because I feared by heedless methods of doing business we might have tempted some poor soul somewhere to be dishonest. In a week's time the stamps came back of their own accord. Nobody had been dishonest in the least—only a little careless. Well, we may philosophically decide not to worry about money; but we are just beginning to discover (and may God help us) there are other things than money that men covet when Satan has entered their hearts. You can let the *money* go, and say you are only so much poorer. But suppose your little *girl* (or your *neighbor's* girl) has been spirited away by the ruffians—what then? No, no, dear friend; we can not, like Elijah, go and sit down under a juniper-tree and ask God to take us out of the world. Jesus said, "I pray not that thou shouldst take them out of the world, but that thou shouldst keep them from the evil." Bad men are getting into office, and they will just chuckle among themselves, if we do as Elijah did. God forbid. I know, dear brother, that sin seems entering everywhere. Even ministers of the gospel are forgetting their sacred calling, and are stepping down into a whirlwind of worldly things. The great college town of Oberlin has for years past been celebrated for its strict and almost puritanical ideas. I am told that just recently one of its professors joined in a game of cards on one of the electric cars, and kept it up during a trip of several miles from one city to another. No doubt some of you will say I am behind the times in thinking there is any thing wrong in this. Dear friends, it is something very different indeed from what Oberlin has been in times past; and I feel sure, too, that this professor will not particularly commend Oberlin to anybody as a place to send our boys and girls by such conduct as I have mentioned. May God help us in the conflict—a conflict we can not evade or dodge, especially if we profess to be *consistent* followers of Christ Jesus. And especially may he help us to work unitedly for that united church our brother has so well emphasized the need of, thus fulfilling the prayer of the Savior in the well-known text:

That they may all be one, as thou, Father, art in me and I in thee, that they also may be one in us.—JOHN 17:21.

FLORIDA TRAVELS, CONTINUED.

My next stop was at Mr. Bedell's, at Lake Helen. There are beautiful little lakes all around Lake Helen, as, in fact, there are almost everywhere else all through Florida. I can hardly believe there is another spot on the face of the whole earth where there are as many lakes of clean pure soft water as in Florida. The shores and the bottoms are mostly pure clean white sand—so clean that if you wade along the pebbly brink you do not even make the water muddy—at least a great part of them are like this. Mr. Bedell has all sorts of fruits and flowers, and a very pretty little place withal. Mrs. B. said that, as I seemed to be hunting up fish-stories, her husband had one to tell. One day a fish-hawk dove down into the lake close by their home, and brought up a fine large fish; but before he had got very far away an eagle, that had been *watching* to see what "luck" the hawk would have, pounced down on him, and, after a squabble in the air, the fish was dropped. Instead of falling back into the lake it dropped into Mr. Bedell's garden, and they had a very nice fish for dinner.

As one of the principal points of interest in that locality, Mr. Bedell took me over to the Stetson plantation at Deland, some five miles away. We rode in a brand-new buggy that Mr. Bedell said he ordered from one of the carriage-makers who advertised in GLEANINGS. That vehicle certainly *did* do us excellent service, especially when a cold rain caught us. Stetson is one of the Florida millionaires—at least they call him so. He is the founder of the Stetson institute or seminary, at Deland. I was invited to visit this great educational institute, but I could not spare the time. I wanted to see the great orange-sheds and pineapple-sheds of that locality. We found orange-trees inside of these inclosures, perfectly protected from frost, and bearing loads of great luscious fruit. These sheds have to be kept under lock and key; and, even as it is, they are troubled more or less from vandalism. The sides are simply a tolerably tight high board fence—sometimes 18 or 20 feet high. The roof is covered with movable panels. Various devices are used by different orange-growers for opening and closing the roof. They do not even try to have the whole thing so it will shut up air-tight. Many experiments have shown that this is not advisable. In the neighborhood of Deland, however, it is found necessary to have the roof so it can be opened during warm days, to give sunlight and air; and when a frosty time comes, these openings are pretty well closed. Then piles of firewood are located all through the shed. Sometimes a sort of rude stove keeps the wood from getting scattered about where the heat might endanger the trees near by. Unless a certain amount of ventilation

is allowed through the roof, the smoke and heat might do more harm than the frost. I can not just now be real sure, but I think I was told the most efficient apparatus (overhead), considering expense and every thing else, was panels made of boards to be moved back and forth by two men, one standing at each end of the panel. In this case the roof, of course, must be substantial enough so that men can walk over it when handling the panels or shutters. While cotton cloth is used by a good many, there is quite a disposition among other successful men to declare they do not want any more cloth flapping in the wind, getting torn, and subject to decay, etc.

I have already described the pineapple-houses, and pictured them. They are a good deal after the same plan, although in these further north, at Deland, for instance, the openings between the slats must be closed, or partially closed, during very severe weather. We obtained permission at the office to look over the grounds. I can not tell you of all the beautiful scenes we saw during that one afternoon. At one place there is an alligator-pond with a big stout iron fence around it to keep the great reptiles from wandering away. Friend Bedell said he was going to get over the iron fence in order to get a closer view of the "animile." After cautiously keeping one hand on the fence we leaned over the stone abutment, and, sure enough, down in the clear water close by our feet was a motionless creature larger than any horse. It began to rouse up and move along the bottom of the pool, and just then I began making tracks for the fence. Friend Bedell assured me there was no danger. While the foreman of the ground was taking us from one interesting point to another I asked quite a good many questions as usual. Finally he turned to friend Bedell suddenly, and said:

"What name was it you called that man by just now?"

"I called him Root."

"Why, dear me! is this really Mr. A. I. Root whom I have been showing around, and who has been asking me all these questions? I looked at him several times, and was actually wondering what Yankee it was that wanted to know so many things, and also seemed to know quite a little himself."

Then he asked us if we had visited the little greenhouse. We told him we did. He asked us if we saw his particular pet right overhead in the peak of the roof. Neither of us remembered seeing it. You see we went into the greenhouse before we found the foreman; so we started back to the little greenhouse, or conservatory, perhaps I should say. Then for the first time I raised my eyes, and looked overhead. As I did so we both uttered exclamations of surprise and delight. It was a *Bougainvillea Sanderiana*. The vine started in one corner, and sent up a bare trunk like an old grapevine. This ran along without flowers or foliage till it was clear up in the peak of the roof. Then it spread out and made such a display of beauty and brightness as only the bougainvillea can make. A plant I saw in Bermuda covered a house with such a

mass of startling brilliancy as to call forth exclamations of pleasure and surprise from the passerby who was a *whole half mile* away. Now, that is not any "fish story." The first one I saw in Florida was in a garden near the Royal Poinciana. I saw a very pretty one last fall at the Ohio Experiment Station. A year ago last winter we purchased two plants at 15 cents each, to put in our little greenhouse. In the spring we set them in the open ground, and they made a great mass of green foliage, perhaps six feet across, but no bloom.

We moved them into the greenhouse, and succeeded in getting them to live without shortening any of the branches at all; but we carried along a great lot of dirt with them. During the latter part of the winter they were growing luxuriantly—great masses of green, but no sign of flowers. Those who knew, however, told me not to worry—in due time I would get my reward. Some time in March, little white blossoms began to show here and there, and a little later some leaves or bracts began to appear around the insignificant bloom, these new leaves or bracts gradually taking on a rose colored hue; and they kept getting brighter and larger day after day and week after week. During the middle of April these two plants were the center of attraction, and they have been getting brighter and more fascinating all the time. The word *animated* seems to hit it better; and, no matter how dull I may feel (yes, I feel dull and tired sometimes), this bougainvillea always gives me a start. I feel like saying out loud, "O you precious bright little darling!" So many people have wanted just one little sprig of the brilliant plant that it has now been pretty well robbed of its luxuriant beauty. But still as I write this, June 15, it is just as brilliant, what there is of it, as it ever was. I can not understand why this wonderful and magnificent vine is not oftener seen in the greenhouses of private residences. So much for the bougainvillea.

Then the foreman said we would have to go into the house and see his wife. Her father is a bee-keeper away up in the North, and he takes (or did take) GLEANINGS. While looking about the various objects in the beautiful home I picked up a fine piece of porcelain painting. The lady of the house remarked, "O Mr. Root! I especially wanted to show you that picture. I suppose you know what it is."

"Why, it is the most beautiful painting I ever saw, of John Alden and Priscilla—at least that is what I should call it."

"Well, do you remember my husband's name is Alden?"

Sure enough, that was the name friend Bedell mentioned when he introduced us. The lady resumed:

"Well, *we* are descendants of John Alden;" and then there was a pleasant surprise all around. Dear friends, it may not be of any great moment who our ancestors were away back; but it is of great importance that we hand on down to the coming generations a character and a heritage that can be spoken of with pride *long after* we are dead and gone.

GINSENG AND ITS CULTURE; NOT SO DIFFICULT AFTER ALL.

Oh dear me! when shall I ever be old enough to cease making blunders? I felt so sure my ginseng plants were all dead I did not even mulch them last fall. After they died in the latter part of the summer or early fall, I left the slatted frame over them (to give them the right amount of shade), and paid no more attention to them all winter. Well, on May 14, imagine my surprise to see a good thrifty plant right over the spot where every plant died last fall. In fact, I think they will all live, with the exception of one plant, which was thrown out, root and all, by the frost. The fact is, my *treatment* was all right, and my *plants* were all right; but I was not sufficiently acquainted with the "critter" to know that its habit was to cease growing and die down so early. I think now I shall have to apologize to the ginseng advertisers so far as the plant being very difficult to grow is concerned. I was almost as bad as the Irishman who insisted that the mud-turtle was dead after its head was cut off. When they told him it was certainly alive because it was crawling around, he replied, "The craythur is dead, without any question, but he does not, as yet, seem to be *sensible* of the fact."

COMPOST-HEAP FERTILIZER.

Year after year the most effective fertilizer we ever got hold of (not even excepting stable manure) is that from our compost-heap. We have tried it on strawberries, squashes, potatoes—in fact, all sorts of crops; and wherever this compost-heap is put out and plowed under we get the biggest crops. It is a heap of trash not far from the kitchen. All weeds and useless trash from the garden are piled on this heap; all slops from the kitchen are poured on with the other stuff; every thing that we wish to get rid of that will decay is dumped here. I sometimes almost have to quarrel to get the boys to stop putting on broken glass, crockery, brush, and the like. Well, this pile is allowed to grow until it begins to give off traces of unpleasant odor. Then we load it on a wagon, spread it out on some piece that is to be plowed, and turn it under. Several times I have thought I had got hold of a new variety of strawberries, potatoes, Hubbard squash, or something of the sort; but afterward I remembered that this plant with such wonderful vigor grew where we turned under the compost-heap. A great many times squashes, potatoes, and other vegetables come up self-sown where this heap is spread; and they have such remarkable vigor the boys hate to kill them, and hence let them grow. Then we have a great crop of something—a dozen big squashes on a single vine, a great lot of large potatoes as the product of a single sprout, and such like things. By all means have a compost-heap, and you will find it like money in

the bank, besides helping to keep things tidy around the premises.

THE RHODODENDRON.

Something more than twenty years ago a rhododendron was planted in our old cemetery, and I confess that for years I had forgotten it. But this morning, before breakfast, one of our men who lives near the cemetery came to the door with a most beautiful cluster of great purple blossoms, much like the azalea I have just been talking about, and asked me if I could tell the name. I replied at once:

"Why, Mr. K., you have got a most beautiful cluster of blossoms of rhododendron. Where in the world did you find it?"

"It is growing over in the old cemetery. It stands almost as high as your head, and I think there must be toward a hundred clusters of bloom, each one fully equal to this one I have in my hand."

You may be sure I got on my wheel, and in a little time went down to see it. There were 52 clusters, by actual count. The plant is worth going miles to see. We have one in our front yard, on the north side of our house, so as to be in the shade during the hottest part of the day; but it is not yet quite in bloom.

There has been considerable discussion as to whether a rhododendron is hardy enough to be left outdoors unprotected. Storrs & Harrison informed me that, if placed in partial shade, when once established they will live for years. This one at the cemetery is shaded during the hottest part of the day by some large forest-trees on the south. It is true, these beautiful growing plants cost quite a little to start with. I think they are quoted in the catalogs now at from 50 cents to \$1.00. When you get one established, so it will stand, blooming every year for twenty years or more, the cost per annum is almost insignificant. They remain in bloom quite a long time. The clusters and flowers are considerably larger than those of the azalea; and the foliage makes it a very handsome plant, even when not in bloom, for it is really a magnificent flowering evergreen.

AN IMPROVEMENT ON MY TRAP NEST.

Mr. Root.—I inclose a plan or model for a trap nest founded on the automatic nest you showed us on page 410. I think this catch would be an improvement over the one you suggested. Yours is the best trap nest I have seen, though I have plans for one that cost me a dollar. One thing to be remembered about your nest is, it must either be set under a platform or a cover provided, or the hens will get on top of it and close it. No cover is needed when used as an automatic nest, as it will open as soon as they get off. This catch, as you see, can be turned over on top of the nest, and instantly changed from a self-operating to a trap nest.

Bellton, W. Va.

R. C. HINKLE.

I will explain the model as follows: In order to make the nest so it will not rise up and let the hen out when she steps out of the nest, get a strip of wood say 2 feet long. Hinge one end at the corner N (see page 410). When used as an ordinary nest this strip lies flat down on the top of the nest, say along the line E. When you wish to trap the hen, throw it over so the loose end will rest on the ground.

This end catching on the ground will prevent the box from rising up when she steps off the nest. This device is probably cheaper and simpler than the arrangement I proposed, of having a piece of iron on the shelf C, that will drop off when the nest is shut down. By the way, I have learned that a box or basket does not need to be arranged so as to rise up very far. If it tilts easily the hen will soon learn to put her head under the edge and raise it up. In fact, they will exert quite a little force in order to get into the nest when you wish them to stay out. A sitting hen, for instance, will get in by some hook or crook almost in spite of you. My experience thus far convinces me it is exceedingly important to weed out the unprofitable hens. We have two White Plymouth Rocks that look so much alike it is almost impossible to tell one from the other, and yet one lays three times as many eggs as the other, and keeps it up right along. Without a trap nest we are blundering in darkness, not only in getting eggs for table use but in getting eggs to hatch from our most fertile layers.

OUR THREE SITTING HENS.

They hatched out 26 chickens, and not one of the 26 was lost. They are now six weeks old, and fully feathered out. It is no more than fair, however, to say that *Mrs. Root* took care of them. She was raised on a farm, and knows how to manage not only chickens but their *mothers* also. I did not know before what a wonderful amount of vitality a chicken has. When ours were three weeks old they ran through the wet grass from daylight till dark, during all that long cold rainy spell, and they just flopped their wings and had fun, rain or no rain. Of course, *Mrs. Root* kept them well fed (all they would take) with a good variety of nourishing food.

VALUABLE SECRETS, PROCESSES, ETC., OBTAINED BY SENDING A CERTAIN AMOUNT OF MONEY.

You see, friends, I have not become discouraged yet in thinking I may some time get hold of something really valuable in answering advertisements relative to wonderful secrets. The last one, I found in the *Agricultural Epitomist*. It reads as follows:

SECRETS OF CANNING WITHOUT CHEMICALS.

By sending A. D. Hursh, Supt. of the Springfield, Illinois, Canning Co., one dollar, families will receive instructions for canning all vegetables and fruits by proper application of heat on the kitchen stove. All goods will keep fresh, whole, and delicious for years. Mr. Hursh uses this formula in his factory work.

Off went the dollar. The advertisement does not say so, but I rather expected to get some sort of book for a whole dollar; but after considerable delay I received the following letter:

CANNING WITHOUT CHEMICALS.

The formulas that I give below are taken from the recipes that I use in my factory work in canning all vegetables and fruits. Persons who follow the directions given herein will be delighted with results, for the goods will keep delicious, whole, and fresh, indefinitely. In canning fruits and vegetables I recommend the use of tin cans whenever possible, for three reasons: First, the soldering makes them more secure from leaks; second, they save time; third, they protect the goods from the light at all times, thereby preventing

them from losing their color and flavor; and by using your solder-iron to melt the solder around the lid, and following it with an awl or stick under the lid, the cans can be taken off the can emptied, dried inside, and saved for another year. When tin cans are used, it will be necessary to use solder for soldering the lids on, in place of sealing-wax used in ordinary canning, for the reason that all goods when hermetically sealed will swell or bulge at both ends after they are in boiling water long enough to cause the steam and gas to rise from the goods in the can. The solder is put on with a hot copper tipping-iron; and in order to make the solder spread and follow the iron, it is necessary to use a little flux or acid in the groove after the lid is on the can. The flux is made thus: Get a pint or more of muriatic acid, put it in an earthen vessel, and set it out of doors. Put into the acid all the zinc it will cut. When it quits sizzling and gets cold it can be diluted with water one-half. Then it is ready for use. Apply with a small brush in the groove of the can after the lid is on. Get a 3-lb. copper tipping-iron at the hardware store. The iron must be kept trimmed so the solder will follow it around the lid.

TO TIN THE COPPER-IRON.

Heat the iron very hot in the stove, so it will sizzle when stuck into the flux. Take the iron out of the flux and rub the point and lower part with solder. Repeat this process until the solder sticks to the iron and looks as bright as silver; then it is ready for use. When the tin becomes burned off the iron by constant use, the tip of the iron may have to be filed down to a point, and till the copper shows bright, then tin again.

HOW TO SOLDER.

Punch a small vent-hole in the center of the can-lid, with an awl. Put the lid on the can, apply a little flux or fine rosin around the groove of the can. Take the iron in the left hand; apply the solder to the iron with the right; move iron around slowly in the groove of the can; keep the point of the iron well in the groove. If the iron is hot enough the solder will flow freely, and follow the iron around till it flows together on both sides. After the groove is filled with solder, and no pin-holes remain, tip the center or vent-hole in the lid, and the can is ready for the process, or hot water.

RECIPES FOR CANNING.

We are now far enough advanced in the business to do some canning, and so we will proceed to can a gallon of sweet corn in quart tin cans. The amount of ingredients used in this gallon may be increased or diminished in the same proportion, according to the amount of corn used at one cooking. The corn should be taken fresh from the stalk, when it is in the milk. Cut the corn from the cob; scrape the cob with the back of the knife, to get all the juice; put the corn into a porcelain or tin kettle. To each gallon of cut corn add sometimes one cup of granulated sugar, and 4 ounces-half a cup of salt, and one quart of water. Heat and stir all together until the sugar and salt are well dissolved, and the milk curdles in the corn, or just before it strikes the boil. Now dip this hot corn out of the kettle, into your tin cans. Fill the cans within half an inch of the top. Solder the can air-tight at once. Have your wash-board two-thirds full of hot water; put the cans into the water at once, and process them from the time the water begins to boil; then take out and keep in a cool dark place till used. The cans must be kept at least four inches under water while boiling. They will have to be weighted with a board and brick. Note — it will be well to remember that corn, pumpkin, and peas must be kept hot from start to finish. They must be put in cans hot — sealed, and put into hot water at once, and processed the required time.

TO CAN PEAS.

Pick the peas before they get too hard. Hull them, put into a pan, pour boiling water over them, and keep them in it three minutes to blanch them. Dip them out of this water with a strainer-dipper into the cans. Fill the cans within an inch of the top. Have boiling salt water ready, made from one cup of salt to one gallon of water. Pour this, boiling, over the peas in the can till they are well covered, or nearly to the top of the can. Now solder the cans air-tight, and put into the boiler of hot water the same as corn. Process three hours.

TO CAN PUMPKIN.

Cut in small pieces. Boil in a pot with a tight lid until mushy. Add water to keep from burning. After they become soft, add boiling water, at a mash with a masher till thin enough to dip into cans. Fill the cans nearly full; seal air-tight; put into a boiler with hot water, and boil two hours from the time the water begins to boil.

TO CAN TOMATOES.

Scald the tomatoes just enough to take the skin off. Take out the cores with the point of a knife. Put the tomatoes in the can whole. Press them down gently till the can is well filled. Seal air-tight; put into a boiler of hot water, and boil 30 minutes from the time the water begins to boil. Take out and keep in a cool dark place.

TO CAN STRING BEANS.

Take the strings from the beans. Place them in cans with the fingers till the can is well filled; then fill the cans with boiling salt water (same as peas), seal air-tight, place in a boiler of hot water, and process one hour from the time the water begins to boil. To have nice tender beans they must be picked before the beans swell the pod.

TO CAN ALL FRUITS.

To can fruit, care must be taken to cleanse it of all rotten, green, and sour specimens before canning. Fruit can be put in flat-bottomed boiling water, or in a syrup made of 2 lbs. of granulated sugar to one gallon of water. In either case the berries are put into cans, and the boiling syrup poured over them till the can is nearly full. Seal air-tight, place in a boiler of hot water, and use time according to the following table: For all berries, cherries, and grapes, 10 minutes from the time the water begins to boil. Apples and pears, pared

and quartered, 40 minutes from the time the water begins to boil; peaches, 20 minutes.

FOR CANNING IN GLASS JARS.

In using glass jars for canning, the same time is to be used as for tin cans; but the first half of the time the rubber must be left off, the lid screwed down only part way, to allow the gas to escape. The water in the boiler is to be within 3 inches of the top of the cans. After the first half of the time is exhausted, put the rubbers on, screw air-tight, add hot water till the cans are covered 4 inches, and proceed with the last half of the time. After the cans are taken out of the boiler, set them with the top end down, on white paper. If any show leaks, screw the lid tighter or press putty where the leaks are.

Very likely our friend thought if he got dollars enough he might have his directions *printed*. Perhaps I was the only fish that bit at his bait. I hope so, at least. Well, if *he* could not afford to print it *I* have done so for him. Let me see: If it goes to ten thousand different readers, and it is worth a cent to each one of them, I shall get back (or, rather, *you* will get back) \$100. So far as I know, the directions are all very good—that is, if any one wants to fuss to put up fruit and vegetables in this way when he can buy cans of tomato, corn, etc., at 10 cts. each, or three for a quarter. The whole thing illustrates the folly of undertaking to do work at home so as to compete with a canning-factory. It gives one the impression that "the Springfield Canning Co." must be a very small, one-horse concern.

Temperance.

We are glad to give place to the following:

ANTI-SALOON LEAGUE PAN-AMERICAN BUREAU OF INFORMATION AND LOCATION.

Comfortable rooms with reliable Christian homes can be secured through the League Bureau within easy reach of the exposition grounds at reasonable rates.

A corps of uniformed cadets, wearing the Anti-saloon League badge, will meet at depots and League headquarters all of our church and temperance friends, who by correspondence have secured rooms in advance through our Bureau.

The Anti-saloon League Encampment, or village of neat and attractive tents, floating the Anti-saloon League banner, will be a unique feature for accommodating those who prefer a cool tent to a hot room.

One large tent will furnish a delightful meeting place for social and public occasions.

Persons desiring to make definite arrangements for rooms or tents in advance, will please write promptly, enclosing postage for reply.

JOHN F. BRANT,
Supt. Buffalo District.

309 D. S. Morgan Building, Buffalo, N. Y.

We are pleased to note that the Anti saloon League of the United States is going to be on hand at the great exposition, and look after temperance matters and the enforcement of temperance laws. We have just received the following:

Evo. Root:—Will you kindly make note in your excellent magazine that the New York Anti-saloon League and the Pan-American Exposition, Rev. John F. Brant, Supt. for Buffalo District, writes that arrangements are completed for holding a Pan-American Anti-saloon Congress in Buffalo, July 19–21. Speakers and workers of national reputation will address the various sessions of the congress. Buffalo has been getting ready by outlawing 55 concert saloons. The Buffalo Anti-saloon League leads in this crusade.

JOHN F. BRANT.

If you do not know, dear friends, how pleasant it is to meet with somebody who loves righteousness and hates iniquity (as you do), amid a great crowd at a national exposition, I can assure you that I do. Many times when

I have felt myself alone, and have begun to get homesick in a great crowd of unsympathizing people, it has rejoiced my heart, and made me breathe praises to God, to find somebody who could introduce me to those who love temperance, purity, and every thing that is good. May God be with the temperance people of our land as they work together to keep back the foe.

Here is something still later:

The Buffalo Anti-saloon League is making a vigorous effort to combat all forms of vice growing out of the saloon traffic during the Pan-American Exposition. It has met the concert-saloon issue, and won out before the city council, forbidding the issuing of any more concert-saloon licenses; it has even compelled the midway exhibitions to modify their performances by conforming to State laws and city ordinances. The League will be on guard day and night, with 100 churches and the best business men and professional men of Buffalo back of them.

The League Bureau of Information and Location is undertaking to direct Exposition visitors to safe and reliable Christian homes. Their office is 309 D. S. Morgan Building, Buffalo, N. Y.

JOHN F. BRANT, Supt.

While I am about it, let me mention another encouraging thing which I copy from the last *American Issue*:

MORE RAILROAD PROHIBITION.

A press dispatch from Frankfort, Ind., May 10, states that the Clover Leaf Railroad Company has issued a general order prohibiting its employees entering saloons at any time, either on or off duty.

The order also prohibits employees of the road from boarding or rooming at any place with which there is a bar connected, directly or indirectly, and states that any violation will bring instant dismissal.

The order with reference to boarding-houses will affect fully 1000 men.

There is little danger of accidents from drunken employees on a road that has taken an advanced stand like this.

GOOD FOR CHICAGO.

"Grapho," in the *Advance*, says:

We have often heard that Chicago is a "pig-sticking" city. It is in order now to remark that one of our great packing-houses, Swift & Co., has put up a placard which says: "No profanity permitted in this house." Some of the big publishing houses, which are not sticking pigs, and which pride themselves on their literary taste, would do well to hang up a similar placard. They should not be less refined than a packing-house.

While reading the above I was wondering if it would hit anybody in our printing-office, and I drew a breath of relief when I decided, at least in my own mind, it would not hit any of our people—at least not while they are on our premises; and I hope and pray that it does not hit them anywhere.

Special Notices by A. I. Root.

THE DARLING STRAWBERRY.

This variety is ahead of all the rest in the matter of ripening, as usual, and this year it has given me one of my happy surprises in having almost every plant loaded with fruit. In fact, there are no plants on our grounds that have more berries. And, strange to tell, they are old plants that were moved from another bed some time last July.

A TEN-CENT BOOK ON GINSENG CULTURE.

It is quite refreshing to get a nice little book at the above price—a book containing modest and moderate statements—after the exaggerated figures we have had from other growers, and exaggerated prices, not

only on seeds and plants, but books also. This little book is fairly well illustrated, was issued in February, of this year, by J. W. Sears, of Somerset, Ky., and it has a *date* on it. A good many of these high-priced ginseng "books" have not even a date to tell whether they were printed during the current year or ten years ago.

THE DZIERZON THEORY.

I do not know but it is a pretty good thing that I am obliged to read all the proof before GLEANINGS goes to press since Ernest is away. Well, for some time back I have been feeling that most of our journals have been giving place to the discussion of questions that were pretty well settled years and years ago by long and laborious experiment. When GLEANINGS was started, every bee-keeper in the land was more or less familiar with the Dzierzon Theory; and they were forced to admit, too, that, although this little book is quite old, very little that is found in its pages has been found to be incorrect. Now, I do think every bee-keeper of the present day ought to read through, at least once in his life, the Dzierzon Theory. It is the cornerstone and solid rock upon which nearly all we know about bees is based. The little book is only 10 cents, postpaid. If any one thinks the price is too high I will take the responsibility of putting it 5 cents. We do not care whether we make money out of it or not; but we want the people to read it.

OUR ANEROID BAROMETERS.

Two troubles have met us in selling the small-sized instruments we have for years had for sale. We have been sending them by mail; but where the mail-bags are thrown or banged about, the instruments are very likely to be out of order when received; therefore we have decided hereafter to recommend in all cases having them sent by express. The charges will be seldom more than 25 cts. Another thing, we have heretofore used the smaller-sized instrument in order to lessen the expense of postage. After having carefully tested the different sizes we find rather more satisfactory work from the larger size, costing \$3.50 instead of \$2.50 as heretofore. These larger instruments, placed side by side with our mercurial barometer, do most excellent service, many times indicating the approach of a storm, even before the mercurial, because they are more sensitive. Instructions accompany each instrument—one set from the manufacturer, and one set that I have had printed for myself, after having watched the barometer almost daily for several years past. It is a pleasure to me to sell one of these new instruments, because I think they will give both pleasure and profit to the purchaser.

Since testing half a dozen of these instruments right beside our mercurial barometer, under all sorts of circumstances, I find the aneroid is affected more by change of temperature than the mercurial barometer. All barometers should be in the open air. The north porch, where the instrument will be sheltered from rain, and, as far as may be, from drifting snow, is a good place; and the aneroids especially should be where the sun does not strike them; for the heat of the sun, especially in hot weather, is very likely to cause a temporary fluctuation in the needle that might lead one astray if he did not make allowance for it.

MALTED NUTS; A NEW FOOD FOR INVALIDS.

I suppose most of our readers are more or less familiar with malted milk, which has been such a Godsend to thousands of people with weak digestion. But our enterprising friends of the Sanitas Food Co., Battle Creek, Mich., have, in my opinion, gotten out something that is even ahead of malted milk. They call it malted nuts, and say it is a pure product of nuts and nothing else. It is a grayish powder much resembling malted milk; but only two teaspoonfuls, dissolved in a cup of hot water, makes the most delicious and nourishing drink I ever got hold of. When faint with hunger and fatigue, either mental or physical, there is nothing in this world that braces me up so quickly as this drink. Tea and coffee are nowhere, in my opinion. I have been using it now considerably for over a month, and it does not seem to me as if I should ever want tea or coffee again, when I can get hold of this new substitute.

Another new thing in the way of good foods I wish to mention is granose biscuit. With some of this, and malted nuts and a little hot water, I have a delicious meal with very little trouble to the good wife or anybody else. One of the problems just now is help

in the kitchen. Well, Mrs. Root and I are planning now so that we shall not need any hired help in our new summer cottage; and we desire to manage also so that she can have much leisure outdoors. We are planning to live so as to save her not only a lot of labor in preparing food, but the same in taking care of a lot of dishes. Just one cup and a spoon, something to hold the pure hot water, some malted nuts, good bread and butter, fruits and vegetables from our own garden, and we are all right. If we feel the need of fresh meat out there in the woods we can get fish very easily; or, failing in that, canned corn beef or roast beef at the country store near by. I am not sure, but I think the Sanitas Food Co., Battle Creek, Mich., would be glad to send any one a sample of malted nuts. We have given it around to our neighbors, especially those in feeble health, and the universal verdict is that it agrees exactly, even with those who have greatest trouble with indigestion.

One thing I almost forgot to add. There is more nourishment and strength in this new food, pound for pound, than any thing else I have ever come across in the way of food products. If bought in quantity, the dry powder costs only about 40 or 50 cts. per lb. But it is so light that a pound goes a great way. I think one could come nearer to carrying his dinner in his vest pocket with this new food than any thing else I know of.

WHAT CAN BE PLANTED IN THE MIDDLE OR LAST OF JUNE?

Almost every thing, for that matter; and it is particularly the time to plant beans—better now than earlier, because they are more likely to escape the bean-weevil. It may be a little late for the large lima bean, but is just right for Henderson's bush limas. We have a large lot of these that we are offering for only 10 cts. per quart, or 65 cts. a peck. Where there is difficulty in getting large lima beans to ripen, these smaller bush limas are almost sure to make a crop. We have also three or four bushels of the Prizewinner shell bean that that is so early we grew two crops of them last year in the same ground. Quart, 20 cts.; peck, \$1.25. We have a nice stock of Banner field beans at the low price of 10 cts. a quart; 70 cts. per peck; bushel, \$2.75.

Sweet corn will be all right for roasting ears, and it is a good plan to plant three or four kinds the same day, from the earliest to the latest. Popcorn is all right if put in now. We have some extra nice rice popcorn at only 10 cts. a quart; peck, 65 cts.

Cucumbers I would put in just now as you do corn. Plant several kinds, from the earliest to the latest, all the same day.

Do not forget lettuce—that is, in localities where people have learned to use it the year round; and I believe it finds a ready sale in all the large cities every day in the year.

All kinds of melons will give a crop now unless we happen to have an extra-early frost.

In our locality we have no trouble in growing peas right through the hot weather. In fact, we have just been planting five different kinds, from the earliest to the latest, on the same day. Without any more attention this gives us green peas right along without any further care or trouble.

Pumpkins are all right; and if you have not put at least a few among your growing corn, better do so now. They are not only pretty but useful, and often make the most of their growth after the corn is cut, especially early corn. We have Early Sugar pumpkin seed for 30 cts. per lb.; field pumpkin, only 15 cts.

Beets, carrots, and salsify may all be put in now—yes, parsnips too, if you do not care to have them very large; and the medium-sized ones are better for table use than large ones.

Better get in some Hubbard squashes if you have not done so before.

Of course, you know it is just the time for putting out plants—cabbage, cauliflower, celery, tomatoes, etc.

It is a little early for turnips, except the Breadstons and large sweet rutabagas. They should be put in in June, because they need a long season.

If you order any of the above seeds by mail, please remember to add 9 cts. per lb. for packing and postage; beans and peas, 15 cts. a quart, and corn 12 cts. a quart, for postage.

Last, but not least, our favorite season for planting potatoes is the last of June. We still have plenty of potatoes for seed of the Early Ohio, and small lots of other kinds, at 75 cents per bushel right through. A leaflet giving reduced prices on seeds late in the season will be mailed on application.

REARING QUEENS IN SECTION BOXES.

Several pages are occupied in this issue in describing some very ingenious arrangements for rearing queens, not only in little hives, but even in a section box. Now, while I succeeded, years ago, in getting queens fertilized with only the brood contained in a single section box, I decided the matter was too difficult, and required too much constant supervision to make it practical. Very likely our friend "Swarthmore," with trained assistants under his supervision, could have queens fertilized by the hundreds by his arrangement; but in reading it over I was strongly impressed with its being something familiar; and all at once the new book, "Egg Farm," came to my mind. Now, this latter book is wonderfully ingenious, and the story is exceedingly interesting; but careful investigation shows that no one has ever made it a practical success—not even the inventor himself. "Too much machinery" is the trouble. Quite a few of us have had more or less experience with inventions requiring too much complication. The cell-cups are, without question, all right. Our friend W. H. Pridgen has, along a similar line, been making quite a practical success, and I sincerely hope "Swarthmore" may do as well. I am sure he will accept this as a kindly caution (in regard to rearing queens in section boxes) from his old friend who has been "through the mill" pretty well.

SECOND-HAND CANS.

We have a few over 100 boxes of second-hand cans, 2 in a case, in fair condition, which we will sell, while they last, at half price, \$3.75 for 10 boxes, or 50 boxes at 35 cts. a box. Some of these cans are oxidized inside, and all need cleaning before using. They are whole and sound, and we believe will hold honey.

BEESWAX LOWER.

Beeswax is being offered much more freely, and market price is declining. We reduce the price we pay, till further notice, to 26 cents cash, 28 cents trade, for average wax delivered here. We have more than enough on hand to supply our trade for this season, but will take it in at above figure for the present to store for next season.

60-LB. HONEY-CANS.

The American Can Co., commonly known as the Can Trust, having absorbed, practically, all the factories making cans, have raised the price so that, if we had to buy of them at their present prices, we could not sell at the price listed in our catalog at a profit. We are fortunate in having a carload on hand, bought before the rise in price. We have another carload contracted, to arrive this month or next, so we are in shape to fill orders from Medina for 60-lb. cans at the prices listed in our catalog till further notice.

MASON JARS.

Our carload of Mason jars, ordered last February, and promised for delivery in April, is just shipped as we go to press, and, we trust, will be here in good time to fill all orders booked before July 1. The price of jars in the market is advancing, and the outlook for an abundant fruit crop will tend to boost prices of jars still higher. We can not guarantee prices last announced, for any length of time, and will doubtless mark them up a little July first. If in need of jars, send us your orders. We have two or three gross left of quart jars, green glass, with aluminum caps, at 55 cts. per doz.; 6 doz., \$3.15; 12 doz., \$6.25. The jars in the car coming have porcelain-lined zinc caps, and the prices are:

GREEN GLASS.

1 qt., 1 doz., 58c; 6 doz., \$3.30; 12 doz., \$6.50.
2 qt., 1 doz., 80c; 6 doz., \$4.60; 12 doz., \$9.00.

FLINT GLASS.

1 pint, 1 doz., 60c; 6 doz., \$3.45; 12 doz., \$6.75.
1 qt., 1 doz., 65c; 6 doz., \$3.75; 12 doz., \$7.25.
2 qt., 1 doz., 90c; 6 doz., \$5.20; 12 doz., \$10.00.

All put up, one dozen in partitioned cases, and well made.

Every Year's Use

adds to the popularity of Page Fences. This season's sales surpass all previous records.

Box 5. Page W. W. Fence Co., Adrian, Mich.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. LEY'S POULTRY CONDITION POWDER puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls—big and little get all there is in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. Ley's Thoroughbred Minorca eggs, \$1 for 13. Thoroughbred Belgian Hares. Geo. J. Ley, Florence, California.

W. H. Pridgen,

of Creek, Warren Co., N. C., whose money-order office is Warrenton, N. C., is now prepared to fill orders promptly with the Hutchinson "Superior stock," or golden untested queens at 75 cts. each, or queen-cups at \$2.00 per pound, postpaid.

FOR SALE.—Nuclei, in chaff-hive frames; three frames with queen, \$1.75 Good Italians.
H. L. FISHER, New Paris, Ind. R. D. No. 2.

FOR SALE.—100 brood-combs in Hoffman frames, L. size, 12c each. E. R. GIBBS, Norwalk, O.

Wants and Exchange.

WANTED.—To exchange 100 extracting combs—L. size, for rifle or offers.
F. W. HUMPHREY, Oronoque, Ct.

WANTED.—To exchange 50M polished sections (No. 1, nice) for beeswax, at a bargain.
W. H. NORTON, Skowhegan, Me.

WANTED.—Seed buckwheat—silverhull or Japanese. I have bee hives and supplies of all kinds at a bargain. Some are slightly shorn, but all in serviceable condition. CASCADE BEE-HIVE CO.,
W. H. Putnam, Agent. River Falls, Wisconsin.

WANTED.—To exchange a pair of field and marine glasses (cost \$40) or Dobson banjo (cost \$35) for Italian bees on Hoffman wired frames. State condition and number of colonies offered.
DIAMOND, 109 West 42d St., New York City.

WANTED.—To exchange first-class bee-keeping supplies for 2000 lbs beeswax. Will allow 32c for nice wax.
W. H. NORTON, Skowhegan, Me.

WANTED.—To exchange Japanese buckwheat at 80c per bu.—sacks, 15c extra—for Lees in shipping boxes, if not too far away.
ALBERT I. MARTIN, Leonardsburg, Del. Co., O.

WANTED.—To exchange a \$50 Columbia bicycle that has not been ridden 100 miles; never been rained on; out of the factory only about one year. I will sell it or exchange for clover honey, or two-frame Cowan extractor and new Dovetailed hives, to the value of \$35.
A. H. KANAGY, Milroy, Pa.

WANTED.—A young man or married man, to work with 50 to 100 colonies of bees, and work on fruit-farm the rest of his time. Good position to right man. Want one that likes to work with bees; don't care if he doesn't know so much about them, as I have my own method. Good house and plenty of fruit free to married man.
J. A. TAYLOR, Wynnewood, Ind. Ter.

Black and Hybrid Queens for Sale.

Hybrid and Italian queens, from requeening an apiary, 25c each. O. H. HYATT, Shenandoah, Ia.

THE TRUE TEST!

of a strain of bees is the amount of honey they gather under like conditions, compared with others. Mr. D. R. Keys, Dixie, Ga., an old bee-keeper, writes: "That queen from you is simply *splendid*; has shown no disposition to swarm. Her bees have filled three sners of 35 sections each, capped *snow-white*, while the average is not one super so far.—June 6, 1901." See back ads, and write for circular, free. I have carefully selected the best queens for breeders for years, and culled out the poor ones. My stock is a five-band strain, and has *long tongues*. No small or poor-laying queens sent out. Untested, 75c each; six, \$4.00; dozen, \$7.50. For select warranted add 25c. Tested, \$1.25. Select tested, \$2.00. Breeders, \$3.00 and up. Queens sent promptly.

J. B. CASE, Port Orange, Fla.

Sections

The appearance of the honey helps to sell it.

If brought to market in our beautiful sections, it has an appetizing look which recommends it.

These Sections are made of the very best grade of basswood, perfect in finish, and free from defects.

Comb Foundation

and everything that bee-keepers require to make their business profitable, always on hand.

Illustrated catalog for the asking. If requested, we will also include a sample copy of the Weekly AMERICAN BEE JOURNAL.

Geo. W. York & Co.

144 & 146 Erie Street,

Chicago, = Illinois.

WANTED!

Offers on our ENTIRE QUEEN BUSINESS, including our reputation, our Superior long-tongued stock, three entire apiaries, 500 nuclei, and entire outfits for queen-rearing. We have a favorable climate and excellent locations. Cause for selling made known on application. Full particulars free. If interested let us hear from you.

There is no foul brood or other disease in Texas. Single nuclei (with their queens) winter perfectly here.

O. P. HYDE & SON, HUTTO, TEX.

Wanted! HONEY, WAX, MAPLE SUGAR, SYRUP, AND POPCORN.

A. L. JENKS, 42 W. Market St., Buffalo, N. Y.

Red-clover Italian Queens.

The great honey-gatherers: are bred for business; satisfaction guaranteed. Untested queen, 65c; 2, \$1.25. Warranted, 80c; 2, \$1.50. Tested, \$1.25. Select tested, \$2. Estab'd 1872. C. M. HICKS, Hicksville, Md.

The A. I. Root Co.'s Goods

shipped from Jackson, Mich. Root's extra-polished sections, foundation, hives, shipping-cases, etc., cheap. Send for list.

KENDALL, MICHIGAN.

Root's Goods at Root's Prices. : : Catalog free.

For Sale. Choice prolific Italian queens—grand-daughters of a queen of which Doolittle wrote me, "I would not buy her"—mated with drones of Hutchinson's Superior Long-tongue Strain. Warranted queens, 75c; tested, \$1.00 and up. Good references, and satisfaction guaranteed.

EARL Y. SAFFORD, Salem, N. Y.

FOR SALE.—Seventy-five worker combs on Lang. frames (not self-spacing) 8 cts. each.

E. D. BARTON, East Hampton, Conn.

Swarthmore!

We now have facilities for making the Improved Swarthmore Queen-nursery Cages rapidly, and can fill all orders by return mail at 75 cts. each, or 70 cts. by express with other goods. Mr. E. R. Root said: "I believe that the Swarthmore will eventually supersede all other methods of cup-making, it is so simple." Mr. R. V. Murray, artist for The Root Co., says: "I believe your cell-cups and methods of forming by far the simplest and most *up-to-date* thing out—no fuss, no feathers—as handy as a pocket in a shirt." A large queen-breeder in the South says: "Your plan is O. K., and I shall adopt it. Send full outfit at once. We have succeeded in getting 40 cells out of a possible 40 accepted, several times—and such fine ones, too!" We will send a single sample Fertilizing Box, postpaid by mail, for 25 cts. Queens now ready. We have the Golden-all-over and the much-talked-of Long-tongued stock. Tested, either strain, \$1.00 each, *by return mail*. Send for circular.

The Swarthmore Apiaries,
E. L. PRATT, Swarthmore, Pennsylvania.

Northern Italian Queens

Reared from Imported Mothers.

Our stock is so carefully bred and selected as to secure carloads of honey. Locality free from foul brood and other bee-diseases. Prices: Untested queen, \$1.00; 6 for \$5.00; tested queen, \$1.50; 6 for \$7.50; best imported queen, \$6.00; fair imported queen, \$5.00.

Ada L. Pickard, : Richland Center, Wis.

FOR SALE.—200 crates of two 60-lb. cans each; been used once; in good condition; in lots of 10 crates, 35 cts. each. **FRED W. MUTH & Co.,** Southwest Corner Front & Walnut, Cincinnati, O.

The \$25 Prize

offered by The A. I. Co. for the longest-tongued bees goes to J. P. Moore, Morgan, Ky. He has a queen, some of whose bees show a TONGUE-REACH of 23-100 of an inch. Now, please bear in mind that this is not the *whole length of the tongue* by a good deal. It is the length of *that part only* which extends beyond the mandibles of the bee, and is, therefore, available in securing nectar from the flowers. There are other ways of measuring that would make these tongues show a measurement of 33-100 of an inch, perhaps. This queen is a daughter of The A. I. Root Co.'s \$200 red-clover breeder, and is of the typical leather color. See adv't on page 499.

U - NEED - A GLOSSOMETER.

It measures the actual reach of the tongue of a living bee to thousandths of an inch, also the capacity of the honey-sac; accurate, durable, practical. No rule or magnifying-glass needed. Satisfaction guaranteed. Price \$1.00 postpaid. Send for *Queen Circular*, and learn how to get a glossometer free. High-grade queens of the Sweetheart and other strains at reasonable prices.

The Best Bees.

Much has been said of late regarding the relation of long tongues in bees to their honey-gathering abilities on other sources than that of red clover. In the article contributed to the June Review, by Mr. F. B. Simpson, mentioned in my adv. in the last issue of Gleanings, there appears the following:

"In conclusion, my opinion, based on the above points, is as follows: Whenever a colony of long-tongued bees is superior to a colony of bees with shorter tongues, as shown by the gathering of nectar from red clover, such superiority is due to increased vigor, which (other things being equal) shows that the greater length of tongue is due to increased use of and energy in the use of that member, usually through several generations, it being apparent that it takes more energy to use a long tongue than a shorter one. It naturally follows that in a locality, or at a time when red clover fails to yield nectar, this increased energy of the long-tongued colony will not go to waste, but will be used to advantage in the more rapid storing of more easily reached nectar, regardless of its source. And it is quite pertinent to the subject, that the colony which has given me the most nectar to date, this season, from fruit bloom, contains by far the longest-tongued bees that I have. And this

also is a point in favor of my idea that the best bee is the best, regardless of locality."

The strain of bees that I have been advertising for three years, as "Superior Stock," have not only proved themselves superior by their works, but no bees have yet been reported with longer tongues. Whether they are superior because they have long tongues, or have long tongues because they are superior, makes no difference so long as they are really superior. This is the report that comes from North, South, East, and West. I sell one queen for \$1.50, but I guarantee safe arrival, purity of mating, safe introduction, if instructions are followed, and complete satisfaction to the extent that the queen may be returned any time within two years and the money will be refunded, and 50 cts. additional to pay for the trouble. There is only one way in which you can get a queen for less money, and that is by subscribing for the Review. For \$2.00 I will send one of these queens and the Review for 1901.

W. Z. Hutchinson, Flint, Michigan.

Long-tongue Adel Bees.

From one 3-frame nucleus of Adel bees you sent me I took 213½ lbs. extracted honey.—*Wm. S. Barclay, Beaver, Pa., Apr. 3, 1901.* Queens, \$1 each. Any queen guaranteed to be perfect, and just as good in all respects as any queens at any price. Address

RED-CLOVER QUEENS!

ESTABLISHED 1881.

200 lbs. per colony is our record last season; principally from red clover. Will say that if any one doubts our word, and if you come here and find that our strain of bees don't work in red clover as well as in white I will give you \$100 down. No disease known here. Ten years ago we bought an imported queen from A. I. Root, and we queen our stock with her. The next year we found our bees worked red clover, and so we call them red-clover queens. We use the best queens that money and labor can procure. Our trade has been doubling every year the past ten years. Prices: Untested queens, \$1.00; dozen, \$10.00. Tested, \$1.50. Breeding queens, \$3.00 and up. We guarantee safe delivery. All queens sent by return mail. Our bees are beauties to look at; gentle and prolific; try them. My money-order office is Guernsey. Address

G. R. Routzahn, Menallen, Adams Co., Penn.

HONEY QUEENS!

Leather-colored Long-tongues.—I have a breeder for which \$25 has been offered and refused. You make no mistake in buying her daughters. They are dandies.

Goldens.—The Laws strain is as good as years of patient selection and breeding can establish.

Holy Lands.—These are a deserving race of bees. With two years' acquaintance I find them great workers, with no vindictive traits, easily handled, are becoming popular, especially in South.

The above races of bees are each bred in separate apiaries, and you can get them in their purity. Am filling all orders by return mail, and I sell at the following low prices, with the usual guarantees. Single queen, untested, 75c; six for \$4.00. Tested, \$1.00; six for \$5.00. Breeders, either race, \$2.50 each. Address

W. H. Laws, Beeville, Texas.

If You Want to Secure

a large crop of honey in 1902, stock your apiary with daughters of Moore's 23-100 breeder. See ad. page 499.

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a select daughter of their \$200 queen that they refuse to quote me prices on. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

Prices: Untested, 75c; 6, \$4.25; 12, \$8.00. Select untested, \$1.00; 6, \$5.00; 12, \$9.00. Tested, \$1.00; 6, \$6.00. Select tested, \$1.50.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20-100, \$3.00. Breeders, whose best bees show 21-100, with an average of 20½-100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100, \$7.00.

I have discovered 2 breeders whose best bees show 23 100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2. Imported queens, daughters and grand-daughters. Have just received an importation direct from Italy which has been introduced into this apiary.

Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

**W. O. VICTOR, WHARTON, TEXAS.
QUEEN SPECIALIST.**

FOR SALE.—Italian bees and queens. Untested queens, \$1.00; tested, \$1.25; full colonies, \$4.00; nuclei, one frame with queen, \$1.50; two frames, \$2.00; 1 lb., \$1.00. MRS. A. A. SIMPSON, Swarts, Pa.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldens, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop ink drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

KRETCHMER M'F'G CO., Red Oak, Iowa.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Ferguson Suppers, etc. Write at once for a catalog.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm ly attached to all four sides, the combs ansoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 2.—Three-fourths of the total surface must be filled and sealed.
 No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

SAN FRANCISCO.—To the Trade.—Comb honey, 10@12. Extracted water-white, 6½@7; light amber, 5@5½; dark amber, 4½@5. Beeswax, 25@27. To the Producer.—1c a pound less, and 5 per cent commission. Commission houses charge 1c a pound more than they al on the producer. E. H. SCHEFFLE, June 11. Murphys, Cal.

NEW YORK.—The market for comb and extracted honey remains dull. There is no stock on hand, and but little demand for comb; while extracted seems plentiful, but no buyers in the market at present. Prices remain as per our previous quotations. FRANCIS H. LEGGETT & Co., Franklin, West Broadway, and Varick Sts., June 19. New York City.

CHICAGO.—The new comb honey has not yet reached this market. It would sell at 15@16 if choice white, and the ambers at 12@13. The market is entirely bare with exception of a few cases of a lot that we had held for us, expecting it would be needed. Advices are that shipments will be started by July 1st. Very little trading is being done in extracted, as large dealers will not contract this season unless at low figures. Some sales of amber have been made at 4½ and 5 for early autumn delivery. White is held at 5½. Beeswax sells at 30. R. A. BURNETT & Co., 199 South Water St., Chicago, Ill.

MILWAUKEE.—There is a continued demand for fancy quality comb honey, and if this should fall under the eye of any shipper we advise him to ship to us, as we can make sale readily at this time, and we invite correspondence. Extracted very quiet, and not much wanted. We quote fancy 1-lb. sections, 17@18; A No 1, 16@17; No. 1, 15@16; amber, 13@14. Extracted white, in cans and barrels, 8@9; amber, in same, 7@7½. Beeswax, 25@28. A. V. BISHOP & Co., June 19. 119 Buffalo St. Milwaukee, Wis.

BOSTON.—There is practically no comb honey in our market, and owing to warm weather very little call for it. Are expecting some new comb early next month. Market for extracted dull, and prices nominally the same as last. BLAKE, SCOTT & LEE, June 11. 31, 33 Commercial St., Boston, Mass.

PHILADELPHIA.—It being now between seasons, it is very hard to give an intelligent quotation on honey. Some few sales of extracted honey (new Southern crop) have been made in barrels at 5¼@6. No comb honey in this market, except some old lots which are selling at buyers' offers. Beeswax a little weaker, selling at 26@27. We are producers of honey—do not handle on commission. WM. A. SELSER, June 20. 10 Vine St., Philadelphia, Pa

TORONTO.—There is very little honey in sight. The old is nearly all sold, and there is no new honey yet. Being a little out of season, and to clear out what is left, fancy comb would sell for \$1.80 a dozen; A No. 1, \$1.50; dark, \$1.00. M. MOYER & SON, June 19. 408 Stadia Ave., Toronto, Canada.

DETROIT.—Very few sales of honey, but prices are sustained on good lots. The new crop will start out at good prices, and with little old honey. Beeswax in fair demand at 27@28. M. H. HUNT & SON, June 24. Bell Branch, Mich.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHHEIM, 1318-1324 Union Avenue, Kansas City, Mo.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co., 163 South Water St., Chicago, Ill.

FOR SALE.—Extracted honey from alfalfa; 60-lb. cans at 7 cts., and smaller cans. D. S. JENKINS, Las Animas, Colo.

GRAY CARNIOLANS

We are the largest breeders and importers of this race of bees in America. They are the most gentle bees and the best of workers. Untested queen, 65c; tested, \$1.25; select tested, \$2.25; best imported, \$4.00. Golden Italian queens, same prices. For prices on large orders, nuclei, and full colonies, send for descriptive price list. Address as below.

F. A. LOCKHART & CO., Caldwell, N. Y.

See How Simple.

When a colony swarms cut out some of the best cells, and place them in Swarthmore Fertilizing Boxes; attach the boxes to the outside of the hive, and the queens will mate all in one colony and all from one stand. No fuss—any child can do it. Sample box, by post, with directions, 25c. Queens now ready, only \$1.00. Swarthmore Nursery Cage, 75c. Cell compressor, \$2. Compressed Cells, 2c each—will last a lifetime used over and over. Address The Swarthmore Apiaries, Swarthmore, Pennsylvania.

E. L. PRATT.

Albino Queens.

If you want the most prolific queens; if you want the gentlest bees; if you want the best honey-gatherer you ever saw, try my Albinos. Untested queens, \$1.00; tested, \$1.50. J. D. GIVENS, Lisbon, Texas.

QUEENS! Fine, large, gentle, and prolific; long-tongued; fine reach; either 3 or 5 banded; 75 cents each; six for \$4.25. Try them and be pleased. CHAS. H. THIES, Steelville, Ill.

Queens! I have now some very fine queens for sale, either 3 banded or 5 banded goldens, at the following prices: Untested, 6c; \$4.25; \$2, \$8.00. Tested, \$1.25; 6, \$6.50; 12, \$12.00. Select tested, \$2.00. Golden breeders, \$5.00. We have Root's bee-supplies at Root's prices. We have a special low price on honey-cans. Give us your orders, and I will guarantee you satisfaction. Robert W. Rogers, Hutto, Tex.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

The A. I. Root's Co.'s Office, 10 Vine Street, Philadelphia, Pa.

C. B. Lewis Company, Watertown, Wis., U. S. A.

ILLUSTRATED SEMI-MONTHLY

Published by THE A. T. ROOY CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

JULY 1, 1901.

No. 13.

FOR CHAPPED HANDS or rough face, one part borax, two parts honey, eight parts glycerine, and a few drops of orange-flower water. —*Union Apicole.*

UNDER no consideration use basswood in brood-frames. Use pine, as that will not warp and twist and crawl out of the hive. [You are right, I think. —ED.]

THE STATEMENT is going the rounds in foreign journals that a monument costing \$3000 has been put up in memory of Langstroth. That gives American bee-keepers undue credit. It should be \$300.

DEACON HARDSCRABBLE, in the *American Bee-keeper*, quotes Mrs. Rorer as saying, "Honey is an admirable sweet if taken once in a while with moderation." Instead of taking his with moderation, the deacon prefers to take it with bread and milk.

THE ASSERTION that, when the bees of a colony with laying workers are shaken off the combs at some distance from the hive, the laying workers will not find their way back, Editor Kellen, of the *Luxemb. Bienenzeitung*, says is simple humbug. I guess he's about right.

IN HUNGARY, says the *Leipziger Bienenzeitung*, where tobacco is largely cultivated, at Nagy-Iesca, bees work busily on the blossoms, but thousands of dead bees are found on the leaves, and colonies are greatly weakened. Why don't they offer the bees a smoker to let the nasty stuff alone?

IT IS SAID there is a vast amount of ignorance about "scientific queen-rearing." That hits me. I don't know much about it, and I should like to. If the good brethren who know all about it would take up less space scolding and more in giving information I should have a better chance to learn. ["Scientific queen-rearing"—is that not somewhat of a misnomer? All queen-rearing has to do with science. The word "scientific" in this

connection I suspect more often means "modern" or "up to date."—ED.]

THE RULE that a bee works on only one kind of flower on the same trip is not without exception. I have seen a bee vibrate from one kind of flower to another half a dozen times in half as many minutes, and I've seen a bee busily working on white clover with orange pollen on its legs. [I have seen bees in California work from one species to an entirely different species of flower. If bees work on one flower I suspect that it is because almost nothing else is in bloom.—ED.]

COMPARING the bee with ourselves, we are likely to think of the thorax as containing a considerable portion of the digestive system. Nothing of the kind. All of the digestive system found in the thorax is the oesophagus, or gullet, a narrow tube that runs straight through the thorax to find the honey-sac in the abdomen. Then comes the chyle-stomach, or true stomach, and the small and the large intestine. But the length of intestine is very small compared with that of the human system.

YES, that cover described on page 522 may be just what is wanted. The dead-air space is all right, and it is absolutely essential that the grain of the two thicknesses run in opposite directions. That secured, and the cleats so made that they will not project below the surface, and I see no reason why you have not a cover for all climates. [I find that there is a tendency to use a double cover here on the Pacific coast. Rambler has just shown me one of his, and it is like our cover. It must be a good one.—ED.]

THAT SUGGESTION of E. H. Schaeffle is worth thinking about. It seems pretty well agreed that honey extracted from black brood-combs is not quite as light as that from new comb, and any one may have noticed that when water stands for some time in old brood combs, and is then shaken out, it will be quite black. But I think Mr. Schaeffle is the first to put the two facts together and suggest washing out the combs. Lay the combs flat, fill the cells with water from the rose of a watering-can, then after soaking throw the water out with an extractor.

HERR KRAMER, in *Deutsche Bienenzucht*, speaks of certain American breeders who maintain that it is a matter of indifference whether eggs or young or old larvæ are used for queen-rearing. There must be some mistake about that. I think no American breeder uses larvæ more than three days old, and it is doubtful that a three-day-old larva is as good as one younger, seeing that queenless bees, when given their choice, prefer the younger. [Herr Kramer has misread or mistranslated your article on the subject. It is to be regretted that we do not all have one universal language.—ED.]

COMPLAINT is made by some that, when no queen-excluder is used, the queen goes up and lays in the sections. The curious part is that A says he has no trouble at all, while B has brood in a fourth of his sections. Possibly this explains it: There is no drone comb in the brood-chamber in either case. B's bees have only starters in the sections, and they will build drone comb there, and the queen will come up to lay where the drone comb is. A's sections are filled with worker foundation, and there will be no drone comb there to bait the queen up. [In California, so far as I have gone, perforated zinc seems to be generally used, even for comb honey.—ED.]

RASPBERRY-BLOSSOMS have interested me much. Acres of raspberries are on my place, and Langstroth's mention of the "drooping blossoms that protect the honey from moisture" may be all right for the wild plants with canes 6 to 10 feet long, but here the blossoms are upright. Work begins on these blossoms in the early morning, and I've seen bees on them at 7:40 on a rather cloudy evening. At first I thought no pollen was gathered from raspberry; but patient looking showed one bee among a great many with a small load, and by looking closely in the morning, with glasses, I found nearly every bee had a very small load. This makes me think it must be a mistake that a bee does not gather nectar and pollen on the same trip.

ELIAS FOX raises the question whether drones from laying workers and drone-laying queens are virile. I think it would be hard to prove that drones from laying workers are not all right, but I should not want them. But I should have no fear about drones from a well-developed queen, whether fecundated or not. What change can fecundation possibly make upon eggs that are in no case fertilized? Are not the drones of a played-out queen just the same after the contents of her spermatheca have become exhausted as before? And why should they not be the same before the fecundation of the queen? Of course, that is not positive proof. There was a case in Australia—possibly others in this country—in which positive proof was claimed: a queen properly fecundated at a time when it was known there could be no other drones except those from a drone-laying queen. [If we can make the matter of fertilizing queens in confinement a success we might prove or disprove the virility of drones from laying workers.—ED.]

Jupiter Pluvius reigns this spring,
And gives the rain loose rein;
It comes in cloudburst, shower, and storm,
On city, field, and plain.

BEE-KEEPERS' REVIEW.

H. D. Burrill has a good article on the prevention of swarming. He says, "A good deal may be done to discourage swarming by giving plenty of surplus room, and ample ventilation and shade. Have no queens over two years old in honey colonies."

In my opinion, this (June) is the best issue Mr. Hutchinson ever got out. He either sits up nights to do such fine work or else he studies on his plans after retiring. The frontispiece shows the main street in Flint. It is spanned by several iron arches, each supporting 50 incandescent lights, and these alone add greatly to the beauty of the street, which stretches away into illimitable perspective in the distance; and, what a place for wheeling! the astonishing statement is made that more vehicles are made in Flint than in any other place in the world except Cincinnati, and it is likely that it will soon stand at the head. About 800 houses will be built there this year. They have a thousand-dollar marble drinking-fountain for people, supplied from an artesian well 600 feet deep, all built by private subscription. It seems that what they want they get and pay for it.

The star article is written by F. B. Simpson, on in-breeding. As stated in Mr. Hutchinson's advertisement in this journal, p. 492, Mr. Simpson may well be regarded as an authority on this subject. "If practiced it should be sparingly and with good judgment" is the tenor of the whole article, occupying four and a half pages, every line of which is readable. After speaking of the advantages that have resulted by in-breeding in case of some plants and cattle he says:

Until we can get some absolute proof that these arguments are untrue in the specific case of bee-breeding, it would seem unsafe for any queen-bee breeder to do any in-breeding with the intention of selling the resulting stock; but only as a matter of research until some absolute proof could be obtained by experimental work through several generations of bees. Few queen-bee breeders will consider that they can afford to do even this amount of experimenting in view of the fact that out-crossing has none of the objectionable features in the public mind that in-breeding possesses. One of the bottom facts of in-breeding is, that *nature* never does it unless compelled to.

Concerning bees with long tongues, Mr. Simpson says:

Other things being equal, I want long tongues; but if I were raising my ideal of a bee for sale, the "long-tongue" part of my advertisement would be in smaller type, while with great "scare heads" I would proclaim "Superior Suckers." Above all, I want a bee that can suck and carry as large a load as possible, or else make it up in increased number of loads. To my mind, the long-tongue agitation is too much like treating a *symptom*, instead of the *disease itself*. . . .

Whenever a colony of long tongued bees is superior to a colony of bees with shorter tongues, as shown by the gathering of nectar from red clover, such superiority is due to increased vigor, which (other things being equal) shows that the greater length of tongue is due to increased use of and energy in the use of that member, usually through several generations, it being apparent that it takes more energy to use a long tongue than a shorter one. It naturally follows that in a locality, or at a time when red clover fails to yield nectar, this increased energy of the long-tongued colony will not go to waste, but will be used to advantage in the more rapid storing of more easily reached nectar, regardless of its source.

The last sentence will stand another reading.

Concerning the value of bee-papers to bee-keepers, Rambler makes the following forcible suggestion:

I am acquainted with a bee keeper who owns 600 colonies of bees. I broached the subject of bee-papers, and he said he had not taken a bee-paper for several years; he didn't see that a paper did him a bit of benefit. "Here, I have my bees," said he. "The bees suit me, the hives are right, I know how to extract, and what more can I know about the business that would be of benefit?"

All very well so far. A few months after, I was in one of his apiaries with him and he made a great complaint about getting queen-cells accepted. "Why," said he, "they tear down almost every one I insert; do you have such trouble?"

"Certainly," said I. "Unless I cage the cell." I then showed him how to make a very simple cell-cage by taking a piece of wire cloth about three inches square and working a lead-pencil through the center, leaving it cone-shaped. Now, he might have learned that simple thing a dozen years ago from a bee-paper just as I did; but he had to wait to get it second-hand, and away past date. All the same, it came through reading the bee-papers. And there you are, Mr. Editor. If you arouse that class of bee-men you have a big job on your hands.

A "big job" truly; for all experience shows that men have been as averse to the things that help them as to those that injure. All great inventions have had to plow their way through icebergs of prejudice, especially the steam-engine and telegraph.

BRITISH BEE JOURNAL.

A writer has the following to say in regard to sparrows:

My apiary is situated in the garden, and I noticed after the young sparrows had flown from the nest that they, along with the old ones, spent a good deal of time near the bee-hives. After watching them for some time I noticed the old sparrows perched on top of the hives, and now and again making a dart caught any bee that came near; indeed, they sometimes alighted on the ground in front of the entrance and picked up any poor bee that had fallen down too heavy-laden to reach the alighting-board, and carried them off to where the young sparrows were waiting, and in the midst of great rejoicing devoured them. I will leave you to guess what were the feelings I had to see my workmen so ruthlessly destroyed, and sparrows are now, and ever will be, classed by me among the worst enemies of bees. I regard them as far worse than tom-tits.

These birds should doubtless be destroyed wherever found, just as rats and mice are.

AMERICAN BEE JOURNAL.

In speaking of our national affairs, Prof. Cook says, in his Home Circle:

The entire world looks enviously at our commercial progress. They watch our rapid and increased thrift. They watch our continued and rapidly increasing prosperity with almost consternation. That should make us no less energetic or frugal. It should make them hasten to study our methods, and to adopt our practice.

BOTTLING HONEY.

How it is Kept in the Liquid Form; a Few of the Secrets of the Trade Explained; How to Construct Special Apparatus for a Large Bottling Business.

BY J. R. SCHMIDT.

The bottling of extracted honey for the wholesale and retail trade to supply a market which calls for and wants only extracted honey must necessarily be undertaken on a large scale, and one somewhat larger than most bee-keepers have been accustomed to battle with. Cincinnati, as many know, is a market for extracted honey from the small ten-cent bottle to the 500-lb. barrel shipped in by the carload, and bought by the manufacturer who uses a large quantity of the darker and inferior grades. Then comes the grocery trade, each store with its large or small display of various-sized bottles containing extracted honey of the best looks and the best flavor—the very cream of the bee-keeper's labor. This trade, although not as large as the manufacturer's, is nevertheless a very important and delicate one; for, if the honey is granulated, it is looked upon with suspicion. A shelf containing bottles filled with liquid honey, and one just below it with granulated honey of the same quality, the latter will stand untouched while the former is often sold twice over.

This state of affairs has set Mr. C. H. W. Weber, our Cincinnati honey-merchant, to thinking; for, to be continually replacing honey which granulates so quickly during cold weather, was a task almost impossible, and not at all profitable. Mr. W. follows a plan of putting up honey which he calls the new way of liquefying and bottling honey; and this plan is not only a success so far, after the most severe tests, but also allows the work to be done rapidly and to the very degree of perfection. Through the kindness of Mr. W., who explained every thing in detail, and allowed me to take several photographs, I will try to impart some of this interesting knowledge to the bee-keepers.

This new (?) method is to some extent based on the same principle which our mothers and grandmothers have been practicing for years, and is now still in use, and probably will be through the present century and may be the next one. We all know how much care is taken at home, during preserving time, to have all the jars and cans containing the fruit to be preserved for future use very hot just before they are sealed air-tight. Fruit put up this way in their rich syrup will keep for years, and the syrup will never show the slightest trace of granulation. Now, why can't this method preserve honey in the liquid form? Well, it can do it in this case just as well as in the first. This is Mr. W.'s foundation upon which he bottles honey; and as most of the

BOTTLING HONEY ; FILLING, CORKING, AND COOLING THE BOTTLES AFTER BEING FILLED.

WEBER'S HONEY-MELTING TANK FOR BOTTLING PURPOSES.

honey which comes to him is in the granulated form, this method must be worked on the wholesale plan; for, instead of working with quarts or gallons, we must now consider barrels at a time.

For this purpose a large tank was constructed (see photo) which will easily hold one barrel of granulated honey at a time. This tank is an ingenious affair, and is really two tanks in one. The inside, or honey-chamber, is surrounded by an outer tank made of copper, with a three-inch space between the two for the water. This surrounding water is heated by a gas-stove of special design which also acts as a support for the tank. The height of the water within the tank is registered on the outside (at the left) at all times, and this amount can be increased by turning on the water connection which is shown on the right-hand side. Should the water supply become too great, a turn or two on the small wheel at the bottom of the tank on the left-hand side allows the water to escape into a drain, and it is carried away without further attention.

This brief description, together with a study of the photograph, will give some idea as to how the honey is liquefied.

When the honey has been reconverted into the liquid state, and the register on the tank shows that the proper temperature has been reached (180°), or has been so for at least five or ten minutes, one of the assistants at work allows a quantity of the hot honey to run into the large coffee-pot, which is found to be an excellent article in this work on account of the large lip which makes pouring without spilling an easy thing. Then he immediately proceeds to fill the empty bottles waiting for him at the end of the counter (see photo). The next man, supplied with corks and a mallet, takes the bottles as fast as they are filled, and hammers a cork into each. This method of inserting corks seems rather strange; for, to see him rain heavy blows upon the mouth of each bottle, makes one believe he possesses a wonderful amount of skill to hit the cork every time and keep the bottle from flying to pieces; but upon investigation the whole secret is found to be in the mallet, which is made of solid *rubber*; and any amount of hammering on the bottle would not break it. This mallet does its work well, for it puts the cork in squarely and rapidly, and has never been known to break a bottle. From his hands the corked bottle passes on to Mr. W., who dips the same into a melted preparation of rosin and beeswax, which gives the bottle a perfectly air-tight seal, and also a nice yellow cap, which is in perfect harmony with the light-yellow honey within the bottle; and last, but not least, this cap is cheap.

The bottle next passes to the cooler, who takes the same and arranges the bottles near the large block of ice in order that the caps will harden quickly, thereby preventing air-bubbles from working through the cap, which would leave a weak place in the same, and finally allow air to enter; and the ice also prevents the bottles from accumulating in an unfinished condition on the operating-table.

This part of the operation is not yet perfect-

ed, as Mr. W. intends to have a track built, upon which a small carriage travels, constructed so as to hold about one dozen bottles in an inverted condition, and this carriage is to carry and hold the bottles over a tray of crushed ice. After the caps on the bottles are hardened they are placed on shelves, and afterward properly labeled, and then are ready for the trade, with the guarantee that the contents is strictly pure, and with the assurance that no granulation will take place in the future.

The rapidity with which this work is done is really astonishing. The three experienced helpers can easily bottle one barrel of honey in three hours, or 1200 bottles. The success of this method of bottling honey may be readily seen from the fact that some honey put up and sealed last summer had been kept on ice since bottling, and, after passing through the present winter, is just as clear as it was the day it was put up, and not a case of granulated honey had to be replaced this winter. The whole operation of reliequifying and bottling honey is done right in Mr. W.'s large roomy store, where customers and visitors are always welcome to witness the operation from beginning to end. This, many take advantage of; and when they see a barrel of granulated honey transferred to the large tank (part of which may be seen at the further end of operating-table), and then extracted from the same in the form of thick golden liquid, and, after following it through the various operations until the sealed bottle stands at the end of the table ready to receive the label, little doubt remains in their mind as to the purity of the article, and many leave with the old proverb, that "all pure honey granulates," badly exploded, for they have just learned that "all pure honey will not granulate," which may now be called the twentieth-century revision of what has heretofore been pumped into the ears of the public, and supposed to be a true test for pure honey.

Now, instead of trying to teach people to accept something they don't want, why not spend less time, do less talking, and make more money, by giving them what they *do* want? for, "a man convinced against his will is of the same opinion still;" and if he asks for extracted honey, and you talk him into buying a bottle or a barrel of granulated honey, nine times out of ten he will hesitate the next time, and generally go where he knows he can get what he asks for.

A tank like the one described costs about \$100; but this price depends a great deal on the pocket-book; for \$100 includes a tank made of the very best material, the "made-to-order" gas-stove, and the cost of having the separate hydraulic connection made. In fact, this price could be reduced nearly half, and still would do the same work, but, of course, not so rapidly or conveniently. Probably in a few years, when the good points are known, a tank will be placed on the market for less than half the price, for it may become almost as great a necessity, if not as great, as the wax or honey extractor is to many beekeepers to-day.

Cincinnati, Ohio.

[This is the last of a series of articles on the subject of bottling honey. We believe we have now covered every detail of the *modus operandi* of some of the largest bottlers of extracted honey. Mr. Weber is in the very field so successfully filled by Mr. C. F. Muth. In consequence of the educational work done by him years ago, there seems to be in the Cincinnati market a strong demand for bottled honey, and Mr. Weber is now taking advantage of the situation.]

This we consider one of the best articles of the series, and those who contemplate embarking in the business will do well to lay this journal aside.—Ed.]

NOTES OF TRAVEL.

A Visit with J. M. Jenkins; among the Black People of the Cotton Belt; the Bloody Shirt, etc.

BY E. R. ROOT.

J. M. Jenkins, of Wetumpka, Ala., quite to my surprise, met me at Montgomery, from which point I expected to take another train to his home. After we had exchanged greetings he asked whether I would prefer to wait and go by train or drive across the country through the cotton-plantations with his pony. I chose the latter; but before leaving we took a stroll through the city. We visited the State capitol, in which was held the constitutional convention to consider the question of granting to or withholding the right of franchise from the illiterates of the State. We stood on the very spot, on the stone steps marked by a star, where Jefferson Davis stood when he took the oath of office of the Confederacy; saw the house which he occupied with his cabinet; took several snap shots, and then started on our drive overland through the cotton-plantations occupied and worked by the black people. This ride was to me one of rare interest. As we passed field after field and cabin after cabin with its inmates out in front, I fairly rained the questions upon friend Jenkins. I presume—yes, I know—that I asked many a silly question in regular Yankee style, for I was anxious to know and understand the problem of the colored race from a truly Southern standpoint; for I was sure that we of the North, with our prejudices, did not have all of right on our side. While I can not go into the matter fully here I'll give a few incidents:

After we had gone about a mile out of the city Mr. Jenkins stopped his horse in front of an old colored woman hobbling on crutches. As he did so he said, "Howdy, Aunt Carrie? Stop a minute; we want to talk to you."

She seemed neither surprised nor pleased.

"How old are you?" said Mr. Jenkins.

"Dunno, boss."

"What do you do for a living?"

"Nufun. Gits what I can find."

"How long have you been here?"

"Since 'marcipation."

"When was that?"

"Dunno."

With this Mr. Jenkins handed her a dime,

which she received with the same blank look, without a show of surprise, pleasure, or thanks.

As we drove on Mr. Jenkins explained that a large majority of the "old timers" among the colored people knew no more of their history than this old black woman. The younger generation, having the advantage of schools, are much better off; but in the matter of thanks for favors received, he said they are on about a level with their parents.

Mr. Jenkins, in this connection, told how, one winter, when it was quite cold, he sent around a load of wood to each of his colored tenants free. When the wood was all gone, with one exception they would come back and talk after this fashion:

"Say, boss, that wood you sent is all gone. When you gwine to send some mo?" And this came from able-bodied men who had the privilege of going to his woods and cutting for themselves as much as they liked.

We passed by many and many a cabin where the "man of the house" was loafing, lazing away in a listless sort of fashion in the shade during the best part of the day, when he should have been at work. The cotton-plants, full of weeds, were just at that time needing attention. I fairly ached to spank some sort of ambition into them. Not all the colored men that I watched were thus indolent, but it seemed to me over half that I saw in that stretch of 14 miles were, and those that did work did so in a lazy way.

I saw on many of the plantations trees that were girdled, dead, and standing up like great black shafts.

"Why don't they cut the trees down in the first place, and then dig up the stumps?"

"Because," said Mr. Jenkins, with a smile, "the other way is easier."

About this time we got into the vicinity of one of Mr. Jenkins' out-apiaries; and, as we neared the yard, we could hear the roar of the black bees overhead, busily at work, and in delightful contrast to the way the other blacks worked, and which I have just been describing. Presently we came up to the apiary located in the midst of a thick woods, and bearing the name of Hallonquist yard. It contains 100 colonies run for extracted honey. The hives are well made, neatly painted, and well laid out. The annexed engraving gives a partial view of the yard. The building shown in the foreground is the extracting-house; and the novel part of it is that it is made up of panels so that the house can be taken down at any time, and its panels loaded on to a wagon whenever it becomes necessary to move the yard to some other location. The panels are so neatly joined together that a careful scrutiny of the engraving will scarcely show where the one begins and the other ends.

The bees seemed to be working well, but apparently did not like to have me point my camera in a threatening manner. While I was engaged in picture-taking Mr. Jenkins had found a big snake. I suggested that he put it in front of a hive and see what the bees would do with it. I was not sure but that the act would be one of cruelty to animals; but I eased my conscience by thinking that it was

JENKINS' TAKE-DOWN HONEY AND EXTRACTING HOUSE.

"in the interest of science." Whatever friend Jenkins thought of it, he immediately put my suggestion into effect, and, presto! how infuriated those bees became! Instead of attacking his snakeship they literally poured out (punched) their vials of wrath on our faces. For my cruel suggestion I received no less than five stings around one eye, and broke my glasses in the bargain. By the way Mr. Jenkins was performing, slapping his face and neck, I concluded he was being served in like manner; but, nothing daunted, he kept on "steering" the aforesaid snake with a stick, toward the entrances. Those bees would rush out and make for us. A closer scrutiny (when the bees would give us a chance to see) showed that the skin of the snake was so tough that stings had no effect on it. However, the reptile had no desire to crawl into an entrance. When we found we couldn't get the bees to kill it, Mr. Jenkins dispatched it in the good old-fashioned way, with a stick.

CONSTRUCTION OF HIVE-COVERS AND BOTTOM-BOARDS.

Peculiar Conditions in Cuba.

BY W. W. SOMERFORD.

As time glides along, progress is constantly bubbling up and out to the readers of GLEANINGS, especially through Trade Notes. As "simplicity," cheapness, and durability are essentials to success, I will offer a few observations for Trade Notes.

Covers have often been under discussion. I saw in one of Dr. Miller's Straws that, so long as his "covers came from Medina," even when new, they would continue to be "stuffed with rags." I was surprised to see such a slam from the doctor on the Root hive-covers, as I have read GLEANINGS for more than fifteen years, and distinctly remember that Dr. M. figured very prominently in "the Medina delegation" when it met to discuss and devise a *perfect hive*—a hive without a blemish from top to bottom. The Root Dovetailed hive, with flat cover, was the decision of the Medina commission. I have used said hive since its birth, and am *sure it is perfect*, and especially the flat-cover feature. I have had those same flat reversible covers in use since their birth, and have yet to see the first robber bee go under them. But deliver me from such trash as the Excelsior cover. I had a shipment of them last October. They are now spreading their wings as though to fly, and summer hasn't come yet either. Still it would take a bagful of rags to make them all bee-tight, even to-day. "Unless otherwise specified, this cover will be furnished with *all* our hive combinations." Deliver us!

As the good old Medina flat reversible cover has come for ever to stay, I will discuss it just a bit.

It is easier than the easiest to put together, and will last longer than the longest, because necessarily made of the best material. It will ventilate better than the best by lifting and pulling back just one inch, so as to catch the end cleat on the front of the hive. It will

keep warmer than the warmest by using a top cloth under it. In fact, it is simple perfection. In making you have only three pieces to nail together. In making the Excelsior cover you have six pieces to nail together.

Now comes the question for the poor "bug-man." I say "poor," for I've never known one any other way. The price? That is the question that caused me to write this letter. It is, of course, high, as such lumber runs "in the fifties," and lumber at \$50.00 per 1000 makes dear covers, although good ones.

Now, to cut the price I began experimenting ten years ago with thickness. I tried $\frac{1}{2}$ inch in thickness; found it to be too thin; then I tried $\frac{3}{8}$, and have used them for years. I have just completed 500 of them, and can assure any one that a cover $\frac{3}{8}$ thick is nicer, lighter, and cheaper, by a lot, than the old inch-thick cover adopted years ago. The thinner ones warp with less force. It will last a lifetime, if painted, and never need rags if occasionally reversed. In fact, they are for me a happy solution of the vexed cover question. Now for bottom-boards.

The bottom-board question has troubled me more than the cover question; but I have solved it too, at last. The fact is, I belong to the 90 per cent or more who set bees on the ground, or very close to it, for many good reasons. I find that, the closer to the ground, the better. Why? They are warmer in winter and cooler in summer when standing flat on the dirt. These are facts; and no queens ever get under the bottom-boards and get lost—a big thing here in Cuba, where hives are so often opened to empty them.

A friend of mine, with a 300-hive apiary, said he had the real hive-stand, two railroad irons on the ground, side by side, and 15 inches apart (cost him a lot, though, and had to throw them away very soon, as, in going over with the first extracting after getting over, he found 37 queens out of 300 *black ones* between the rails under the hives, with bees and combs started). The best bottom-boards must have the $\frac{7}{8}$ bee-space, in order to handle big colonies in a hurry, as, with the $\frac{3}{4}$ space, bees don't pile up and clog under the frames when rammed in in a hurry—a very important item. The way I solved the bottom-board question, I began using the $\frac{7}{8}$ side of the Danzenbaker bottom-board—set them flat on the ground, and soon learned that Don Carlos, one of our big tough Cuban grasses, would find the joints in the bottoms, and crawl right up through them, ramming the tight joints out to bee-entrances—a bad thing, too—many of them in the same bottom-board. So I scratched my head, knowing there was not a hive factory in the world that could make of wood a bottom-board to rest on the ground and keep Don Carlos out, to say nothing of decay and wood-eating bugs that are so numerous down here. As I said, I scratched my head, got on my wheel, and started off with a Spanish-talking American bee-keeper, to a tile-brick factory. We soon found the jolly owner, and told him just what we wanted—smooth and straight flat-pressed brick, 16 inches wide by 21 long. He smiled, and said

he had just the "American machine" to make them with, and made them. And, gentlemen, I can tell you now, as I place them on nice flat ridges of earth, it is with a feeling that I shall be grown old and gray before the meanest one begins to even show decay. The man who made them said they would last for ever. Just think of a nice bottom-board lasting for ever, and costing only ten cents! If you have no tile-factory to apply to, concrete or cement will make them—are cooler than the coolest in summer, and warmer than the warmest in winter.

As many wonder why the Hoffman frame has been pushed so to the front, I will explain the matter to my readers. GLEANINGS has an editor of rare ability as an observer, and a hard thinker, coupled with long years of experience and observation in many parts of the country. In contact with the bright lights of apiculture, he knows a good thing for the average bee-keeper at a glance; and the Hoffman frame, for the average bee-keeper, is the only thing for the average bee-keeper. Why? Because, without the Hoffman or a self-spacing frame it is almost impossible to induce beginners to space properly. I have taught bee culture to many, and find they all hang on spacing—can't space brood-combs close enough. The Hoffman frame does it, of itself, and is, of course, the only thing for the beginner, and rightly belongs in the front ranks; and as the old story holds true about the lady who carried a cow on her back, the Hoffman frame to begin with is always the frame. The way the lady came to carrying a cow on her back is this: She lived in a city, and had a little calf given her; and as it was not possible to leave it in the street nights she began carrying it upstairs, and got used to it, so it didn't bother her to carry a cow on her back. The Hoffman frames are the same way—only need to get used to them. I heard a leading light once say that they were beautiful, from the fact that they were absolutely "fool-proof."

Those staples for end spacing, that the catalog shows so plainly, should be driven in at the *bottom* corners of all frames, not at the top corner, as in cuts in catalog. When at the bottom corners you can snatch frames out or in, in a hurry, and not a bee be killed. W. L. Coggs shall is the leader, and user of such staples, and has been for years. Just try them, and you will wonder why any one ever put them at the top corners of frames.

Caimito, Cuba, May 12.

[We are very glad to get any thing of this nature, even if it is in the way of criticism of the goods put out by us or by any other manufacturer. But the Excelsior covers, the Higgsville, the Danzenbaker, and other three and four piece covers, are designed for the average of localities in the United States. But such covers, I am free to confess, probably are not as good as the plain flat board covers for hot and dry climates such as we find in Colorado, California, and even in Cuba; and it is possible that locality may have a similar bearing on bottom-boards. But it is al-

most impossible to get up a cover or bottom board that will suit all classes and all climates; and my impression is that the sooner supply-manufacturers make such covers for special climates, the better it will be for them and for their customers.

If there are any of our subscribers who desire to raise a good-natured "kick," or any other kind of "kick," I hope such a one will be free to let drive his pedal extremity clear into the editorial sanctum of GLEANINGS, which, for the time being, and for the convenience of "kickers," will be found anywhere from Medina to California and return. —Ed.]

MAKING SWARMS.

"Busy at the bees this morning, are you, Mr. Doolittle? Well, I'll hinder you but a few minutes."

"The man who is interested in his calling will always be busy with it, friend Jones; and when his body is not busy with them, as in the case of the bees, his mind will usually be actively engaged in planning for them, or for their future welfare. But what do you wish to hinder me about?"

"Only about two-thirds of my bees have swarmed, and I wish to make the rest swarm, and done with it; and what I want to know is, how best to do this."

"Many plans have been given in the past to make swarms of bees, other than by natural swarming, those advocating these plans believing that the apiarist could make his swarms to better advantage to himself, if not to the bees, than to have them swarm as their instinct directs; and from this cause many modes of artificial increase have arisen without much, if any, reference to the laws which govern natural swarming and the general economy of the hive, thereby causing a failure to a certain extent."

"Are there any special laws that govern bees in swarming? I thought they came out hap-hazard, just as each one feels at the time."

"I do not think there is any hap-hazard work in this matter. Evidently, the same laws that governed bees in their primitive state govern them now; and in all of the various operations conducted in the apiary, the bee-keeper should conform to these laws as nearly as possible, if he wishes to be a successful apiarist in the fullest sense of the word. A plan for making swarms, to be successful, must carry with it the taking of bees of all ages, and making them stay contentedly where put, the same as does a natural swarm."

"Do you think that necessary? My old neighbor, Smith, claimed that it was mostly old bees which went with the swarm."

"Many think that way; but after careful

observation, covering a period of 30 years, I am sure that bees of all ages, in about equal proportions, go with a prime swarm; and when any plan for making a swarm arises which compels the old bees, or field-workers, to become nurse-bees and perform the labors which, when the bees are in a normal condition, devolve on the young bees, we should not adopt it."

"Have you a plan which you consider meets all of the requirements of the laws governing the hive?"

"I think so, or, at least, as nearly as may be."

"Well, what is it?"

"Have you any queen-cells on hand?"

"I suppose there are plenty in any of those hives which have swarmed during the last week."

"You will see why I asked about the queen-cells before we get through. Now to the plan: Take a box holding from three pecks to a bushel, and place it on a wide board a few feet from the hive you wish to make the swarm from, raising the front edge on a little block, enough so the bees can run under. Now open the hive you wish to make the swarm from, and find the queen, caging her on one of the combs, when all the frames are put back in the hive again. If you do not see plenty of unsealed honey, uncap some along the top-bars of the frames and close the hive. Now blow in quite a little smoke at the entrance of the hive, and rap on the sides of it as you would in driving bees, rapping at intervals, and leaving the entrance open so that the bees returning from the fields may enter the hive. In from five to eight minutes open the hive and take out the frames and shake the bees in front of the box, and thus continue till you get at least three-fourths of the bees in the box. When you come to the frame which has the queen on it, place her at the entrance of the box and let her run in with the bees. When you get the desired amount of bees in the box, put the frames back in the hive and close it."

"Why do you run the bees into such a box instead of into a hive all prepared for them?"

"If you will not be impatient I will tell you so you will see the reason. Now, we will suppose that you have three-fourths of the bees, and the queen in your box. You are next to take the box of bees to the shade of some tree and lean the box against the tree in an inclined position, with the open side of the box outward, leaving it there three-quarters of an hour, at which time you will find them clustered in the upper part of the box as they would be on the limb of a tree, if they had swarmed naturally. During the three-quarters of an hour, if you have more to make, keep on making from other hives in the same way. At the end of the time, hive the bees that are in the box the same as you would hive any natural swarm. Put the hive on the stand you wish them to occupy, and see that all of them go into the hive, and they will stay and work the same as a natural swarm would."

"Then this leaving them the three-fourths

of an hour with the open side of the box out is to make them think they have left home, so they will mark their location as does a swarm?"

"Exactly."

"I see now why mine would not stay when I shook them into a hive. But what about what is left in the old hive?"

"The next day after making such a swarm, give the old colony a queen-cell from one of the hives you say have such, giving cells from the colonies which have those the nearest ripe, and the work is done. If you have stopped to think as we went along you will see that you have bees of all ages in your made swarm, just as there would be in a natural swarm, and that each bee has its sac full of honey the same as they do when they come out themselves, the drumming causing them to fill themselves full more completely than they do when swarming. By being left three-quarters of an hour to cluster in the box they mark their location anew, the same as a natural swarm, as you expressed a few moments ago."

"But is the old colony in as good condition as if it had swarmed naturally?"

"I think so, fully, and more so; for in natural swarming the first young queen does not emerge from her cell in less than seven days, unless the swarm has been kept back by bad weather; while with our made swarm, and a ripe cell being given, they will have a queen in two days from the time of making. If preferred, and you have them, a laying queen can be given to the old colony."

"Why would not this be a good plan to work an out-apiary, where there was no one to take care of swarms when they issue?"

"It would. And it is equally adapted for those who can not be at home between the hours of 8 A. M. and 4 P. M. to care for their bees when swarming naturally."

"Well, I have bothered you long enough, and think I understand how to work. Good day."

CROWFOOT AS A HONEY-PLANT.

In our locality it grows extensively, and I think it produces a nice lot of honey when it is the most needed, as it comes right after fruit-bloom and dandelion, and lasts from about May 10 till white clover comes.

Rohr, W. Va.

W. D. KEPHART.

ABSCONDING SWARMS.

I am a beginner in bee-raising. I had a swarm of bees Monday. It clustered on a limb of a tree. I cut the limb and laid it on the ground in front of the hive. After they entered the hive I set it with the rest of my hives, and they worked like little men on Tuesday, making 3 combs about 5 inches around, and on Wednesday morning not a bee

was remaining in the hive. Another colony sent out a swarm Tuesday, clustering on a limb. I hived them half an hour afterward, but they left the hive and entered the old hive. On Wednesday they swarmed again. I stopped them five or six rods from the hive, and they clustered on a limb. I cut the limb, and laid it on the ground in front of the hive. They all entered at 10 o'clock in the morning; by 7 o'clock in the evening not a bee remained in the hive. How would you account for such an occurrence? they were all large swarms. CHRIS. KINSEL.

Dysart, Iowa, June 13.

[Such a case as you mention happens occasionally, although not very often. If you have the A B C of Bee Culture you will notice we recommend giving every new swarm a frame of comb containing a little unsealed brood. This unsealed brood will almost invariably hold the colony in any new hive. Sometimes the bees desert the hive because it is put right out in the hot sun. It is possible that the queen was missed in one of the cases you mention; therefore the bees left the hive as soon as they discovered she was not with them; but in such a case unsealed brood would hold them just about as well as the queen. In practice I should give every swarm put into any hive at least one comb containing brood. Then they will stay, no matter whether they have a queen or not; and if they have a queen, she will go to laying at once; and I think they always work better if they have the comb. Another thing, if this brood is present you will know at once when the queen is missing by finding queen-cells started inside of a few hours. Thus you see, unsealed brood, be it only a little patch in the comb, renders it unnecessary for you to get sight of the queen at all to be sure she is with the bees.—A. I. R.]

CANDIED COMB HONEY; USING SECTIONS CONTAINING CANDIED COMB HONEY.

I meant to drop you a line before, bearing on the position taken by Doolittle with reference to the use of sections containing candied honey, but have, as usual, been too much rushed to spare time for the purpose. I wish to say here that I am greatly astonished at such teaching from such a source, and wish to enter an emphatic dissent to the views expressed in the article referred to. I will say that I have had occasion to handle a great many lots of honey in past years, containing sections having more or less old and candied honey in the combs, and there is no question that either this honey does not become liquid to any extent while on the hives, or else it recandies (as one would naturally expect), after removal; and as the sale of such honey on a city market does as much as any one thing to prejudice purchasers against the use of comb honey (as they are quite sure to regard the presence of the candied part as a sure proof

of the impurity of the goods), the practice in question certainly can't be too strongly condemned. B. WALKER.

Battle Creek, Mich., May 10.

AN IMPROVED DRONE-TRAP.

The inclosed drawing is a queen and drone trap that I have made. I work my hives for extracted honey, so of course I do not have any swarms—at least not for the four seasons I have owned bees. It catches the drones all right, from the fact that, in their first flight, they do not discover the side entrance, but go toward the light in the front of the hive. I have concluded the queen would do the same. The field bees (the majority) use the side entrance as an exit too. They are not bothered with the perforations, and the pollen is not brushed off their legs. In comb honey it

FRICK'S QUEEN AND DRONE TRAP.

- AA, entrance.
- BB, wire cloth.
- C, guard.
- ED, trap for drones.

would send them up the sides into the super, which, I understand from your journal, is an important factor. HENRY N. FRICK.

North Wales, Pa.

[The object of this improvement, as I understand it, is to make it unnecessary for the field bees to go to and fro through perforated metal. To accomplish this the incoming bees go through that part of the entrance (the two sides) that are not obstructed at AA, pass under the wire cloth BB, finally reaching the orifices at the corners, or as indicated by the arrows in Fig. 2, and by A in Figs. 3 and 4. The drones and queens would, of course, rush for the first time (as do the workers also) toward the light, and there would be barred by the perforated metal, when they would be trapped by the cone opposite E in Figs. 3 and 4. The workers soon learn the trick of going through the unobstructed way, and, of course, would not pass the metal.

The objection to this trap is that of expense and the difficulty of fitting it to various styles of hives. After all, the regular Alley trap will be just as good and much cheaper. If the perforated metal is of the Tinker style the bees can pass it with little or no hindrance.—ED.]

A NEW DRONE-TRAP.

If you want a perfect drone-trap, cut a saw-kerf in the side-bars on the deep side of the Danzenbaker bottom-board, an equal distance from the edge and bottom-board proper; tack some $\frac{3}{8}$ -inch strips to the bottom-board, and slip a sheet of perforated zinc in the saw-kerf, and allow it to rest on the strips. Turn the end of the zinc up and tack it to some blocks on the front of the hive, and set an ordinary drone-trap, minus the bottom part, over it. The drones will escape through the upper entrance thus formed, while the one next to the bottom-board will be left free for the exit and entrance of the workers. There will be no danger of clogging or suffocation.

An ordinary excluder placed on a bottom-board with an entrance above and below the excluder, with a drone-trap adjusted to the upper entrance, removes the objectionable features of a drone-trap so far as the trapping of the drones is concerned, and does not interfere with the progress of the workers at all, further than forcing them to pass through the excluders.

W. H. PRIDGEN.

Creek, N. C.

BEE-KEEPING IN OKLAHOMA.

Mr. Root:—Did you know there were beemen in this new country, and that the business is growing? Two years ago I had the only bees in this neighborhood; now there are some ten or twelve men keeping bees. Our honey is from sumac and cotton. You no doubt know what it is—white and light amber—and it sells as well here as the alfalfa honey that is shipped in. My average, last season, was 66 lbs. per colony, spring count. The season is somewhat backward. Bees are just beginning to swarm, which is about ten days later than last year; but I hope they will make up the lost time.

F. W. VAN DE MARK.

Ripley, Okla., June 6.

SWEET CLOVER FOR HAY, ETC.

Is melilot, or sweet clover, of any value for hay? and, if so, when should it be cut? Can it be cured sufficiently to mow away? I have several acres in my pastures, and this wet weather of the past few weeks has pushed it till no grass will grow beneath it. Stock will not eat it green; but mules and hardy Canadian horses are said to relish the hay made from it.

S. S. FETHEROFF.

Era, Ohio, June 10.

[Friend F., you evidently have not been reading GLEANINGS very long, for this matter has been most fully discussed for several years past. Horses and cattle, after they have once acquired a taste for sweet clover, either green or cured, as a rule prefer it to any other

kind of hay. If cut before it gets tall, so as to be hard and woody, it makes the best kind of hay that I know of for all kinds of stock; and I can not remember that I have ever seen any stock that would not eat it when thus cured. See pamphlet we are mailing you, free of charge, that tells all about sweet clover.—A. I. R.]

WHY DID THE SWARM GO OFF TO THE WOODS?

I had a swarm issue June 17, with a clipped queen. I caught the queen, and moved the old hive away—set a new one in its place with starters. The bees settled close by. I had every thing ready. I gave the cluster a little smoke, and they started back. I put the clipped queen at the entrance, and she went in. The next day they came out again, and I picked up the same queen and caged her; but the bees did not stop—they went to the woods. Do you think they had two queens in the hive?

WM. FOX.

Longwood, Wis., June 19.

[This case is evidently one where there were two queens in the hive—mother and daughter. At this season of the year this thing is not so very unusual. The clipped queen was getting old, and the bees had reared another, and both were very likely laying eggs right along together. Of course, the bees did not care particularly for the old queen, so they went straight for the woods, where they had probably selected a home some days before the swarm came out.—A. I. R.]

HATCHING DRONES FROM QUEEN-CELLS.

Before it slips our mind, we desire to report the hatching of a perfect drone from a queen-cell. Cell was cut from a comb of a choice colony of Italians, and placed in a queen-cell cage, the same being put into a nursery. I do not remember seeing or having any thing of the kind happen before, and so thought it worth while reporting. There was no chance of a slip twixt cup and—in this case.

H. G. QUIRIN.

Parkertown, Ohio, May 21.

A GOOD REPORT.

There is one of the finest honey-flows here now that we have had since 1897. In fact, the white clover lacks but little of being as plentiful as it was then. But I find a great many more bees on red clover than on white. The honey is just rolling in. I have a good many colonies with the second super on. I commenced to raise the first super up the 15th of June. Basswood is going to be simply grand.

CHAUNCEY REYNOLDS.

Fremont, O., June 21.

Half of the bees or more have died here, and in near-by towns, where they have been wintered out of doors. The season was wet and cold up to June 1. We have now had a few fair days, raspberry just beginning to bloom. Bees have commenced swarming where they have wintered well.

N. D. WEST.

Middleburgh, N. Y., June 7.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chapinville, N. Y.; J. M. Hambaugh, Escondido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

In the *American Bee-keeper* which has reached me on the fly I see that Editor Hill has replied to the editorial on page 476 of GLEANINGS regarding the matter of high values on queens. While I differ on many of his points, there is one on which I feel constrained to acquiesce; viz., that, if one owner of some really valuable queen places a high value on her, other breeders, perhaps less scrupulous, may put equal or higher values on breeders comparatively mediocre or even poor. As the matter is liable to abuse we have decided to place no values on breeders which we propose to keep and will not sell. But queens from such choice stock, best we have, we may hold all the way from \$10.00 to \$25.00.

THE BEES AND PEAR-BLIGHT IN CENTRAL CALIFORNIA.

On the train to San Francisco, June 21.

It has been charged by the fruit-men at Hanford, Cal., that bees are responsible for pear-blight through the medium of the blossoms in the spring. There were threats of the law and of the poisoning of the bees. As an officer of the National Bee-keepers' Association I was asked to come and investigate, which I did. Result, a truce was declared, and a compromise agreed to pending an investigation. For the time being good feeling on both sides prevails. Full particulars later.

E. R. ROOT, *Pres. N. B. K. A.*

"GO WEST, YOUNG MAN."

THIS is sometimes good advice and sometimes it is not; but there are many locations for bees in the South and West not yet occupied. These are *not* in fields already occupied by bee-keepers, and generally overstocked, but in new locations about to be irrigated. As fast as enterprise and capital can move onward, places now desert that will hardly support jack rabbits and coyotes will be converted into veritable gardens of Eden, raising the richest vegetation of the tropics. I have seen many such places during the last few days on my travels, that, fifteen years ago, were barren wastes with very scanty vegetation, but are now growing alfalfa, great trees, oranges, lemons, peaches, pears, and a long list of luscious fruits too numerous to mention. The fields already occupied by bee-keepers are, as

a rule, overstocked, and no one should go into these territories without buying some one out.

Now, don't think that I am interested in some new tract of land for myself or any one else, for I am not. One who goes west should be very cautious, for many a poor man has been fleeced by the land-sharks that are all too numerous. I'll have more to say on this subject later, and until then the prospective home-seeker had better go slow if he is following in the wake of my travels.

THE MAGNIFICENT DISTANCES IN CALIFORNIA.

THERE are "magnificent distances" in California. On the ordinary map it *looks* as if the town of one bee-keeper in the State might be close to that of another; but when one gets here and finds that they may be two or three hundred miles apart, he concludes that he won't visit both in the same day—at least that has been my experience. While I was traveling through this State of the setting sun at home, "on paper," I saw, for example, that one bee-keeper whom I desired to visit from a central point where I expected to make my headquarters was "only over in the next county," and that I could easily, in imagination, wheel out to him in a few hours. Well, when I got here, and found that he was 200 miles away, and that some eastern States could be spread out inside of one of these California counties—yes, two of 'em—well, I stood aghast. My time was very, very short, and my pocketbook ever so small. I say this in apology for not calling on some of my friends along the route. The same thing was true of Texas, and, for a like reason, I missed seeing several whom I had planned to meet in the Lone Star State. I shall make between five and six thousand miles, all told, among the bee-keepers of this great, great West; and, although I have made many stops, and kodaked as many apiaries, I still find that there are very many that I ought not to have missed.

This is written while I am stopping with Rambler at the home of J. C. McCubbin, Reedley, Cal.

CHARACTERISTICS OF BLACKS AND ITALIANS.

ONE of the few who prefer black bees is C. Davenport, although he calls them "brown" bees, and says there is as much difference in brown bees as there is in Italians. In the *American Bee Journal* he gives his reason for preferring the dark bees, a preference based on years of experience on a large scale with both kinds side by side. That experience teaches him that he can secure more surplus white comb honey in his locality with the brown than with Italians. He says:

"The main trouble I find with Italians is their determination to stuff the brood-chamber at the commencement of the flow, and I have never been able to overcome this trait. And then, after they have put anywhere from 15 to 30 pounds of white honey in the brood-chamber which should have been in sections, instead of then being willing to work in sec-

tions they are usually determined to swarm." In this respect he thinks the brown bees better. It would be very interesting to know whether other localities or other management would lead to the same conclusion. Certainly there are fine crops of comb honey secured by Italians. What makes the difference?

As Mr. Davenport avowedly prefers and keeps black bees, his testimony in favor of Italians should have weight. He says:

"For extracted honey I prefer Italians. They will gather more honey, go a greater distance, and protect their hive and combs from the ravages of the moth-worms much better than will brown bees, and this is no small matter in my locality.

"Some claim that moth-worms never injure strong colonies of any kind of bees; but this is a mistake, for the combs will be injured, and hundreds of eggs, larvae, and hatching brood, will sometimes be destroyed here by moth-worms in strong thrifty colonies of brown bees."

RED CLOVER — HOW IMPORTANT IS IT?

THE desire to obtain the nectar secreted by red clover is one of long standing; and the common impression is that a very large quantity of nectar per acre would be secured from it if the flower-tubes were not too deep for the reach of the honey-bee. Latterly some discredit has been cast upon red clover as a honey-plant, even supposing that all its nectar could be secured, by the fact that it is not a plant of universal cultivation.

There are a few plants that yield an enormous amount of nectar; but as they are kept only in greenhouses, averaging less than one plant to the acre, they are valueless from a bee-keeper's standpoint. If, however, any good honey-yielder were widely distributed in dense quantity over a single State, then it would assume some degree of importance. The buckwheat crop of the State of New York would be no trifling matter, even if not another acre of buckwheat were found elsewhere in the United States. If it were possible to obtain certain bees that would double the buckwheat-honey crop of New York, the amount of money gained by that would warrant no small outlay. Is it not possible that there are single States in which the nectar secreted by red clover would amount to several thousand dollars?

But is red clover confined to a rather limited area? It would be interesting to know just what is the average acreage. Lacking that, some estimate may be made from the amount of clover seed raised. The government statistics give us the figures, and it is probably safe to infer that by "clover seed" is meant that from red clover. According to the last census available, that of 1900, an amount of clover seed, large or small, is given as being raised in every State and Territory of the United States except Montana and Wyoming. Certainly that shows that it is not confined to so small an area as some suppose.

The North Central division leads with a product of 2,544,864 bushels. The South Central comes next with 77,783 bushels; the North

Atlantic, 71,128 bushels; So. Atlantic, 35,155 bushels; Western, 24,250. Total, 3,753,180 bushels.

That shows a very unequal distribution; but the distribution of the growing plants is by no means what the figures would indicate. From the States that are the greatest producers, as New York and Pennsylvania, large quantities are exported, and, of course, other States import, thus making the acreage grown in the different States much more uniform than the amount of seed produced.

If all the seed raised is sown again — and it is not likely that it is ever used for any other purpose — and if a peck of seed is sown to the acre, it would cover a little more than eleven millions of acres. To speculate as to the amount of honey that could be obtained from this acreage would be outside of the present inquiry, and it is doubtful as to there being sufficient data to justify any thing like a reasonable estimate. It is only desired to show that the aggregate of red-clover territory is no trifling affair, and that it is widely distributed.

BEE-KEEPING AS A SOLE BUSINESS.

ONE of the questions likely to occur to every young bee keeper who has made a substantial success with a few colonies of bees may be worded in some such terms as the following: "Can I make a good living at bee-keeping alone?" On this account comes very frequently the question as to what may be depended upon as the average yield or profit from a single colony of bees, or the question, "How many colonies of bees shall I need so that I may depend upon them alone for a living?" — questions which no man living can answer definitely.

C. Davenport gives the matter some discussion in the *American Bee Journal*, and settles the question as to whether one can make a living at bee-keeping alone by saying he *has* done it. But he says his is a good locality, and that he has no wife or family to support, and adds, "While I would not advise a young man to take up bee-keeping as a lifework, in my opinion there is no question but that a living can be made at it in a good locality if one understands the business."

While he may be entirely right in this, there are those who would not be in accord with his ideas when he says, "If I had my life to live over I would not be a bee-keeper; for I believe the work I have done to make what might be called a success in our pursuit would, in some others, have resulted in better success financially, and also in other ways." It is just possible that, if Mr. Davenport could live his present life through, and then live another life without bees, in some business at which he could make more money, he might give his judgment as follows: "I must say that, after having lived the two lives so that I am now able to judge between them, I prefer the bee-keeper's life, which, although giving less opportunity for amassing wealth, gives one the opportunity for a greater amount of happiness."

Taking the expressions of some of the veterans who have been in the business many years, we might suppose one of them near the close of life to express himself as follows :

"Judged from the standpoint of those who measure success in life only by the amount of wealth accumulated, my life has not been a great success. Folks compare me with my brother John, and have a feeling for me akin to pity. John and I started life with equal chances; and, if I may be allowed to judge, John had no more business ability than I. He went into merchandizing, and devoted all his energies to making money. He said he did not care for money, only as it would allow him to have something he could enjoy; and when he got enough he would give up the drudgery and enjoy life. But somehow he kept on piling up more and more, turning his business talents in this direction and that; and although to-day he could buy and sell me many times over, I don't believe he enjoys life any better than I. I have all I can eat, and that's all he has in the way of food. He may buy dainties that I can not afford, but his dyspeptic stomach will punish him for eating them; and, having spent so much of my time outdoors all these years, I have a hearty appetite that makes me relish plain and wholesome food more than he relishes dainties. The great difference, however, between John's life and mine is that, in the past years, his has been one of continual drudgery, and mine has been one mainly of enjoyment. I've had my good times as I went along. Working at the bees has been just as good sport as going hunting or fishing, and it's a sport of which one never wearies. So you see my playtime has not been something to look forward to in the future, but something I've had all along. No, with all his wealth I wouldn't swap places with John."

Some one may say, "That's very pretty talk; but my experience has been that there's hard work in bee-keeping, and lots of it." Sure. But isn't there hard work in nearly all kinds of play? Do you work any harder at bee-keeping than you do when you hunt or fish all day? Do you begin to work as hard as the man who plays ball till he is as red as a beet in the face, and is so sore and lame at night that he can not lie still?

AS TO EDITORS OF BEE-JOURNALS.

It seems to some a matter of reproach that editors of bee-journals are not completely informed on all topics nearly or remotely connected with the subject of bee-keeping. On page 382 Arthur C. Miller complains of the silence of the text-books and the ignorance of editors as to the laws of heredity and the principles of breeding; and now F. L. Thompson, in *Progressive Bee-Keeper*, takes up the refrain at still greater length. This reproach against the ignorance of bee-editors does not seem to be bitterly resented by at least one editor, for the editor of *Progressive* makes no word of reply, and it is not likely that any other will attempt to deny the charge. No one is more likely than the editor of a bee-journal himself to be conscious of his need of

information; and the reproach that he has not yet learned all that is to be known about bee-keeping is likely to strike him much as would the reproach that he has not strength to live on without eating.

The mistake that Mr. Thompson seems to make is in supposing that editors of bee-journals pose as the repositories of all knowledge on the subject of bee-keeping. If bee-keepers had any such view, then their journals would be made up entirely of editorials. But at the present day no bee-journal is conducted on any such line. Instead of being filled up entirely with what the editor has to say, the bee-journal of the present day seeks contributions from all quarters. If any bee-keeper has had special opportunity for becoming particularly well informed on some one subject connected with bee-keeping, contributions from him upon that subject will be eagerly sought. Instead of a bee-journal being a mouth-piece through which one man seated on a pinnacle may deal out wisdom to the common herd below, it is, rather, a clearing-house through which may pass in exchange the gathered wisdom of all.

Still greater is the mistake that a bee-journal should seek to repress knowledge upon a subject with which the editor is not entirely familiar. Having learned that an article having some reference to the matter of scientific queen-rearing had been sent to appear in the columns of this journal, Mr. Thompson says, "I fear that either it will never get there, or, if it does, it will be accompanied by a crushing footnote, written more in sorrow than in anger." If he will turn to page 382 he will find the article in question, with a footnote not at all "crushing," containing neither sorrow nor anger. So far from that, he will be rejoiced to find the footnote only commendatory, saying, "Bee-keepers have much to learn from the breeders of other fine stock," and his joy will be increased to find that sufficient progress has been made to commend heartily in-breeding on the lines indicated. No, the bee journal that seeks to repress knowledge that may benefit bee-keepers in general would be committing suicide. The watchword with all should be, and probably is, "Let there be light."

R. WILKIN—CAREER OF A REMARKABLE MAN.

R. WILKIN, whose death occurred just before the writer reached there, was one of the pioneer bee-keepers on the Pacific coast, going to California in 1875 with a carload of bees, and subsequently settling in the Sespe Valley.

His first experience with them was in helping to prepare a shipment of bees for Mr. Harbison, who was then about to leave Pennsylvania (where he was then residing) for California. This was some time in the early '50's; and the result of this venture, and how Harbison subsequently came to be the great bee-king of California, owning and operating at one time some 6000 colonies, are matters of history.

Mr. Wilkin began keeping bees while he

was at Westminster College, Pa. The next we know of him in connection with bees was at the county fairs of Northern Ohio. On these occasions he astonished the natives by having a swarm of bees hanging from his hat and beard. This series of remarkable feats was accomplished by having a queen caged under his chin; and as long as she remained the bees continued to hang from his head, to the wonder of the aforesaid natives. It is not told that he was ever stung, except on one occasion, when he says he very foolishly attempted to put some of those gentle, fly-like bees in his mouth. The incident resulted in his being stung in the throat, and from that time on he never attempted the feat again.

At this time Mr. Wilkin's home was at Cadiz, Ohio. From this point he attained considerable celebrity as a bee master; and so many were the questions that were plied him that he finally, to answer all, wrote a book of 100 pages, entitled "Hand-book on Bee Culture," which at the time, 1871, had a considerable sale.

Just what induced him to go to California is not stated. Possibly the success of Harbison, who had preceded him, had much to do with it; but after he had gone to the coast in 1875, with his family and a carload of bees, and had produced those enormous yields of sage honey in the now celebrated Sespe Apiary, his celebrity, which had hitherto been only local, was made world-wide. Here he produced honey by the carload, and sold in the London markets for a number of years.

His largest yield was in 1884, when he produced from his Sespe Apiary 60,000 lbs. of honey. The largest number of colonies he had in this yard at one time was 700. Such a number managed profitably, in one apiary, seems, to an Eastern bee-keeper, almost incredible. But to one who has just come from the location, as I have, with its great mountains on every side, and the orange groves in the valley, the number does not seem so impossible of belief after all. Indeed, to see is to believe.

In later years the Sespe Apiary has been occupied by his son-in-law, J. F. McIntyre; and during all the years this location has supported on an average 500 colonies.

Mr. Wilkin, even up to the time of his death, retained a deep interest in bees; and, though his success in life had been such that it was no longer necessary for him to work, yet at the time of his death he was managing an apiary at Newhall, Cal., some 450 colonies, I believe.

A few days before his death he had sent me a pressing invitation to visit him, saying that, although he had got to be an old man, there was much that he wanted to talk to me about on bees, and it was with no little surprise and sorrow that, on arriving at Los Angeles, I learned of his short illness and death.

Although well advanced in years, when most old men lose interest in the business of a lifetime, Mr. Wilkin retained all the enthusiasm of youth. His love of bees seemed to be as strong as ever; and even up to the last days his mind seemed to possess all the vigor

of his earlier years. A college graduate, it is said of him that he was "a close and profound thinker."

His daughter, Mrs. McIntyre, who had been called to his bedside at his last illness, told me recently that he seemed to count much on my visit, and at the time had no thought but that he would get well. Among other things he told her that, when I came, he would show me some old brood-combs that he got of Adam Grim that were 30 years old, and which at the time were still in use, rearing bees that were full size. Evidently he had no faith in the late dogma that old combs raise small bees, and should, therefore, be melted up.

Mr. Wilkin was twice elected President of the California State Bee-keepers' Association, and in all the doings of that organization was a prominent and conspicuous figure. There

R. WILKIN.

is many a present-day bee-keeper in the State who will remember the kindly services performed for them by our departed friend; and although he is gone he will not be forgotten.

N. B.—For the main facts of this write-up I am indebted to his daughter, Mrs. McIntyre, who, I judge, must, in years gone by, have been an efficient helper to her father. At a later time I shall have occasion to refer to my visit to the McIntyre's, all of whom, including the baby, are bee-keepers, from the ground up.

This is written on the train, *en route* to Fresno, Cal., and if Mrs. McIntyre finds any inaccuracies it will be because this jiggly-joggly train has jiggly-joggled my memory.

And the nations of them which are saved shall walk in the light of it; and the kings of the earth do bring their glory and honor into it. And the gates of it shall not be shut at all by day; for there shall be no night there. And they shall bring the glory and honor of the nations into it. And there shall in no wise enter into it any thing that defileth, neither whatsoever worketh abomination, or maketh a lie; but they which are written in the Lamb's book of life.—REV. 21: 24-27.

Years ago I said in these Home Papers that Revelation was a very hard book for me to understand; but I have said at different times, also, that, as I grow older, the book seems to unfold—at least certain parts of it. A few days ago we had a certain portion of this book for a Sunday-school lesson. In our morning reading I frankly acknowledged to Mrs. Root that I could not understand or explain it. I said further that the explanations given in commentaries and by doctors of divinity did not seem to me the correct ones. I felt somewhat encouraged later on to find that one of the very best lessons—helps I know of said substantially the same thing—that there are so many differences of opinion, even among learned scholars, as to the real meaning of certain passages, that it was very likely no one had as yet struck upon the true meaning. Skeptics might throw it up to us that a great part of our precious Bible no one could understand, and perhaps no one ever would understand.

Well, even if this is true, there are passages all along through the whole Bible, and even in the book of Revelation, that are so much in advance—so far superior to any words of any other book ever written, that we have at least very good reason for believing the Bible to be divinely inspired, or, if you choose, for believing it to be the work of God and not of man. The words that I have put at the head of this talk, from the next to the last chapter of Revelation, form one of these wonderful and beautiful passages. The description seems to be of the holy city. The first words, about there being no darkness and no night, would indicate it would afford no harbor for those who love darkness rather than light. The next verse tells us that this city is so great in area that *nations* shall walk therein; and we are told the gates of it shall not be shut at all by day, and that there shall be no night there. It is a pleasant thought about the gates being always open; and, in fact, we may suppose there is nobody there, outside or inside, to be kept out. I suppose there are no policemen there, for everybody *wants* to do right. The glory and honor of all the nations of this earth shall be brought into this holy city. The last verse is the crowning one of all, the cappingstone of the citadel—"There shall in no wise enter into it any thing that defileth; neither whatsoever worketh abomination or maketh a lie." I can imagine how the average man of the world who never gives much thought or attention to the Bible or Christian-

ity would receive any such statement. He would probably laugh and jeer at the idea; and if he would tell you the whole truth that lies right down at the bottom of his heart I do not know but he would say he did not wish to live in any such place. Such a state could be congenial only to those who love righteousness and hate iniquity.

Some might ask, "When is all this coming to pass? when shall we have that new Jerusalem?" I for one do not know. I know it is coming, for the Bible tells us so. Its promises are scattered all through, from the first page to the last. We are told in substance, over and over again, "Blessed are they which hunger and thirst after righteousness, for they shall be filled."

I know there has been a great amount of dispute about this whole matter of the new heaven and a new earth. Some claim that at death we are ushered into the new Jerusalem. Others say it does not come to pass until the judgment day. As for myself, I do not see why we should waste time or thought in regard to this matter where there are so many differences of opinion. We have God's promise, and that is enough for me. "Shall not the Judge of all the earth do right?" I am willing to trust *him* to manage the whole matter. I do not even believe I can afford to read the books and pamphlets that are sent me, arguing on different sides of the matter. Jesus said to the thief on the cross, "This day shalt thou be with me in paradise." Of course, I know some maintain that "paradise" is a wrong translation. But that would make no difference to me. If I am to be where Jesus is, I am content. I ask nothing more.

But, friends, God has not seen fit as yet to usher us into this holy city. He has placed us here in this world of ours to work. I am sure of that. He did not put us here to idle away our time; and we are to work either for righteousness or iniquity. Which shall it be?

Perhaps I have said a great deal of late in regard to the wickedness that seems to be abroad throughout our land and throughout the whole world at the present time. Dear friends, I am not oblivious to the good that is also abroad. I assure you I am looking on with joy and thanksgiving and praise to note the progress that is being made in praiseworthy directions. I love to read our daily papers. Perhaps I had better say I love to read our *good* dailies; for when I am away from home I pick up daily papers here and there that I do not love at all. I often read them, however, even if with pain; and sometimes I read them, too, with shame. I feel ashamed that our people, with all our present enlightenment, should encourage and sustain papers that seem to say on the face of them that they love iniquity rather than righteousness. But even in the worst of our dailies we find a record, more or less, of good things. The world at large is climbing out of many of the abuses in which we have for long ages existed. I think the general trend is upward; yes, and in some directions we are making marvelous progress. The experiment stations of the world are achieving wonders in the

way of separating truth from falsehood and superstition, by real scientific research—a research that is managed with sense and reason. Our government bulletins from Washington are also doing grand things in teaching the world at large honest and substantial truth. By the way, I have been greatly pleased with the bulletins discussing the real value to the human family of certain articles of food. There has been one published in regard to beans, another in regard to sugar. In considering the food value of these articles of regular diet, we have had another one recently all about eggs for food, and all of these bulletins are scholarly efforts. I think the writers come very near the exact truth. Now, why can not the United States, in the same way, give us a calm, honest, and unprejudiced discussion in regard to tobacco—this crop for which we spend about 600 millions of dollars annually. I wish I had influence enough with the Agricultural Department at Washington to induce it to publish a bulletin with a heading something like this:

“Tobacco, and its General Effect on the Human Family. Should its Cultivation and Dissemination be Encouraged or Discouraged?”

Then I should like to have a closing chapter something like this:

“The Effect of Tobacco on Children and Young People. Should its Use be Prohibited to those under a certain Age? if so, what Age? Also a Consideration of the Cigarette Habit.”

Now, if the above suggestion is not a proper one for a bulletin, will the authorities at the heads of the proper departments explain why the matter can not be discussed just as honestly and frankly as these bulletins I have mentioned discuss the food (and *health*) value of beans, sugar, eggs, etc.? Surely Uncle Samuel can give even one of the humblest of his subjects a fair and frank answer. If tobacco comes under some other head, *why* does it? Our country is doing great things in the way of sanitary measures for the protection and preservation of the health of our people. We are making great strides in many directions. We are even able to go into cities of foreign lands and drive out contagious fevers that have existed there for ages. In the matter of sanitation we are able to teach every nation on the face of the earth. If there is any thing that blocks the way and hinders our being able to grapple with something like tobacco, that ruins more bodies and souls than any thing else in the world, unless it is strong drink, what reasonable excuse can there be for evading or avoiding the subject? May God help us.

I told you some time ago there was something I feared more than intemperance—yes, I may say more than intemperance and tobacco; but I suppose the reason is because intemperance exists largely *because* of this thing I fear. It is the disregard of law. I think I may say the great disregard and ignoring of law—not only the laws of our land but the laws of God—the laws of truth, honesty, and fairness. Excuse me if I go over ground that I have touched a great many times already.

The people voted to have intemperance excluded from the army as it had been from the navy. The brewers and saloon men were furious. They declared the law should not stand, even if they had been fairly and squarely beaten by the temperance people. But they were in a corner, and there was no honest way out of that corner. There was *no legal* way out of it. In this crisis Griggs, backed by the brewers, perpetrated the notorious “nullification act.” I presume he and those back of him laughed because we in our turn—at least some of us—felt “furious.” There was a universal feeling of indignation growing and spreading all over our land. The powers that be evidently decided it would not be wise to try the patience of the Christian temperance people any further in that direction. They finally gave us the law we should have had a long time ago. But now the brewers and whisky men are furious once more. They have been forced to admit that in honest, fair fight, we are too much for them; and just now they are leaving no stone unturned to accomplish by foul falsehood, and with money, a thing they can never bring to pass by fair means; and the contest is now going on right before the eyes of the people of America. Which will win—falsehood with millions of dollars back of it, or truth and honesty with nothing back of them except the conscience of our people?

Some of you may say, as has often been said to me, “Mr. Root, this is a comparatively small matter—an exceedingly small one compared with other things that need prompt and immediate attention.” But I do not agree. If falsehood wins in this case it is going to win in every other one, and we as a nation will soon be bound hand and foot with Satan’s shackles. The strings of falsehoods would not trouble me so much if they were only confined to the liquor dealers’ periodicals. Neither would I feel greatly troubled if our great dailies once in a great while gave place to them by mistake, and would promptly acknowledge, when furnished adequate proof, that they had been wrongly informed. Of course, I mean they should make acknowledgment as public as they made the falsehood public. I allude to the stories that are now current almost everywhere about the disastrous results upon our soldiers since the closing of the army canteen. Evidently quite a few of the readers of GLEANINGS seem to think I am reading only one side of the matter, and am not posted. I judge from clippings from different periodicals sent to me. The great dailies that we have considered reliable, and honest and fair, have, by some process unknown to me, been induced to lend their aid to circulate falsehoods. Worse than all, as I have told you, proof after proof, furnished by mayors and other officials, with sworn statements, have been forwarded to these editors, asking them to recall the whole-cloth falsehood they had been induced to print in their columns; but the only reply has been to report the same falsehoods in a more aggravating form, and to continue that policy. While I write, clippings are before me from the fol-

lowing papers: New York *Herald*; Washington *Times*; New York *Journal*; Chicago *American*; New York *Evening Post*; Tacoma *News*; Chicago *Chronicle*; Atlanta *Journal*.

I have given the names of papers from different cities to show how universally this thing is carried on, and how systematically it is managed. Not one of these periodicals, at least so I am told by some of our most reliable papers, has consented to publish a retraction of their false statements. If this thing keeps on would it be anything strange if a large number of well-meaning — well, say Christian voters, should decide they were mistaken, and that this army canteen was really a temperance (?) institution as all these dailies, and perhaps a thousand other papers, would lead us to think? I do not know why so many periodicals have gone into this thing. I do not know whether it is because the managers love drink themselves, or whether the brewers have bought the space, and have bought it on condition that these editors should not print the truth, even when it is proven to them beyond all question.

I have been told from childhood that lies do not carry the day *very long*. My father used to say, perhaps in language not very elegant, that even the Devil would hang himself if you give him rope enough; but I confess I have begun to fear of late that the brewers, with their millions, have got out some patent-right way of managing the Devil so that he does not show his hoofs and horns as he used to do after he had been given about so long a time.

In olden time, we are told, there was a certain people who said by their acts, if not in words, "We have made lies our refuge, and under falsehood have we hid ourselves." Isaiah does not tell us very clearly just how far these people got along under that sort of cloak and refuge; but I am really afraid the brewers are going to make a great deal of trouble just now unless the *church of God* bestirs herself. A few religious periodicals are helping to expose these falsehoods. The strictly temperance papers are all fighting valiantly; but unless the church, and a united church, takes hold and helps us, I really fear the canteen will be re-established, and that, too, by the votes of well-meaning but foolish people.

Do you ask me for proof that *I* am right? Well, if you want straight clear proof, go yourself to any one of the forts where it is claimed these new saloons have been started, and witness the strings of lies that have no foundation whatever. If you will be satisfied with the affidavits of the mayors and officers of the town, and with the statements of some of the army officers and chaplains besides, in those places where are located the soldiers' barracks, you can find them in any of our temperance papers, some of them reproduced in *fac simile* by the photograph.

The closing words of our text tell us that no one shall enter the holy city who "worketh abomination or maketh a lie;" and I have sometimes wondered what place would be accorded to good people who stand about with their hands in their pockets, figuratively,

while these frauds are perpetrated, and pass through the medium of the press into almost every home in our land. May God help us; and may God help me to be sure that I am making no mistake and holding up a warning again and again about something that is, as some tell me, only a comparatively small matter after all.

Just one thing more: If a paper comes into your home, making these statements in regard to the disastrous results of shutting up the canteen, remonstrate with the editor. If he pays no attention to your protest, subscribe for some paper that is willing to tell the *truth* in regard to the drink-traffic.

Permit me to say that I have never seen in the Cleveland *Leader* one of these preposterous statements. On the other hand, they continue to give us brief editorials in the cause of truth and temperance every little while. If our people would promptly protest to the editors themselves whenever these false statements appear, they would soon conclude that their championing the brewers may prove to be, after all, an expensive piece of business.

GETTING LOST IN THE FLORIDA WOODS.

When I came into Oak Hill, Fla., on the automobile, as I have told you about, I was putting on considerable style — that is, considerable for *me*. But a great many times in my travels I make my appearance before beekeepers without very much style — in fact, sometimes without any style at all. Once or twice I have received a gentle rebuke. When I was passing on that long trip over the Ozark Mountains, in Missouri, I called on a subscriber to GLEANINGS who had a very pretty greenhouse. He looked me over and finally said right out:

"Why, Mr. Root, I can hardly understand how a man occupying the position you do would wish to be seen riding about the country in this eccentric style, far from home, on a *wheel*."

I tried to explain to him that I was doing it just for the fun of the thing, because I loved adventure; but a good many times his kindly reproof occurs to me. Several times I have promised Mrs. Root — yes, I have promised myself, after getting into a disagreeable fix — that I would try in the future to be a little bit more dignified, and not rush things so much.

I reached the station at Sanford, Fla., before sundown. I remembered there was an old friend of mine a little way out in the country, Mr. J. A. McMillan, where I had a most pleasant visit six years before. I inquired at a livery stable what they would charge to take me out there. They wanted a pretty big price, I thought; and as I had been riding in a buggy nearly all day I felt a good deal like walking. In fact, I walked out there six years be-

fore, and, as nearly as I could remember, it was only a mile or a little more. I knew it was not far from Fort Reed, where there is a little settlement and a store. If it took me till after dark I figured I could easily get directions at the store. When I came to the store, however, I found it was something like two miles; and, to tell the truth, there was not any store. It had been burned down, and there was no house in the immediate neighborhood. Yes, and it gets dark in Florida *all of a sudden*. They do not have the long twilight we have here in Ohio.

I followed the directions as nearly as I could remember, planning to inquire at the first house. Said house was quite a piece away, especially when the roadway was all through soft yielding sand. Before the darkness came I looked at my list of subscribers, and discovered, for the first time, that the address was printed *Mrs.* instead of *Mr.* J. A. McMillan. Then it occurred to me that my old friend must have died without my having known it.

I was told on inquiry that it was quite a difficult matter to reach the widow's home in the night time; but my informant went quite a piece with me through the sandy woods, got me on the right road, and gave me plain directions to a little place where Charlie McMillan lived, not far from his mother's house. He said Charlie would gladly take charge of me. The directions were that I should pass three unoccupied houses, and then go down to the left through a little lane or by-path, and the first house was the one I wanted. I found the place all right; but as it was quite a distance I had "waded" through the soft sand, I became pretty tired. Then I discovered that no one was at home. I then went on to the next place, quite a fine-looking residence; but after going around to all the doors, and trying them all, I decided that *that* place too was unoccupied. A little further on, another fine residence proved likewise; but away off in the distance, I could not tell just how far, a light twinkled from a fine-looking mansion. The gentleman who went part way with me said Charlie's mother lived not more than twenty rods from his little home. I remembered, too, it was on the shore of a little lake. I said to myself, "If Mrs. McMillan's house is not more than twenty rods from this spot, and on the shore of a lake, I can certainly find it in the course of half an hour." But I explored north, south, east, and west. There was no such establishment in that vicinity. I was getting to be very tired, and finally decided to go for that twinkling light and get information. Before I got near the place, however, struggling through the weeds and bushes, I came to the shores of a little (but not *the*) lake. With weary steps I pushed my way around the borders of the lake, and came to a fine mansion and beautiful grounds, and every thing in city style. I could not find the bell, so I rapped on the door. A woman's voice inside asked what was wanted. I explained the circumstances and asked for directions. She did not think proper to open the door. She said Mrs. McMillan's house was a long way off, and asked what I wanted

of her at such a time of night. I tried to explain matters, told her that I had plenty of money to pay for all time and trouble, and asked if I could not sleep somewhere there till daylight. She said her husband was too unwell to come and give me the information I wanted, but said if I would follow around the lake some of their hired help had a cottage there, and he would give me what information and assistance I desired.

Now, this seemed for the time a little bit hard on a stranger, but the circumstances were much against me. I was disturbing people after the usual hours of repose. I was not coming exactly like a thief in the night, but I was coming very much like a *tramp* in the night. Had I come in the day time, with a carriage, or even a humble equipage, very likely I should have received a most cordial welcome from these good people, who, under the circumstances, seemed quite willing I should sleep outdoors in the sand; and, in fact, I meditated doing so. My bed would have been soft enough, no doubt; but I think I might have had chills before morning. The cottage I was referred to was kept by some colored people. They told me where I could find the residence of Mrs. McMillan. But I got lost again; and out in that deserted wilderness I found another beautiful mansion. Why, it was almost princely in its appointments—fruits, flowers, beautiful walks, curved driveways with curb made of artificial stone, and here and there summer-houses. Tired as I was, it seemed as if I had fallen into a place of enchantment. The moon had come out by this time, and I wondered if the "Arabian Nights" had not broken out away up here in the sandy Florida wastes. I rapped at the door, and a woman's musical voice responded from above. I wondered if she was not some fairy lady who was kept there by "enchantment." She listened to my "tale of woe," and seemed exceedingly kind and sympathetic. She tried to direct me to the place I was seeking; but it was so near midnight, and I had become so "rattled," I really did not know any thing. When she told me that Mrs. McMillan's house was in plain sight of their place in the day time I almost felt like shouting for joy. I did not know north, east, south, or west; but by centering my mind on the matter I *could* decide which was my right and which was my left hand. She told me to go right through the gate where I came in, turn to the right, and just follow the road, and I would reach Mrs. McMillan's in a few minutes. I did so, and received such a cordial welcome that I forgot all my troubles and fatigue. But I made some big resolutions that night, to the effect that you would not catch me again, lost in the Florida woods and sand after dark. A refreshing sleep made me myself again when daylight came. Charlie and his wife, it seems, had left their own home, and were staying with his mother at the time. While we were laughing over the adventures of the night before, I asked Charlie to explain what the storekeeper meant by saying his place was not over twenty rods from his mother's house.

"Well," said he, "because that is about the distance."

"Why, look here, Charlie. Your place—at least the place I went to in the night—is away off in *that* direction, and it is certainly a good big mile from here."

Charlie was contrary, however. He declared he ought to know about the matter, for he had lived several years right near his mother.

After breakfast I said, "Now, Charlie, I want you to go out in the direction you say your place lies, and find it for me within twenty rods of where we are."

Well, Charlie was quite right. Sure enough, right close by, was the little home where I had rapped on the door so persistently, but without effect, the night before. It made me think again of a land of enchantment. Some of our older readers will remember that that is the place where I found a pouy that had been tamed and civilized by feeding him bread and honey. Some sad changes had taken place during the years that had passed. My genial friend was gone to the great unknown beyond. The bees did not prosper as they did years before; and, in fact, the frost had ruined things generally in that neighborhood. The deserted homes where I could not find anybody to wake up the night before were one of the results of that memorable freeze.

That day Charlie very kindly took his horse and buggy and carried me around among the celery-growers. On page 252, March 15, you will find an account of our visit. Now, here is the wonderfully strange and inconsistent thing that astonished me all over Florida. This great discovery in the way of growing celery is right in the very neighborhood of these deserted plantations; and notwithstanding the enormous profits experts are making with the favorable soil and artesian water, land may be bought for almost a song all around in that locality.

There is another strange thing about Florida. There are vacant houses and deserted farms here in Ohio; but usually, before they are vacated, the place has run down and looks forbidding. In Florida the places will have every evidence of being occupied and cared for; but investigation shows the owner has all at once dropped every thing and gone. There is going to be a change in Florida, no doubt—in fact, great changes have been made already in many of these deserted places. When people learn how to avoid the disastrous results of the sudden changes in temperature, then things will be started on a firmer basis.

THE APPLE-TREE BORER; HOW TO CIRCUMVENT IT; ALSO SOMETHING ABOUT THE TRAP LANTERN.

The inventor, or one of the inventors, of the trap lantern, sends us the following:

THE APPLE-TREE BORER.

There are two species of apple-tree borers—one known as the flat head, that bores into the body of the tree; the other the round-headed borer that enters the tree near the surface of the ground.

In over 2000 acres of apple orchards we have had no trouble with body borers for many years. I learned how to eliminate the body-borer in the summer of 1874. My father, the late Hon. Ira S. Haseltine, planted a pioneer orchard of 90 acres, consisting of more than 100 varieties of apples, and a large number of varieties of pears and peaches. While working in this orchard I discovered that the body-borers were in the trees that had been sun-scalded or injured on the south and southwest side. I therefore bent limbs and twisted suckers so as to shade the trunk or body of the tree. These trees had all been headed high in the nursery. We notified the nurserymen who expected to supply us with future nursery stock to head their trees low, and raised nursery stock ourselves for additional orchards, and headed or limbed the trees near the ground, for three reasons: 1. To prevent the body-borer from entering the tree; 2. To prevent the winds from tipping the tree so easily; 3. To make apples one-half cheaper to gather. In planting these trees we leaned some of them a little to the southwest to protect the body until the head or top was sufficiently large to shade it thoroughly, and also from the fact that our prevailing winds are from the southwest, and would otherwise lean the tree in the opposite direction. In this way we have entirely eliminated the body-borer and made strong, vigorous, healthy trees.

The root or round headed borer was not so easily dealt with. It is the most destructive orchard-pest, as it girdles the tree and kills the orchard if not removed. Until I invented my moth-catcher we used a jack-knife and wire to extract them as the only sure means to protect the trees. Many washes have been recommended to catch the beetles. But until we discovered that we could catch the beetles, as the Department of Agriculture at Washington, D. C., in their bulletin No. 32, July 1, 1898, page 7, says: "They are attracted to a light at night to some extent, and some meet their end in this way," we had still to use the jack-knife and wire to get out the old stock of worms, as the larva of the beetle stays in the tree about three years, and we did not discover how to catch the striped parent beetle or bug until last year. This borer-beetle lays eggs in the month of June, and later. Therefore, now is the time to catch it.

S. A. HASELTINE.

The suggestions in regard to leaning fruit-trees to the southwest as a remedy for borers are all right. I have followed almost exactly the plan outlined for years. Trees that are allowed to be tipped over toward the northeast by the prevailing winds are almost sure to have sun-scald, and, later on, borers. I find young basswood-trees very susceptible to sun-scald, if they are allowed to tip over so the sun strikes directly on their bodies, almost at right angles, in the middle of the afternoon. Pull them over by some efficient means so that the foliage of the tree will shade the trunk till the sun is nearly down, and they will recover all right. The suggestion about the moth-catcher referred to in the last part of the article, I am not so sure of. Just now, however, Mr. Haseltine sends me the following from Prof. Stedman:

I can recommend the Haseltine moth-catcher to gardeners, farmers, and horticulturists for catching the following injurious insects: The moths of the striped worm in corn, cotton, and tomatoes (corn or boll worm); June or May beetle adults of the white grubs; tent caterpillar moths; pickle-worm moth in cucumber; army-worm moth; cut-worm moth; fruit-leaf roller-moth, adult of the worm that eats apple, pear, peach, plum, cherry, quince.

J. M. STEDMAN, Entomologist.
Experimental Sta., Columbia, Mo., June 18, 1901.

Now, I must confess I am not enough of an entomologist to decide whether the above list includes the beetle that produces the borers

or not. No doubt the trap-lantern will catch some of these enemies of the fruit-grower; but the testimony from several experiment stations seems very strong to the effect that it is not going to accomplish by any means all that the vendors claim for it in their circulars. It is always in order to get the borer out of your trees just as soon as you discover they are at work. But the question of keeping them away by means of trap-lanterns placed at intervals through the orchard is one yet to be settled. I would ask our readers to take notice that Prof. Steadman does not anywhere, in the above, mention the codling-moth; yet the circular that Mr. Haseltine sends out claims in the very first sentence that it destroys the codling-moth; and in some of their advertisements they have declared it would render spraying unnecessary*. I should say this latter claim is pretty nearly superfluous. We shall be glad, however, if the device will do only a part of what they claim for it.

Special Notices by A. I. Root.

AN ILLUSTRATED WEEKLY PAPER FOR YOUNG PEOPLE, WHICH WE CAN HEARTILY RECOMMEND.

In our June 15th issue I said our people had been making exceedingly liberal offers to club GLEANINGS with other periodicals, and that some of these periodicals that had been "pushed" quite vehemently I did not particularly indorse. Well, a few weeks ago I picked up a Sunday-school paper belonging to some of the grandchildren. The articles were of such merit, so full of instruction in business and other matters in life, I was agreeably surprised. When I mentioned the name of the paper to the other members of our firm I found each one of them had been reading the *Hellspring* (for that is its name), and all were equally delighted with its high moral tone as well as its beautiful pictures and exceedingly interesting articles; and when I said, "Boys, here is something really worthy of encouragement. Now, even if it is not offered at so low a price as some other periodicals, let us give it such a recommend as it deserves, and try to introduce it into homes where GLEANINGS goes," they all assented. I wrote the publishers, and they made me a better offer than I had any right to expect. This paper, so interesting that even I take time to read it, comes weekly, is beautifully illustrated and yet we are going to club it with GLEANINGS for only \$1.25. The regular price of the little paper is 75 cts. a year. You can have a sample copy free on application. The publishers do not say so, but I do, just write me on a postal, "Send a sample copy of the *Hellspring*," and I will see that you get it. Then if you want it a whole year, it will be only 25 cts. more than you pay for GLEANINGS—that is, if you ask for no other premium.

THE NEW CRAIG POTATO.

We say now just as we said a year ago, that the New Craig is the best cooking potato we have in our whole assortment at this season of the year. A dish of them that we had on the table this morning looked so handsome and floury, rolling open almost like a dish of popcorn, I felt like having it photographed. Now, I confess this is one of my happy surprises. We have

* Here are some more statements I find in the Haseltine circular in regard to the moth-catcher:

By spraying, many head of stock were killed, several of them thoroughbreds. . . . Trees that have been sprayed the most, show signs of decay, and may die. Spraying apples may cause an early decay.

In regard to stock being killed by spraying fruit-trees, I have never been able to find such a case; and some of our best agricultural journals say the same. In regard to injuring trees by spraying this is the first time I ever saw such a suggestion, and I know of orchards that have been sprayed thoroughly almost ever since spraying was introduced.

had the New Craig for seven years. It is the best yielder we have ever gotten hold of—almost as handsome in shape as Carman No. 3—a rank strong grower that is seldom troubled with either bugs or blight on our ground. Besides this it is one of the best keepers, if not the very best one, we know of. It is very slow to sprout in the spring. The potatoes keep hard and firm, with very little care, clear on into June; and during the whole spring months it is our very best table potato, not even excepting the Freeman and Snowflake. On our own grounds, and in our own cellar, it has no drawback whatever. It stands at the head of late potatoes. With us, it has no fault; but, to tell the truth, it does not seem to succeed in some localities as well as it does here in Medina. Not only on our own grounds, but our neighbors all around us succeed with the Craig just as I have told you above; but when we send it away, a good many complain of it. Why, our own Ohio Experiment Station reported one year that they thought it was especially subject to blight, when *with us* it is the nearest to being blight-proof of anything on our grounds.

Oh yes! there is one other thing. Prof. Chamberlain, of Hudson, O., objected to it on the ground of its being a red potato. Well, we have some good news right here. Last season we planted New Craigs entirely on a piece of ground along the railroad. We did not manure and underdrain it, as the land is not ours; but we got a splendid crop of New Craigs, nevertheless. Why, it was one of the biggest of my happy surprises. And then there was another happy surprise on top of it all. The boys found about a bushel and a half of white Craigs in one spot of ground where it was rather more sandy and gravelly than the rest of the lot. I do not know what in the world should have made them white, but white, almost entirely, they were, and rounder and smoother than any Craigs I ever saw before. Every one of our readers who grows potatoes ought to try the New Craig. If it succeeds on your ground as it does with us, it ought to be worth a pile of money to you.

Just one thing *more* in their favor, and it is a big point too. Unless you plant them quite close, many of the potatoes will be too large to suit the women-folks. With close planting the vines will very quickly cover the entire ground, choking out weeds of every kind. We have them every year so I can stretch single vines higher than my head. Well, when the ground is covered with such a heavy mat of potato-vines there is no more cultivating to do, and no trouble with weeds, and very seldom any trouble with bugs.

I know this is saying a great deal about just one potato; but year after year keeps telling the same story in our locality, and I think the world at large ought to give this splendid potato more attention.

Now, this story is not told as a preface to get you to buy some Craigs, for every one of them is planted. I would advise you, however, to lay in at least a few in the fall, when we come to dig them. For a big crop you will need to plant them early, for they will keep green and growing clear on till frost, no matter when you put them in the ground.

New York State Apiarian Exhibit at the Pan-American.

Nearly all the honey in the New York apiarian exhibit is to be replaced by honey of this year's production as soon as the latter can be obtained from the bee-keepers of this State. A goodly number of New York bee-keepers are now represented, but it is desirable that many more participate. Let all bee keepers of this State who are so fortunate as to be favored with fine honey, both comb and extracted, correspond with the superintendent of the New York apiarian exhibit with a view of sending in an exhibit. There will be absolutely no expense to the exhibitor, further than the extra pains he takes to produce fine exhibition honey, and in the extra care taken to ship the same in a manner to minimize danger of breakage.

OREL L. HERSHISER, Superintendent.

GLEANINGS AS AN ADVERTISING MEDIUM.

I desire to express my gratification over the result of the small "ad" the Pere Marquette R. R. is running in GLEANINGS. It has attracted attention and brought forth requests for further information from Oklahoma to Ontario, Can.

W. C. TOUSEY,
Toledo, O., May 1.

To Our Shippers.

About May 1st last, we removed our business from the buildings, 120-122 W. Broadway, to larger and more commodious quarters at Nos. 265-267 Greenwich Street, and 82-84-86 Murray Street, and we duly sent to our friends in the trade a notice of our removal. Shortly after we vacated the premises, 120-122 W. Broadway, one Joseph M. McCaul, rented a portion of our old quarters, and hung out a sign, "Hildreth, McCaul Co., Jos. M. McCaul, Prop.," with other large signs to the effect that his business is "Headquarters for honey, beeswax, maple sugar, and maple syrup."

The mercantile agencies report that Joseph M. McCaul is the sole proprietor of the new business, and that he claims to have paid to one Henry P. Hildreth, who has no connection with our business, a consideration for the use of his name.

We will not comment upon the act of leasing our old quarters and exposing thereon the sign, "Hildreth, McCaul Co.," further than to state that we have instructed our attorneys to apply for an injunction restraining the said McCaul from using the name "Hildreth" in connection with his business in any manner whatsoever.

We value highly the good name and business we have established by many years of satisfactory dealing with our friends in the trade, and we therefore send this notice so that you may not possibly confound us in any manner with the so-called "Hildreth, McCaul Co."

Our firm name remains as heretofore, and all our business is carried on at our new quarters, Nos. 265-267 Greenwich St., and Nos. 82-84-86 Murray Street, New York.

Respectfully yours,

HILDRETH & SEGELKEN.

TRIAL TRIP.

3 Months, 20c. 6 Months, 30c.

TO NEW SUBSCRIBERS. — We want every subscriber of *Gleanings* to read the WEEKLY AMERICAN BEE JOURNAL for 3 or 6 months at least, and so we make the above very low offers to those who are not already getting our journal. Just think of it—13 Nos. for 20c, or 26 for only 30c! Better send in your subscription at once, and begin with July 1st.

ALSO DON'T FORGET that we're headquarters in Chicago for

Root's Bee-keepers' Supplies.

A catalog and also a sample copy of the American Bee Journal free upon request.

George W. York & Co.,
144-146 Erie Street, Chicago, Ill.

Prices for July and August.

Your choice, either golden or leather-colored queens. Prices are, 1 untested, 65 cts.; 2 for \$1.00. Tested, \$1.00. Breeding queens, \$3.00 to \$5.00 each. If you want tons of honey try them. See my ad. in June 15th number.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. LEY'S Poultry CONDITION POWDER puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls—big and little get all there is in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. Ley's Thoroughbred Minorca eggs, \$1 for 13. Thoroughbred Belgian Hares. **Geo. J. Ley, Florence, California.**

For Sale. Choice prolific Italian queens—granddaughters of a queen of which Doolittle wrote me, "\$100 will not buy her"—mated with drones of Hutchinson's Superior Long-tongue Strain. Warranted queens, 75c; tested, \$1.00 and up. Good references, and satisfaction guaranteed.

EARL Y. SAFFORD, Salem, N. Y.

GLEANINGS AS AN ADVERTISING MEDIUM.

From the number of letters I found awaiting me when I arrived where I got my mail, referring to GLEANINGS with reference to bee-hives, I concluded you gave me a free ad't. I thought I had fixed all my matters so I would have no mail to follow for the two months I was on the wing; but I was surprised to find more letters than I have found time to read, much less answer; so please say to the many friends, "hives sold;" make my apology for not answering. I fully realize GLEANINGS is the place to advertise.

The Power Question

—for farm use, dairies, creameries, cheese factories—anything requiring light power, is best settled by buying one of these

LEFFEL ENGINES.

They are made in both horizontal and upright pattern, with engine attached to boilers. Being very simple and direct in construction they are economic of fuel and great developers of power. Best for cutting and grinding feed, sawing wood, pumping water, separating cream, churning, &c. Made of the best material throughout they are durable and long lived.

Send stamp for our Book on Engines and Power.

JAMES LEFFEL & CO., Box 89, Springfield, O.

How Moore's strain of Italians roll in the honey down in Texas:

Hutto, Texas, Nov. 19th, 1900.

J. P. Moore.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner: Untested, 75c; six, \$1.00; doz., \$7.50. Select untested, \$1.00; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, Lock box 1, Morgan, Pend. Co., Ky.

(Mr. J. P. Moore is entirely reliable.—A. I. R. Co.)

FOR SALE. Orchards, farms, and city property in S. W. Mo.; climate, water, and fruit unexcelled. Yellowstone Park.

Extended tour, leisurely itinerary with long stops in the Park. Private coaches for exclusive use on the drive. Pullman sleeping and dining cars. Established limit to number going. Escort of the American Tourist Association. Ream Campbell, General Manager, 123 Marquette Building, Chicago. Colorado and Alaska tours also.

Tickets include all Expenses Everywhere.

Train leaves Chicago, via Chicago, Milwaukee & St. Paul R'y, Tuesday, July 9, 10:00 P. M.

What I Guarantee.

I am selling queens of a strain of dark Italians that are the equals of any bees and the superior of many. No other breeder guarantees his queens in as many respects as I guarantee these queens. First, I guarantee safe arrival. If the queen arrives dead, another is sent. Second, I guarantee safe introduction if instructions are followed. This is not done by any other breeder, so far as I know. Third, I guarantee purity of mating. If a queen proves impurely mated, another will be sent free of charge. Fourth, I guar-

antee satisfaction to the extent that any time within two years a queen may be returned and the money will be refunded, and 50 cts extra sent to help pay for trouble. Don't you see that you run no risk whatever in buying one of these queens. I run all of the risks, and you can have your money back any time inside of two years if you are not satisfied.

Price of a queen is \$1.50, or I will send the Review one year and a queen for only \$2.00.

W. Z. HUTCHINSON, Flint, Mich.

Marshfield Manufacturing Company, Marshfield, Wisconsin.

THE TRUE TEST!

of a strain of bees is the amount of honey they gather under like conditions, compared with others. Mr. D. R. Keys, Dixie, Ga., an old bee keeper, writes: "That queen from you is simply *splendid*: has shown no disposition to swarm. Her bees have filled three supers of 35 sections each, capped *snow-white*, while the average is not one super so far.—June 6, 1901." See back ads, and write for circular, free. I have carefully selected the best queens for breeders for years, and culled out the poor ones. My stock is a five-band strain, and has *long tongues*. No small or poor-laying queens sent out. Untested, 75c each; six, \$1.00; dozen, \$7.50. For select warranted add 25c. Tested, \$1.25. Select tested, \$2.00. Breeders, \$3.00 and up. Queens sent promptly. **J. B. CASE, Port Orange, Fla.**

WANTED!

Offers on our ENTIRE QUEEN BUSINESS, including our reputation, our Superior long-tongued stock, three entire apiaries, 500 nuclei, and entire outfits for queen-rearing. We have a favorable climate and excellent locations. Cause for selling made known on application. Full particulars free. If interested let us hear from you.

There is no foul brood or other disease in Texas. Single nuclei (with their queens) winter perfectly here.

O. P. HYDE & SON, HUTTO, TEX.

Northern Italian Queens Reared from Imported Mothers.

Our stock is so carefully bred and selected as to secure carloads of honey. Locality free from foul brood and other bee-diseases. Prices: Untested queen, \$1.00; 6 for \$5.00; tested queen, \$1.50; 6 for \$7.50; best imported queen, \$6.00; fair imported queen, \$5.00.

Ada L. Pickard, : Richland Center, Wis.

U - NEED - A GLOSSOMETER.

It measures the actual reach of the tongue of a living bee to thousandths of an inch, also the capacity of the honey-sac; accurate, durable, practical. No rule or magnifying-glass needed. Satisfaction guaranteed. Price \$1.00 postpaid. Send for *Queen Circular*, and learn how to get a glossometer free. High-grade queens of the Sweet-heart and other strains at reasonable prices.

A. J. WRIGHT, Bradford, Steuben Co., New York.

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a *select daughter of their \$200 queen that they refuse to quote me prices on*. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

Prices: Untested, 75c; 6, \$1.25; 12, \$8.00. Select untested, \$1.00; 6, \$5.00; 12, \$9.00. Tested, \$1.00; 6, \$6.00. Select tested, \$1.50.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20-100, \$3.00. Breeders, whose best bees show 21-100, with an average of 20-100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100, \$7.00.

I have discovered 2 breeders whose best bees show 23-100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2. Imported queens, daughters and grand-daughters. Have just received an importation direct from Italy which has been introduced into this apiary.

Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

**W. O. VICTOR, WHARTON, TEXAS.
QUEEN SPECIALIST.**

HONEY QUEENS!

Leather-colored Long-tongues.—I have a breeder for which \$25 has been offered and refused. You make no mistake in buying her daughters. They are dandies.

Goldens.—The Lows strain is as good as years of patient selection and breeding can establish.

Holy Lands.—These are a deserving race of bees. With two years' acquaintance I find them great workers, with no vindictive traits, easily handled, are becoming popular, especially in South.

The above races of bees are each bred in separate apiaries, and you can get them in their purity. Am filling all orders by return mail, and I sell at the following low prices, with the usual guarantees. Single queen, untested, 75c; six for \$4.00. Tested, \$1.00; six for \$5.00. Breeders, either race, \$2.50 each. Address

W. H. Laws, Beeville, Texas.

FOR SALE.—Italian bees and queens. Untested queens, \$1.00 tested, \$1.25; full colonies, \$4.00; nuclei, one frame with queen, \$1.50; two frames, \$2.00; 1 lb., \$1.00. MRS. A. A. SIMPSON, Swartz, Pa.

Standard-Bred Queens!

Acme of Perfection; Not a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$4.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover hustlers of America. \$1.00 each; six for \$5.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

GUS. DITTMER, AUGUSTA, WIS.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beville, Bee Co., Texas.

Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALKENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper. \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beville, Bee Co., Texas.

KRETCHMER M'FG CO., Red Oak, Iowa.

BEE-SUPPLIES.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Rutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop ink drops. The perforated steel fire-grate has 81 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

BUFFALO.—Fancy white comb, 14@15; A No. 1, 13@14; No. 1, 12@13; No. 2, 11@12; No. 3, 9@10; fancy dark, 10@11. Extracted, white, 6@7; dark, 4½@5. Beeswax, 28@30. Very little demand for old honey. New will sell very well. W. C. TOWNSEND, June 28. Buffalo, N. Y.

NEW YORK.—Our market is practically bare of comb honey, and we are having a good demand for white comb. Fancy stock sells readily at 15; No. 1 white, 13@14; amber, 11@12. Extracted not in much demand, with plenty of supply. We quote white @ 6½; light amber, 5½; dark, 4½@5. Beeswax remains firm at 29. HILDRETH & SEGELKEN, July 8. 265 Greenwich St., New York City.

CHICAGO.—The new honey is arriving, and some nice lots of white-clover comb have sold at 16. The urgent demand has been supplied (which is very light at this season of the year), and we find shipments beginning to accumulate, so that 15c would be accepted if offered. Amber grades are nominal at 12@13. Extracted white is selling slowly at 5½@6; amber, 5@5½, according to body, flavor, and style of package. Beeswax, 30, for choice yellow. R. A. BURNETT & Co., July 8. 199 South Water St., Chicago, Ill.

WANTED.—Comb and extracted honey; will buy your honey no matter what quantity. Mail sample of extracted; state quality of comb honey, and price expected delivered Cincinnati. I pay promptly on receipt of goods. Refer you to Brighton German Bank, this city. C. H. W. WEBER, 2146-2148 Central Ave., Cincinnati, Ohio.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co., Front and Walnut Streets, Cincinnati, Ohio.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHHEIM, 1318-1321 Union Avenue, Kansas City, Mo.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co., 163 South Water St., Chicago, Ill.

FOR SALE.—Extracted honey from alfalfa; 60-lb. cans at 7 cts., and smaller cans. D. S. JENKINS, Las Animas, Colo.

GLEANINGS IN BEE CULTURE

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

ILLUSTRATED SEMI-MONTHLY

Published by THE A. I. ROOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

Vol. XXIX.

JULY 15, 1901.

No. 14.

I'M DELIGHTED to see by the footnotes that A. I. Root is getting interested again in bee-keeping.

THE *American Bee Keeper* now wears footnotes, and Editor Hill seems to be a good footnoter.

E. F. ROBINSON says in *Canadian Bee Journal* that he weighed a lot of natural-wax scales on jeweler's diamond scales, and found 192 to the grain. That makes 1,344,000 to the pound.

EDITOR YORK is determined the young Methodists shall not grow up in ignorance as to bees. The *Epworth Herald* contains two instructive articles from his pen. [Good for York!—ED.]

IT SEEMS STRANGE that C. H. W. Weber, the man who is in the front rank in bottling honey that never granulates, should be a successor to C. F. Muth, the man who did more than any one else to popularize granulated honey.

THE DZIERZON THEORY "is the cornerstone and solid rock upon which nearly all we know about bees is based." I am glad A. I. Root had to read proof, so as to make him say that on page 531. Every bee-keeper who is not yet familiar with the Dzierzon theory should make it his first business to get it.

EASTERN BEES may not do exactly as Texas and Arizona bees are said to do on page 523; but still it is well known that they are much less inclined to swarm when a full yield is on than when there is a moderate flow. [But did you ever know them, when the honey-flow begins, to kill off the drones and destroy cells?—ED.]

A NOTION lingers with me that, before the year is out, the editor will discover that hot water is ahead of steam for wax-presses. Germans who are familiar with both put hot water in the lead, and Rambler seems to be of the same way of thinking, page 513. Now, Rambler, tell us all you know about it. [I

may change my mind, perhaps. But I don't see how the hot-water device is going to be as simple and clean.—ED.]

FRIEND A. I. ROOT, when you solve the puzzle why government can't give us bulletins about beer as well as beans, here's another for you to tackle: Why is it that, if more liquor is drunk since the abolishment of the canteen, the men who manufacture the liquor are the ones most anxious for the re-establishment of the canteen?

AFTER a queen has distinguished herself for three successive seasons as the best in your apiary, you are anxious to have her live longer so as to breed from her. Don't shorten her life by profuse laying in a strong colony, but keep her in a nucleus. [That is just what we are doing with our best breeder, and did do last season. The advice is sound.—ED.]

DAVITTE says the important thing in his big tent is to tame the drones. The problem now is to find the smallest tent in which drones can be trained to fly at ease. Possibly it may be yet brought within the reach of every bee-keeper. [When I get home I expect to try a small tent, then a larger one later. I can't get away from the belief that a small tent would fill the bill.—ED.]

IS IT TRUE that, when bees are deprived of a queen, they of choice select for the rearing of queens larvae that are three days old or older? Any one ought to be able to settle the question for himself. All you need to do is to look at the cells first started and see the size of the grub. I have yet to see a case where the first larva selected was three days old if younger were present.

AFTER REFLECTION I am not prepared to admit that "scientific queen-rearing" is a misnomer, and I think there's very little science in most of the queen-rearing that's done, page 545. The man who rears queens with no attention to the stock from which his queens are reared, and no regard to the drones used, is not doing a scientific job, even if he uses up-to-date methods, Doolittle cups and all.

W. W. SOMERFORD thinks the flat cover perfect, p. 553. That may be due to the "peculiar conditions in Cuba." In Illinois it will

warp, and, worse yet, it will twist. No doubt he is right that the $\frac{5}{8}$ cover will warp less than the $\frac{3}{4}$. His top ventilation (pulling back the cover to rest on cleat) would be too much in Illinois. The flat cover is warm with a cloth under it; but wouldn't it be still warmer with a dead-air space and a cloth?

AND NOW the geographical center of the honey-yield shifts to Arkansas, where L. E. Kerr lives. He tells in the *Amer. Bee-Keeper* that, in his locality, all a wide-awake bee-keeper has to do in the seven months of slow, steady flow, is to care for swarms in April and May, keep good queens, and let the bees alone, and he will average 100 to 300 lbs. of first-class comb honey. [I could and will tell of some other geographical centers a little later.—ED.]

"IF YOU WOULD see the influence of a queen on her bees, take the mildest colony that you have, and also the most irritable, and exchange their queens, and note the effect 36 hours after the queens are liberated," says D. B. Norton in *American Bee Keeper*. I never watched so closely as that; but when I've killed a queen because her bees were savage, I have been puzzled to find a marked change before there could be much change in the bees. [Similar statements have been made before, and I believe there is something in it; and yet—and yet—it seems hardly possible that a queen could exert so great an influence in so short a time.—ED.]

SCIENTIFIC queen-rearing requires careful selection of sire and dam, adapting one to the other. Little can be done at that till fecundation can be controlled. In the mean time, if every bee-keeper persistently breeds from queens whose colonies store biggest crops, I'm sure he will bring up his average. [Yes, that is true.] J. F. McIntyre, of California, has a row of hives in his apiary, each of which has a queen from his best breeder. He says it was easy to see that this row of hives gives a larger yield than any other row of an equal number and strength. By the by, in my travels I have run across a number of bee-keepers who have daughters from this McIntyre queen, and they all say they are something extra. Their colonies surpass in honey the other colonies in the yard. If McIntyre gets a free advertisement out of this he is welcome to it.—ED.]

LONGEVITY in bees is coming to the front. Assuming that in harvest time a worker lives six weeks, and goes afield when 16 days old, if its life were prolonged a week it could store 27 per cent more. If one queen lives twice as long as another, will not her workers live at least a little longer? Is it not possible that, by proper selection continuously exercised, we might add that week to the life of the worker? If we could add a sixth to its summer life, that ought to add a sixth to its winter life. In that case a bee born Oct. 1, which now lives till Apr. 1, would live till May 1—quite a help in the wintering problem. Another thing: We can tell better what a queen is by two or three seasons' work than we can by a single season's work. The one that shows herself

best for three seasons is a safe one to breed from. I have queens born in 1897 that are among the best—one of them, I think, the very best I have. [While this is true, the average queen, I think, had better be displaced in two years by a young one.—ED.]

G. M. DOOLITTLE does some figuring in the *American Bee Journal*, that seems to have no flaws in it, by which he shows that a queen in the hands of a queen-breeder may be worth \$3750. That seems an astounding value, but it's hard to get away from it if we admit his data: A queen whose bees store 10 lbs. more than the common, one fourth of whose queen progeny will equal the mother, which will live three years, or long enough for the breeder to rear from her 4000 queens. The important thing, connected to a certain extent with this, that I'd like to ding into the ears of every bee-keeper, is that, if he will take the pains to keep a record of the performance of his bees, and then breed only from the queen whose bees have done the best storing, he would be materially adding to his income. [Doolittle is not far wrong. See my answer concerning the McIntyre queen, in the preceding column.—ED.]

Summer's blossoms everywhere,
Sweetest perfumes fill the air;
Bees are busy all the day,
Buzzing their melodious lay.

Dr. Miller says in a private letter: "Unless rain comes soon every thing will be dried up." Quite the opposite in this region of country. The amount of rain fallen between May 25 and July 5 has almost if not entirely broken the record, while the heat has touched the 100 point.

A Cleveland daily of July 4 speaks of what it calls a very odd consignment of goods from Italy—"a queen-bee, a large bee designed as the nucleus of an apiary." Is it possible that such a thing should create surprise in a city whose smoke can be seen from the Home of the Honey-bees? A constant stream of such bees has been flowing from Italy to America for years, and they have been sent even to Australia and other remote countries.

The indications are that bee culture is taking great strides now in Italy, in common with many other lines of industry. The papers tell us that Italy has just passed France in point of population, and will soon regain much of its lost prestige among the great nations. Conservatism among bee-keepers is fast giving way to the search-light of actual test. As Italy has done so much in the way of giving to the world its best bees, we can

not help feeling a deep interest in the welfare of that land of song. Its chief and almost only bee-journal is *L'Apicoltore*, published at Milan. It is, to a great extent, an able summing-up of bee culture in Europe and other countries.

AMERICAN BEE JOURNAL.

In his issue for June 27 Mr. York seems to have gotten up a little surprise party for the benefit of Dr. C. C. Miller. The doctor's picture appears on the first page, accompanied by some lines supposed to represent the retrospective views of a man who has just passed 70 years of life, as the doctor did on the 10th of June. Mr. York speaks of Dr. Miller as "the most prolific writer on bee culture today." This is probably true, although G. M. Doolittle certainly gives him a close second. It is very gratifying to have the doctor tell us of his good health and of the amount of work he is still able to do personally. He calls himself "seventy years young," and that is certainly a good way to put it.

AUSTRALIAN BEE-KEEPERS' REVIEW.

The first issue of this journal has just arrived, and is simply an index of the rapid advance in bee culture now being made in Australia. It has 16 pages, very plain print. What strikes me as the star article was written by Mr. J. E. Crane, of Middlebury, Vt. It is in regard to what might almost be called a good hobby with Mr. Crane—the improvement of bees themselves rather than spending so much time with hives and appliances. He says:

"It is not certain that the great mass of bees to-day are any better for honey-gathering than in the days of Virgil and Aristotle. So busy, indeed, have bee-keepers been during this nineteenth century inventing hives, boxes, sections, supers, foundation, smokers, extractors, with systems of management, manipulation, and a thousand and one other things connected with bee-keeping, that they seem to have almost forgotten the possibilities of improving the bees themselves."

It seems, however, as if the matter of improved bees had not been entirely neglected in these columns.

The printer, not being familiar with the word "Carniolans," has disguised it under the new spelling of "Carrinolaus."

L'APICULTURE PRATIQUE.

This journal, published at the old home of Charles Dadant, in France, makes the following parallel between the honey display in Paris last year and that at Buffalo this year:

The exposition of 1900 was the admiration of the whole world. That is an understood thing; but was it really practical? We are in a position to doubt it from our point of view. Apiculture was represented there, it is true, but with what parsimony was space allotted to it! Under such circumstances, what was the impression visitors received of our industry? Thorough contempt, probably.

The Americans, on the other hand, understanding the importance of a well-arranged exhibit, have not hesitated to make the greatest sacrifices for the Pan-American.

A special building has been decided on, where will be exhibited all the implements used in apiculture, as well as their products. But the most interesting point is that all systems of hives will be exhibited

filled with bees, which, by an ingenious arrangement, will be able to communicate with the outside while doing their work, while visitors will be able to examine the interior of the hives through observation glasses. It will be tried in every way to demonstrate the part bees play in the fertilization of blossoms. An exhibition of this kind will certainly make a great impression on the public, who frequently are ignorant of the elementary principles of apiculture.

The above is designed as an addition to Dr. Mason's announcement in this issue. It certainly should stir our people up to do their best in the way of an exhibit.

Combs built by bees, when one and two years old, are more fragile, and require more care if used in the extractor, than those built on sheets of foundation. With the former it is necessary to turn the extractor very gently, and avoid sudden stoppages. The third year, the natural combs become more firm.

THE BEE IN LAW.

Property Right in Bees.

BY R. D. FISHER.

There is natural cause for wonder why the legal status of the bee has not been more definitely exploited, since bee culture has long since passed from that of a fad, by a large number of persons who had no definite reason why they kept bees other than that they can be kept on a farm without expense and with very little trouble, to that of a scientific and profitable business. Just as the law of real property differs from that of personal property as dealing with what is immovable and indestructible, so the law of animate differs from that of inanimate property—a distinction far more significant in the science and philosophy of the law than one would suppose who had given the subject but little thought. As a matter of fact, these powers and liabilities in animal life form the basis of an elaborate system of rights and responsibilities, and by no means has the bee been overlooked or wholly disregarded. However, so far as the present writer has been able to ascertain, no effort has been made, as yet, to work these scattered elements into any sort of publication. It is hoped, therefore, that this and subsequent articles may serve to the accomplishment of such an end.

It must be primarily understood that, animals being personal property, the whole law governing such property is applicable, of course, to bees; but it is only such particular portions of that law as relate distinctly to their peculiar qualities that can be called, with any technical accuracy, the "Law of Bees."

Matters connected with their natures, dispositions, and habits, their inclination and liability to injure and be injured are proper subjects for consideration, and are more and more

becoming active factors in the results of litigation to establish the property rights in the bee and the liability of the owner thereof.

In the treatment of this subject it will be our object to let the cases speak as much as possible for themselves—in other words, to give, as far as is consistent with reasonable brevity, the facts and grounds of the decisions of our courts in the more important cases. Further along, if deemed advisable, we may compile a digest of the statutory laws of the respective States on the subject of bees; but at present we shall only aim to awaken in our readers a deeper interest in the rights and responsibilities of the bee-keeper as relating to property rights.

GENERAL NATURE OF THIS PROPERTY.

The distinction between wild and domestic bees as subjects of property is one that exists both in the common and the civil law. Without discussing the question whether all bees were originally wild by nature until tamed by man, and the distinction of the law between such animals as we generally see tame and are, therefore, seldom, if ever, found wandering at large, and such creatures as are usually found at liberty, though sometimes tamed and confined by the art and industry of man, it is safe to assume that a qualified property right may exist at common law in bees where a man reclaims and tames them, or confines them so that they can not enjoy their natural liberty. So in the civil law, the title termed "occupation," or the acquisition of ownership by taking possession of bees formerly without an owner, exists; but it must be kept in mind that, "if we have caught a wild beast or bird or fish or bee, the moment this animal has been caught it becomes ours, and it is regarded as ours so long as it is under the restraint of our safe keeping; but when it has escaped from our keeping, and regained its natural liberty, it becomes the property of the first taker, because it ceases to be ours; and such an animal is considered to regain its natural liberty when either it has escaped out of our sight, or, though still in our sight, the pursuit is difficult."

Having laid down the general rules that govern property in wild animals, we shall consider their application to bees. With regard to bees, Blackstone, the great law-giver, says: "Bees also are *feræ naturæ* (wild by nature); but when hived and reclaimed, a man may have a qualified property in them by the law of nature as well as by the civil law." And to the same purpose, not to say in the same words with the civil law, speaks Bracton: "Occupation, that is, hiving or including them, gives the property in bees; for, though a swarm alights upon my tree, I have no more property in them till I have hived them than I have in the birds which make their nest thereon; and, therefore, if another hives them, he shall be their proprietor; but a swarm which flies from out of my hive is mine so long as I can keep it in sight and have power to pursue them; and in these circumstances no one else is entitled to take them." But in respect to such animals as are in the habit of

going and returning, as pigeons and bees, which are accustomed to go into the woods and fields, and come again, we have this traditional rule that, if they cease to have the intention of returning, they also cease to be ours, and become the property of the first taker, because they cease to be what are termed *animus revertendi* when they have discontinued their habits of returning.

Ownership in bees is *ratione soli*—that is, bearing reference to the soil, and is said to be the ground of ownership in bees. So in the civil law, if a swarm of bees had flown from A's hive they were reputed his so long as they remained in sight and might easily be pursued; but they do not become private property until they are actually hived. Bees, along with other wild animals, furnish the only distinct class of chattels which have been made the subject of primary occupancy. Even here, notwithstanding the universal principle of law, that all mankind may pursue and take animals, whether of the air, earth, or water, in a wild state, the first occupant becoming the owner, there is found a restraint which ownership of the soil imposes, and which fastens the closer as population grows and civilization advances.

[This is one of a series of articles that will follow in the coming issues. We hope to have them in book form for convenient reference, as there are many "nice points," as a lawyer would say, affecting bees.—ED.]

MEASURING BEES' TONGUES.

BY A. J. WRIGHT.

I have been reading with much interest the various articles on the above subject appearing in your journal from time to time. There can be no question, I think, that a long-tongued bee has a decided advantage over a short-tongued one in the ability to reach the nectar; and I think, too, that the agitation of the question will result in an improvement of stock; but it strikes me that the experiments have not been carried far enough. In looking to the length of the tongue, have we not overlooked the capacity of the honey-sac and the individual energy of the bee—two very important factors? Suppose we take two bees having the same length of tongue, we would conclude, if we stopped here with the experiment, that these bees would store an equal amount of honey; but it is a fact that there is as much difference in the capacity of the honey-sacs and the energy of bees as in the length of their tongues. It is also a fact that a long-tongued bee has a larger honey-sac than a short-tongued one, and also greater energy.

Now, while this places long-tongued bees in a class by themselves, and gives them a great advantage over short tongues, the fact still remains that there is a difference between individual members of the long-tongued class—a difference in the capacity of the honey-sac and the energy of the bee.

With the foregoing in mind I began a year ago to experiment and construct a glossometer

that would give practical results along the right line.

A glossometer, to be practical, must be simple in construction, and free from delicate springs and wires. It must be direct in action. It must be accurate. It must measure the length of the tongue of the *living* bee, not the length of tongue of the carcass. It must give measurements of the capacity of the honey-sac, and must show the energy of the bee. It should have a scale or dial that can be plainly read to thousandths of an inch, without the aid of rule or lens. To meet the requirements I constructed the instrument shown.

WRIGHT'S GLOSSOMETER.

- S, metal standard.
 P, pointer, or indicator.
 G, glass tube, length 2 in., diam., $\frac{1}{2}$ in.
 M, mica disk.
 D, dial plate, reading to thousandths.
 H, candy-cup filled with Good candy.
 g, small glass tube to hold thin honey or sugar syrup.
 C, wire-cloth cage.
 s, screw.
 K, knob.

The bees to be tested are placed in wire cage C, which is slipped over glass tube G, allowing bees to enter the tube as far as the disk, M, which has perforations corresponding in shape and size to the large end of the largest red-clover corolla-tubes. The honey-cup H is brought in contact with this disk by means of the screw. The bees will quickly begin to take up the candy through the perforations. The instrument is placed before the operator, with knob K at left hand, and, preferably, in front of a window or before a lamp or other good light. When the bees are working at the candy, the knob K is turned slowly away from the operator. This causes the candy cup to recede from the disk, and this is continued until the bee has done its best, when the pointer is brought down upon the dial, and the reading to hundredths or thousandths is easily taken.

To get a clearer idea, we will suppose that the threads of the screw are one-tenth of an inch apart. Then it is evident that one complete turn of the dial-plate will cause the candy-cup to recede one-tenth, or ten-hundredths from the disk. It is also evident that, if the circumference of the dial-plate is five inches, and this is divided into ten equal spaces, each

space will be $\frac{1}{2}$ inch; and if the pointer is caused, by turning the dial, to move over this $\frac{1}{2}$ inch, it will move the candy-cup only one-hundredth of an inch away from the mica disk; and if this half-inch space is again divided into tenths, each space will be $\frac{1}{20}$, which would represent only a thousandth between the disk and candy-cup; and the divisions on the dial can, of course, be easily read without the aid of rule or lens.

The energy of the bees is clearly shown in their efforts to reach the candy. While some are easily discouraged, and give up without much effort, others will persevere, and work and stretch their tongues to the utmost limit; and when the candy is clearly beyond their reach they seem loath to yield.

The small tube, g, is filled with thin honey or sugar syrup, and brought up under the wire-cloth cage. The bee to be tested may then be left to fill its honey-sac. The little band of brass may then be moved until its rim just comes in line with the surface of the liquid left in the tube, which is then removed and placed on top of the large tube horizontally, and measurements to thousandths of an inch are made in the same manner as in measuring the tongues. One or several bees may be placed in the cage for tongue measure, but, of course, the honey-sac of one bee only can be measured at one time. It occurs to me that any arrangement which requires the bee to put its tongue through wire cloth must be a partial failure, as the meshes vary considerably in size, and the *shape* also gives chance for considerable variation. It seems to me that any attempt to measure a colony collectively would not amount to much, as at the best only the longest tongue of a single bee in the colony would be the result, and then it would not be at all certain that the bee in question belonged in the colony at all, as bees mix to quite an extent.

Glossometer tests bring out some curious facts. One is, that the living bee, when reaching for nectar, can protrude its tongue further than the tongue of the dead bee can be stretched without rupture. Another striking fact is, that the bees of a queen, *if pure*, differ but little from each other in tongue measure, capacity of the honey-sac, and working energy.

I am of the opinion that the only practical method is to measure the actual reach of tongue of the *living* bee through perforations of a standard size. I have adopted .065 as a standard diameter. Wire cloth in common use measures the square way of the mesh about .075 to .08; cornerwise it measures from .10 to .11, showing its unreliability. I believe the glossometer will recommend itself to every humane bee-keeper, as it renders unnecessary the killing of our pets to determine the length of their tongues.

If we are to accept .25 ($\frac{1}{4}$ inch) as the maximum depth of red-clover corolla-tubes, then I think we need not worry much about the best of our long-tongued strains being able to secure the crop. I have found bees in my best colony of Sweetheart's that would reach .259, and I have found none showing less than .238. This is not a free advertisement for this strain,

as every queen-breeder has his favorites; but it shows that, in the near future, the red-clover crop is *ours*.

Bradford, N. Y.

[Mr. Wright is entirely correct in regard to wire cloth. The meshes of ordinary queen-cage cloth are too large, and, what is worse, they are usually somewhat irregular. Sometimes the bees will stick their noses down through a large hole, and at others through a small one. Perforated metal having openings as large as the corolla-tubes of red-clover, for instance, should be used. Then care should be taken to see that there are no burr edges around the perforations. It is possible and even probable that a glossometer—something that requires the bees to stretch their tongues (while in life) to their utmost limits may be better than the measurements effected by methods described in GLEANINGS recently, by which the bees are chloroformed, decapitated, and the tongues combed out on the steel rule. But such treatment can hardly be regarded as inhuman, as suggested by Mr. Wright, for the simple reason that any animal or insect under the influence of chloroform experiences no pain, much less when the head has been severed from the trunk; but for other reasons the glossometer may give us more uniform and accurate results; and if so I should be very glad to acknowledge the fact.—ED.]

do not lay claim to owning the longest-tongued bees.

Now it strikes me that, if the proper-sized wire mesh could be decided on, then every bee-keeper with some such arrangement as I send you could find the length of his bees'

FIG. 1.—A is a bottomless bottle connecting with wire-covered hole B, which passage also is well waxed to prevent absorption. C, hole or bee-passage connecting through the cover of the hive. E, measuring-scale. F, wire mesh covering hole B. D, confining-frame. G, wire cloth covering D.
 FIG. 2.—This shows the application of the glossometer to hive D.
 FIG. 3 shows the principle involved.

WHITING'S GLOSSOMETER.

A Simple and Practical Device.

BY W. M. WHITING.

I take the liberty of sending you a feeder that I have been experimenting with to find the length of my bees' tongues. The parts of the feeder that hold the diluted honey have been waxed so as to stop all absorption. I first level the hive so that the top is perfectly level. Then I bore an inch hole through the top board, and place the feeder over the hole. In a short time the bees will lower the liquid as far as they can reach it through the wire netting. I have one colony of bees (and the best honey-gatherers I ever owned) that lower the liquid $\frac{2.6}{10.0}$; and as the longest-tongued bees that I ever read about have tongues only $\frac{3.0}{10.0}$, I think my feeder must be a little off, as I

tongues with very little trouble. I have tried measuring the tongues with a rule, and I consider it too uncertain.

East Orange, N. J.

[This glossometer is all right, I think, and so simple any one can make one. We have tried it to some extent, as we go to press, with fairly good results. The wire cloth through which the bees run their tongues is 11 meshes to the inch. It is so coarse the bees can run their mandibles clear down through the meshes. For this reason the tongue-reach is longer than what we get by our steel-rule plan.—ED.]

A VISIT TO HENRY ALLEY.

BY A. C. MILLER.

Mr. Henry Alley, easily the foremost queen-rearer in the country, is as hale and hearty at 67 as many a man at 40. In a recent visit to his apiary I found him hard at work, moving with a quick, springy step, all his operations betokening a sound body and an alert mind.

His home in the pretty country town of Wenham, Mass., is almost hidden among the trees, and his apiary was so distributed among the raspberry and currant bushes that a satisfactory photo was impossible. Mr. A. said he had been too busy to trim away the bushes and to slick things up, but the essentials he certainly does not neglect. His kitchen garden was as free from weeds, and as thrifty, as any one could desire; and while his workshop, spare hives, etc., were in some confusion, it was only such as is brought about by a rush of work. It was a pleasure to watch him as he made up nuclei, fixed frames of cages containing cells or queens, and prepared strips of comb for cell-building. To those who are not familiar with Mr. Alley's system a brief description may be interesting.

First, his breeding queens are kept in little hives containing five frames about five inches square, and from these little frames he cuts a comb whenever he wants eggs for cell-building. For doing this work he prefers black bees, buying many colonies of them every spring. He has to send far afield for them now, as those anywhere near Wenham were gone long ago. When received, the entrance is covered with a drone-trap, and all black drones kept from flying until he is all ready to use the colony for cell-building. To prepare them for this they are taken into his workshop where the queen is found and removed, and the bees are brushed into an empty hive and shut in with a wire-cloth cover, so to remain for several hours. When they have been shut up long enough, the prepared eggs are given to them and they are left until night when they are placed on a stand out of doors, and the entrance opened. The operation of preparing the cells I will describe as I saw him do it.

In his shop he lighted a kerosene-stove and set on it a pan containing a mixture of bees-wax and rosin. Then he took two L. frames from which the lower half of the combs had been cut, and, by a quick stroke of his knife, removed the remains of a previous lot of cells. He then went to the colony of one of his breeding-queens, picked out one of the little combs, stepped back into the shop, and, with a hot knife, cut the comb from the frame, slit it into strips containing one row of cells each, took a match and destroyed the egg in each alternate cell on one side of the strips, dipped the other side into the melted rosin and wax, and stuck them to the bottom edge of the L. combs above referred to. His next step was to hang these in an empty hive, fill the rest of the hive with combs of honey and pollen, jar the confined bees to the bottom of the hive they were in, put on the top of it a zinc excluder ("drone-strainer" he calls it), place on this the hive containing the prepared strips of eggs (enough for 60 cells), and over this a wire screen. In a few minutes a large part of the bees were in the upper hive. The operation from the time he went for the eggs until they were given to the bees was just eight minutes. When the cells are sealed they are cut apart and each one put into a little cage by itself, and a lot of these cages are fastened

into an L. frame and hung in any queenless colony until they hatch. The next step is the making of a lot of little nuclei from the small 5x5 frames, stocking them with bees, giving them a virgin queen and carrying them to an out-apiary where he has his drone-rearing colonies.

I am fairly familiar with both this and the cell-cup system; and for celerity of operation and excellence of results I consider Mr. Alley's plan far ahead of the others. His system is certainly best for those bee-keepers who rear queens solely for their own use; but each commercial queen-raiser will use the system he is most accustomed to. He had in cages a lot of virgin queens of various ages; and finer and larger queens I never saw. From their size I took it for granted they were laying queens just caged, until informed to the contrary.

The Adels are large, active bees, clinging well to the combs, easily handled and reasonably gentle. Mr. Alley speaks highly of their honey gathering and comb-building qualities; but with them in that respect I am not familiar. The using of black bees for building cells has its advantages (one of which is cheapness) and its disadvantages, the chief being their stings. Ah, but how they stung! They used my head and neck for a pin-cushion, but not a sting did I get from the Adels. Mr. Alley never wears a veil, but does have a handkerchief hanging from the back of his hat to protect his neck and the back of his head. To see him working among the bees one would never think a sting troubled him. He has a pleasant, genial way of treating his visitors that causes a visit to be agreeably remembered.

Providence, R. I., June 25.

BEE-KEEPING IN CUBA.

Large Honey Yields; Peculiar Conditions in the Island.

BY FRANK N. SOMERFORD.

After a long disastrous drouth which lasted all spring, greatly shrinking the amount of late spring surplus honey, and retarding natural as well as artificial increase, besides causing great loss to the agricultural industries, we were visited in this section some days ago by one of the heaviest rains known for many years, which inundated large tracts of flat lands, doing great damage. One man alone, a Cuban, lost 300 chickens; another, several colonies of bees, besides several who lost cattle that were staked in low places. Much damage was also done to roads, bridges, etc. This was followed by the hottest weather known for 15 years, as stated by Spanish papers; and now the rainy season seems to have burst upon us, and vegetation is growing at a rate almost astonishing. We are enjoying mud, mud, mud; and wheel-riding, except on the macadamized roads, is done with now for a while.

Mr. Harry Osburn's honey crop for the past season was taken from about 400 hives. I

visited his ranch last summer, and there were over 300 hives; in early autumn he increased 100, which gave a total of about 400. Of this number there are possibly 50 from which no honey, scarcely, was taken.

In Mr. Osburn's calculations I think he should have stated that there were 1200 colonies on his range, including the apiary that he has; and I might add that 500 or 600 of these will barely come within the three miles; or, in other words, are just about three miles away. This, however, doesn't place the entire force of all those bees on that same territory, because, five miles from Mr. Osburn, or one, two, and three miles from the other two large apiaries along the coast, the range is almost as good as if not better than the range near him.

The two other apiaries are separated by three or four miles, thus scattering those bees over a much larger territory than Mr. Osburn seems to indicate. He also signifies that, could he have remained at the apiary and personally superintended or done the work himself, during the winter of 1898, he would have made a great record; yet whoever had the ranch that year secured more than double the amount per colony that Mr. Osburn received the past season.

Taking the unusual amount of 50,000 lbs. from 200 hives, this gives 250 lbs. per colony. Taking the 400 colonies that Mr. Osburn had the past season, that produced 40,500 lbs., this gives a fraction over 104 lbs. per colony. This is not saying much for him as a record-smasher, for a single year, but his figures for a term of years are very large. It should be taken into consideration, also, that the year 1898 was when farming was paralyzed, and there were but few stocks on the range to eat and trample under foot the flowers that at that time must have grown in profusion everywhere, thus making it possible at that time to secure such large yields.

There is something strange regarding the quantity of honey a bee or a hive will gather here as compared with what a colony of the same strength would gather in the States. In the best of the honey-flow it requires here on an average a third more time or a third longer for a hive to fill up and become ready to extract than in the States. I think several others have noticed this too, and I have heard Mr. Harry Howe say that he has never seen bees work here with the eagerness and rapidity with which they work in the North. I might add, though, that people are affected in the same way; and what is done is by force more than by the natural desire that a person has for activity in the States.

I can look at the cut of "Rambler's Retreat" among the peach-trees, with the fruit in plain view, with a longing eye and watering mouth. It reminds me a little of our mangoes here in Cuba, excepting that the mango grows very large, and tall, almost, as an oak-tree, and are sometimes laden with fruit from the first branches clear to the top, and will have small fruit and ripening fruit at the same time. This is a large fruit, rather coarse, though, that to some extent fills the

vacancy of the peach here. But I am afraid, were Rambler here with that pretty ranch in so much shade, without sheds, he would soon find things unpleasantly damp, especially through June, July, and August. That little 22-caliber honey-elevator looks more like the inventive genius of a novice than the man of Rambler's experience; and should he, while extracting, allow his thoughts to ramble as his pen does sometimes he would soon find that honey to be of a rambling disposition also. However, some of our Cuban bee-keepers prefer a little can arrangement, to place honey in the cask with. An American in Cuba, though, can be partially excused for such arrangements, for they tend to concentrate a person's thoughts and keep him from thinking of the good country, good people, good society and surroundings, where the good English language is spoken. That little elevator would, of course, place all such thoughts in oblivion, as it were, to the operator, whose thoughts would be occupied thus: "Can I uncup this comb before that can runs over? can I throw out these two combs before that can runs over? can I put some more fuel in the smoker by the time that can is full?" or else in steps a friend whom you were not expecting, and you can't give him a welcome handshake, and an unrestrained greeting, on account of that miserable little can.

Yes, you all know this, and even more is true. I've traveled this path, and have decided, just for one season, a platform just high enough to allow the honey to run right into the tank. This must have a long gradually sloping plank approach to allow the cart to run right up on the platform beside the uncapping-box and extractor; then you can work unmolested; and should you hear some noise in the apiary, or something call your attention, your honey is going right on into the tank. And this question of honey at a little less than 3 cents per lb. that we have to contend with here is not conducive to a desire to handle it any more than is actually necessary.

However, I am glad to learn that Mr. Osburn has so satisfactorily settled this question for himself that it gives him no uneasiness. I think I shall go over and see friend O., and see if I can't get a key to the situation. All Cuban bee-keepers should be annexationists. Bejucal, Cuba, June 11.

THE SWARTHMORE SYSTEM OF QUEEN-REARING.

Starting Queen-cells by the Shell cup Plan.

BY SWARTHMORE.

To start queen-cells by the shell-cup plan, proceed as follows:

To an empty hive-body attach, at top and bottom, frames covered with wire netting so as to confine a swarm of bees as Henry Alley does in his well-known "swarm-box." In the top screen is left an opening to admit of placing several Swarthmore top-bars side by side, as shown in the drawing. Bind the bars close together with four pins, A, A, A, A. Then

A NEW CELL-GETTING CONTRIVANCE.

Above is shown a cell-starting screen attached to a Dovetailed hive-body, showing manner of adjusting the shells for queen-cell starting.

OPEN-TOP OR BARLESS BROOD-FRAME, FOR CONVENIENCE IN DRAWING CELLS FOR USE.

This drawing is from a half-size model. The real frame is L., or any other standard size,

supply the holes in the series of top bars with compressed shell cups. Now shake into the hive-body a goodly number of bees that have just had their queen taken from them, and, after placing in this hive combs containing honey, pollen, and water, *no brood*, put on the cell-starting screen. Then remove the chamber to the honey-house, and leave the bees thus confined until they are fully aware of their absolutely queenless condition—perhaps over one night. In the morning set the hive close up to the bench, and proceed to graft the shell cups. Begin at one corner; and as you draw the shell have ready a blank to plug the hole, and so on, one at a time, systematically, until each cup has been sup-

plied with a larva. Take all the time in the work you wish. There is no need of hurrying, for, even as you proceed, the bees are at work constructing cells from the first cell-cups grafted.

Directly after grafting, fill a salt-shaker feeder with thin honey, and adjust it into the hole shown at B, in the screen. Let no time be lost between the removing of the blank plug and the inserting of the shells or the feeder, lest too many bees escape. There is no need of allowing even one bee to escape if the apiarist is skillful. Leave the colony undisturbed until the cells are well under way. Make examination toward evening by drawing one shell at a time, marking any that have failed, and the next morning new larvæ can be grafted into each shell marked.

At the end of 36 hours, place the hive on its original stand; collate the perfect cells and fit the top-bars into the cage parts, slip in the dividing-tins, adjust the zincs, and divide the cages among powerful colonies, allowing no more than 16 cells to a single colony. If cells are to be finished by queenless bees they need not be caged until capped. For convenience in distributing cages, or in getting at to remove a single queen, cell, or a cageful of either, at any time, without disturbance to the bees, or the use of smoke, even, have several brood-frames constructed with open tops—that is, the regular top-bar of a plain frame is dropped down about 2 inches, and is there nailed fast to the end-bars. Two

OPEN TOP FRAME WITH CAGE IN PLACE.

In the cut above, A shows shells in place; B, shells removed; D, zinc side; E, wire side; C, division-tins, F, comb or foundation to fill the lower part of the frame.

strips are then nailed edgewise across the top, as distinctly shown in the drawing, thus forming a frame with an open top, into which two cages will fit nicely. Fill the lower section of this frame with brood comb (or full sheets of brood foundation can be used), and hang in the midst of any powerful colony all ready to receive nursery-cages at any time. When not occupied by cages, fill the space with a block of wood cut a little short so it may be easily removed, even if covered with burr-comb.

Cover the frames with an ordinary sheet split in the middle so as to expose the shell cups; then when you want cells, simply draw them—no smoke, no disturbance to the bees.

[I do not hesitate to say that, in my opinion, Swarthmore has devised a very simple

[I do not hesitate to say that, in my opinion, Swarthmore has devised a very simple

and perfect system of queen-rearing. The feature of having removable shells that can be handled for grafting or when the cells have been completed, is excellent. There are several other unique ideas that Swarthmore has that will be described later.—ED]

.....

THE HIVE I USE.

Producing Comb and Extracted Honey; Eight and Ten Frame Langstroth Hives; the Hyde-Scholl Divisible-brood-chamber Hives.

BY LOUIS SCHOLL.

After considering all of the many good points possessed by some of all the hives before the bee-keepers now, with frames of different depths and lengths—eight, ten, and more frames in a brood-chamber, using one deep body for the brood-chamber with shallow supers for the surplus, and others with two shallow chambers, and also with the supers of the same depth, has led me to try a number of hives which will be described further on.

Starting with the eight-frame Dovetailed hive, which was then considered the standard size, I thought myself up to the times. But these soon proved to be too small for this southern climate, with its long flows, so the ten-framers were considered. These proved to be some better; but the depth of the Langstroth frame proved to be objectionable. This was true when producing comb honey in section-supers above the brood-frames. There was trouble from the bees filling the deep frames with the honey that ought to go into the sections—this to a greater extent during a slow flow, and especially along the top edge of the comb above the brood; and after this honey was once sealed, the bees were quite loth to store surplus above such sealed stores, causing them to loaf and to hang out in great festoons all over the front of the hive.

Besides, the queen was also crowded out, as the bees filled every cell with honey as fast as the young bees hatched out, although there was plenty of room in the super above.

Now, the question was, how to avoid this trouble and how to get that honey out of the way and into the sections, and this also with as little labor as possible.

Of course, this could be done by inverting the whole hive and letting it remain for a few days for the bees to remove the honey; but this causes a great deal of trouble and labor. Here, now, is a good point in favor of reversible frames, but I am not an advocate of such.

Then I found that it can be accomplished to a great extent by using a divisible-brood-chamber hive by exchanging the upper case (which has the honey along the top) with the lower one, which puts the honey in the center of the brood-nest where it will be removed by the bees.

As there now is brood in the frames which are now above, the bees are compelled to store the honey in the sections above; and by removing the honey in the brood-chamber the bees also provide more breeding room for the

queen. By exchanging the cases of the brood-chamber in this way at certain times during the main honey-flow it is possible to get nearly all the honey of that flow into the sections.

Then shallow frames possess a great many other advantages over deep frames, which I learned when using shallow frames in supers above my standard Langstroth hives, which led me to adopt a hive with shallow frames throughout. Especially when running for extracted honey, the hive consisting of two, three, or more cases with all shallow frames, one is not bothered with frames of different depths, and all cases are interchangeable.

These cases are more convenient to handle, as they are not as heavy as full-depth supers, and are also easier to remove when full, as, by smoking the bees thoroughly when raising the cover, they can be readily driven down out of such shallow supers, when they are taken off practically free from bees, and without any brushing of bees.

Then the shallow frames are easier to uncap, as one draw of the knife uncaps a whole side of the comb, while it takes longer with deep frames, besides being awkward to handle, and the danger of broken combs.

Shallow frames I prefer, too, for a great many other purposes in the apiary; and as there is not very much need of handling the frames individually except in a few instances, the hive is mostly handled by cases with the whole set of frames; and all that is necessary when examining colonies for any purpose at any time is to tilt the upper case of the brood-chamber back, and then one can get a full view of the brood-nest.

In this way it is quite easy to ascertain the conditions and strength of a colony at any time, and also during the swarming season, when looking for queen-cells. If there are any present in any hive they will generally be found on the bottom edge of the upper frames.

When providing more room for the queen in early spring, or for honey later on, one of these shallow cases is added, without the bad result of giving too much room at once, as is mostly the case when giving full-depth supers.

Many other points in favor of shallow frames used in connection with such a hive could be recited; but as time and space do not permit, I will now give a description of the hive which, after being used in the apiary, has given good satisfaction.

The brood-chamber consists of two shallow dovetailed cases, standard ten-frame L. size, but only $5\frac{3}{4}$ inches deep each, both giving a brood-chamber $11\frac{1}{2}$ inches in depth.

Each case holds a set of 10 shallow Hoffman self-spacing frames, the same in size as the standard L. frame, but only $5\frac{3}{8}$ inches deep; this makes 20 frames, with a comb surface of nearly 12 Langstroth frames, thus providing a large brood-nest.

The Danzy bottom-board and cover are used on this hive.

The same shallow frame cases are used when producing extracted honey, and the supershell of the section supers is one and the same kind.

The comb-honey super is the same in every

particular as the "Ideal," with tall plain sections, $3\frac{3}{8} \times 5 \times 1\frac{1}{2}$; 35 in each super, in 7 rows, 5 in a row, resting on plain slats the same width as the sections, and these taking up the full inside length of the super, except the separators, as the Hyde-Scholl No. 2 separators are used in this super, one between each row of sections, and also one on each outside row next to the wall, when all is tightened up with a follower-board and super-springs.

This super is, in my mind, superior to any other for section honey; and if time permits I will say something more about it in some future article.

Hunter, Texas.

[There is a great deal of sound truth given in the article above. There are times and places when there is an advantage, undoubtedly, in using shallow or divisible brood-chambers. While they have their objections, yet it is probably true, if I may judge from correspondence, that these double brood-nests are increasing in popularity.—ED.]

SHALLOW BROOD-CHAMBERS, AGAIN.

The time is drawing nearer when the bee-keepers will be putting to the test some of the theories that have been advanced through the journals during the winter and previous season. I suppose that quite a few of the readers of this journal will try the shallow, temporary brood-chambers for swarms or colonies worked for comb honey. I for one shall use that plan for all colonies that swarm or that make unmistakable preparations for swarming. As some who have written on the subject do not seem to have gotten hold of the plan in all its phases I should like to call attention to some points that I consider of the greatest importance.

I will quote from the article by Mr. Atwater, on page 8. He says: "To illustrate, the past summer I hived a strong natural swarm in a single section of the Heddon hive. The frames contained foundation starters $\frac{1}{2}$ inch wide. The hive was put on the old stand. The three ideal supers were taken from the parent colony and placed on the swarm. Work in the supers went on for about two weeks. By that time the colony was weakened so by the loss of old bees that super work was almost entirely discontinued. A little over half as much comb honey was taken from this colony as from colonies of like strength that did not swarm."

Now, it would seem that Mr. Atwater left out one of the most essential points in the whole plan. I like the plan especially, because the working colony in the shallow brood-chamber *does not* become weak from the loss of old bees, for the reason that I constantly strengthen them by shaking off bees from the hatching combs of brood contained in the parent hive. I use that hive as a feeder, and do not expect to make a working colony out of it for the white-honey harvest.

I make it a point to watch the working colonies closely, and give them bees enough to keep up the maximum force for storing. If I can't get the bees from their own parent hive

I can get them from some other part of the yard. Fifty such strong colonies will store more surplus honey than one hundred with forces divided, and therefore concentration of forces is my motto. As soon as the main honey-flow is over, these working colonies can be united to the parent hive; and if there should be a late crop of amber honey you will have good strong colonies to secure it.

HARRY LATHROP.

Browntown, Wis., Mar. 26.

NOTES OF TRAVEL.

A Visit with J. M. Jenkins; the Bloody Shirt, etc.; Continued from Last Issue.

BY E. R. ROOT.

After leaving the yard we met on the road one of the veterans of the Confederacy. Mr. Jenkins introduced me as "a real live Yankee from the North." He received me most cordially, after the manner of a true Southern gentleman, which he was. I remarked that I was glad to see that there was less of a disposition on the part of the Northern and Southern press to "wave the bloody shirt" than formerly.

"Yes," said he sadly, "but the bloody shirt is *there* all the same," and I am afraid the remark is too true; and "it will be there" so long as the veterans of both sides remain alive. The boys in blue don't like to forget Libby and Andersonville; and the boys in gray are no more inclined to forget how their homes and plantations were overrun and destroyed, and how, for years after the war closed, the North kept standing armies in the South. But in the minds of the younger generation I am sure these bitter memories will fade, and the great North and the great South will be united as they never were before. While "the bloody shirt is there" it is buried. I believe, where it never more can wave.

We next arrived in Wetumpka, visited the bank in which Mr. Jenkins is a director and stockholder, and then crossed the big bridge for the other side of the town, where our friend's bee-hive factory is located. He has quite an extensive plant—one which will be enlarged to twice its present capacity the coming season. There will be a new and larger engine and boiler, a new double-surfacer planer, besides other new machinery and a brand-new shop.

Of the two remaining pictures, one shows a view of the home yard with its long shed, and the other, another out-yard, the Evelyn, located in a beautiful grove of pines. This yard, as well as the other ones, is under the direct management of Mr. H. Fitz Hart, formerly of Florida. Mr. Hart is a bee-keeper who is exceptionally well posted on all bee-lore, both of this country and of England, for he is a native of that country. While in the motherland he made the acquaintance of such men as Frank Cheshire, who has acknowledged that he received important suggestions and assistance from Mr. Hart in his scientific work. Mr. Hart has written for these columns at va-

J. M. JENKINS' HOME APIARY UNDER SHED; ALSO ONE OF HIS OUT-APIARIES (EVELYN) AMONG THE PINES.

rious times, and will be remembered by our older readers.

On returning from the bee-yards Mr. Jenkins proposed that we drive around to some of the cabins of the colored people on his plantation, and talk with them. We drove up to the home of one old colored woman, and Mr. Jenkins, after calling her out to the buggy, began the conversation in this wise:

"Well, auntie, I brought around a real gospel train you talk so much about. Is it running yet?"

"You'h jes' right it's a runnin', Mista Jenkins, all de time. Yis, sah; it runs all de time. Au' so dis ge'men's from de No'th, is he? Glad to see you, Mista Root. Hab you got on dat gospel train?"

This was a pointed question, and I did not know whether I had got on *her* train or not, and I answered her accordingly.

"Bettah git a ticket putty soon, for it may be too late, Mista Root."

"But your ticket has all run out," said Mr. Jenkins banteringly.

"No, 'tain't, Mista Jenkins. De Lor' Jesus he punched my ticket."

"But your ticket ought to be renewed."

"Yis, yis, Mista Jenkins. I have de Lor' Jesus renew it eb'ry day, Mista Jenkins. Say, Mista Jenkins, does you renew you's eb'ry day? an' you, Mista Root?" said she, looking me straight in the face. I said I hoped so.

"Well, you bettah. De debble is aftah ye, sart'n shu', Mista Root."

"But," said Mr. Jenkins, "how are we *white* folks going to get on *your* train?"

"We'll all be white when we git on dat train. The' won't be no compahiments for brack folks. You, me, an' all on us will be white—yis, sah, Mista Jenkins."

"But where will the black folks go?" inquired Mr. Jenkins.

"If dey doan git on dat gospel train dey'll all go down to hell—yis, sah, down to hell, an', say; dar'll be some white folks dat'll go down to hell. Dey'll be white up heah, but be brack down dar. Yis, sah; dey'll all be brack down dar; but in hebbem we'll all be white, no mattah whethah we got a brack skin heah o' not—yis, sah; yes, sah."

"How do you renew your ticket?"

"I makes my peace with my God eb'ry night an' eb'ry mo'nin'—yis, sa. Say, Mista Jenkins and Mista Root, do you do it eb'ry night an' mo'nin'?"

We told her we tried to, and then drove on to see others.

Mr. Jenkins explained that the religion of the black people is largely sentimental; that some of the loudest shouters would lie and steal, and yet *not seem to know* that their lives were inconsistent. They need a gospel so taught that it will take hold of their lives, he explained. "They need to be taught," he said, "to be provident; to have a sense of ownership, and, more than all, that lying and stealing are an offense unto the Lord."

Mr. and Mrs. Jenkins are earnest Christians, and are doing much for the blacks all around them. The colored folks always had a pleas-

ant smile for "Mista Jenkins," and are always glad to see him.

"But," said Mr. Jenkins, "some of the theories held by some of the Northern white people concerning this race problem will not work out in practice. What the colored people need is not higher education but a practical knowledge of some trade. They should be taught to read and write, to earn and buy a home, not to rent one. Booker H. Washington's methods are all right."

I must confess that many of my preconceived notions have been materially changed since visiting the Southland, and I only wish that there might be more charity on the part of the Christian press of the North in dealing with the race problem.

CONVENTION NOTICE.

All arrangements for the next convention of the National Bee-keepers' Association have been completed so far as possible, and the convention will be held in the audience room of the Buffalo Society of Natural Sciences, Sept. 10th, 11th, and 12th; commencing on the evening of the 10th. The place of meeting is in the Buffalo Library building, corner of Washington and Clinton Streets, near the business center of the city. The president of the Natural Sciences Society, Mr. Smith, has also kindly offered our Association the use of their library and other committee rooms during the time of our convention, and to do all in the power of the society to help make our meeting a success.

Railroad rates will vary in the different passenger association territory, from one cent per mile each way to one and one-third fare for the round trip. Each person can readily learn the rate on inquiry at his railroad station.

The Buffalo bee-keepers will try to provide entertainment at reasonable rates for all attending the convention, who will notify Mr. Sydney S. Sleeper, of Holland, N. Y., by Sept. 2d, of their wish for entertainment.

In a letter just received from Mr. Sleeper he says, "We want all to come who can, for we wish to make the Buffalo meeting the most pleasant and instructive one that was ever held in America. We will have the co-operation of all the sciences as well as the school board," and names some professional men who are interested in our specialty and will be at the convention to help.

In a long letter from Mr. Hershiser, just received, he closes by saying, "Call upon me for whatever further assistance I am able to render," and Mr. Penton, an ex-president of the Erie County Bee-keepers' Society, and others, have offered to do all they can to provide for the comfort of the delegates.

As stated in my previous convention notice in GLEANINGS, there will be no fixed program and no papers, and the time will be occupied in answering and discussing questions, except that on Thursday evening there will be a joint session of our association with the American Pomological Society, to discuss "the mutual relations of bee-keeping and fruit-growing;" and Prof. Beach, of the N. Y. Agricultural Experiment Station, and Prof. Fletcher, of the Central Experimental Farm of the Dominion of Canada, will help talk for the bees at that session, and it is hoped that much good will result to fruit-growers and bee-keepers from this joint session.

If any bee-keeper who can not be at the convention has any questions, knotty or otherwise, he would like to have answered at the convention, will send them to me I will see that they are presented.

A. B. MASON, Sec., Sta. B. Toledo, O.

ROBBING the bees is a term used by many of the Western bee-keepers for taking off the finished supers. Our forefathers used to talk about robbing their bees when they sulphured them in the good old-fashioned way, and the term has crept into use, even among up-to-date bee-keepers in the great West.

APIARIAN EXHIBITS AT THE PAN-AMERICAN.

BY OREL L. HERSHISER.

Now that we have settled warm weather the daily attendance at and interest in the Pan-American is rapidly increasing, and this has been especially noted in the Apianian Department. Besides the many visitors who take only a passing interest in the fine appearance of honey, and marvel at the instinct of the bees, we are now having daily visits from scientific gentlemen eager for the more substantial and practical knowledge of apiculture. One professor of agriculture, of an agricultural college in one of our Southern States, contemplates the teaching of apiculture as a part of the course, just as it has been taught for many years at the Michigan Agricultural College, and was therefore greatly interested. One Pan-American commissioner of a South-American Republic is seeking knowledge as to whether bees would be likely to do well on the tablelands in equatorial South America, and when, in the course of our conversation, I learned that bees were practically unknown in his country, and that alfalfa was very extensively and generally grown there, it created that longing for "pastures new" that so many apianists have experienced in these recent years of failure of the honey crops. Another scientific gentleman and extensive fruit-grower, after a short discussion of the great value of bees as pollenizers of fruit-bloom, expressed a wish that he had a thousand hives of bees within reach of his 200 acres of fruit-trees.

At present New York is the only State represented in the apianian exhibits of honey and bees. The show-cases in this exhibit are similar in appearance to those used for apianian exhibits at the Columbian Exposition. All the cases are 10 feet high from the floor, and about $2\frac{1}{2}$ feet wide by 7 feet high, inside measure. The space allotted to New York is approximately $16\frac{1}{2}$ feet deep by 39 feet front. On the west end of this space is a case approximately $2\frac{1}{2}$ ft. by $11\frac{1}{2}$ ft., and set at right angles with the front line of space, and the south end of case on the front line, leaving a spacious passageway between its north end and the wall. A large case about $2\frac{1}{2}$ by 23 feet rests with its outer edge on the long dimension of the space next to the main passageway, with its west end about $5\frac{1}{2}$ ft. from the first mentioned case. A third case of the same dimensions as the first mentioned is placed at right angles with the front line and on the east end of space, leaving a space of about $5\frac{1}{2}$ feet between the east end of the second mentioned case and the west side of the third case. A fourth case, about $4\frac{1}{2}$ by $11\frac{1}{2}$ feet, is built against the wall, covering a large window, the glass of which have been removed. This case is built at right angles with the third-mentioned case, and its east end about $2\frac{1}{2}$ feet from the west and north corner thereof. In this space, and between the north end of the third-mentioned case, is constructed a small locker for the storage of supplies for the exhibit. Thus the entire

space is enclosed, making a spacious booth with a passageway at either end opening into the main passage, and another spacious passageway between the wall and the first-mentioned case opening into the exhibit of The A. I. Root Co. and that of The W. T. Falconer Mfg. Co.

The fourth-mentioned case is for the exhibition of a small apiary of bees at work in hives of various patterns, one of which is an observatory hive. This case has glass front and glass on the west end, and the hives rest on a platform about 9 inches high. The third-mentioned case has glass on the side facing the booth and the end facing the main passageway. The second-mentioned case has glass on both sides and both ends; and the first-mentioned case has glass on both ends and the side facing the booth. The back of this case also forms the background of the exhibit of The W. T. Falconer Mfg. Co., between which and the exhibit of The A. I. Root Co. is a spacious passageway opening into the main passage at the south, and into the New York booth at the north. An ornamental railing and cornice bearing the legend, "The A. I. Root Co." and "The W. T. Falconer Mfg. Co.," surmounted by three beautiful bronzed or golden imitation straw bee-hives, one at either end and one in the center, the latter marking the dividing line between the two exhibits, completes the front of this double booth. The background of the exhibit of The A. I. Root Co. is also 10 feet high, and extends from the main passageway to the wall, a distance of about $16\frac{1}{2}$ feet. The combined width of these two spaces is $11\frac{1}{2}$ feet.

Owing to the very general failure of the honey crop of 1900, the exhibits in this line are not what might have been expected under more favorable conditions, and there is no doubt that this failure has deterred several States from making exhibits early in the exposition. I am informed, however, that Canada and several of the States will make exhibits of the present season's honey as early as possible, and we may therefore expect a large showing of the apianian interests. It is well known that there are many Canadian bee-keepers who understand well the art of exhibiting apianian products. In fact, I believe the Ontario Bee-keepers' Association annually appoints a representative to each of their principal expositions. Buffalo being quite convenient to Canada, we may therefore expect some very handsome exhibits from that quarter.

All the apianian exhibits are to be placed in the west end of the gallery of the Agricultural Building, which, when the moving stairway is in operation, will be very easy of access. This gallery makes a beautiful promenade and balcony, from which to view the collective agricultural exhibits on the main floor. Many other interesting exhibits are in this gallery.

Our white-clover harvest came to a close yesterday—owing to extreme heat and dry weather—22,500 lbs. clover. Basswood is opening, but bees so far fail to find honey in the bloom.

N. E. FRANCE.

Platteville, Wis., July 1.

SWARMING, AND SECTION HONEY.

"Hello, Doolittle! Awful hot to-day. My hives are covered with bees hanging out, and I fear they are going to have a swarming-time just when basswood is at its best, as it will be in ten days now. What method do you use in order to keep the bees from swarming just when it is important to keep the hives crowded with bees in order to secure a good yield of section honey?"

"You are not the first one to ask such a question, Bro. Brown, for this is something bee-keepers have been asking during the past quarter of a century. If the apiarist has done what he could to get his hives full of brood at the proper time, he will have lots of bees in time for the honey harvest—hives overflowing with bees, as you say yours are now; and in order to be successful with them, all swarming should be done before the height of the season arrives."

"But I supposed you did not allow your bees to swarm, for, I am told, no large amount of section honey can be obtained if we let our bees swarm."

"In this you err, for the swarm and parent colony, if rightly managed, will do fully as much with the average bee-keeper, when just one swarm is allowed to issue, as could be gotten were they not allowed to swarm; and, besides, if we tried to keep them together by cutting out queen-cells, giving extra section room, etc., we would, as a rule, only delay swarming, so it would come during the last half of the honey harvest, when it would be the most detrimental to our interests."

"But is there no such thing as non-swarming hives, used when working for section honey?"

"Whenever I hear men talking about non-swarming hives in connection with raising section honey I feel quite a little like doubting their practical experience as apiarists."

"Well, what is *your* method, if you do not use non-swarming hives, and let your bees swarm at will?"

"All my early swarms are hived singly in a hive having but five frames in them, containing a starter of comb foundation about half an inch deep, and the sections are put on at time of hiving, as five frames give hardly room enough for a large prime swarm."

"What do you mean by those coming early?"

"Such as come out from ten to fifteen days before the main honey harvest, which, in this locality, is generally from basswood."

"And do all of your colonies obey and swarm during those five or six days?"

"No; I do not have all swarms come out just as I might wish, but I have a different plan of management for those that come later, say from five to eight days before the harvest. These later ones are united, so that two are

put in a hive filled with combs, the section boxes being set from one of the old colonies on the hive containing the united swarms. Then this old colony is set on a new stand, and the hive containing the two swarms put in its place, thus giving all the field bees from this colony, in addition to the two swarms, which makes a colony which will do wonderful work during the honey harvest, a colony from which I take 100, 150, and even 200 one pound sections of the choicest of honey, according as the season proves."

"But what about the queens? Do you let both go in with the doubled swarms?"

"No. The queens having their wings clipped gives me the power of disposing of them as I think best, and so I let the queen go back with the colony which was moved to a new stand, and allow the one from the colony not moved to go with the united swarms. The moved colony losing not only the swarm, but also all of its field bees, feels so poor that the queen-cells are torn down, and all idea of swarming is given up; but this colony soon picks up from the multitudinous emerging brood, so that often it will do quite good work in the sections."

"But will not there be after-swarms from the other parent colony?"

"The hive furnishing the queen for the doubled swarms is not disturbed in eight days, at which time the first young queen will have emerged from her cell, when the hive should be opened and all queen-cells destroyed, which will entirely prevent any attempt at second or after-swarming."

"But if all have not swarmed up to within a day or two of the opening of the harvest, what do you do with them—keep on uniting two swarms together?"

"No. All that have not swarmed at the commencement of the honey harvest are made to swarm in this manner: A hive is filled with frames of empty combs, or those partially or wholly full of honey, and placed upon the stand of one of the colonies which has not swarmed, and all the sections are taken off and placed thereon; then all the bees are shaken and brushed off their combs of brood and honey in front of this prepared hive. Thus we have the queen, bees, partly filled sections, etc., which make a colony ready for business at once. Previous to this a few nuclei should have been started, so that we may have the needed laying queens to use. Now take all the combs from which the bees were brushed except one, and arrange them in the hive, carrying it to the stand of another colony which has not swarmed. Next take the comb of brood which was left out, and go to a nucleus, taking out the frame having the laying queen on it, and put the comb of brood in its place. Take the frame (bees, queen, and all) and set it in the place left vacant for it when arranging the combs of brood. Put on the sections, and when all is complete move the colony, not having swarmed, to a new stand and set the prepared hive in its place. Thus we have a laying queen and enough of her own bees to protect her, combs full of brood, and all of the field or old bees

from the removed colony, which makes a colony that is ready to go into the sections in a very few days. The removed colony has simply lost the old or field bees, so as to stop the swarming impulse, and in a week will be ready for work in the sections again."

"That sounds good, and I believe I will try some of my colonies that way. But don't you think non-swarming would be desirable under any circumstances?"

"Yes, I certainly do, especially for out-apiaries. We have many of our best bee-keepers at work in the matter, and I fully expect that, before the year 1925 shall be ushered in, something of universal value will have been brought out for the benefit of the fraternity. But the above is as good as any thing in sight at present for the home apiary, such as yours. But I hear Mrs. D. calling me, and I was to help her a little while."

STAYING FOUNDATION WITH WOOD SPLINTS;
THE PLAN A SUCCESS; HOW TO USE THE
SPLINTS.

Noting your editorial footnote in regard to wood splints, as advanced in *Stray Straws* by Dr. Miller, I beg to say that I have used splints with best results to a considerable extent. These splints need not be waxed, as the queens lay in the same regular manner on the splints in the bottom of cells as on either side of the splints in adjacent cells. I used splints sawn from cottonwood lumber; but some material of harder texture may be more suitable. These splints were $\frac{3}{8}$, $\frac{1}{2}$, and $\frac{1}{4}$ inch longer than the inside depth of the frames. A saw-kerf is required in both top and bottom bars for the insertion of the ends of the splints. These should be $\frac{1}{8}$ deep. No fastening is required if the sheets of foundation touch the top-bars the entire length. Otherwise the foundation bulges from the weight of a new swarm, and irregular, wavy combs are the result. Seven splints will answer to the frame with medium brood foundation; for light brood, 8 splints would probably be required. With foundation wired from the mill, the foundation would still have to be attached to the frames; with the splints, the foundation is put in the frames, and securely stayed at the one operation. I could put in frames from 100 to 125 sheets per hour, with the splints, and I never have seen more perfect combs, all things considered. They stand extracting remarkably well. No cracks appear in the combs from this strain, as with horizontal wiring. I wrote you a few years ago about this matter, and again am prepared to say that you can advocate the general adoption of wood splints for foundation brood-combs, without hesitation as to their giving any dissatisfaction.

In putting in the splints, a board of suitable

thickness is placed inside the frame. Put 4 splints in place, then lay on the sheets of foundation; then put the other splints in place and roll them down with moderate pressure. Turn the frame and roll down the first splints; and this completes the job. Why not get out a few of these splints, and give them a trial? I am convinced that they will meet with your approval. B. F. AVERILL.

Howardsville, Va., Apr. 9.

[I believe the use of wooden splints is all right; and for some bee keepers it may be the very best method of staying up foundation. Personally, we here at the Home of the Honey-bees prefer horizontal wires—wires fastened to the end-bars of the frames.—ED.]

HOW BEES USE THEIR TONGUES IN SIPPING
UP HONEY; THE ALLEGED BIAS OF
THE EDITOR.

After reading the discussion of long tongues, beginning on page 476, I began trying to think of some reason why bees with long tongues would be better on other flowers than red clover. Wishing to observe closely just how bees use their tongues, I took some honey in a bottle, and a small piece of board, and went out into the apiary. In the first place I put some large drops of honey on the board, and presented it to the bees. It took only a minute to see that they always inserted the tongue into the drop about one-third its length. The honey was then spread out on the board as thin as I could spread it with my finger. In sipping this, the bees doubled the tongue back about the same distance that they inserted it in the drops in the first instance. When the honey was nearly all taken up, so that the board was only wet with it, they doubled their tongues back still further. From those observations it seems to me that the bees can take honey faster, at least, with the tongue bent backward at some distance from the tip, and I believe they would have much difficulty in getting honey if it could be reached only with the extreme tip of the tongue. The tongue is brush-like at the tip, and honey could rise on it only by capillary attraction, not at all by suction. Of course, we can not see how the tongue is used in a flower-tube, but it is quite probable that it is used the same as on a flat surface. If this be the case, a long-tongued bee could gather a load in much less time, even on white clover, than a short-tongued one; for the tenth part of a second saved on each floweret would enable it to get its load in 30 per cent less time, which would mean 30 per cent more honey.

In regard to the bias of the editor, alleged by Mr. Doolittle, in looking over *GLEANINGS* for the last year I have been unable to find an instance where the case was not stated with perfect fairness. The editor undoubtedly knows (what every one should know) that the best way to convince an opponent is to show a friendly consideration for the evidence on the other side.

C. F. BENDER.

Newman, Ill.
[The microscope shows that the bee's tongue is made up of a series of compound tubes.

There is one very small one that reaches clear to the end of the tongue; but this tube is so minute that the process of taking honey through it is very slow. But your point, that bees bend the tongues when taking honey rapidly, is true, and therefore long tongues would be an advantage, even with white clover.—ED.]

SHORTER STINGS V. LONGER TONGUES.

So much has been said recently about long-tongued queens that I feel that there is another "burning" question that should be brought, more or less, before the public; viz., produce bees with short stings. Every time I get this "pointer" I come to the hasty conclusion that the barbed-wire injector is about two feet long. That's an objectionable "point," eh? It is indeed an "intricate point" to overcome; but she (the workers) should have more tongue and less sting. I'm not pugnaciously inclined, as I would not walk across the street to witness a so-called prize-fight; but I might believe in the plan to catch the drones and attach eight-ounce gloves to their fore hoofs so that, during the virgin's flight, she would be so frightened by the "sporty" costume of her male attendant that her offspring would be birth-marked, and known thereafter as "boxer" bees. If some inventive genius can not find a means to "curtail" this "intricate point," why, I will think seriously of running opposition to our hot-air and steam-heater establishments. What is the use of going to the expense of purchasing coal to heat our dwellings when you can run an apiary to supply the heat? If it's extremely cold weather, apply three bees to your anatomy; milder weather, one would be quite sufficient. I'm with the queen-breeder who can give more attention to the rear end. These rear-end collisions are becoming entirely too numerous.

Cranford, N. J., May 9.

RESNAW.

HOW LONG WILL A QUEEN LIVE AND DO GOOD WORK?

In going over a yard recently bought, the other day, clipping the queens, I found one already clipped. The man who is working the yard said he knew there had never been a queen clipped in that yard, and could account for it in only one way. This particular hive, with others of the same kind, had been bought and brought from a distance, six years ago, and this queen must have come from that yard. If F. McNay sees this article I wish he would answer it, as this queen was found in his old Mauston yard, in a hive with oak top-bars. The queen had a fine lot of brood.

Bees in this locality are building up finely.

C. H. PIERCE.

Kilbourn, Wis., May 18, 1901.

[I saw Mr. McNay at Los Angeles, and it is his practice to have young queens. Mr. McNay is a very successful bee-man, and one of his secrets of success is in having young queens. I hope if he sees this he will give us the further history of that old queen if he can.—ED.]

"BAIT SECTIONS;" DIFFERENCE IN EXPERIENCE.

Dr. Miller wonders what makes the difference between my experience and his in using bait sections (p. 379, May 1st). I believe he hints at the reason himself in the last three lines of his Straw. I think likely that, in a slow or short honey-flow, the baits would be sealed as he says. Our honey-flow always comes with a rush, as thousands of acres of alfalfa come into bloom at about the same time. The bees pile the ready-made combs full of thin honey; and the sections being thick the honey does not ripen as fast as that stored as the comb is built, so they just take their time about sealing it, and we often find sections left until the end of the season. I think this is probably another case of "locality."

MRS. A. J. BARBER.

Mancos, Col., May 10, 1901.

[When Mrs. Barber speaks of locality she hits the nail on the head. As I travel over the country I am more and more impressed with the differences in locality.—ED.]

PIGS, WHEELBARROWS, AND QUEENS.

In GLEANINGS and elsewhere, after an offer of queens at exceptionally high prices, are to be found the following words:

It seems as if it ought not to be necessary to say that no one but a queen-breeder or a large honey-producer should order these high-priced queens; but it is a fact according to our experience that beginners with only a few colonies will order our highest-priced imported queens. Such bee-keepers have no more use for such queens than a pig has for a wheelbarrow.

I never was a pig, so I may not be a competent judge as to the yearnings that animal may have for a wheelbarrow; but I have been a beginner in bee-keeping, and I am not so far from being one now that I can be satisfied to read those words without entering a protest. I am not going to uphold the idea of gouging the queen-breeder or the large honey-producer by making him pay \$25 for a thing as little as a queen-bee, but I do protest that we beginners are not away off in trying to get the best that is to be had. "Beginners with only a few colonies will order our highest-priced imported queens," forsooth. Why shouldn't they? Any scrub stock will do for the beginner with five or six colonies, and then when he gets up to 50 or 100 he should get a best imported queen and have a time working out all his poor stock. Please tell us why it would not be the wise thing to begin with the best and have the best all the time. Wouldn't it be a good deal easier to change the stock with five colonies than with fifty?

Perhaps you will say, "But not every beginner with five colonies increases to fifty. Wait till you know that he will have enough to make it worth while. It may be that he will be satisfied not to go beyond the five colonies." Well, suppose he should never go beyond five. Let us figure a little to determine what he might afford for those five. If he is in an average locality, with only five colonies, and those no better stock than beginners usually have, it would be nothing strange that a change to best imported Italians would in-

crease the harvest of each colony a sufficient number of pounds to amount to one dollar a year. That would be \$5.00 a year; and if he should continue only two years in the business it would be \$10.00. That would pay for a best imported Italian queen, and leave a remainder of \$3.00 to \$5.50. Look at it another way. Suppose a beginner with five colonies pays \$7.00 for a best imported queen. He might be allowed at least three years in which his increased harvest should pay for the queen. That would be \$2.33 a year, or 47 cents a year for each colony. Do you think it would be difficult to reach that increase? Please stop throwing pigs and wheelbarrows as stumbling-blocks in the way of beginners.

Marengo, Ill. C. C. MILLER.

[I still think my advice is good; but you make one good point when you say it is cheaper to start out with good stock than to get it after the apiary assumes some size. Agreed; but I would still advise the beginner not to get an imported or a high-priced breeder until he has acquired some experience. Let him get good stock by all means; but get untested from some fine breeding-queen. These untested are cheap, and may develop to be as good as the breeder.]

Say—you are no spring chicken in the business.—ED.]

BEARS IN THE APIARY.

For the past three weeks I have been bothered a great deal by bears in one of my out-apiaries. They have caused me considerable loss in honey, bees, and hives. I lost five colonies entirely, and a good deal of honey from other colonies; but the trouble and expense of watching and protecting the apiary, and at the same time getting rid of the bear, has been the greatest loss. On the night of the 11th I succeeded in wounding one measuring 6 feet 7 inches from tip to tip; so that, on the 12th, I was able to capture him; and on the night of the 19th I was fortunate in killing one measuring 7 feet 11 inches from tip to tip, which I trust will close the chapter for the present.

W. O. VICTOR.

Wharton, Texas, June 21, 1901.

THE BONNEY METHOD OF INTRODUCING QUEENS.

J. H. Martin says, on page 80, that he would like to ask Mr. Bonney or any one using his method of introducing queens if he ever had any trouble from the queen killing the bees. In answer I would say that I never have had any such trouble, nor have I ever seen a queen kill workers but in a single instance. Then a virgin queen stung four workers to death in quick succession when the comb which she was on was lifted from the hive. I consider this a freak, as I have never seen any thing like it in all my experience.

I judge from Mr. Martin's statement, that he placed the queen in the cage and then put in the bees one at a time. A queen might possibly attack a single strange bee, but I am inclined to think it would be more of a freak than a regular occurrence. Mr. Pridgen tells

us he sometimes puts in the bees one at a time, and I have done so myself, and there was no quarreling; but I prefer to cage quite a number of bees until they have a sense of loneliness and queenlessness, then place the queen among them, and in no case has the queen or worker shown any disposition to harm the other. I have never lost a queen by this method, and I regard it as the safest of any plan I know unless it is Mr. Alley's method of tobacco smoke, which is, perhaps, equally sure; but I like my plan best, as the bees do not have to remain queenless so long, and there is less danger from robbing; besides, some do not like the smell of tobacco smoke, and I do not like to handle it myself. I hope Martin the Rambler will give this method a thorough test, and let us hear his echo on the subject, through GLEANINGS.

C. T. BONNEY.

BIRDS KILLING BEES IN FLORIDA.

In this part of Florida bee-keepers are just recovering from a severe loss of bees. The late storm in April brought thousands of birds which were never known in this portion of Florida before. They were the most destructive bee-enemy ever known here. They would alight on the hives and catch every bee that came out. If a bee chanced to escape to the fields they would capture it. We killed the birds by hundreds. They now have emigrated to parts unknown. The birds were something like our Northern cherry-birds—male, red collar, but no tuft on top of head; female, yellow breast, brown wings.

W. T. MUNDT.

Pt. Washington, Fla., May 10.

BETA NAPHTHOL VS. SALICYLIC ACID.

Last spring I fed salicylic acid, but foul brood appeared again in the fall. This spring I sprayed the empty brood-combs with a solution of beta naphthol, using a Faultless sprayer, and also used the same drug to medicate syrup fed. I also kept a piece of naphthaline in each hive, on the back of the bottom-board. My hives under this treatment are practically free from foul brood. See Cowan's "British Bee-keeper's Guide."

HIVES FOR NEW ZEALAND.

Although an eight-frame Langstroth hive in the hands of a practical bee-keeper is good, yet in a climate like that of New Zealand, where bees fly all the year round, and we frequently have rough weather in the spring, I am inclined to think that the ten-frame Jumbo would be more suitable here, as it holds more stores, and consequently requires less attention. My experience with bees hived in kerosene-boxes, which are about 14 inches deep and 9×18, is that they make 9 or 10 inches of brood and 3 or 4 of sealed honey above; hence I believe the Jumbo frame more nearly meets the natural requirements of the bees than the Langstroth depth, and the queens would rarely lay in the Dadant shallow extracting-supers above the Jumbo brood-nest.

CHARLES F. ENGLAND.

Foxton, N. Z., Feb. 4.

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 5512 Monroe St., Sta. P., Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitecomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chapinville, N. Y.; J. M. Hambaugh, Escondido, Cal.; C. P. Daddant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

It is not true that alfalfa honey is always light. In some localities it is a light amber, and in others it is next thing to water-white. But the flavor, so far as I can find, is always good.

HUTCHINSON is right in preaching "more bees." I find in my travels that the most successful bee-keepers—those who make money—are those who run from 500 to 1000 colonies, and some of them make more clean cash than the ranch and fruit men with ten times the investment.

MY LONG TRIP.

By the time this journal reaches our Western readers my trip of some five or six thousand miles on the cars, and some three or four hundred more in a buggy, will be near the end. My note-book and cameras have been kept busy; and as the months go by I'll try to tell you what I have seen and learned.

I find it hard work writing copy on the cars, and trying to edit a bee-journal at long range, even with so good a veteran as A. I. R. at home to read proof and splice out the gaps. Editor Hill has my sincere sympathy.

PRICES ON CALIFORNIA SAGE HONEY.

SOUTHERN CALIFORNIA will not have the big crop that was expected earlier in the season. The rain fell short at just the critical time. But some of the buyers and commission merchants are trying to cram the idea into bee-keepers that the yield has "been tremendous," and, in consequence, are making low offerings. A few who need ready money may have to take advantage of the low market; but I am satisfied that prices will advance a little later, as soon as some small lots are sold. But I know of some large lots that will be held till better prices are obtained.

THE FUTURE OF IDAHO AS A BEE COUNTRY.

ONE of the paradises of bee-keeping to be in the State of Idaho. I have just passed through thousands and thousands of acres of white clover, red clover, and alfalfa, and yet no bees in sight. Thousands of acres of alfalfa are to be opened up as soon as irrigation is extended. I don't mean to say that there are

no bees in Idaho, for there are a good many, but not nearly what the State will support if what I can see and learn is correct. But no one should locate in Idaho, or anywhere else, until he has investigated for himself, and made a preliminary advance trip; and no one should even then think of going on to the bee-range of some other person already located.

THE FOURTH OF JULY AT THE HOME OF THE HONEY-BEES.

THE machinery is still, and everybody has gone except two or three of the faithful ones. Mr. Wardell is in the apiary, and has been almost ever since daylight. He rather wanted some help, but nobody wanted to help on the Fourth. Basswood is in full bloom, and honey is coming in with a rush. Every empty comb on the premises has been gathered up, and, later, every frame containing sheets of foundation, and yet some of the bees are building combs back of the division-board. "Robert" promises to have plenty of sheets of foundation in the frames bright and early to-morrow morning, but he did not want to tackle the work on Independence day.

Well, we are glad that honey has finally come. There is not any more need of feeding at present. Each one of the 540 colonies and nuclei is filling its combs, and the bees all seem to be happy.—A. I. R.

BEEES AS FERTILIZERS.

IN our intercourse with the farming class we not infrequently meet people who are almost if not quite hostile to the bee-keeper. They seem to think the bee-keepers' bees have no business trespassing on some one else's land, etc. Many of these people can not be reached through the agricultural press, for they do not read agricultural papers. Some of them, of course, could, and the more professional apicultural writers should, write from time to time suitable articles for these papers. It should be the bee-keepers' business to furnish their local newspapers with such articles, and thus all classes could be reached.

While it can not always be positively proven that honey-bees are important factors in bringing about fertilization of blossoms, yet we do know that in some instances they help materially. If they are a help in some cases, they at least should stand above suspicion of doing harm in other instances.

We know of many fruit-trees—cherry, apple, and pear—standing in the midst of large apiaries, bearing fruit abundantly from year to year. If these trees can fruit under such conditions it certainly can not be said that bees are doing them injury; and if they do not injure the fruit-bloom it is not likely they will other bloom—for instance, the buckwheat.

A neighbor of one of our friends in New York expressed his fear that the bees might injure his buckwheat if he should sow it next to the apiary. It took a great deal of arguing to convince him that there was no such danger.

Honey-bees are by no means the only in-

sects visiting blossoms for the purpose of obtaining honey and pollen. Let us observe once how many different bees and insects visit the sunflower. It would seem that all the pollen and nectar this flower produces would be carried away. Yet every single floweret becomes fertilized, and seeds form with the greatest regularity.

The honey or nectar the blossoms secrete is of no direct use to them—they do not need it for their development. If it were necessary, many plants would have become extinct long ago. For what other reason would a plant continue to produce this nectar year after year if it were not for the very purpose of drawing insects? These and other points may be brought out by the bee-keeper in his local paper to good advantage.

Our friend W. F. Marks, one of the Directors of the National B. K. A., has the following advice to offer in the line above mentioned: "Owing to the hostility or prejudice against bees in many localities, bee-keepers as a class should be urged to step forward and take an active part in the various agricultural, fruit-growing, and kindred organizations when possible to do so. In so doing they can quietly but surely bring about a change for the general good of their pursuit—a matter that should not be neglected or ignored. This need in no way interfere with their duties in and for the bee-keepers' organizations. To this we can only say amen.—F. G.

"BUSY" BEES AND LAZY BEES.

An old veteran bee-keeper from an adjoining county is just here. He is very much put out because of 15 queens he bought of a noted queen-breeder. He says they are "no good," and thinks he has been swindled. When I asked him if they did not keep their hives full of bees he said, "Yes, *too* full." He says they just keep raising brood all the while. Now, the question is, "What *more* does anybody want of a queen?" But his complaint is this: These hives full of bees do not gather any honey of any account; while another colony, whose queen is a daughter of our celebrated clover queen, rolls the honey right in. Now, may be you think we ought to be satisfied with such a testimonial for our stock; but I am not satisfied. I may be after a while, but I am not yet. I can hardly think that one colony overflowing with bees will not get honey, while another, equally or less populous, does get honey. This is a thing we are trying to settle; but I believe we are all more or less in the dark in regard to it. We can tell how many eggs one hen lays compared with another, and I hope our experiment stations or somebody else can soon tell us whether 40,000 bees in one hive gather more honey than 40,000 bees in another hive. The 15 queens mentioned came from one of our most reliable breeders, and one who has also a queen producing bees with tongues of extra length, the daughter of our clover queen. I think our friend may change his mind if he waits till a little later in the season. Mr. Wardell says he does not expect our high-

priced queen to show much difference in honey-gathering till later in the season, about the time of red-clover bloom. Of course, we are drawing on her brood heavily, and shall be doing so all through the season, so she probably will not have as many bees as some of our other colonies.—A. I. R.

QUEEN-BREEDERS WHO CAN NOT AFFORD TIME AND MONEY TO WRITE A POSTAL CARD.

THE following appears in the middle of a pleasant letter from a subscriber down in Texas. It was not intended for print, but I think it ought to be printed. I have thought best to withhold the name of the writer, at least for the present:

I ordered some queens from a certain breeder who, by the way, is an advertiser in GLEANINGS, and now nearly two months have passed and no queens have shown up, though I have written him twice. I wrote him the other day to return the money, and can't hear a word. If he doesn't do something I will give you his name soon. He may be sick, or something else bad; but he certainly could let me hear from him some way—drop me a card with the one word "Rheumatism," as one other one did, and I should be better satisfied. But I will await further results and developments.

Ladonia, Texas, July 2, 1901.

Some may urge that perhaps this queen-breeder did not get the money. Of course, the writer does not say he acknowledges having received the money; but he does refuse to answer inquiries. Now, the man who wrote the single word "rheumatism" on a postal card did a little better; but even that is not good business. Whoever advertises any thing in any periodical, should, before he sends the advertisement, provide himself with postal cards and other stationery (perhaps something partly printed to save time), and then he should get some sort of acknowledgment back by the very first mail whenever he receives money. If he can send a queen by next mail I suppose there is not any particular need of writing even a postal card; but if there is going to be a delay, let the customer know at once just about how much delay so he can make his plans accordingly. If, later on, he finds there must be still more delay, write another postal. When you have received money for queens, you are in a measure responsible for every day that passes without sending the queen, and should be, so to speak, "on your good behavior." You are indebted to the customer who sent you the money, and you are under special obligations to be courteous and pleasant, not only because it is manly and Christianlike to do so, but because *your bread and butter* depends on it.

Now, if there is anybody who advertises in this journal, who can not afford a postal card to acknowledge the receipt of money, and another one to explain why delays occur, we do not want his advertisement. The single word "rheumatism," it is true, may be better than nothing, but it is hardly enough—that is, if you have got somebody's money, and are keeping him waiting.

Our friend in the above speaks about asking to have the money returned. Any man who makes any pretensions to being honorable and

square in deal will, of course, return the money the very day he receives orders to do so. Of course, everybody who is complained of should have a hearing; but it will do us all good to have these loose ways of doing business held up before the people. If nothing else will answer, we are ready to do some advertising that we do not get any pay for. If there are any more "Luptoms" among our number we wish to weed them out before they get a going very much.—A. I. R.

THE BEE AND FRUIT CASE AT HANFORD, CAL.; DO BEES SPREAD PEAR-BLIGHT?

As announced in our last issue, trouble has been brewing for some months between the fruit-men on the one side and the bee-men on the other at Hanford, in the San Joaquin Valley, Cal. On the part of the first-named, the contention was that the bees, the property of the other parties, were the principal means of spreading the pear-blight, which had been working such awful havoc among the pear orchards in the vicinity mentioned. The bee-men, on the other hand, took the ground that their stock were not carrying the pear-blight; and, even assuming that they might do so, averred that other insects, and birds, as well as the wind, might and could do all the mischief laid to the door of the bees, and that, therefore, the removal of the insects under the direct control of man would not afford the relief sought. The contention waxed warm. Each side called special meetings to discuss the matter. Bitter words as well as threats were used. Some of the more rabid of the fruit-men proposed to use poison to exterminate the bees in case they were not speedily removed by their owners. This only tended to aggravate matters. The bee-men retorted that, if any one were foolish enough to resort to such a procedure, not only killing the bees but endangering the lives of human beings, they would meet them on the issue half way; that they had, as backing, the National Bee-keepers' Association, which had hundreds of dollars to its credit, had fought many cases in court, and had always been successful; that, moreover, it had decisions already on the question of poisoning bees, and that the fruit-men "could drive ahead" if they wished to. The latter maintained that they "had looked up the law," and that they knew what they were about.

It appears that those who indulged the most freely in this war of words were not those who had the largest interests at stake, either in the bees or in the pears; that the large pear-growers as well as the largest bee-keepers were men who indulged in no threats, but who believed that a compromise might be effected between neighbors who were men of fairness as well as men who are willing to listen to reason, and so the sequel proved.

The president of the National Bee-keepers' Association was asked by resident members to make a visit to the scene of the impending trouble; investigate, and take such action as might, after a conference, seem most advisable. Accordingly, on the 18th of June that

officer appeared at Hanford, Cal., being dropped, as it were, into that "nest of hornets" by the redoubtable John H. Martin (Rambler), and J. C. McCubbin, of Reedley, who came with him officially and unofficially to see that no harm was done him; but, be it said, they deemed it advisable to go home that same day, although they did participate in one or two little "skirmishes" on the street. Unfortunately the Rambler didn't have along his invincible umbrella and stovepipe hat; for with such offensive and defensive weapons he would surely have come off victorious. As it was, it was a "draw," and he departed with John C. under his arm.

It appears that the local members of the Association had made a great handle of the coming of the President of the National; of the strength of our organization, how it had never lost a case in court, and that it had secured valuable decisions from the high courts. But as he did not come at the time expected, and days went by, and still he did not come, the fruit-men began to think that this talk was all "bluff;" and when he did appear, there seemed to be a feeling on their part that he had come, not to bring peace, but war, and that an organization that would send a "walking delegate" clear from Ohio surely meant business. After a little sparring on both sides, a truce and a compromise began to be talked of. On our side was a special committee appointed by the Central California Bee-keepers' Association, at its last meeting, to meet the representative of the National Bee-keepers' Association; and on the other was N. W. Motheral, Horticultural Commissioner, of Hanford, Cal., who seemed to represent the fruit-men, but whom some jokingly said was the mother of the whole trouble.

When both sides got together it was suggested by one of the fruit-men that, as a compromise, the bees be moved from the vicinity of the pear-trees during the time they were in bloom, and that, after they were out of bloom, and when the alfalfa began to yield nectar, they be returned to take the heavy or main crop. This, it was thought, would give the bee-men time to investigate for themselves, and if, after investigation, it was shown that the claims of the fruit-men were well grounded, afford in the mean time the necessary relief. This was finally agreed to, although it would entail a big expense on the bee-men.

It may be wondered why the latter were willing to listen to a compromise at all. In the first place, they desired to be fair; and in the second place, the fruit-men had the testimony of Prof. M. B. Waite, Assistant Chief of the Division of Vegetable Physiology and Pathology at Washington, D. C. This official takes the position that bees do carry the microbes of pear-blight from flower to flower while the trees are in bloom. In this opinion he appears to be supported by Prof. N. B. Pierce, Pathologist of the Pacific Coast Laboratory, Santa Ana, Cal.

The following letter, directed to N. W. Motheral, Commissioner of Horticulture at Hanford, Cal., from Prof. Pierce, explains the position of the scientists, in a nutshell:

Mr. N. W. Motheral, Horticultural Commissioner, Hanford, California.

Dear Sir:—In fulfillment of my former letter, and in reply to your request, I herewith give the main facts upon which are based the claim that bees take an active part in spreading the disease of trees variously known as pear-blight, twig-blight, fire-blight, etc.

1. Pear-blight is a bacterial disease which affects pear, apple, crabapple, quince, and related trees. It is induced through the action of a specific micro-organism belonging to the bacteria, and known as *Bacillus amylovorus* (Burrill), de Toni.

These facts have been demonstrated by many scientific workers by careful inoculation, experiments conducted with pure cultures of the bacillus. The cause of the disease has therefore been well known for many years.

2. The identity of the blight of pear-trees in the Clow and Taylor orchards near Hanford (these particular orchards are cited only for the sake of accuracy, as there are many others affected) with true eastern pear-blight has been demonstrated at this laboratory. *Bacillus amylovorus* was isolated in pure culture by the plate process from blighted branches from Mr. Clow's trees, and a young and thrifty pear-tree was inoculated, and died to within a few inches of the ground of true pear-blight. A control tree treated the same way as the inoculated tree, except that the bacillus was not introduced, remained perfectly healthy.

Mr. M. B. Waite, Assistant Chief of this Division of the Department, has kindly supplied the following additional facts bearing on this matter:

3. "The occurrence of the blight on the blossoms in great quantities, and the great rapidity with which the disease spreads from flower to flower, indicates a normal and very effective method of distribution."

4. "The germs were found growing freely in the nectar of the blossoms."

5. "Bees were seen repeatedly visiting the infected flowers, and some were caught taking infected nectar, and, by means of plate cultures, the pear-blight germs were isolated from their mouth parts."

6. "By covering parts of the trees with sacks of various kinds of material, and then artificially infecting certain flowers on the tree, the blight was observed to spread very freely over the uninfected and uncovered blossoms, but was entirely absent in the blossoms covered by mosquito netting."

7. "Blossoms were infected, and at once covered with sacks, and the blight, in such cases, was retained in the infected blossoms."

8. "Pear-blight germs died very soon after being dried up, and lived for only a brief period on exposure to weather conditions out of doors, hence they can not live in dust, and be blown around to any great extent by the wind."

9. "Pear-blight virus, particularly that which occurs on blossoms, is a very sticky substance, and is readily carried by insects, birds, or other animals, but can not be blown by the wind."

This brief presentation will, I believe, furnish your board with the main facts needed to show the connection existing between the visits of bees to pear-flowers and the spread of pear-blight.

Sincerely yours,
APRIL 23, 1901.

NEWTON B. PIERCE,
Pathologist in Charge.

Prof. Pierce happened to be in the city at the time, and in an interview which we had with him he gave utterance to substantially the statements as are given above. If any thing, his verbal statement incriminating the bees was even stronger. So far as I could judge, he seemed to be a competent scientist, and a fair-minded gentleman; but, unconsciously, he is prejudiced, I think, in favor of the pear-men, with whom he has come much in contact of late. I asked him if it were not true that wild bees, insects, and birds, over which man has no control, could do all the mischief ascribed to the bees. He admitted that this was possible but not probable. Did he not think that bees were valuable as fertilizers of the blossoms, especially of those of the Bartlett pear? He thought they were. Well, did not this service of the bee, year in

and year out, more than counterbalance the alleged mischief done by them in the occasional year when pear-blight was so prevalent? He could not say, although he was of the opinion that, by a certain alteration of varieties, the services of the bee might be dispensed with entirely; but of this he was not sure.

From Prof. Waite's statement it would appear (to express it in common parlance) that the bees have been caught "red-handed," bearing the marks of the alleged criminal act. If I understood Prof. Pierce he had not found the bacteria of pear-blight on the tongues of the bees, nor had he himself seen the microbes in the nectar. If this be true, we have, as the only real incriminating chain of evidence, the statement of Prof. Waite. Without detracting in the least from the skill of the professor, it is proper to remark that even the best of scientific men make mistakes, and we as bee keepers can not accept the unsupported statement of Prof. Waite without further investigation by some of our men equally competent and fair.

This is a nice question, as a lawyer would say, and we need to go at it carefully and candidly to get at the truth, cut where it may.

There is some evidence that goes to show that Prof. Waite is mistaken. For instance, there are young pear-trees, acres and acres of them, that have never been in bloom, and yet these young trees are blighted to death. How in the name of reason did the bees carry blight to these trees when it is apparent that they never went near them? And then there are little shoots that have pushed up from the ground since the big trees were in flower, and yet these shoots are blighted like the rest. Assuming, for argument's sake, that bees may carry the blight on old trees, we must admit that there is some agency, possibly the wind, Prof. Waite to the contrary, that carries the destructive microbe to the young shoots and the young trees. There are some things that are not explained yet.

Again, I believe we have the right to insist, for the present, until we have more corroborative evidence that wild bees, other insects, and birds, over which man has no control, may be able to spread the blight just as much as the bees under the control of man. For example, this illustration was used: If a barrel full of water has two plugs in it near the bottom, the larger plug, represented by the tame bees, and the other plug (the small one) by insects, birds, and wild bees, will not the small plug exhaust the barrel just as surely as the large one? If this be true the removal of the bees controlled by man would not bring the relief expected, by a long way.

In conclusion, let me say that I visited the worst-affected large pear-orchards in the vicinity of Hanford, Cal. The large pear-growers were fair, intelligent men. While they thought the bees were to blame, they also thought the pear-men had some responsibility in the matter.

I visited one orchard of 120 acres, and every tree was badly blighted, and no mistake; but in this orchard we found the badly blighted little shoots I have referred to.

Behold the Lamb of God that taketh away the sin of the world.—JOHN 1:21.

We have not a high priest that can not be touched with the feeling of our infirmities, but was in all points tempted like as we are, yet without sin.—HEB. 4:15.

More than twenty-five years ago, before I began to write or talk for Christ Jesus—yes, at a time when I knew not the Lamb of God that taketh away the sin of the world, I stood with a companion looking out into the street. Nobody was near to hear our conversation. A remark was made to me to the effect that even the poor dumb brutes and domestic animals in the street were more worthy of confidence than my own poor sinful self. They were not responsible before God and before man for their actions; but *I*, who professed to be a man, and a man of integrity, really belonged on a scale lower than that of the brutes. This was spoken in a sort of sarcasm. And, by the way, it is rather strange, but none the less true, that partners in crime sometimes speak the truth plainly. I have seen several men together in a drunken orgie, when one of them would speak out and tell the other what a beast he was making of himself by his continued intemperance; yes, and after winding up what might be considered a pretty good plain temperance lecture to the poor sot, the one who told this plain truth would finish by saying, "Now, boys, is it not true, every word I said?" When they would assent with grave-looking faces, the speaker would add, "Come, let's take another drink."

I do not mean to tell you, friends, that I was a *drinking* man at this time—at least, that was not my particular sin. When my companion uttered this plain scathing truth I bowed my head in shame, for I knew it was true. A spark of manhood, however, did prompt me to make a feeble resolution to do better, and I think I added something like this; and I said it, too, with honest, sober sadness: "If what you say is true, I think I had better turn over a new leaf right here on the spot, and be a little more of a man than I have been."

I remember I had considerable of a dogged determination in my heart just then to show my tormentor, for the time being, that I could and *would* be different in the future. At this point I received a still more cutting piece of sarcasm, and that from one who had not labored very hard in times past to make me better. The words were something like this:

"Turn over a new leaf, and do differently from what you have been doing? No, you won't. You will keep right on just as it has been for months and years past."

When I came to think it over in my sober moments, and remembered the resolutions I had made but never kept, I was forced to acknowledge there was very little probability, as things were going, that I would ever be any different or any better. May God help the

poor sinner who has lost hope because he has struggled in vain so many times to break asunder Satan's shackles. Why do I bring this thing up from so long ago? Well, I think it was a dream that reminded me of the occurrence. I was away back in the old times; but in the dream I did not bow my head in shame, in submission, and in despair. Do you know why I didn't? Because, since that time I have had more than twenty-five years' experience in breathing that little prayer I have told you of so often, "Lord, help." When my companion taunted me with the fact that I was not only away down in conscience and rectitude, but that I was helpless and *lost*, in my dream, I forgot that reference to my helpless and lost condition, and turned from my tormentor—yes, I turned from all the world with all its trials and temptations. I turned toward that "Lamb of God," as we have it in our text, and implored help. I said, "Lord, I am weak and sinful. My *record* is bad. I have made resolutions again and again; but Satan has brushed them away as if they were cobwebs. I have nothing to plead in the way of my own merit. I am a lost, helpless sinner without the help of thy strong arm. Lord, help and save."

In an instant I felt my feet planted on the solid rock. Poor and unworthy as I was, I was *not* alone. In my *dream* the wondrous truth burst upon me, of the great and inestimable privilege it is to have Christ Jesus for a friend and a helper! It seemed to me then as if nothing this world could furnish—no, not even death itself—had any terrors, for Jesus promises to be not only with us through life, but he promises to be our pilot and guide through the dark valley of death.

Those who have read GLEANINGS very long know something about this turning-point in my life. In mechanical work men often go to great expense to get something solid and substantial to tie to. When planting heavy machinery they go away down into the ground and build piles of heavy and expensive masonry, to get something solid. When erecting buildings, or any sort of structure, men look about for something solid on which to fasten their ropes. Sometimes a large tree holds a guy rope. If this tree, or whatever it is, should give way, loss of property and loss of life might ensue. Old experienced hands in building bridges and other great structures will never be satisfied unless they have something *solid* and *substantial*. During that old life I had no substantial anchor. Worst of all, I had lost confidence in undertaking to break away, because I had failed, miserably failed, every time. I did not know in that old life, that this whole wide universe offered any thing solid and secure when the poor weak human will was found to be inefficient. Yes, let me say again in my *waking* moments, as I said in my *dream*, it is a great and wonderful privilege to any human being to feel that he is permitted to reach out and grasp hold of the strong arm of Him who created the world. Nay, more than that: when there is not time, and you have not the strength to reach out, just breathe that little prayer, and He whom

even the winds and waves obeyed has promised to look after and care for you. I remember hearing of a certain old colored man who used to say, when greatly tempted, "Lord, your property is in danger." When asked how he dared pray with such assurance, he said that for many years he had belonged to the Lord, and therefore he had a *right* to consider himself the Lord's property.

Now, that dream I have alluded to might have been forgotten and passed by, but a strange thing brought it to mind. We are now having exceedingly hot and sultry weather, for to-day is July 1. Well, along with the hot weather we are getting out our easy-chairs, hammocks, cushions, etc., so that we can take rest and enjoyment in the shade. Among other things, Mrs. Root showed me a beautiful soft pillow. It is covered with silk, and on the silk is an inscription. Some good lady away off in California worked it out in fancy needlework and embroidery, and sent it to me for a present. Here are the words :

Lord, help! this is my favorite prayer
In time of trouble and of care.
I may not all the wants disclose,
But these my loving Father knows;
But help I need, and up to heaven
I lift my prayer and help is given.

You will notice I have two texts at the head of my talk. You might infer from the above that, during the twenty-five years that are past, I had triumphed very easily over every temptation. Please do not understand me so. It is true I have been ultimately delivered, and have come safely through all trials; but I have had my sore conflicts like the rest of humanity. Again and again have I exhorted others to let go of the follies and trials of this world, and turn to the Lamb of God, and yet in just a few hours afterward I have been myself, as it were, struggling in the Slough of Despond, as we have it in Pilgrim's Progress; and many times I have thought, "Well, it is a long time since Satan has had hold of me along that line. Very likely he has met with so little success that he has given up the job and concluded he can accomplish more by prowling around somewhere else;" but again and again (sometimes in just a few hours) I have found that I am a good deal the same chap that I have been all through these years. I hope I am climbing slowly away from earth, and up toward heaven. But earthly things hang to me with a strong grip, even yet. Sometimes I wonder at these conflicts and skirmishes. Yes, sometimes I am really appalled by the sin that still lurks in my own heart. Let me digress a little.

During these twenty-five years or more, I have exhorted many to turn to the Lamb of God that taketh away the sin of the world. Sometimes I have been asked to settle difficulties, and have been chosen arbitrator. I have had one recent experience. The parties are both friends of mine, and they have been for years friends to each other. They have been mutually helpful to each other, doing business in the way of buying and selling honey to the amount of hundreds if not thousands of dollars. They are both, I think, professing Christians. Of course, each was to present the

matter from his own standpoint. In the first place, they had trusted each other *too* much. Things that ought to have been down in black and white had been allowed for years to go without a settlement. We have no right to do this, any of us. After the disagreement, each questioned the other's sincerity and Christianity. I plead with both of them to consider the other as still his brother, and that they should fix the matter up and go on doing business together like two brothers. But Satan had got into their hearts (I hope both will forgive me for speaking thus plainly), and I fear I succeeded very poorly. I have seen many cases of this kind. A man goes on at great length to tell me of the inconsistency and mistakes of his neighbor. When I remind him of how many years they got along pleasantly together, my informant says, "Yes, that is true; but something has got into him lately. He did not use to be so mean and ugly."

I reply, "Yes, my friend, something *has* got into his heart. Satan has got hold of him. Are you not sorry for this neighbor of yours? Do you not pity him?"

The reply, however, is something very often like this: "No, I do not pity him a bit. I do not care how much trouble he has. I should like to punch his head this minute."

Sometimes I have tried to make peace between husband and wife. I have told you about it on these pages. I have begged and implored each of the two parties to remember the good qualities of the dear partner. I have urged each one to pray that God might loosen the hold the evil one had got on the heart of the other. Sometimes I have said, "Why, Mr. A, can you not look at this thing as you would if your wife had suffered some misfortune? or as if it were sickness that ailed her? Let us just suppose for a minute that she is unfortunate and to be pitied. Perhaps through no particular fault of her own, Satan has got into her heart. Can you not help restore her to her old self by being kind and gentle? Will you not try very hard not to fan into a flame this thing that is only just started, by any imprudent or foolish act of your own? Never mind who is right or who is wrong. Never mind if she *is* unreasonable, yes, and even exasperating. 'A soft answer turneth away wrath.' Disarm her by kindness and gentleness, and show a spirit just the very opposite from the one *she* exhibits."

Sometimes my exhortations bear good fruit; but too often the husband declares he is going to pay her back in the same coin she gives him. And then comes a separation, even after the two have brought up a family of children.

Sometimes a row is started because one man calls another one a liar. Again and again I have tried to persuade both parties that this was not an excuse for a "fight."

I have sometimes said, "Why, if he told the truth, and you *are* a liar, you ought to thank him for telling you of your faults. And then you ought to go to work right earnestly to break away from such sinful habits. If you are not a liar, denying the charge in his

present frame of mind would not convince him at all. Just quietly keep telling the truth so persistently that nobody will believe what he says."

I have sometimes *almost* wished somebody would call *me* a liar so that I could demonstrate to those around how easy a thing it is to look pleasant and smiling under such trials, rather than to strike back, or even reply by like unkind words.

I fear I was getting to be unconsciously proud of the example I was setting in respect to such things. Howard suggested to his mother that may be God punished "grandpa" for boasting. I do not know but the dear Savior has just been punishing me for being self-confident. One evening I had been reading until I felt tired and sleepy. I said I would have to go right to bed, for I could hardly hold my eyes open a minute longer; but in less time than you can think I was so wide-awake that hours passed before I could quiet the tumult that rankled within, enough to even *think* of sleep. Some little incident occurred. A discussion as to "who was to blame," sprang up before I knew it. It was a little misunderstanding over a matter of no importance to anybody. It is true, something happened with some of my utensils that I can not understand even yet; but there was no reason in the world why this trifling displacement of some of my property should even start a discussion. It lasted hardly a minute by the clock. During that minute the blood was coursing to my very fingers' ends. The warning note of danger, my little prayer, kept sounding louder and louder, but I was *sorely tempted* to have out *first* my say, and listen to the warning *afterward*. But I had grace enough to stop. But, even though I uttered no word, that did not end it. A fierce conflict was going on in my soul, and that warped my better judgment and drowned out my sense and reason. I prayed for peace and tranquillity; but for some reason or other the dear Savior did not see fit to send it. I dare not put on paper the vicious and evil thoughts that trooped through my mind as I sat at my accustomed desk trying to read the paper before my face. Some of my friends will say that it will hurt me, and perhaps spoil my influence, to make even such a confession as I have made. But, dear friends, I do not believe I shall suffer in the estimation of good people who know what it is to be sorely tempted, even as I am and have been tempted. I knew I was not myself, and for a long time it seemed as if there was little I could do to help matters except to keep still and pray. We have a picture in the Bible of the way in which Satan was allowed to persecute and try Job. I have wondered since if it can be true that the Lord permitted Satan to gain just enough access to my heart to give me a glimpse (or a sample) of the machinery he employs in breaking up homes and making the nearest and dearest friends the bitterest enemies. I am sure one of Satan's favorite plans to get a foothold is to start foolish discussions and disputes. I once visited a family where every thing was lovely outside and indoors except

the habit of contradicting each other. Somebody would make a statement in answer to a question that I innocently asked. Almost before my question was answered, some other member of the family would say, "It's no such thing." Then a third one would put in, "You are neither of you right. I was there myself yesterday." And thus it kept going until it seemed as if they must come to blows when there were no visitors around. There is an old adage that comes in very pat on such occasions—"Least said, soonest mended."

We are all of us startled almost every day by the newspaper accounts of how some man shot his wife and then committed suicide. Humanitarians are becoming appalled at the frequency of such tragedies. I have watched all such statements in order to see what started the trouble. A great many times we are told a man and his wife had disagreed a good deal, and had had frequent jangles, but nobody thought it would amount to any thing more than just talk. I have suspected, however, that Satan has learned a new trick. He is always trying to start a fuss between the best friends, even between parties who are united by the nearest and dearest ties of relationship God ever formed between two persons—man and wife. He gets into the heart of one of them, and suggests a harsh and unfeeling speech. Then quicker than an electric flash he goes into the heart of the other, and suggests an appropriate (?) keen, cutting reply. Thus he goes back and forth until good breeding and good sense prompt either one or both parties to stop. A Christian spirit and a love for Christ Jesus in the heart of each one of the two ought to extinguish such sudden flames at the very outset. May God help me, as I utter these words, to practice *better* what I preach.

Some kind sympathetic friend will suggest to me right here that I was overworked and worn out. Perhaps my nerves were overwrought by the hot weather or something of the kind. I am glad to say that such excuses for me have no weight. I never felt stronger or healthier in my life than I do now. I have been for weeks living on a diet mostly of strawberries and bread and butter. My drink has been distilled water, and I am *just as well as can be*. I had a good half-hour nap on the afternoon in question, and I was in full possession of all of my powers of mind and body. I think, too, I was reasonably filled with love toward Christ Jesus and love toward humanity. Satan got into my heart, notwithstanding, in just a few brief seconds, and touched hidden springs of my life and my being (that I never knew of before) in that brief time, so that I felt it the next day. Some time last winter the sewage-pipe to our kitchen sink got out of order. I looked at it, and thought I could fix it in about a minute. But when that was done, something else needed fixing, and I kept on pulling it to pieces until I had worked hard for over an hour. Had I known how many repairs were needed, I would have sent for a plumber; but after I got started I did not like to give up beat on the job. I came out ahead and made it all right; but I

had to work in such a cramped position it made my muscles and joints ache for several hours afterward. Next day I wondered what made me feel so sore all over. I did not know but I was going to be sick, until I remembered about cramping and twisting myself while working at that pipe.

Now, this encounter that I have been telling you about, with the powers of evil, affected my nerves and my spirituality more or less all the next day. Every little while I would be wondering what was the matter with me, and then I would reflect. Bunyan gives us a very good picture of such a conflict, in Pilgrim's Progress, where Christian had a hand-to-hand conflict with Apollyon. The latter was much the larger, and poor Christian was no match at all for him in point of strength. Reason and common sense would have said that Apollyon might crush him as one might crush a fly. Well, the loving Father looked on, and he always looks on, and will never let a faithful "soldier of the cross" be overcome nor entirely overpowered. We are tempted to have but little charity for the actors in these suicides and murders. We might say, "Let them get out of the world so good people can have peace." But, dear friends, this remark does not seem to work. Even though a good many are gotten out of the way by this process, the thing seems to grow. In fact, there seems to be a good deal of reason for taking the stand that these unfortunate people are not *altogether* to blame. Satan had got hold of them; and sometimes a man or woman in an unguarded hour lets Satan get a start. We frequently see the remark in the papers something like this: "This man had been such an exemplary person all his life that no reason can be given for the strange act but temporary insanity." Let us be warned and prepared beforehand for these very cases of temporary insanity that are getting to be so frequent. Is not a great deal of it only a new scheme started by the evil one?

In the latter of the two texts, we are told that even the dear Savior himself was in all points tempted like as we are; and would it be any thing very strange if he in his great love should think best to give even his followers like glimpses of great temptation, that they might be better able to preach the gospel, and warn mankind of the evils that Satan brings to pass? We read in the first chapter of James, verses 2, 3:

My brethren, count it all joy when ye fall into divers temptations; knowing this, that the trying of your faith worketh patience.

In thinking the matter over I am forced to believe that a foolish pride is at the bottom of many of these troubles. We are not humble enough—not meek enough, if you choose. "Blessed are the meek, for they shall inherit the earth." Sometimes people think *I* have not pride *enough*. When I was prowling around in the Florida woods in the middle of the night I needed more of a certain kind of pride; but in some other ways I am often tempted to be proud and overbearing. A few days ago I dictated something to one of our typewriter clerks. When I read the letter aft-

erward I told him he must have omitted a very important part of it. The conversation was something like this:

"You may have meant to put in something, Mr. Root, but you must have forgotten it, for I wrote down every word you said."

Now, I knew certain reasons why I could not have dictated just what he wrote, that he did not know as well as I did. I said quietly, "Hunt up your notes and see if you did not omit two or three lines in copying your notes on the typewriter." He replied:

"It isn't any use to hunt up the notes, for I wrote down every thing you said."

Now, the young man was foolish in being so positive. I suppose most of us are often foolish in being over-positive. I felt sure I was right, but I thought I would not say any thing for fear I might betray my—was it not pride? He should have remembered the years of experience I have had in such matters. He did not know that it has long been my practice to watch the pencil of the clerk as he makes his crooked marks, to see just when he has finished the sentence as I dictate. If a line is dropped I am pretty sure to notice it by the motion of the pencil. I did not say any thing more, but stood by him while he hunted up his notes and commenced to read his record. There was quite a change in his countenance when he said:

"Oh! I beg pardon. I *did* leave out something after all."

I mention this as an illustration, not because I wish to reflect severely on the young man. We meet the same thing, most of us, thousands of times. The hired girl tells you very pertly you did not say a word about a part of the work you explained quite at length. What shall be done about it? Why, keep cool, and do not get proud and overbearing, even if you are boss or mistress, and even if you have grown gray in watching to see how these little mistakes come about. Take a humble place in the affairs of life. Sit at the feet of the dear Savior, and learn of him. O God, help me to practice *all the time* the precepts I am now trying to give to others. I know how natural it is to go to great pains, and to great lengths, to prove we are right. In the case I have mentioned, I knew the pencil-marks of my young friend would prove to him that I knew what I was talking about. But in ordinary talk or in ordinary disputes we do not often have such proof in black and white of exactly what we did say.

Of late it has been a difficult question to decide whether certain ones are insane or simply ugly. Judges are appointed to decide the matter. Now, if I were a judge, and if I were to settle the question as to whether some one in a quarrel was getting out of his head or not, I would test him by a scripture text. When he got to going on about his neighbor, and began telling his side of the story, of how he had been used, I would quietly ask him to hold on just a minute. Then I would say:

"My friend, you know the Bible says, 'Love ye your enemies; do good to them that hate you; bless them that curse you, and pray for them that despitefully use you.' Now,

what do you think of the above words? Do they not sound more like the words of the heavenly Father to his contrary children than like words that ever came from any human being?"

If the person assents that these *are* probably the words of *God*, and that they are grand and glorious words to sinful humanity, I should say right away that the man is not crazy at all. He is perfectly sound in mind. If, however, these beautiful texts should make him angry, and even uglier and more vindictive than he was before, then I should say, "That man has a touch of insanity. He will be crazy if he pushes ahead in this quarrel or other like quarrels."

My prediction in this way has several times come true. There is a kind of insanity that prompts these crimes we read about, and this insanity is Satan's work. *He* is at the bottom of every bit of it. Now, dear brothers and sisters, if we believe this, if we recognize that Satan is *really* going about as a roaring lion, just as the Bible says, then let us be careful. Whenever the time comes that you can not kneel down at night and pray honestly for every one who has provoked you or even done you harm during the day, Satan is getting into your heart; and may God help you to say, "Get thee behind me, Satan."

FLORIDA TRAVELS, CONTINUED.

My next point from Sanford was Sorrento. There is a railway off in this direction; but since the big freeze the trains run only twice a week. As my destination was only about twenty miles, we made the trip with a horse and buggy. On the way we had to cross a river. As there is not travel enough to pay for an expensive bridge, two counties unite and keep a man at the crossing, with a ferry-boat. He is paid a salary, so the traveler has nothing to pay. At a moment's warning, day or night, he is carried safely over the stream. It seemed to me as if it must be a pretty big job to push the boat over when loaded with horses and vehicles. But the ferryman's daughter, scarcely a dozen years old, said she had ferried people over frequently during her father's absence. Of course, there is not very much current to this river. In fact, it is like a good many of the Florida rivers—only a narrow stream connecting one lake with another one.

At Sorrento I stopped at R. M. McColley's. Mr. M. is, like many other bee-keepers, a sort of odd genius. He has a home in Ohio, not very far from Medina, and it is a very nice comfortable home too; but on account of his health he has for several years spent his winters in Florida. At the present time he has also a very nice place in Florida. In fact, he has a steam-engine to pump water and saw wood, and quite a lot of agricultural imple-

ments; and when GLEANINGS described the home-made windmills a little while ago he had to make such a mill. It was my privilege there to pick luscious tangerines right from the trees; in fact, he has succeeded in growing some very fine fruit almost without protection.

This matter of having a home in Florida and another in the North, and migrating back and forth as the birds do, is one that has been considered a good deal. But there is a serious drawback to it. When you get every thing fixed up nice, and wish to go away, you must either close up every thing, and hope nobody will break into the house and steal while you are gone, or you must leave hired help to look after things and take care of it; and the latter is sometimes more unsatisfactory than the former. Mr. and Mrs. McColley were telling me how they found things in Ohio after they had trusted to hired help or renters for several years. I believe the tenants did not get quite to the point of keeping "pigs in the parlor," but they came very near it, and our two friends are now back in Ohio fixing up their home again, growing crops, and getting things in shape as well as they can, as they were before they went to Florida.

In the afternoon I was driven over to Mount Dora, where I met our good friend Longstreet, who was one of our veteran bee-keepers. He lived for many years in York State, not far from Doolittle. He went to Florida on account of poor health, and at the time of my visit he was feeling very poorly on account of the grip and some other troubles that had set in. I was almost frightened to see him several times make such an effort to get his breath. He said he would feel better to get out in the sunshine in his beautiful yard among the orange-trees; and after a while he recovered so as to talk about the bees, tropical gardening, etc., quite like his old self. I feared when I bade him good-by he was not going to live long; but still I was somewhat surprised to learn that he died shortly after my visit.

As my visit was on the day of the semi-weekly train, I decided to wait for it in order to ride six miles to Tavares. Well, this train that runs only twice a week was delayed *six hours*. Of course, I could have made the trip on foot much easier than to wait away along into the night; but the operator kept telling us all the while the train would be along in a short time. Well, when we got to Tavares (after waiting six hours to get six miles) the station had been burned down, and I did not recognize the place, so I was carried on past my stopping-place. The conductor *declared* that he called out "Travares;" but so many passengers said with me they did not hear any thing of the kind, he finally relented. I was carried on to a beautiful little town called Eustis. The conductor, of course, gave me free transportation there and back. At Eustis I found a bee-keeper, and for the first time in my life saw redbud-trees in full bloom; and let me tell you redbud is one of the handsomest ornamental trees to be found anywhere in the world. The sight of a tree in full bloom, in a dooryard, called forth exclaima-

tions of surprise; and I wonder now that the tree is not grown more as an ornamental shrub. We tried it years ago here in Medina, but did not succeed in getting it to bloom. From Tavares I went to Oakland, on the shores of Lake Apopka.

We hear people boast, many times, that this, that, or the other locality is entirely free from grip, and that people never have grip in that region. These statements often come from people who have real estate to sell. I think they have some grip in Florida. When I was waiting for the train at Mount Dora, within about fifteen minutes I began to feel my breathing-apparatus clogging up. I put on my overcoat, and bundled up unpleasantly warm; but I had such a cold by the time I reached Oakland I was pretty nearly down sick. In studying the matter over I got an idea that plenty of heat applied in the right way to the seat of the mischief would help very much to get rid of the grip, or, if you choose, any sudden severe attack of cold. My cousin's folks had a fireplace, and a good lot of pitch-pine wood to make a nice hot fire. Well, I got the heat from that open fireplace to strike right square on my bald head, and I kept on with the treatment until it really seemed as if my brains would get to boiling—that is, if there were any brains down through my thick skull—and I just roasted that cold clear out of my head and throat. I presume it was something on the same principle as the cabinets or vapor baths that are advertised so extensively. It did the business; and after resting two days I started on to Orlando, comparatively well. At this place I was nicely entertained by Mr. A. E. Woodward, a veteran bee-keeper from York State, who spends his winters in Florida.

Daytona has often been called the handsomest town in Florida; but Orlando is certainly equal to Daytona, and I do not know but it is a little ahead. It is situated in the midst of a group of beautiful pure soft-water lakes. If I am correct, there are four or five around in the suburbs of the town. The finest pineapple-shed I saw in the whole State was at Orlando. It was managed by Mr. T. J. Arnold, of the Little Gem Pinery. He has taken from half an acre in two years fruit and slips to the amount of \$2600. The slips bring him 12 cents each, and are mostly engaged in advance. He had then an acre and a half under shed. In the vicinity of Orlando there are perhaps 200 acres of pineapple-sheds. It costs about \$2500 to shed, set, fertilize, gather, and market the first crop, per acre.

Orlando has five nice churches, a fine bank, very pleasant hotels, and boarding-houses. The latter, where I stopped with Mr. Woodward, has rates of only \$7.00 a week, and every thing was in excellent trim. There are beautiful stores, orange-groves covered with bloom all around the town. Orlando is said to be on the highest ridge in the State. The land is what is called "pine land" for many miles about the town. Strawberries and all kinds of vegetables are in abundance the year round. Friend Woodward, during the summer time, lives at Grooms, N. Y.

Tobacco.

TOBACCO—IS IT A GOOD THING OR A BAD THING?

The Philadelphia *Farm Journal*, that bright little sheet that you can get (in clubs) five years for \$1.00, hits the spot once in a while. It says:

There is a clashing of interests in Connecticut quite remarkable. A law of the State provides that the children in the public schools shall be taught that tobacco is a poison which no human being should ever take into his system. While Connecticut is spending money on tobacco culture, she is teaching her children that the growth and use of tobacco is a wicked sort of business. The moral inconsistency of the situation is easily grasped by outsiders at least. The situation is an odd one, but it is not likely that Connecticut will be extricated from it. The State will continue to grow tobacco, and the depravity will probably continue to be taught to the rising generation.

I would suggest that the teachers and professors of Connecticut hold a joint convention with the agricultural papers and moneyed men, and discuss the question, and try to have it settled as to who is right and who is wrong. Or they might put it this way: Which is of more importance, the health and moral growth of our boys, or the tobacco business, together with the money invested in the traffic? You know we had some years ago a joint convention of the bee-keepers and fruit-growers of Michigan, and good came of it. Now, Connecticut might have a convention in regard to a matter of a thousand times more importance than either fruit or bees, and all the other States and *all the rest of the world* might look on with profit.

THE HOME CIRCLE.

The above is the title of a department in the *American Bee Journal*, conducted by our good friend Prof. Cook. It rejoices my heart to read friend Cook's exhortations for righteousness, temperance, and purity; and it rejoices my heart again to see the bee-journals of our land standing out so boldly and bravely against tobacco and intoxicants.

In the issue for June 13 we find the following from Prof. Cook in regard to tobacco:

Over 100 of our college folks—almost half of us—went to Los Angeles last Saturday to attend the Inter-collegiate Oratorical Contest, and the second contest of three arranged with one of the colleges to decide who were champions in base-ball. I was proud, as our fellows won the trophies in the ball game, as they had won in the first, with a great score of 15 to 2. I was still more proud as we achieved victory in the oratorical contest. But I was most proud of the gentlemanly character of our students. One way this was shown, was in the entire absence of smoking among our fellows. The others smoked. We did not. I rejoice that we have no smoking at our college. I wish tobacco were eschewed in all our homes. Our friend A. I. Root, in "Our Homes," has done splendid service in urging against this habit. I wish I could be like happy in these "Home Circle" columns. To the hundreds of students that I have taught physiology, I have always spoken, as best I might, against all use of tobacco.

The worst count that perhaps can be brought against this arch enemy of the well-being of our people, and especially of our youth, is the tendency of the habit to make its patrons thoughtless—regardless of the comfort of others, and thus to destroy the gentlemanly instinct among us. How often in public places our ladies must endure the poisonous fumes from cigar or pipe! Only a few days ago I was pre-

siding at a large picnic gathering, where speaking was going on, when some ladies appealed to me to relieve them from just such an annoyance. I have had to do this unpleasant duty over and over again. Can people acquire the tobacco habit, and preserve their gentlemanly instinct, all unimpaired?

There is one special point in the above that is worth noting. In any contest requiring the fullest development, both of nerves and muscles, and especially alertness as well as strength, the young man who does not use tobacco will, as a rule, come out ahead; expert cyclists learned this a long time ago; and in every department of business where a clear head and a cool ripe judgment are required, the boy or man who lets stimulants alone has the advantage. Long live the Home Circle in the *American Bee Journal*; and may Prof. Cook be spared for many years to conduct it.

TRAP LANTERNS, ETC.—SEE PAGE 566, JULY 1.

A communication from Prof. J. M. Stedman, Entomologist at the Experiment Station, Columbia, Mo., is just at hand, severely criticizing Mr. Haseltine, the inventor of the trap lantern, for his unfair way of using Mr. Stedman's name to sell his invention. We have not room here for giving the whole paper, but we make the following extracts from special newspaper bulletin No. 16, June 26:

It should be distinctly understood that the moth-catchers can not in any sense of the word take the place of sprays, in a general way. While the moth-catcher is a good thing for certain very restricted insects at a certain very restricted time in the proper season of the year, and while it is true that sprays are to a certain extent unsatisfactory for certain insects, yet, on the whole, the spray may be relied upon, even though used by inexperienced persons; while the moth-catcher can not be relied upon without a thorough knowledge of the exact time it should be used for each special case.

We can say that the moth-catcher is the best thing that can be used in large fields for the corn-worm moth, for the fruit-leaf roller, for the pickle-worm moth, and for the June or May beetle. Let it be definitely understood, then, that we recommend the moth catcher for no other insects than those named; and that for the tent caterpillar, the army-worm, and the cut-worm, there are other methods of fighting these insects that are much better.

Taken as a whole, then, the use of moth-catchers by the general public will do more harm than good.

J. M. STEDMAN,
Entomologist of the Experiment Station,
Columbia, Mo.

June 26.

Permit me to add further that we have purchased one of the largest-sized Haseltine moth traps. The price is excessive, and there is no reason in the world why *any one* (if he wants to) should not use a lamp over a tub of water, with pieces of tin or cheap looking-glasses arranged so the insects will bump against the mirrors and fall into the water.

GETTING MONEY IN SOME EASIER AND QUICKER WAY THAN BY DAILY TOIL.

I have long been thinking of saying something about this matter; but the *Philadelphia Farm Journal* has said so much better exactly what I would say, I take the liberty of copying the following. The italics are mine:

Now, what shall we say about the great Wall Street stock gamble, which culminated in May in one of the greatest shearing of the innocent lambs that has ever

taken place: Tens of thousands of people all over the country were drawn into the maelstrom of speculation, and most of them lost money. A few won more than they lost. These we hear of; but of the many that lost, little is said. They keep quiet about it, though sooner or later the bankrupt court will know what has happened. If people who are tempted to speculate only knew that, whether they win or lose in the gamble, they receive injury beyond repair, they would not engage in it. If they lose, that is the loss only of money, which is not so bad; but if they win, their character is likely to suffer. *It is bad to lose, but it is worse to win; for to win means that, ever after, they will be tempted to get gain by games of chance.* Money won by any kind of gamble is not going to be of any benefit. It will not last. Sooner or later another venture will sweep all away. We pity the poor lamb that is shorn, but the shearer is worse off or will be finally. Money should be honestly earned to do anybody any good. And it is best to come slowly, little by little, day by day, and should fairly represent the patience, honesty, and toil of the individual and not the lucky chance of an hour.

A minister wisely says: "The evils of drink are familiar to you. There are other evils. But the greatest peril is the insane spirit of gambling which seems to have taken hold of the people irrespective of social standing or religious belief. The insane desire to get rich quickly is at the bottom of it all. There is no difference between the newsboy who flips coins and the man in Wall Street who buys stocks on margins on a chance that they will rise or fall. Both wish to get something for nothing; both are gamblers. From the tiny lad selling newspapers on the street to the men dwelling in a palace, the gambling spirit seems to have invaded all. Where is this thing going to end?"

HONEY-CANS.

We are supplying a good many 60-lb. cans, two in a case. Since our last report we have received another carload of these cans, so that we are prepared with nearly two carloads, which we are selling at prices listed in our catalog—\$7.50 for 10 boxes. Most of those handling our goods by the carload are supplied with these cans also. At the rate we have been shipping them for the past two weeks our stock will not last more than two months, and we can not guarantee these prices beyond our present supply of stock. We can not replace it from the Can Trust, and come out even, at present prices. If in need of cans, send in your orders while the supply lasts.

BUSHEL BOXES AND CRATES.

Because of changes in some of our manufacturing processes the slats used in our slatted and all-slatted bushel boxes are a little wider and thicker than formerly, so that we are not able to pack 13 K. D. boxes inside of two nailed up, as we have done heretofore; but we can pack 12 inside, making 14 complete boxes, with nails, in a crate of the all-slatted kind, and 12 each of the slatted or galvanized bound. We have also revised our prices on boxes to the following:

All slatted, per crate of 14, \$1.90.

Slatted, tight ends, per crate of 12, \$1.65.

Galvanized bound, per crate of 12, \$2.25.

This is a slight reduction on prices ruling the past two years. These prices are subject to a discount of 5 per cent in lots of 10 crates or more.

NO. 2 SECTIONS FOR FALL HONEY.

Those who produce amber or dark grades of comb honey should use No. 2 grade of sections in order to have the wood of the section more in harmony with its contents. In fact, the whitest grades of honey will make just as good appearance in the most of our No. 2 grade sections as they will in No. 1. Don't be afraid to try the No. 2 grade. You can save money by using them. They cost 50 cts. per 1000 less than No. 1, and, as containers of honey, are just as good. Some people have a prejudice against No. 2 sections because they think the color of the wood, being a little darker, must be nearer the heart of the tree, and therefore is more brittle or brash. This is an entirely mistaken

notion. The wood in our No. 2 sections is every bit as strong as the No. 1. We put absolutely no heart timber into sections at all. I have so much faith in our No. 2, as they are now put up, that I feel satisfied that fully half of those now using No. 1 would be well pleased with the No. 2, and prefer them at the reduced price.

BEE SWAX.

Until further notice we will pay 26 cents cash, or 28 in trade, for average wax delivered here. Be sure to mark your package so we may know whom it comes from. We are continually being annoyed by careless people shipping us wax without the slightest sign or mark of identification. They seem to think they are the only people sending us wax, and, of course, we ought to know that it comes from them without any identification marks. If you will please bear in mind that some days we have as high as ten or a dozen shipments coming in from as many different people, and that there are six days in every week, and 52 weeks in a year, and will try to put yourself in our place. I am sure you will not think we are unreasonable in asking you to place your name and address in or on each package, and write us when you can make shipment, giving the gross weight of each package, also its weight before the wax is put into it, and the net weight of wax. Get a receipt from the railroad agent, with the rate of freight inserted, if possible, and send that with your letter. Be careful also to send us nothing but pure beeswax, as we have no use for any other kind.

MASON FRUIT JARS AND NO. 25 JARS.

Our carload of jars reached us just before going to press for July 1st, but space was so crowded I was unable to get in a notice. We were disappointed in not getting any flint jars except in the pint size. All the quart and two-quart jars are green glass. They are not as green as the jars we have handled in the past, and few will find them objectionable as regards color. They are smoother, better-made jars than any we have had for years. The tops are zinc, porcelain-lined. We have pints in both green and flint glass. In the same car we received a good supply of No. 25 jars which hold just one pound of honey. The prices, till further notice, will be as follows:

1-pint flint-glass, 60c doz.;	6 doz.,	\$3.45;	12 doz.,	\$6.75
1 " green " 58c "	6 "	3.35;	12 "	6.50
1-quart " 60c "	6 "	3.45;	12 "	6.75
2 " " 85c "	6 "	4.85;	12 "	9.50
2-gross lots deduct 25c per gross.				
5 " " 50c "				

Jars are all put up one dozen in a case, with partitions. These prices are below the market, and are not guaranteed. When our stock is exhausted we can not replace them nor offer them at these prices. If you need jars, send on your orders. These prices are only for shipment from Medina.

NEW ROOT PERFORATED ZINC.

The illustration below shows the size and style of perforations in our new queen excluding zinc made on our Root perforating-machine. We have expended a large sum in refitting this machine with new dies and punches, and the product is as near perfection as

it is possible to reach. The perforations are uniform in size, and $\frac{1}{16}$ inch, which seems to be the correct size for surely excluding all queens and drones, and allowing the workers to pass freely. The rows of holes, although not quite as close together as in the Tinker zinc, are much closer than in the old Root zinc. In a sheet of zinc 28 in. wide there are 87 rows of holes, while in the old zinc there were 70 rows—an increase of 25 per cent. Then the holes are longer and with rounding ends, making the increase in total space of perforations over the old zinc fully 30 per cent. We shall list only one kind hereafter, as we regard this fully equal to the Tinker zinc. We shall be pleased to mail samples to those interested.

Special Notices by A. I. Root.

BUCKWHEAT—TIME TO SOW IT.

From now on to the middle of August is the time to sow buckwheat, in my opinion. I know a good many think it ought to be sown in June, and some say the fore part of July. But buckwheat is a cold-weather plant, and it does not set its grain well unless the weather is cool. The largest crops I have ever seen matured just before the first killing frost. Of course, it is a little risky to get too close to the frost line, but I do not believe a frost is very much worse than having it almost or quite ruined by hot weather when it comes into bloom. Perhaps it may be well to make two or three sowings, and then some of them may hit it just right. We have a nice stock of Japanese seed at \$1.10 per bushel, or a two-bushel sack for \$2.00; half-bushel, 60 cts.; peck, 35 cts.

CRIMSON OR SCARLET CLOVER.

Now is the time to get it in whenever the ground is vacated by anything else. You certainly can not afford to let any piece of ground grow up to weeds, and I believe there have been very few failures with crimson clover where it was put in in July; and, so far as I can learn, medium red and mammoth clovers have also succeeded when sown by themselves in July. Up in the Traverse region, Michigan, they succeed by sowing any of these clovers in August; but, of course, they have more snow for protection, as a rule, than we do here. In our locality, on our rich ground, we succeed with crimson clover year after year when put in at any time in August; and we usually get a good stand if sown during the fore part of September. A year ago we put in a piece where mammoth clover failed because our wheat grew so rank. After the wheat was cut we sowed crimson clover on the stubble, and went over it at once with the cutaway harrow. The clover made a dense mat before winter, and the ground was so thickly covered with this same mat in the spring that the frost had no effect on it whatever. From 8 to 15 lbs. of seed is sown to the acre. On poor land, put more seed; for in rich land it branches out so one seed makes a great mass of clover-stalks. We consider it worth almost as much as red clover to turn under, and it blossoms so much earlier we can get it out in full bloom (getting the advantage of a honey crop) and then have time to turn it under for potatoes and get them in early. We rather prefer mammoth clover for enriching the ground; but it does not get in full bloom till the last of June, and a good many people object to waiting till so late for planting potatoes.

The present price of crimson clover, new seed, is, two-bushel sack, \$10.00; bushel, \$5.50; half-bushel, \$3.00; peck, \$1.60; half-peck, 85 cts.; 1 lb., 15 cts.; by mail, 1 lb., 25 cts.

I know crimson-clover seed is offered at a lower price than the above; but after having had some sad experience with crimson clover that germinated only from 10 to 50 per cent, and one lot, in fact, that would not grow at all, although it looked all right, I do not dare, hereafter, to handle any thing except the best new seed. The seed we offer for sale is absolutely new, and what is called "fancy." As the seed is mostly grown in the latitude of Philadelphia, quotations on it will always be a little lower in the south-east. Of course, we have to add something for freight from the place where grown.

EXCURSIONS TO NORTHERN MICHIGAN.

When this reaches our friends I shall probably be in the Grand Traverse region, but for only a brief stay, however. The friends who have been thinking about an excursion to Northern Michigan may be pleased to know that a very low price for the round trip from Toledo is to be made July 25. The Pere Marquette Railway Co. write us as follows:

We are to run an excursion to Ludington, Manistee, and Traverse City, July 25th, at \$4.00 for the round trip. Tickets may be used out of here on all trains on the 25th, good returning in 15 days. For the accommodation of excursionists we will arrange to run through coaches.

W. C. TOUSEY, Toledo, Ohio.

The Pere Marquette Railway Co. will, on application, send you descriptive pamphlets, free of charge, describing the attractions of Northern Michigan, telling all about crops grown there, price of land, etc. Address S. S. Thorpe, Majestic Building, Detroit, Mich.

To Our Shippers.

About May 1st last, we removed our business from the buildings, 120-122 W. Broadway, to larger and more commodious quarters at Nos. 265-267 Greenwich Street, and 82-84-86 Murray Street, and we duly sent to our friends in the trade a notice of our removal. Shortly after we vacated the premises, 120-122 W. Broadway, one Joseph M. McCaul, rented a portion of our old quarters, and hung out a sign, "Hildreth, McCaul Co., Jos. M. McCaul, Prop.," with other large signs to the effect that his business is "Headquarters for honey, beeswax, maple sugar, and maple syrup."

The mercantile agencies report that Joseph M. McCaul is the sole proprietor of the new business, and that he claims to have paid to one Henry P. Hildreth, who has no connection with our business, a consideration for the use of his name.

We will not comment upon the act of leasing our old quarters and exposing thereon the sign, "Hildreth, McCaul Co.," further than to state that we have instructed our attorneys to apply for an injunction restraining the said McCaul from using the name "Hildreth" in connection with his business in any manner whatsoever.

We value highly the good name and business we have established by many years of satisfactory dealing with our friends in the trade, and we therefore send this notice so that you may not possibly confound us in any manner with the so-called "Hildreth, McCaul Co."

Our firm name remains as heretofore, and all our business is carried on at our new quarters, Nos. 265-267 Greenwich St., and Nos. 82-84-86 Murray Street, New York.

Respectfully yours,

HILDRETH & SEGELKEN.

TRIAL TRIP.

3 Months, 20c. 6 Months, 30c.

TO NEW SUBSCRIBERS. — We want every subscriber of *Gleanings* to read the WEEKLY AMERICAN BEE JOURNAL for 3 or 6 months at least, and so we make the above very low offers to those who are not already getting our journal. Just think of it—13 Nos. for 20c, or 26 for only 30c! Better send in your subscription at once, and begin with July list.

ALSO DON'T FORGET
that we're headquarters in Chicago for

Root's Bee-keepers' Supplies.

A catalog and also a sample copy of the American Bee Journal free upon request.

George W. York & Co.,
144-146 Erie Street, Chicago, Ill.

3 Good Points

Good Stock ;
Low Prices ;
Prompt Service.

My stock is from J. P. Moore's long-tongue strain, A. I. Root's famous \$200 queen, and from the stock of J. F. McIntyre that filled supers when other colonies were starving. I sell warranted queens in any quantity, at 50 cts. each. If a queen proves impurely mated, another is sent free of charge. All queens go by return mail unless otherwise ordered. I guarantee safe arrival and entire satisfaction. Otherwise, the money is refunded.

L. H. Robey, Worthington, W. Va.

W. H. Pridgen,

of Creek, Warren Co., N. C., whose money-order office is Warrenton, N. C., is now prepared to fill orders promptly with the Hutchinson "Superior stock," or golden untested queens, at 75 cts. each, or queen-cups at \$2.00 per pound, postpaid.

Barnes' Hand and Foot Power Machinery.

This cut represents our combined circular saw, which is made for beekeepers' use in the construction of their hives, sections, boxes, etc. **Machines on trial.** Send for illustrated catalogue and prices.

W. F. & John Barnes Co.,
545 Ruby St.,
Rockford - - Ill.

ALBINO QUEENS. If you want the most prolific queens, the best honey-gatherers, the best comb-builders, the hardest and gentlest bees known, try my albinos. My untested queens, 75c. J. D. GIVENS, Lisbon, Texas.

YOU CAN NOT afford to let the season pass without introducing some of Moore's 23-100 stock into your apiary. See advertisement on page 614.

FOR SALE. One 10 h.-p. engine and boiler (upright boiler), one 18-inch planer, one Root saw-table, 30 ft. line-shafting, hanger pulleys, and belting. Will take \$250. J. W. BITTENBENDER, Knoxville, Ia.

WANTED.—To exchange Barnes saw for camera, not less than 4x5. M. W. SHEPHERD, Mannville, Putnam Co., Florida.

WANTED.—To exchange worker combs, in either Hoffman or Simplicity frames, for Italian queens. L. D. GALE, Stedman, N. Y.

Abbott L. Swinson,

practical apiarist, and breeder of bees and queens for over 12 years in the "Tar Heel" apiaries, at Goldsboro, N. C., is now one of the firm of Swinson & Boardman, Macon, Ga., and the apiarist in charge, where he will be pleased to hear from his old friends, and supply them as of old with bees and queens.

Respectfully, **ABBOTT L. SWINSON,**
Box 358, Macon, Ga.

Hybrid and black queens, good ones, 25 cts. each.
F. H. McFARLAND, Hyde Park, Vermont.

KIND WORDS FROM OUR CUSTOMERS.

Don't stop GLEANINGS, please. I don't want to miss its bright face even once; neither do I want to miss Uncle Amos' talks. K. C. LUCKEY.
Poy Sippi, Wis., May 31.

I bought a queen from you five years ago, and I believe my stock from her is the *best in the world*. I wish to test your strain again. I will give it a fair, critical test, and report to you. EVAN E. EDWARDS.
Alexandria, Ind., May 11.

The premium queen you sent me last July is a beauty. I bought myself a rule with 100ths of an inch on it, a small microscope, and some chloroform. I measured some of her bees' tongues the other day, and they were nearly $\frac{3}{8}$ of an inch long. I have several virgin queens ready to mate, and some in cells almost ready to come out, from the premium queen you sent me. L. A. HAMMOND.
Keedysville, Md.

Having spent 17 years in a salaried pastorate in Illinois and Colorado, and now 6 years as a faith missionary in the desert, I know the advantages of both God's and man's promises; and as a working capital in any circumstance I prefer God's word *every time*. Tell your people to *have faith in God*. We eat at the same table with our Indian children; and if you come out here to visit us I would invite you to do the same, and make no apology. HOWARD R. ANTES.
Anath, Utah.

THE "AGE OF CONSENT."

Mr. Root:—On page 47 you say that the age of consent in Ohio is 14 years. The W. C. T. U. of Ohio succeeded in getting the age raised to 16 years in 1898. I enjoy reading your Home Papers.

ANNIE W. CLARK, Pres. Ohio W. C. T. U.
Columbus, O., May 20.

May the Lord be praised for this information, dear sister. Now, it is of great importance that the misstatement which I copied from the book, "Traffic in Girls," be corrected at once. Let it not be said of such a book that it contains one misrepresentation or exaggeration. Thank God for the raising of the age of consent from 14 to 16 years. But why not have Ohio stand beside New York and make it 18? But doubtless the age given, 14, was correct when printed.

Long Tongues Valuable South as well as North.

How Moore's strain of Italians roll in the honey down in Texas:

Hutto, Texas, Nov. 19th, 1900.

J. P. Moore.—*Dear Sir:*—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 25-100 breeder, the prize-winner: Untested, 75c; six, \$1.00; doz., \$7.50. Select untested, \$1.00; six, \$5.00, dozen, \$9.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

Twice as Much Honey!

Dr. Mason's Experience with Superior Stock.

Dr. Mason, Secretary of the National Bee-keepers' Association, writes me, on date of June 28, as follows:

"I think that I am safe in saying that the colony of bees that has the \$1.50 queen that I got of you about a year ago, although not as populous as most of our colonies, is gathering nearly, if not quite, as much honey as any *two* of our most populous colonies. I never use any smoke in handling them and never get stung.

It's just fun to handle them. When I remove a comb, unless it rubs against another, they don't run and make a fuss about it, but keep quiet and attend to their business."

Price of a queen, \$1.50, or the Review one year and a queen for \$2.00.

W. Z. HUTCHINSON, Flint, Mich.

Marshfield Manufacturing Company, Marshfield, Wisconsin.

THE TRUE TEST!

of a strain of bees is the amount of honey they gather under like conditions, compared with others. Mr. D. R. Keys, Dixie, Ga., an old bee keeper, writes: "That queen from you is simply *splendid*, has shown no disposition to swarm. Her bees have filled three supers of 35 sections each, capped *snow-white*, while the average is not one super so far.—June 6, 1901." See back ads, and write for circular, free. I have carefully selected the best queens for breeders for years, and culled out the poor ones. My stock is a five-band strain, and has *long tongues*. No small or poor-laying queens sent out. Untested, 75c each; six, \$1.00; dozen, \$7.50. For select warranted add 25c. Tested, \$1.25. Select tested, \$2.00. Breeders, \$3.00 and up. Queens sent promptly.

J. B. CASE, Port Orange, Fla.

Crimson-Clover Seed.

I have fifty bushels grown on hard land, a No. 1 article, at \$1.00 per bushel for one or more bushels; 1/2 bushel, \$2.25; 1/4 bushel, \$1.25; bags free. Reference, any business firm or bank in Kent Co., Del.

J. Colby Smith, Willow Grove, Del.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. LEY'S POULTRY CONDITION POWDER puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls—big and little get all there is in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. Ley's Thoroughbred Minorca Eggs, \$1 for 13. Thoroughbred Belgian Hares, Geo. J. Ley, Florence, California.

The A. I. Root Co.'s Goods

shipped from Jackson, Mich. Root's extra-pollished sections, foundation, hives, shipping-cases, etc., cheap. Send for list.

W. D. Soper, R. D. 3, Jackson, Mich.

Queens! I have now some very fine queens for sale, either 3 banded or 5 banded goldens, at the following prices: Untested, 75c; 6, \$1.25; 12, \$8.00. Tested, \$1.25; 6, \$6.50; 12, \$12.00. Select tested, \$2.00. Golden breeders, \$5.00. We have Root's bee-supplies at Root's prices. We have a special low price on honey-cans. Give us your orders, and I will guarantee you satisfaction.

Robert W. Rogers, Hutto, Tex.

Northern Italian Queens

Reared from Imported Mothers.

Our stock is so carefully bred and selected as to secure carloads of honey. Locality free from foul brood and other bee-diseases. Prices: Untested queen, \$1.00; 6 for \$5.00; tested queen, \$1.50; 6 for \$7.50; best imported queen, \$6.00; fair imported queen, \$5.00.

Ada L. Pickard, : Richland Center, Wis.

GRAY CARNIOLANS

We are the largest breeders and importers of this race of bees in America. They are the most gentle bees and the best of workers. Untested queen, 65c; tested, \$1.25; select tested, \$2.25; best imported, \$4.00. Golden Italian queens, same prices. For prices on large orders, nuclei, and full colonies, send for descriptive price list. Address as below.

F. A. LOCKHART & CO., Caldwell, N. Y.

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a *select daughter of their \$200 queen that they refuse to quote me prices on*. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

Prices: Untested, 75c; 6, \$1.25; 12, \$8.00. Select untested, \$1.00; 6, \$5.00; 12, \$9.00. Tested, \$1.00; 6, \$6.00. Select tested, \$1.50.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20-100, \$3.00. Breeders, whose best bees show 21-100, with an average of 20 1/2-100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100 \$7.00.

I have discovered 2 breeders whose best bees show 23-100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2 Imported queens, daughters and grand-daughters. Have just received an importation direct from Italy which has been introduced into this apiary.

Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

W. O. VICTOR, WHARTON, TEXAS.
QUEEN SPECIALIST.

HONEY QUEENS!

Leather-colored Long-tongues.—I have a breeder for which \$25 has been offered and refused. You make no mistake in buying her daughters. They are dandies.

Goldens.—The Laws strain is as good as years of patient selection and breeding can establish.

Holy Lands.—These are a deserving race of bees. With two years' acquaintance I find them great workers, with no vindictive traits, easily handled, are becoming popular, especially in South.

The above races of bees are each bred in separate apiaries, and you can get them in their purity. Am filling all orders by return mail, and I sell at the following low prices, with the usual guarantees. Single queen, untested, 75c; six for \$1.00. Tested, \$1.00; six for \$5.00. Breeders, either race, \$2.50 each. Address

W. H. Laws, Beeville, Texas.

FOR SALE.—Italian bees and queens. Untested queens, \$1.00; tested, \$1.25; full colonies, \$4.00; nuclei, one frame with queen, \$1.50; two frames, \$2.00; 1 lb., \$1.00. MRS. A. A. SIMPSON, Swarts, Pa.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.
The Jennie Atchley Co., Beeville, Bee Co., Texas:

Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 2.—Three-fourths of the total surface must be filled and sealed.
 No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

CHICAGO.—Choice white comb honey is arriving rather more freely, and brings 15 cents. There is no accumulation at this writing, as receipts sell within a week after arriving, some of them on the same day. Amber grades bring about 12 cents. Extracted, dull and slow of sale at anything over 5@5½. Beeswax steady at 30 cents, with good demand.
 R. A. BURNETT & Co.,
 199 South Water St., Chicago, Ill.
 July 18.

ALBANY.—Honey market quiet, but some inquiries from both buyer and bee-keeper. We look for good demand earlier this season than usual, as no old honey is remaining over.
 McDUGGAL & Co.,
 Albany, N. Y.
 July 21.

NEW YORK.—Comb and extracted honey market dull and featureless. Some small lots of Southern comb honey arriving, but demand is very limited, quoting 11@15c per lb. as to quality. The outlook at the present is for a good crop, and prices are not likely to rule as high as last season particularly extracted. Beeswax is not as firm as has been, and prices not ruling as high; fancy, 30@31, average, 28@29.
 CHAS. ISRAEL & BROS.,
 486, 488, & 490 Canal St., Cor. Watt St.
 July 19.

DETROIT.—Fancy comb, white, 15c; No. 1, 13@14; no dark to quote. Extracted, white, 6@7c; dark and amber, 5@6c.
 M. H. HUNT & SON,
 Bell Branch, Mich.
 July 18.

SAN FRANCISCO.—The following are the quotations of the San Francisco Chronicle, of July 11th:

Comb honey, per lb., 10@12; extracted, water white, 5½@6½; light amber, 4½@5½; dark amber, 4@5c. Beeswax, per lb., 25@27.

Mr. H. J. Wilder, of Riverside, writes me as follows: "Riverside, Cal., July 9, 1901.—It is true that a report went east early in the season, to the effect that we were going to have an immense crop, but it came from sensational newspaper correspondents, and not from bee-men; they knew that with three-fourths of our bees dead the output of honey couldn't be heavy."

As Mr. Wilder is the president of the Bee-keepers' Exchange of Los Angeles, he can be said to speak with authority.
 E. H. SCHEFFLE.

Murphys, Cal., July 13.

NEW YORK.—Just at present the market is almost entirely cleaned up of all kinds of comb honey. Some few lots of fancy white have been received from the South and sell readily at from 14@15c per lb. Extracted honey is without demand at present, and is selling at from 4½@6, according to grade. Beeswax is in good demand and sells promptly at from 28@29c.
 FRANCIS H. LEGGETT & Co.,
 West Broadway, Franklin & Varick Sts.

July 22.

MILWAUKEE.—The receipts of new comb honey thus far have been very fine, showing an improvement on receipts of last year, and the demand is very fair considering the season, and sales at good rich values for the producer. We can encourage shipments of best quality, and assure good sales. We quote fancy 1 lb., 17@18c; A No. 1, 16@17; amber, nominal, 13@15. Extracted, in bb's, kegs, pails, or cans, white, 6@8c; amber, 5@6. Beeswax, 20@28@30.
 A. W. BISHOP & Co.,
 119 Buffalo St., Milwaukee, Wis.

July 20.

DENVER.—New comb honey, No. 1 white, \$3.00 per case; No. 2 \$2.75 per case. Extracted, white, 7c. Beeswax, 22@24.

THE COLORADO HONEY PRODUCERS' ASS'N,
 1440 Market St., Denver, Col.
 July 20.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co.,
 Front and Walnut Streets, Cincinnati, Ohio.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co.,
 163 South Water St., Chicago, Ill.

WANTED.—Extracted clover honey in cans; cans furnished if desired. Quote price.
 I. J. STRINGHAM, 105 Park Place, New York.

WANTED.—To buy your honey. State your lowest cash price, kind, and quantity.
 EDW. WILKINSON, Wilton, Wis.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.
 THOS. C. STANLEY & SON, Fairfield, Ill.

FOR SALE.—Extracted honey in 60-lb. cans, No. 1 alfalfa, 7½c per lb.; partly from other bloom, 6½c.
 D. S. JENKINS, Las Animas, Colo.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHAM,
 1318-1324 Union Avenue, Kansas City, Mo.

NO MORE SPOILT FRUIT.

Canning made easy and sure by using my Standard Patent self-melting, self-sealing wax strings. Very economical, and easy to use. Valuable fruit information and 100 strings, by mail, for forty-five cents in stamps.
 C. C. Fouts, Middletown, Ohio.

Write Me for price if you want 100 or 200 colonies of bees in 8 frame hives, delivered in New York City or Havana, Cuba. I want 25 Carniolan queens October 1st.
 W. L. COGGSHALL, W. Groton, N. Y.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

VOL. XXIX.

AUG. 1, 1901.

No. 15

A FOUL-BROOD LAW is strongly opposed by bee-keepers in Australia. T'other way here.

THE Chicago *Record-Herald* has this:

The bee stings once, and then
May never sting again;
The slanderer, day after day,
In wanton malice stings away.

AUSTRALIA now has a third bee-journal. Like its predecessors, the new comer rejoices in a long name, *Australian Bee keepers' Review*.

THE WORST DROUTH I ever knew in July. Grass entirely dead, to all appearance. Bees in danger of starving. [See answer to Straw elsewhere.—ED.]

FOR TARTAR on the teeth, dentists use, says *Le Miroir des Modes du Jour*, the following: One part muriatic acid, one part water, and two parts honey.

FOR CRACKED LIPS.—Apply, on going to bed, a lotion consisting of two parts honey, two parts lemon juice, and one part cologne water.—*Le Progres Apicole*.

DOOLITTLE says in *Progressive* that stimulative feeding in time of dearth will keep up laying if weather is fairly comfortable, but it will do little or no good after three or more days of continued bad weather.

SILVER LINDEN was accused of destroying bees, many dead bees being found under it. Numerous defenders have appeared in the foreign journals, and it now seems doubtful that it was ever guilty in any case.

MRS. BARBER's explanation seems reasonable for her bees, p. 598; but it still leaves the puzzling question, why do my bees act so differently? for when honey comes in a flood the baits are the first sections sealed in the super.

E. RUFFY reports in *Revue Internationale* that he put in his hives beside the feeders balls of unwashed cappings, and the bees used the wax of the cappings in building out comb with great rapidity. The balls may be the

size of an apple to the size of one's head, and it is essential that the cappings be unwashed.

B. F. AVERILL beats me in using foundation-splints without waxing. The bees tore down such splints for me. I like better the length of his splints, but putting them in out of hot wax I must use them shorter. I think I must try again and see if I can succeed with dry splints.

JULY 15 some of my colonies have stopped brood-rearing on account of the drouth. Sealed brood and eggs in the hive, but no unsealed brood, showing that the queen still lays, but the workers will not rear brood. I think that occurs more frequently than is generally supposed.

"AFTER A BEE has filled a cell with nectar she turns round and puts a drop of formic acid in it to preserve it."—Dear *British B. J.*, how could you allow such a statement in your columns without saying it was rank nonsense? [That does sound queer in so reliable and scientific a bee-paper as our esteemed cotemporary the *British Bee Journal*.—ED.]

In *Wegweiser* is reported the case of a child brought up on the bottle. Equal parts of milk and water were used, sweetened with honey. In 7 months the child had consumed 25 lbs. of honey (nearly 2 oz. a day). Later the proportion was 4 parts milk to 1 of water, the honey still continued. The child was very hearty, sleeping the whole night, and being remarkably free from the usual ills of childhood.

THAT HONEY is used for a coloring material, *Illustrierte Monatsblätter* rightly says, is not generally known. The coloring of agate depends upon the porosity of the individual layers of the stone, which are capable of absorbing liquids. The stone lies several weeks in dissolved honey, and is then boiled in sulphuric acid. The charred honey colors the stone black where of greater porosity, gray or brown where of less.

AT MEDINA you like horizontal wiring. So do I, if I could get combs built clear down to the bottom-bar. Can you do that at Medina with horizontal wiring? [Yes, and no. It depends on the season when such frames of wired foundation are given to the bees in the

first place. I have taken a set of Hoffman frames, and laid on them two strips of wood, turned the hive upside down on the bottom-board, and let the hive remain upside down for two or three days during the height of the honey-flow. It does not take long for the bees to force the comb clear up to the bottom-bars in this case.—ED.]

DIE BIENE reports that H. Heimberger had 4000 combs built from cylinder foundation, and 1000 built from foundation made in a foundation-press. The latter were the only ones that did not stretch out of shape. [By "cylinder foundation" I suppose is meant that which comes off from ordinary foundation rolls. The ordinary article I have seen, that comes from the press, has a thicker base and much heavier walls than that which comes from the rolls. If this is the case, of course the former would not be as much inclined to stretch as the latter. Foundation from rolls, as a general thing has lighter walls; and I should incline to the opinion that it is not a question of rolls or plates, but a question of cell-walls in the first place.—ED.]

A PUTTY-KNIFE of overgrown size is greatly liked by S. E. Miller (*Progressive Bee-keeper*). Handle and all, it is nearly a foot long; will pry apart bodies with ease and without a snap, and will scrape burr-combs from two top-bars at once. It is made of $\frac{1}{8}$ -inch steel, $2\frac{1}{2}$ broad at the end, tapering to $1\frac{1}{4}$ inches 6 inches from end, or where handle begins. The handle is made of two half-round pieces of wood riveted on like handles of butcher-knives.—[Our people at the Home of the Honey-bees use, as a general thing, a putty-knife for a hive-tool, seeming to prefer it to any thing else. Although I have handled a variety of hive-tools, yet they all seem to be laid aside, and the good old-fashioned putty-knife is used.—ED.]

AN ERROR that seems to have more or less credence among those who might easily know better, if they would use their eyes, is that a post-constructed queen-cell consists of three cells made into one. It is never any other than a single worker-cell enlarged. The usually reliable *British Bee Journal* admits an article with the error aggravated by speaking of the queen laying in cells "consisting of three cells turned into one." [You seemed to be surprised once because I did not know what "post-constructed" and "pre-constructed" cells were. Well, now, I am not going to say whether I have forgotten or not; but methinks you had better make a definition of both, so we can have it incorporated in GLEANINGS and in the A B C book.—ED.]

MY HEART is singing with gratitude this 18th of July. Last night we had a glorious rain to break the terrible drouth. For weeks no rain, and for many days up to 98° to 100°, one day reaching 105° with an incubator thermometer. The honey crop is a failure, some other crops as well, but there's lots to live for yet. It's worth while to be roasted a while to find out how good a thing a drenching rain is. I'm now writing on the piazza at 9:30 A. M., with the thermometer at 83°, and it seems

so nice and cool. [On my trip from Colorado eastward I took occasion to ride through Kansas and Nebraska in the day time, because I had heard about the awful drouths in those two States, and I wanted to see for myself. Sure enough, the corn was beginning to show the effects of the drouth, and no mistake. But, fortunately, I soon had the pleasure of seeing the gathering clouds, and in a day or two afterward I heard that those two States had had a good shower; but it would take a number of them, I should judge, before the thirsty ground would have enough to put things on a boom again. When I got into Iowa I found every thing parched just the same; and at Des Moines the lawns were all brown. It had been found to be practically useless to sprinkle them, as the heat was so intense. As I moved eastward I could see more and more evidences of rain; and when I got into Ohio, my dear old State, the ground was nice and moist, and every thing on a boom. While in the mountain States the ranchers in the valleys were discussing the drouth in the States east of them, and were congratulating themselves because they could have water, and plenty of it, any time they opened their irrigating-ditches.—ED.]

"Whew!" says Denver; "It's getting cool;
It's down to 96;"
"I fear we'll melt," says Illinois;
"It's up to 96."

In the previous issue I spoke of an article appearing in the *Australian Bee-keepers' Review*, credited to J. E. Crane. W. Z. Hutchinson informs me that said article first appeared in the *American Bee-keeper*, of Jamestown, N. Y., our Australian friends failing to give proper credit. I am glad Mr. Hutchinson noticed the error.

REVUE UNIVERSELLE D'APICULTURE.

As Mr. Fisher's regular article, Bees in Law, does not appear in this issue I thought that it might not be uninteresting to the readers to know that this matter has been before the French courts, and constitutes a very considerable part of their jurisprudence. The questions arising in regard to swarms have been matters of judicial action since the days of the Romans at least; and out of a great many precedents we have to-day the law as it stands in France. I make a translation of only the essence of some decisions thus far arrived at, omitting the dates of the laws.

As to the right of pursuit, the owner has the right to capture and revive a swarm so long as he has not ceased to follow it. This confers on the owner of the hive the right to follow, in preference to that of any other person. The legitimacy of this right is recognized in

all legislation, and can not be contested. It is evident that the swarm belongs to the owner of the hive whence it issued, so long as he has not abandoned pursuit, for he thus shows his intention to keep what has never ceased to be his property.

Can the owner of a swarm chase it by proxy? We do not believe a man can be compelled to chase his swarm in person. No law prescribes that; and no one can in right refuse the right of pursuit to one who, unable to do so himself, authorizes a second person to take his place.

As to following a swarm on uninclosed land, if a swarm alights on such ground the bee-keeper may follow it, but is responsible for all incidental damage. If the land is fenced, the pursuer has the right to claim and retake when entrance to the farm has been accorded. But how shall one act when permission is refused? In that case he goes before a justice of the peace and gets out a "letter of delay," in view of the urgency of the case, summoning the owner of the land before the court, ordering him to give up the swarm or pay for it. It has been decided that one who refuses to the owner of a swarm the right to have access to his land, even when surrounded by walls, and whereon the bees have lodged, becomes responsible for the damage caused by this refusal.

In regard to following a swarm lodged in an empty hive, such swarm belongs to the pursuer, at least so long as he has not abandoned pursuit. In such a case, no right can take priority over his own; hence he may take the swarm, without hesitation. But suppose the hive is already occupied, what then? It often happens that a swarm, in quest of a home, attacks a feeble colony, or one ill defended, overpowering it by main force, and, after a regular siege, occupies the hive. The pursuer, in this case, finds it impossible to identify or retake his own bees; for how can he tell his own bees from the others? It has then been generally decided that the swarm should belong to the owner of the hive where it is lodged, and without indemnity to the pursuer, who has gained nothing, but lost the greater part of his bees. The Roman law did not confer the right of pursuit except when the chase was easy. The French law seems to confirm this, as it presupposes the possibility of retaking the swarm.

On whom is it incumbent to prove the ownership of the swarm? In cases of dispute with the owner of the land on which the bees have settled, it is for the owner of the bees to prove that they came from his hive. The owner of the land finds himself the owner of the bees unless he has by fraud enticed them, or unless the owner of the hive has given up pursuit. This decision conforms to the old laws, and especially to the Ordinance of Louis IX., in 1270. Ordinary proof by witnesses is admissible. But it often happens that witnesses were not on hand at the time the swarm issued; but for all that, reasonable presumption must be allowed.

The pursuit of bees may be interrupted by a temporary obstacle, such as the coming of

night or the passage of a stream of water. But the right to follow is maintained in this case, but on condition that the owner of the bees shall resume pursuit as soon as possible—for example, in the morning or when the stream is crossed.

The right to follow ceases with the abandoning of the pursuit.

Has everybody, like the owner of a colony, the right to follow an abandoned swarm? It would seem, at first sight, that such a swarm belonged to nobody; that the first one coming might follow it as well as the original owner. But this opinion can not be sustained; for, as Mr. Varembeys says, the right to follow, accorded by the law of 1889 to the owner of a hive casting a swarm, is an exceptional right which can not be extended to other cases. The pursuit should not be confounded with occupation, the latter consisting only of the real taking of the bees. Everybody may follow, without doubt, an abandoned swarm, without having a real *right* to follow, including all the results arising therefrom. He who, then, is the first to take possession of an abandoned swarm becomes thereby the rightful owner to the exclusion of all others.

In reference to an abandoned swarm in simple repose, such swarm, before choosing a habitation, frequently does not stop except momentarily for a rest. In this case who is the owner? The law is silent in this case; but there is no doubt that the swarm, having regained its natural liberty, should be considered wild, and the property of the finder.

NOTES OF TRAVEL.

A Visit with L. Stachelhausen and Louis Scholl; the Honey-plants and Honey-resources of South-central Texas.

BY E. R. ROOT.

After leaving Mr. Jenkins at Wetumpka, Ala., I took the train for San Antonio, Texas, going through Mississippi, Louisiana, and part of Texas without a stop. At the station I was met by a thick-set, full-bearded gentleman, no less a personage than L. Stachelhausen, of Selma, Texas. As a writer on bees in the journals of both America and Germany, no man is better known. Always practical, his writings show a marked familiarity with the bee literature of both continents. When, therefore, the person I have described modestly stepped forward and introduced himself as Stachelhausen it was with a real thrill of pleasure that I grasped his hand—a hand that knows well how to lift heavy supers of honey as well as swing the pen. He explained that he was serving on the jury, and hence was temporarily in San Antonio. As court had been dismissed for the day, and knowing the

hour of my arrival, he came down to the train. How we did talk over men and methods! He was still using his method of brushed swarms with success—something that he described in GLEANINGS some months ago. As Mr. Stachelhausen was to go on duty the next day I took the train for Hunter, Texas, where resides a young bee-keeper not yet of age, but who, nevertheless, has become quite well

L. STACHELHAUSEN.

known through the bee-journals. I refer to Louis Scholl, an intimate friend of another young bee-keeper, and equally well known—H. H. Hyde, of Hutto, Texas. These two enthusiasts have gotten up what is known as the Hyde-Scholl separator, a device which, if I may judge from results, is not without some merit. Some one let leak the fact in my ears that a pretty sister of one of the boys made the attachment all the stronger. What could be more natural than that one of the boys would contrive to see the other (boy) just as often as he could? But be that as it may, the two (mayhap the three) evidently have studied and planned many a little convenience for the apiary. Certainly the workshop of Mr. Scholl, which I saw, gave many evidences of it. There was a machine for putting starters in sections, and one for putting them in brood-frames. The last named is quite ingenious, and perhaps Mr. Scholl will describe it later.

Among other interesting things in the aforesaid shop Mr. S. showed me a very complete herbarium of all the honey-plants of Texas, with their names, and a brief note of their importance to the bee-keeper. It is the best collection of honey-plants for one State I have ever seen, and it serves to show the thoroughness with which our young friend has gone into the study of every thing connected with his pets, the bees.

Of three of the most important for his part of the State, and on which he relies for his main crop, I took photographs from life, and nearly life size. These I present to our readers. Concerning each I asked Mr. Scholl to prepare a short note, and this he has done.

HORSEMINT—MONARDA PUNCTATA.

"Begins to bloom in May, sometimes a little later, June, depending on the season, such as a very dry and a backward spring. The honey is compared with that of the basswood of the North on account of its peculiar strong flavor which it resembles; is of light color; one of the best honey-plants of the South, and tremendous yields have been obtained. I have just gone out to procure some of the flowerets, and send same to you herewith. Perhaps you remember what you said about a chance for long tongues while taking the shot at the horsemint on our porch. I have been interested in this question, and can not see how short-tongued bees could ever get every thing that is nectar out of those long tubes. What do you think about it? Red clover not alone for long tongues."

MARIGOLD—(?).

"Marigold is one of our main honey-producers, yielding in May and June a rich golden

LOUIS SCHOLL.

honey, having a flavor that is liked by many and preferred to others. The honey is of a very heavy body, as sections of the plain ($3\frac{5}{8} \times 5 \times 1\frac{1}{2}$) kind, filled the same as those with mesquite or cotton honey, outweigh these by over 2 oz., the heaviest weighing a little over $16\frac{1}{4}$ oz. The comb also is of a golden yellow color."

HOARHOUND—MARRUBIUM VULGARE (?).

"Some time in February the hoarhound begins to bloom, lasting and yielding a steady

flow of nectar until very late in summer or until very hot and dry weather puts an end to it. The honey is of a golden color, heavy and limpid in body. It will be remembered that the honey from this source is generally proclaimed as being so bitter that it is worthless; but such does not seem to be the case with it here, as in some years quite a lot was produced, and sold too, without any complaints. The honey is really sweeter, or has such a sweet taste that it is nauseating to some. It has good medicinal qualities, and has been recommended as such by some persons having had good results after using."

As Mr. Scholl had no recent photograph of himself I made one of him. This picture, as originally taken by me, is half life size, and yet it was taken with a 7×5 folding kodak, without a ground glass, and weighing only 4 lbs. and 4 oz. It was pronounced so perfect by an expert in Los Angeles, who saw the negative, that he wanted to send it in for me to compete for the \$500 prize offered for such work, and this he has done. If this picture receives even honorable mention, friend Scholl can send a copy of it to that pretty girl, with my best compliments; but the prize money—I'll pocket that. I am not worrying what I'll do with the money, for I'll never get it, for the chance is as one in a thousand.

The other picture shows Mr. Scholl in his work clothes—rough and ready for work

among the bees. He is standing before one of his favorite colonies, prepared to open it. On the right will be seen a handsome bunch of cactus, just as it came up naturally. To Mr. Scholl and his people there was nothing rare or beautiful about it, as it is too abundant with its pricklers to be at all pleasant. But I thought, what would a florist or a landscape-gardener of the North give for such a beautiful thing? How true it is that a prophet is not without honor save in his own country, and that familiarity breeds contempt, even for cacti!

Another thing that interested me was the Texas horned toads that were running over this apiary, and even over the buildings. These ugly things, more suggestive of his satanic majesty than any thing else, did not win my admiration as did the cacti. But the way they would dart about was enough to arrest the attention of any tenderfoot.

Mr. Scholl uses and prefers, I believe, shallow brood-chambers. He has been testing various styles of hives side by side for several years, and the more he experiments the more he inclines to the divisible brood-chamber, for the production of comb honey at least.

I did not go further north, as I had planned, to see the Hydes, as I saw that it would throw me out of my schedule, which had been too hastily laid out; so I bade Mr. Scholl good by and took the train back to San Antonio.

LOUIS SCHOLL AT WORK AMONG HIS BEES; EVERGREEN SHADE ON THE LEFT AND CACTUS ON THE RIGHT.

THE SWARTHMORE SYSTEM OF FERTILIZING NUCLEI CRITICISED.

Is the Scheme of Small Nuclei for the Purpose a Permanent Success?

BY GEO. J. VANDE VORD.

My attention was arrested by the fascinating and alluring description of Swarthmore's effective (?) plan of getting queens fertilized from those little one-frame (section size) nuclei, described in *GLEANINGS*, page 434; and I almost found an old-time enthusiasm arising in me on the subject of mating queens from small nuclei; but a mental picture of past experience that was pretty full of shadows effectually cooled me off, and I began to wonder how many more of *GLEANINGS* readers had struck shoal water on small nuclei since A. I. Root first enthused on them, only to abandon them after using them for some time. It may interest those who see in his article a way to produce queens at a greatly reduced price, to read of some difficulties that

lie ahead of them in following his plan, and that he has entirely failed to mention.

For several years I was using, or trying to use, nuclei composed of from two to four sections, placing several together in one section-super, and having entrances nearly 14 inches apart—about twice as far as Swarthmore's—and differing from one another by having blocks of varying shape at every other entrance.

I found such nuclei to be all right for keeping virgin queens in up to the time of their flight; but an extra large percentage would at that time take to running around outside the entrances; and if the bees at the neighboring entrance should be fanning, she would run over there, presumably to see what the fun was, and quite frequently she would slip inside the entrance unopposed, to "visit with Cousin Kate," but, unlike Timmy Doolan's cat in the comic song, she would never come back.

Then there is always, by any system, a percentage that get lost when taking their flight; and by Swarthmore's plan the nuclei from

TEXAS HORSEMINT; ONE OF THE PLANTS THAT HAS LONGER FLOWER-TUBES THAN RED CLOVER.

which these queens come are a source of danger to the neighboring queens, as they are very much given to running across to the nearest entrance having a queen within, leaving barely any bees to care for the few cells of brood in their old home; and while, if honey is coming in freely, they will rarely do any harm, yet if it is not, they are very apt to ball the queen they came to pay homage to, within two days, if she should not have begun laying. If she has begun laying, then the addition to the number of bees in the little nuclei only hastens a danger that is always present with very small nuclei, of the queen and bees swarming out and completely deserting their home, brood or no brood, honey or no honey, on account of its small size and entire unfitness to retain a normal colony, of which the bees often seem more aware than their owner.

In those cases where the queen gets safely

through the previous dangers, and begins laying, she will scarcely have been laying 24 hours, when, becoming discontented with her small accommodations, she must be quickly removed or fastened in by entrance-guards if she is to stay where the bee-keeper can put his fingers on her.

If black or hybrid bees are used for forming the nuclei, the danger from the bees running from one entrance to another is greatly augmented.

I have sometimes seen the bees from one of these little nuclei, after losing their queen on her flight, come out in a string and run to their nearest neighbor, fanning their "queenless" note, and entering without opposition, staying only a short time, evidently searching for their lost queen, when out they came, and on to the next entrance; and whenever they will go in, and yet not stay, you may confidently open the nuclei to take out a balled

MARIGOLD, ONE OF THE PRINCIPAL HONEY-PLANTS OF TEXAS; BUT FOUND ALL OVER THE UNITED STATES.

TEXAS HOARHOUND STALKS (LIFE SIZE) WITH SMALL, WHITE, STAR-LIKE FLOWERS.

queen; and sometimes, even when they stay, the queen disappears in a few days.

One swallow does not make a summer, nor does success with an occasional bunch of these small nuclei, when every thing is favorable, and the queen and bees happen to refrain from "visiting," warrant the conclusion that such nuclei are both practical and profitable.

I'll warrant the opinion that there is not one in four of the queen-breeders of to-day who has not tried and discarded some such plan of running little nuclei; but there are few who will rush into print to tell of the things they have tried and found unworkable. We all know that a queen is very reluctant to lay in a single comb; and many young queens will swarm out after becoming fertilized, and arriving at the point of laying, rather than begin in a frame that is not protected by combs on each side of it; and this is especially true of single combs that are smaller than half the size of a Langstroth frame.

His directions for collating a large number of queens in one hive (magazine hives, page 506), will work for only a few weeks, and then the bees will favor one of the queens, and neglect or even destroy all the rest. That is my experience, at all events.

Daytona, Fla.

[It is possible and even probable that most people will fail in getting queens fertilized in nuclei as small as Swarthmore describes, and especially so many of them so closely put together; but there are several who have made a success in having queens fertilized in small three-comb nuclei of no larger size than three $4\frac{1}{4}$ sections.

Herman Rauchfuss, of Colorado, told me, when I called on him recently, that he had succeeded in having 6 out of 8 queens fertilized in these little three-comb boxes. He divided off an ordinary super into 8 compartments, each having three little combs of the size of a section honey-box. There are two entrances on each side, and two on each end. In these little nuclei he not only had queens fertilized, but confined them and

kept them there by the use of perforated metal after they had begun laying eggs. Two years ago, when I visited Mr. Rauchfuss I took a photo of him, his little girl, and the queen-mating super, one of which he is holding in his hand. Its general mode of construction will be apparent from the engraving.

Mr. E. F. Atwater, of Meridian, Idaho, was using something quite like this when I called on him recently, and he was making a success of it; and in a letter received from one of the best queen-breeders in the country, Mr. W. H. Pridgen, I found he has also used something similar and made it work; and you yourself, I believe, have accomplished it, but you do not consider it a reliable plan. But Swarthmore has gone one step further; and instead of having three little nucleus frames he has only one, and that a little larger size. If it is possible to make the others a success, *perhaps*, with the right management and the requisite amount of skill, one could make the other. This is a matter of considerable importance; and if bees sufficient to cover one or two Langstroth frames, and equivalent brood, can be made to have six or

MR. HERMAN RAUCHFUSS SHOWING HIS QUEEN-MATING SUPER.

eight queens fertilized where only one would be ordinarily, then we have made a step in advance. Swarthmore's method may be open to criticism; and if so, let those who have had experience enlighten us, for it is only by discussion that we can get at the full truth.—

Later.—We have just received word from Carl F. Buck, of Augusta, Kan., who has been trying the Swarthmore methods, that he had "just taken from ten Swarthmore nuclei boxes nine queens. I attached the boxes to brood-chamber above an excluder. Will you please let me know what you actually think of the fertilizing of queens in Swarthmore nuclei boxes, attached to upper chamber above excluder?" Answering your question, A. I. R. feels sure that the one-comb section-box will not generally prove to be a success.—Ed.]

THE SWARTHMORE SYSTEM OF QUEEN-REARING.

Continued from last Issue.

BY SWARTHMORE.

With open-top frames and shell cups, all one needs to do, when he wants queens or cells, is to roll the sheet back a bit and draw one or a cageful—no smoke, no stings, no undue disturbance to the bees, no laborious work in the hot sun, no fear from robbers—just the simple act of "drawing one;" then replace the hive-cover and come away. One has all he needs, without lifting a frame.

HOFFMAN BARLESS FRAME.

The above shows the manner of converting a Hoffman frame into an open-top or barless frame for receiving nursery-cages.

It might be well to say, that the sheet should be split directly over the "open frame," then it is not necessary to skin the entire surface of the frames every time one needs a cell or a queen, or a cageful of queens.

To convert a Hoffman frame into an "open frame," remove the regular top-bar and fit a

$\frac{3}{8}$ strip between the end-bars, two inches below. Screw brackets of strap iron firmly on to each end-bar, as shown in the sketch, to form ears for the support of the frame in proper position. One thin strip nailed edgewise on to the flat edges of the end-bars will suffice to steady the cages.

MAKING PLUG-CUPS.

The molding of the plugs ready for compression can be done on cool days—when a little fire is welcome, you know. I prepare 500 to 600 plugs at a time, and do them all at one melting, thus:

The top-bars are laid flat upon strips of tin in lots of 50 or more, and the shells are stood upon end in shallow trays, in lots of 100 or more. The melted wax is then poured into each hole very quickly, with a long-nosed ladle or small coffee-pot. If one is skillful and neat, very little shaving will have to be done afterward.

BURNISHING OR FORMING STICK.

A hand tool for mending and smoothing plug cups.

HAND CELL-COMPRESSING TOOL.

The above is for reshaping cell-cups, or for queen-rearing on a small scale by the plug-cup plan.

As soon as the wax has cooled hard, strike the top-bars on the bench, and the tin strips will drop off, leaving a perfectly smooth surface upon the face of each plug; then they are ready for the compressor any time.

The advantages of compressed cell-cups over dipped or molded cell-cups are many. First, they are not so fussy to prepare, and they do not require so much skill in the making; second, they are not delicate waxwork—the bugaboo of such a clumsy fellow as myself. The average bee-keeper can readily operate a cell-compressor where the dipping of cells would be an utter failure with him. Third, compressed cell-cups will stand pretty rough usage without being injured, where the

least little mishap will ruin a whole row of dipped cell-cups. Fourth, compressed cell-cups may be worked over and over again—they are practically indestructible, either by the bees or the bee-keeper himself. Fifth, compressed cell-cups are marketable and mailable; they are also practicable to both maker and user. Being encased or surrounded with wood they are protected at all times. Sixth, compressed cell-cups are readily mended by simply smoothing them a bit with a forming-stick and a little spittle; both of which are always at hand. Seventh, the making of compressed cell-cups is comfortable work, while the dipping of cell-cups is exasperating—especially during a hot summer's day. Eighth, in the wholesale dipping or molding of cell-cups an endless list of paraphernalia (hot wax, fire, water, steady nerves, etc.) more or less intricate and ingenious, is necessary; but with compressed cell-cups only the one simple hand tool is required, which any child can work.

The "shells" are designed to fit the holes in the top-bars of the Swarthmore cages to render the cells easily removable; but with a drop of wax they may be stuck on to any thing anywhere.

Suppose one is starting a batch of cells. If one or two cells should fail they may be replaced with others that are on the way toward development, thus saving much cage space.

And, again, suppose the apiarist desires a hatching cell, he can at any time draw one from any cage, without taking the cage apart or even lifting out a frame—simply roll back the sheet of the hive containing the cageful, and—there you are. Draw one, close the hive, and all is well—no trouble—not even smoke being necessary.

[These tools will form cells very quickly; and it is surprising how perfect and smooth they can be made.—Ed.]

PRODUCING COMB AND EXTRACTED HONEY IN THE SAME HIVE AT THE SAME TIME.

The Use of Divisible Brood-chambers.

BY LOUIS SCHOLL.

Having described the hive I use, page 591, it will, perhaps, be of interest to some to know how colonies in such hives were managed for the surplus honey. As I have a demand for it, my object is to produce both comb and extracted honey, and, instead of manipulating a certain number of colonies to produce the required amount of comb honey, and using other colonies solely for extracted honey, as is generally done, I have found that I could produce both at the same time with all the colonies, and with greater satisfaction.

Now, before giving my mode of operation for the season I wish to state, as there is a difference between our seasons here in the South, that these rules will not apply to the North, and will, therefore, have to be changed accordingly. Then, too, as we have such changeable weather here in Texas our honey resources are not alike each season, so each

must know his locality, study his honey resources, and must also know when to expect his honey-flows. He must also have every thing in readiness beforehand, by having his supers and every thing else in shape when a flow happens.

The fall before, all colonies are put in order for winter in three-hive sections, with plenty of honey. Each colony must have a good queen to keep up a strong colony of bees during the season; and, indeed, much depends on what kind of queens we have. We can not afford to keep any but good ones.

No further attention is given till about February, or when we expect continuously warm weather. Then we overhaul the bees to see that all are supplied with sufficient stores to last till the main honey-flow; for as pollen and honey have been coming in, brood-rearing is going on rapidly now, and during this time more honey will be consumed than at any other time of the year. To examine the colonies, simply pry apart the two lower cases. By tilting the upper one back we can easily ascertain the strength and condition of the colony, which we note. If some are found short of stores, these are provided either with combs of honey, or fed diluted honey or sugar syrup. All queenless colonies are supplied with good queens as soon as possible, and, if none are on hand, they are purchased of some reliable queen-breeder.

After all are in proper order they are let alone for a few weeks; and when the weather is warm and favorable, and honey coming in (we generally have enough honey coming in all along to keep up brood rearing, and sometimes we get some surplus), we again go through all; and, taking off the top (or third) story, we go through the brood-chambers, putting all combs with honey in the top, or the third super, and all the empty combs in the two chambers of the brood-nest, arranging the combs so as to spread the brood, and to push brood-rearing, as we want a great force of bees just at the beginning of the main flow, which with us is about the first of May. The other super, containing the combs of honey, is now set on top. This operation will generally be done at about swarming-time in the month of March, sometimes sooner or later, depending on the earliness or lateness of the season; and at this examination, if some colonies are overpopulous, combs of hatching brood are taken from them and used either to strengthen weaker colonies or for making nuclei. If some of the colonies have already started queen-cells they are destroyed or otherwise as the case may be. I have already said something about swarming; but with such a large brood-chamber, and providing plenty of room for the queen, there will be very little if any swarming; but I gave the foregoing for the "exceptions." Now comes the time of our main flow, which is just beginning; and if every thing has been favorable we shall have strong colonies with a large force of bees; and, besides having had plenty of honey for breeding purposes, they will have some surplus stored in the shallow extracting-super above.

We must now hurry and get on our comb-honey supers; so, taking our section-supers, which we had all nice and ready, with foundation in the sections, and an extra Danzenbaker reversible bottom-board, we proceed as follows:

First set one of the section-supers down, and on this set the upper (or third) case of the hive, without removing the cover. Then move the two lower chambers, bottom-board and all, to one side of the stand, and in its place put the extra Danzenbaker bottom—the deep entrance side up—putting on this the upper one of the two brood-chamber cases, and on this the lower one, thus cutting the brood-nest in two, thereby putting the honey in the upper frames in the center of the brood-nest for the bees to remove, while the upper frames now contain brood.

The two other supers, the section super with the extracted-honey super above it, are now set on top of the brood-chamber. Here are two features with which I am greatly pleased; namely, in having bees first used to storing in shallow extracting-supers; and when the section-super is put in between this and the brood-nest, they go right on to work in the sections without losing any time; and I have also found that nicer and fuller boxes of honey can be produced between such a super than where the cover is directly over the sections. Then by using shallow extracting-supers during the time before the main flow, as we have honey coming in nearly all the time, and sometimes a little more than is necessary for brood-rearing, it is stored in these supers, leaving plenty of room for the queen, while otherwise it would have to go to waste or the bees would store it in the brood chamber, thereby crowding out the queen. With a set of these frames above, too, if a colony has more honey in the brood-chamber than is needed, the bees, when providing room, will carry the honey up into these frames, also bringing the brood up closer to the top of the frames.

Of course, something has already been said about this plan, now known as the "Barber" plan, which was also my own idea. Another feature in forcing the bees and the honey into the sections is by reversing the two brood-cases, cutting the brood-nest in the middle, and putting the honey of the upper frames below, and a large space of brood right under the sections. If the honey-flow continues long enough, this reversing can be done at certain times during the main flow, and all of the honey forced into the sections. This I do not practice to any great extent, as there is sometimes danger of not having sufficient honey below for the winter, as we are not always sure of a later or fall flow.

Now our main flow is over, and we will now proceed to take off the surplus. The shallow-frame super I leave on over the sections during the time, as the bees finish the sections up nicer. Some advise removing the frame-super when putting on sections; but I prefer to let them remain, for the reason given above, and then the extracted honey is much nicer, being well ripened. All of the supers are then re-

moved, the section supers piled up until we have time to tend to them, while the honey of the shallow frames is extracted and the supers put back on the hive.

I have *sometimes* put these in between the two brood-cases, and, when the bees clean up these combs, they provide lots of breeding-room for the queen.

Right here, if I am not mistaken, is something that bee-keepers in northern localities would not think of practicing, hence their talk about useless consumers. But as our season is of such a nature that we have another flow later, after the first main flow, with several weeks of no honey, or very little, between, bees must breed up so as to have sufficient numbers for that last flow.

Having said this much, and hoping that my management is clear, I think each could modify it so as to be used in any locality.

Hunter, Texas.

[The honey season is holding out in and near Medina in a most remarkable manner. The honey comes from red and sweet clover.—Ed.]

CONVENTION NOTICE.

All arrangements for the next convention of the National Bee-keepers' Association have been completed so far as possible, and the convention will be held in the audience room of the Buffalo Society of Natural Sciences, Sept. 10th, 11th, and 12th; commencing on the evening of the 10th. The place of meeting is in the Buffalo Library building, corner of Washington and Clinton Streets, near the business center of the city. The president of the Natural Sciences Society, Mr. Smith, has also kindly offered our Association the use of their library and other committee rooms during the time of our convention, and to do all in the power of the society to help make our meeting a success.

Railroad rates will vary in the different passenger association territory, from one cent per mile each way to one and one-third fare for the round trip. Each person can readily learn the rate on inquiry at his railroad station.

The Buffalo bee-keepers will try to provide entertainment at reasonable rates for all attending the convention, who will notify Mr. Sydney S. Sleeper, of Holland, N. Y., by Sept. 2d, of their wish for entertainment.

In a letter just received from Mr. Sleeper he says, "We want all to come who can, for we wish to make the Buffalo meeting the most pleasant and instructive one that was ever held in America. We will have the co-operation of all the sciences as well as the school board," and names some professional men who are interested in our specialty and will be at the convention to help.

In a long letter from Mr. Hershiser, just received, he closes by saying, "Call upon me for whatever further assistance I am able to render;" and Mr. Penton, an ex-president of the Erie County Bee-keepers' Society, and others, have offered to do all they can to provide for the comfort of the delegates.

As stated in my previous convention notice in GLEANINGS, there will be no fixed program and no papers, and the time will be occupied in answering and discussing questions, except that on Thursday evening there will be a joint session of our association with the American Pomological Society, to discuss "the mutual relations of bee-keeping and fruit-growing;" and Prof. Beach, of the N. Y. Agricultural Experiment Station, and Prof. Fletcher, of the Central Experimental Farm of the Dominion of Canada, will help talk for the bees at that session, and it is hoped that much good will result to fruit-growers and bee-keepers from this joint session.

If any bee-keeper who can not be at the convention has any questions, knotty or otherwise, he would like to have answered at the convention, will send them to me I will see that they are presented.

A. B. MASON, Sec., Sta. B, Toledo, O.

THE ROOT GERMAN STEAM WAX-PRESS.

BY E. R. ROOT.

We have been making and selling for two months back a steam wax-press that embodies all the best features of the most improved German machines that have given such excellent results for the last ten or twelve years. The illustration herewith shows the complete machine as we now make it. It is all metal, galvanized, and is strongly built. The cover is of cast iron, ribbed and braced, and is held

particle of wax is pressed out. The basket is dumped, and the operation is repeated as before.

It is advisable to use a sheet of burlap or cheese-cloth to line the inside of the basket during the process of rendering, otherwise the cocoons will be forced between the meshes of the coarse wire cloth. A finer mesh of cloth would not stand the enormous pressure,

securely in position by four thumb-screw lugs. Through this head passes a powerful screw; and on the end of this screw a plunger plate is pivoted. The basket is made of strong heavy galvanized wire cloth, and is securely hooped and riveted. To stand the enormous pressure of this screw a cast-iron spider is riveted inside of the can, about 8 inches from the bottom.

To use, the can is placed on a common stove, and is filled with about 3 inches of water. The wire-cloth basket is filled with old comb, slumgum, or any wax refuse. The water is brought to a boil, when the basket with its contents is set down into the can. The handle is unscrewed until the pressure-plate rests against the cover plate. This is then set down on top of the can, and the water is allowed to boil. The steam generated passes all through the mass, and when the wax in the basket settles down, more refuse is put in. After all the free wax is steamed out, the screw and plunger-plate are turned down. One person grasps the two handles of the can, and another one turns the screw down until a tight squeeze is exerted. It is then left for a little while when another squeeze is applied, and so alternately for a period of 15 or 20 minutes. The screw is then raised up, and the slumgum is poked over with a stick, and again pressure is applied. By this time every

and hence burlap or cheese-cloth in connection with a coarse wire cloth should be used.

This machine is large enough to hold about a bushel and a quarter of comb at a time; and in connection with a solar wax-extractor it will handle the product of from 500 to 1000 colonies.

MARKETING HONEY.

Fumigating with Bisulphide of Carbon.

BY EARL C. WALKER.

The marketing of honey is one of the most important questions which confront the honey-producer. Many bee-keepers are successful, so far as producing honey is concerned, but comparatively few are eminently successful in marketing it. One may toil throughout the season and obtain a big crop, and a really fancy article of honey, but, through slipshod methods in putting it up, will receive pay for a second or a third class article. Too many think that, as soon as their crop is taken off from the hives, their season is over and their work ended. They are utterly indifferent as to how it is put up or how it should be marketed so as to bring the highest price.

When the producing season is over, the bee-keeper's labor has really just begun. The

bees have produced the honey, and *he* should see that it brings all that it is worth, by properly marketing it. It requires experience and skill to produce a gilt-edged article of honey, and it requires business tact to market it, and, of course, experience too. I wonder why some easy-going, slipshod bee-keeper doesn't breed a bee that will market his honey for him.

The most important item in marketing any thing is to have a good article, and have it put up in as attractive a shape as possible. My experience has been that a fancy grade of honey—yes, and an ordinary grade too—will sell itself. When a customer, either retail or wholesale, learns that he can depend on your honey as always being first-class, you can rest assured that he will continue his patronage, and he will pay you the right price too. If he tries to cut the price, let him know that you are independent, and that your honey will sell anywhere, and that others will be glad to get it. When he learns that you give him his money's worth, and that he gets just what he pays for, he will gladly buy of you.

Let us suppose we have secured a crop of comb honey. I will tell how I prepare it for market.

As soon as the honey is taken from the hive I fumigate it. I use carbon bisulphide, as sulphur is apt to discolor the comb, and, if too strong, leaves a disagreeable odor. For a fumigating-box I use a large ice-box or refrigerator, which is lined with zinc and is practically air-tight, except that it has ventilating-holes at top and bottom. When supers are well filled I place them bodily, as they come from the hive, into the bottom part of the fumigating-box, in such a manner as to allow the free circulation of the fumes about and through them. If the supers are not entirely filled, I of course place only the finished sections in the fumigating-box. I then place an open vessel, filled with bisulphide of carbon, in the top part of the refrigerator, and close the door. The fumes settle and circulate around the honey. It takes about an hour for the fumes to fill entirely the large fumigating-box. As soon as they have, I close the ventilating-holes, thus stopping all drafts, and let the whole thing alone till morning, or for a period of from eight to ten hours. After this time every vestige of a moth worm or egg will have been destroyed. I then remove the vessel of carbon bisulphide and open the ventilators, and, as soon as all fumes have passed off, the honey is ready to be removed.

The honey is then stored in a warm room on shelves, and allowed to sweat. The room should have screen doors and windows, which should be opened to allow a free circulation of air.

Next the sections are scraped, all propolis and stains being removed. As the sections are cleaned the honey is graded. I use three grades. Then it is put into 24-lb. single-tier non-drip shipping-cases with glass on one side. It doesn't pay to "face" the crates. Put sections next to the glass that are a fair sample of the rest of the honey in the whole crate. I have bought honey, as well as produced it.

Nothing is more aggravating than to buy honey at a fancy price, and find "gilt-edge" sections next to the glass, while the remainder of the case is second or third grade. It pays to be honest. The man who practices fraud and deception, in the long run cheats himself. When a small boy I raised a crop of pickle cucumbers. When they were ready for market I put them in bushel baskets, and I *faced* them too. I put all the little ones in the bottom, and the great big "stunners" on top. I drove to market, and was already counting the money I should receive for them. But the first grocer I showed my cucumbers to laughed, and said he could not use such large cucumbers. "No one wants large cucumbers for pickling—they want the *little ones*." I saw my mistake, and confessed that the baskets were "faced." We emptied them, and he bought all the small ones, and I took the big ones back home. There were not very many big ones.

This experience made a lasting impression. When I buy honey I don't want it faced. When I sell, I don't face it.

After the honey is crated I put a label on each case, stating grade, net weight, gross weight, and number of sections in case.

Being near my market I take a sample section of each grade and call on my customers or any dealers to whom I wish to sell. I show my goods and ask them if they wish to purchase. If they are not handling honey, and are in doubt as to whether they want to do so, I propose that they let me bring them a case on trial, and, in nine times out of ten, when I see them again they want more. I then sell for cash. I always sell my own crop, and then buy to supply the trade.

Last season I called on one of my old customers. He is a close man, and always wants to drive a close bargain. I asked him 13 cts. for my honey. He said the honey was all right, but the price was too high. I told him that the honey crop all over the country was short, and that my price was really cheap. He said, "Why, I can get all the honey I want at 10 cts., and it is fancy too."

I told him I should like to buy it at that, and that, if he could do so, he ought to get all he could at that price. I did not make any further effort to sell to him. In about six weeks he sent word that he would like to see me. I called at his store.

"Mr. Walker," he said, "what is honey worth?"

"A fancy article is worth 15 cts." was my answer.

"I will take 2000 lbs. at that price."

"I don't know where you will get it. I have sold all of mine, and should like to buy some myself," was my response.

Oh! but it did me good to tell him this. I asked him why he did not buy the 10-cent honey he had spoken of. He said, "Well, I didn't know the man who offered it to me; and as the price was so low I feared it would not be good."

Now he pays me my price, and is glad to buy of me.

New Albany, Ind.

A SCENT-PRODUCING ORGAN IN THE ABDOMEN OF THE BEE.

The Scent Produced Forms a Means of Communication between the Members of a Swarm or Colony.

BY F. W. L. SLADEN.

The following is a summary of an article on the above subject, contributed to the *British Bee Journal*:

Last July, through the apparent absence of definite evidence that bees are able to hear ordinary sounds, I was led to investigate the phenomenon known as the "joyful hum" among bees. In "The Bee-keeper's Guide-book," 16th edition, page 26, we read, "The joyful hum of the bees as they enter the hive will entice others to follow." I asked myself the question, "Is it entirely the *hum* that attracts the bees, or is there any thing else that exerts the influence?" It was in endeavoring to answer this question that I was led to make certain observations, and to form a theory which I have been unable to find stated in any work on bees, and of which the following is a short account:

If a comb be lifted out of a hive, and the bees on it be shaken off on to the alighting-board, many of the bees will not at once rush into the entrance, but they will pause at the portal, and commence humming, evidently for the purpose of attracting their mates. When humming in this way the bee adopts a certain peculiar attitude. She stands with her head turned toward the entrance. She elevates her abdomen, and uncovers a narrow white membrane situated at the base of the 6th dorsal segment, which, when at rest, is entirely hidden, and covered by the 5th segment. As this membrane is near the extremity of the abdomen it seems but reasonable to suppose that the abdomen is especially elevated to give prominence to it. The "joyful hum," whether it is made, first, under the above circumstances; or, second, when a swarm is being hived; or, third, when a queen is accompanied by a few workers in a cage; or, fourth, when a young or tired bee discovers, after more or less difficulty, the entrance of her hive, is always accompanied with the protrusion of the above-mentioned membrane; and it then has the effect of attracting other bees; and when a number of bees hum in this way, as when a swarm is being hived, their attractive effect on other bees is very marked. On the other hand, when fanning is done merely for the purpose of ventilation, as at the mouth of the hive in very hot weather, the above-mentioned membrane is not, or, at most, is scarcely exposed, and no attractive effect seems to be intended or is observable.

After making the above observation it seemed to me clear that the membrane in question had a great deal to do with the attractive effect produced during the "joyful hum;" and, calling to mind the extremely meager evidence we have that supports the theory that the sense of hearing, as we understand it, is developed in either ants or bees, and, on the other hand, the strong evidence we have in

favor of the high development of the sense of smell in these insects (both points being confirmed, in the case of bumble-bees, by recent experiments of mine), I was led to form the theory that the membrane above mentioned (A, below) contains scent-glands, and that these produce a certain scent which, when the membrane is exposed, forms an important means of communication, by attraction, between the individuals of a colony or swarm. The fanning of the wings during humming would help to distribute this scent.

To endeavor to prove my theory, when hiving a swarm last July I put my nose close down over the mass of humming bees that were spread out on the hiving-board, to try to detect the suspected scent. I certainly smelled a curious, somewhat pungent odor, resem-

Tip of distended abdomen of worker honey-bee seen from above, slightly enlarged.

bling slightly the scent of formic acid that is produced when a nest of *Formica rufa* (the common European wood ant) is disturbed; and, though I was not able at the time to prove it, I strongly suspected that it was the scent produced by the above organ. A sweet "seaweed" scent, which I recognized to be of the same nature, was produced by a few bees accompanying a caged queen a few days later.

I then endeavored to cut off communication in a line of humming bees by dividing it into two parts by the interposition of a thin canvas screen charged with various kinds of scent, which I hoped would nullify the effect of the bees' scent, while allowing a free passage through it for the sounds they produced. If I could do this I thought it would, to a great extent, prove that "humming" bees communicate by the scent they produce, and not by their sound. This experiment had no definite result.

On March 13th of the present year, while dissecting the abdomen of a freshly killed bee in order to examine further the above membrane, I suddenly perceived an odor which I at once recognized as the pungent seaweedy odor that I smelled last summer in hiving the swarm; and in the queen experiment mentioned above I immediately separated the membrane with as little of the connecting tissue as possible, and placed it on a piece of card. I then placed the whole of the rest of the abdomen (except the sting and its appendages, which had been previously removed) on another card. The card with the membrane on it gave out the odor strongly for some minutes; but the card bearing the rest of the abdomen had no perceptible smell. I repeated the experiment with another abdomen, and it produced the same result. I consider that this striking experiment seems to prove the truth of my theory.

The membrane in question appears to have been first noticed as long ago as the year 1883, when Nasonoff, a naturalist of Moscow, described the organ, and an account of his description was sent by Zoubareff to the Swiss *Bulletin d'Apiculture* (translated by Mr. F. Benton, in the *British Bee Journal* for Dec. 15, 1883).

The organ is described as a canal. "At the bottom of this canal a large number of small glands open, each one of which has an oval cell with a well-defined globule. From each cell a duct starts out and extends to the bottom of the canal." Nasonoff further says that the walls of the ducts are of a chitinous texture. He assigns a secretory function to the glands, suggesting that they produce the perspiration. Zoubareff, while not absolutely rejecting Nasonoff's theory, connects the existence of the glands with the little drops of liquid that bees are said to let fall when they are on the wing, which, he says, represent the excess of moisture which nectar freshly gathered from flowers contains over ripened honey, and which, he thinks, is collected and then thrown off by these glands.

These ideas seem to be very crude, and would hardly be believed at the present time, but they are copied into the present edition of Cowan's "Honey-bee," which seems to indicate that the organ in question has not been further investigated since 1883.

In the accompanying illustration, the view represents the extremity of a distended abdomen of a worker honey-bee. *A* is Nasonoff's organ; *B*, a long hollowed-out depression at the outer margin of it.

I hope to send you a description of the structure of the membrane, with some further notes, in a later paper.

The following is a list of the chief works I have consulted:

V. Buttel-Reepen.—"Sind die Bienen Reflexmaschinen?" Leipzig, 1900.

Cowan.—"The Honey-bee." London, 1890.

Cowan.—"The British Bee-keeper's Guide-book," 16th edition. London, 1900.

Cheshire.—"Bees and Bee-keeping." London, 1886.

Lubbock.—"Ants, Bees, and Wasps," 5th edition. London, 1881.

Packard.—"Text-book of Entomology." New York, 1900.

Zoubareff.—"Concerning an Organ of the Bee not yet Described." *British Bee Journal*, 1883.

Ripple Court, Dover, England.

[I have repeatedly noticed that bees, when crawling toward the entrance *en masse*, would elevate the abdomen, as explained, but always supposed this was an act signifying extreme joy. I shall be anxious to watch the bees more closely this summer to discover whether there is something more than mere "noise" that attracts the bees and directs them to a common direction.—ED.]

RAMBLE 188.

Struck it Rich Again.

BY RAMBLER.

I should be getting out of my element if I did not have to fold my cot and move; so, here I am on the wing again. "Where now?" do you ask? Oh! I am only going back to Los Angeles, that beautiful city at the southern end of the State.

"But, Mr. Rambler, you have not told us how much of a honey crop you secured."

Well, that is an inquisitive question; but if you must know, I would say that I secured a

fair crop and a sack of coin. You'd 'a' smiled to see me enter the "City of the Angels." Land sakes! how "we apples" swimmid! new plug hat, new umbrella, new kid gloves, a monacule pants creased "fore and aft." Why! when I struck the town of Reedley a few months ago I told artist Murray how I felt, and you all know how forlornish he pictured me; but I forgive him. Then Arthur C. Miller had to chip in and tell me I "looked like 30 cents;" said if I'd come to Rhode Isl- and he would put me through a clam-

bake with very good results. I can't tell what he was driving at, but I utterly ignored him. Why! I'd like to dump all the Millers I know into one of our hot sulphur springs and boil some of the gall out of them; but that is enough time wasted on the Millers, so just look at me now. Did the bee-men all

around Los Angeles recognize me? Well, I guess so—especially the sack. Poor fellows! how hungry they looked! worse than 30 cents—no honey season, no sack, no coin. I was sorry for them.

Then what changes in a few months! There was friend Jim Crow. When I went north he was all Belgian hares—couldn't talk any thing but does and pedigrees; had 100, great and

“Then there was Brodbeck, just a trifle in the oil business.”

small, and going right along to a thousand; but now it was oil stocks—couldn't say here; referred me to his wife—only 30 hares, and gradually declining.

Then there was Bro. Brodbeck, just a trifle in the oil business when I went away—worse now; all oil; reminded me of an oil-derrick—head turned; sacks of coin galore. Behold the effects of the oil craze. But, after all, Bro. Brodbeck is wise to hold to his bees also—good grit there.

After these pleasant greetings I made haste to visit my apiary in the secluded defiles of Durfee Canyon, and 69 colonies answered the roll-call. There had been some rain before my arrival, but I gave them another liberal sprinkling with the contents of my sack of coin; and, how they brightened up! I don't know why it is, but a little coin here and there in an apiary is a wonderful help. Quite a few bee-keepers utterly ignore this feature

of bee-keeping, but it pays. And, O ye frozen-toed bee-men of the East, all of this brightening-up work was done in December and January, when you were clinging to the stove. You can scarcely imagine how lovely it is to hear the hum of the honey-bee all day long in mid-winter.

Just as I had got my work well done, and was setting out to “ramble” among my old friends in the San Bernardino country, a far cry came from the Simi Valley. Our friend Richardson, afflicted with poor health, needed some one to help regulate things in his apiaries. I heeded the call, and promptly made the 60 miles on my wheel. I found that the three dry seasons had diminished his 1200 colonies about a half, and there were over 12,000 combs to look after in several apiaries. Some of these had been piled up in blocks of bee-hives for two years, and several thousand in a sealed honey-house. Here was surely a study in the preservation of empty combs. We should think that those 250 hives full of empty combs piled five high in a solid block under a live-oak tree, and so long in a semi-tropical climate, would not have much more than webs and powdered refuse in them. In the first place, they were put in the hives just as an experienced bee-man would put them—spaced so that surfaces would not touch. As

Song and dance by Mendleson and others. “Lovely rain; glorious rain.”

a consequence, fully half of the combs were fit to use in the hives again. Now and then a column of hives would have every comb destroyed; others, webbed only in the center. Often a new bright comb would be found untouched, while those on each side of it were destroyed. I found the same conditions in the house. The photo gives a glimpse into the interior, and of the ragged combs. These combs had been sulphured many times, but they were

in worse condition than those piled under the trees. I had a helper a portion of the time; but for all that it was a great scrape — over 5000 combs to be cut out, and the frames cleaned. Well, we completed the job in fine shape, and there was a great pile of sacks of old comb, etc., to be rendered into wax.

You will notice that my helper is cutting out comb with a long knife; another is leaning against a hive. These are uncapping-knives, very long, thick in the center, straight shank, and heavy. A down stroke is intended with these tools.

An excellent machine for rendering this wax would have been the Ferris steam wax-extractor; but other plans and other parties were called into the work later. In Ventura Co. are some very expert men with the wax proposition. Three dry seasons, much loss of bees, much wax to render, has developed a

wide open), said my friend, "I believe I'd like to take a nip; how is it with you, Rambler?"

"No nip for me, my friend. I never nip."

And I walked right along.

"Well—w-e-l-l," said he, hesitating a little; "I guess I won't nip, after all."

After a little silence, said he, "Well, Rambler, that is what we may call the power of example. If you had entered the saloon with me we might have had several nips, hey? but I guess my appetite for breakfast is about as good without it;" and I noticed at table that he ate quite heartily.

When on the street again, whom should we meet but Mr. Mendleson? He came spattering along on a cart. Mud—just happy in mud; rubber boots, just the thing for rainy weather; lovely rain; going to have some more too.

Our accumulated force started out to hunt up some more happy beemen. We found Mr. Wilkin under his own vine and pepper-tree. He greeted us with his accustomed broad and genial smile.

"Why, Rambler, you must have rained down. What a glorious rain!"

We hitched another man to our crowd here and climbed the hill to Mr. Mercer's, and there, in spite of the great rain, we found him humped up in a rocking chair near a blazing hearth, all broken up with the grip.

I always feel it my duty to cheer up the afflicted, and I told Mr. Mercer that I had a plan in mind that I thought would cure his grip. That brightened him up quite a little.

He had two carloads of bees and fixtures away up in Central California. It was high time they were moved south, but this grip had him fast.

"Well," Mr. Mercer, "my remedy is for you to go to Ana Capa Island. I am getting up a party to—"

"You get right out of this, Rambler; don't you mention Ana Capa to me;" and he tore around the room, shaking his fist at me. His wife, dear good woman, pacified him. "Yes, Rambler, you got me over there once, but you can't do it again. The grip—jinco—that's nothing like being seasick. Why, I can feel the way that old crazy schooner bobbed all over the ocean now. Don't you mention Ana Capa to me again."

I think the recalling of the trip to the island in 1894 had a very beneficial effect upon our friend. It roused him up, and I

RAVAGES OF THE BEE-MOTH.

new industry in the wax business. These experts pick up old black slumgum, and, in fact, any old thing that has ever been in a bee-hive, and they wring wax out of it. They claim to get 95 per cent.

I was denied the privilege of getting away from Bro. Richardson's on my wheel. Our great scrape wound up with a great rain; and the harder and longer it rained, the better we bee-men felt. Streams were swollen, roads washed out, trains delayed; but what of that? Plenty of rain means plenty of honey.

After several delays, and nearly a day for it, I reached Ventura, 40 miles. At one of the delay points I met a bee-man from Sau Bernardino Co., and he was happy too—rain, I suppose. We both stopped at the Ana Capa Hotel. We were out at about the same time in the morning, and took a stroll before breakfast. As we passed a saloon (of course it was

understand he started out in a few days and safely moved his bees south.

Our force marched back down town, and further calls upon bee-men were prevented by the arrival of the train; and I left, feeling as though I had some very good friends in Ventura, and no nips taken either.

Along with the pleasure of meeting friends in Los Angeles and Ventura there were also sad features. One of these was in finding a vacancy in the ranks of the bee-keepers by the death of Mr. C. C. Aldrich. He was always in attendance at our conventions, and was a thoroughly posted bee-keeper, and his name has appeared many times in the bee-papers. He was much of a genius in the matter of hives and management. His prime days of bee-keeping were spent in Minnesota, where he manufactured bee-keepers' supplies, and published a little book upon bee management. He came to California about ten years ago to spend his declining years. His apiary was at Elsinore, Cal.; and when not attending his bees he was selling his honey in a little honey-store in Los Angeles. His sign read, "Honey from first hands." Mr. Aldrich was a little over 72 years of age.

FEEDING BACK.

"Good morning, Bro. Doolittle. Can you tell me what is meant by 'feeding back'? I see something about this matter in one of my bee-papers, but I do not think I fully understand it."

"In order that Bro. Brown may know just what was meant, I will say that feeding back is the feeding of extracted honey, taken during the honey-harvest, back to the same colony from which it was taken, after the harvest is past, for the purpose of getting said honey stored in sections, the colony at this time having been fixed for section honey."

"What is that for?"

"The object of such a procedure is to get an article of a less price converted into one which brings a greater price. By using the extractor during the honey-flow, nearly twice the honey is obtained that would have been secured had the colony been worked for comb honey; but this extracted honey does not bring more than about half the price it would if stored in sections. Thus you will see that, if a way could be devised whereby the double quantity of extracted honey could be gotten into the same amount of comb honey, a great gain could be made."

"Yes, I see; and that is something after the idea I got in reading what I did. Say—that would be just the thing for me, as I have a lot of extracted honey on hand; and if I could turn it into section honey it would be a big gain to me. Tell me more about it."

"You get excited over the matter, just as the rest of us have during the past, and I know of no better way to tell you what I wish than to give some of my experiments conducted during the past."

"That is right. That is just what I wish to know about."

"When comb foundation was proven to be a success I thought here was a chance to make a profitable business by extracting my honey during the flow from white clover and bass wood, and feed it back during the time of scarcity between basswood and buckwheat. Accordingly, after the harvest of white honey was over I prepared three colonies that were strong in numbers, to one of which was given 44 sections with baits in the center, the same as would have been put on at the commencement of the season had I been working for section honey. The second was given the same number of sections partly filled from colonies which had not fully completed what they had in their hives, while a third was given the same number of sections with only starters of foundation in them. I now fed these colonies 15 lbs. each, which they carried off during the first day, and kept on feeding as fast as they would take it afterward until I thought the sections ought to be filled."

"How did the matter come out?"

"Those having the partly filled sections took 42 lbs. of honey before the sections were ready for market, and the 44 sections weighed about 47 lbs. when completed; but as they weighed some 32 to 34 lbs. when placed on the hive for feeding, you will see that I had fed 42 lbs. of extracted honey to make a gain of only 15 lbs. in the sections."

"Whew! Not much profit there."

"No; and when it came to the one prepared as we do those worked for section honey at the commencement of the season, I had to feed 134 lbs. before they were completed, or 134 lbs. to secure about 46 lbs. in the sections."

"Worse and worse! But what became of the one having only starters?"

"This part was never completed; for after I had fed them some 50 lbs. they only just got to building comb nicely, and soon after this comb-building seemed to get to be an old story, so that, after awhile, they simply lived out of the feed-dish, and did nothing else."

"But do not others have better success?"

"Some claim that they do; but it was said that, if we thinned the honey, it would be more like the nectar which comes in from the fields, and thus we would secure good results. I tried this, and have made many experiments along this feeding-back line, many times and in many ways, but generally with no real success, unless it may be called a success to have such sections as are nearly completed, those lacking just a little of being full enough for market, finished up for market. In this case I think it pays, even if we have to feed three or four times the amount we get back of what we feed; for, did we not do this, these nearly filled sections would have to be carried over to the next season, and this makes considerable work."

"How do you account for having so much

more taken out of the feeder than what was finally stored in the completed sections?"

"In all of my feeding operations I have ascertained this fact: Bees, fed in excess of what they consume in feeding the brood, become idle, simply living out of the feeder, not getting an ounce from the fields, while those not fed will nearly or quite secure a living from the fields. If fed when honey is plentiful in the fields, they will store no faster out of the feeder than others not fed will from the fields; while those storing from the fields will work in the sections with double the energy which those do that are being fed."

"Then you think that what I read was more from theory than from practice?"

"From all my past experience I must so conclude. But at the same time I am hoping that some way may yet be devised so that it may be a profitable thing to feed the bees extracted honey in such a way that it may be profitably turned into nice section honey."

SOME USEFUL HINTS.

The Daisy foundation-fastener may be kept from slipping on the floor, when working with it, by driving two wire nails into the part that rests on the floor. Let the nails protrude about $\frac{3}{4}$ inch, and file sharp. Have one at or near each corner.

Sections fresh from the factory generally make up without breaking. Old and well-dried sections may be made to absorb enough moisture to make up without breakage by keeping them in a cellar for a number of days. Do not forget and leave them in the cellar long, or they will become moldy.

The weather has been very unfavorable for bees. It is reported to us that, during the first (rainy) week in June, queens ceased to lay, and that at the end of that week almost no unsealed brood could be found in many hives, although well supplied with old honey.

Try to have all old honey used up or worked over. It is not safe to depend on it for next winter's supply. I use a spiked roller to make holes through the cappings of old honey, then place combs so treated into empty hives located somewhat by themselves in the apiary. The honey is then removed by the bees in a short time, and the combs are ready to be used some way or other.

The honey-dearth in June and July caused many bees to suffer last season—so much so that much brood actually died of starvation. In some parts of New York the rumor was spread that the bees were affected with black brood. When the foul-brood inspector came he pronounced it a case of starvation. The disease (?) disappeared as soon as buckwheat yielded honey. The inspector visited the same yard this spring and found the bees all right.

Prof. A. J. Cook speaks at length in June 6th *Amer. Bee Journal* of the Dzierzon and the Dickel theories. Perhaps not many are better fitted to handle this subject and always apply the correct terms. I urge all who are interested to read the article carefully.

Naples, N. Y. F. GREINER.

THE EX-LIGHTNING OPERATOR.

I see by GLEANINGS that you mention my sickness, so I will report. There were two months when I did not work to speak of, but am now able to nail frames and do other light work part of each day. The doctor says I will never be able to do any more hard work, but that, with care, I may be able to do light work. So please put an "ex" before the "lightning operator" in the future.

HARRY S. HOWE.

Artemisa, Cuba, May 25.

[The moral seems to be that it doesn't pay to work so hard; i. e., it is better *never* to be a "lightning operator" than to be afterwards an ex-lightning operator.—ED.]

KEEPING OVER EXTRA QUEENS.

Is there any plan by which I can keep over extra queens from one season until the next spring—that is, keep two or more queens in the same hive by caging or otherwise?

DR. M. FIELDS.

King Creek, Ky., June 7.

[There is no plan that I know of which I would consider reliable. The only way is to keep queens over in nuclei, and winter the nuclei in a good cellar. That is what we did last season.—ED.]

HIVE-COVERS, BOTTOMS, ETC.

After reading the July 15th issue I indorse Somerford's idea as to the flat top being best hive-cover, and believe the tile bottom a good thing for permanent apiaries. Here I shall hereafter make bottoms of red cedar, as it is cheap, \$1 00 a hundred for No. 3, and never rots out like pine.

A good honey-flow has come to an end by dry weather. CHIP HENDERSON.

Murfreesboro, Tenn., July 5.

FEEDING BEET SUGAR.

Out of twelve good swarms I now have only four left. I think one thing that killed them was feeding them beet sugar last fall. The queen you sent me last year as a premium with GLEANINGS was one of your red-clover stock. Her bees were more than a third longer than the rest that I had, and she built up a good colony; but I gave them some beet sugar, and that used them up. A. J. TRUAX.

Leonidas, Mich., May 20.

[I don't think beet sugar killed them. See article by W. K. Morrison, next issue.—ED.]

A HANDY HIVE-TOOL.

I inclose an exact pattern of one of the most handy tools a man or woman ever handled when opening hives and manipulating brood-frames. With the beveled side toward

you, press the lifter down between the brood-frames and press the chisel end down. This pushes the hook point under the lower edge of the frame, and at the same time lifts the frame up, when you take hold of the frame with the left hand; then move the lifter to the opposite end to your right, and raise the frame, which will not slip off. You can carry the frame any place you desire, or you can turn the frame in any position, look for queen, eggs, or brood, without any fear of dropping the frame; and, besides, I will guarantee that no one will ever get rheumatism in his thumbs or fingers when using the lifter, no difference how many frames are lifted, as one often does when having to lift frames with thumb and fingers. Again, no difference how tight a frame is stuck down with propolis, the lifter will just raise it without molesting a bee, besides lifting the frames. If there are any clumps of

propolis on the frame, just turn the lifter end for end, bevel side up; press the end of the frame against something solid, holding the frame with the left hand, and with the right you can shave all propolis off. Catch the frame with the lifter, and replace it in the hive.
J. A. GOLDEN.

Reinersville, Ohio.

[In the design and style of a hive-tool, much depends on the kind of hive and kind of frame one is using, as well as his special method of working. If he has a great deal of propolis in his locality, rendering it necessary to scrape the top-bars as well as the rabbets and other inaccessible places in the hive, a tool like the one described by C. F. England would be better. See description just following.—ED.]

AN AUSTRALIAN HIVE TOOL.

Here is a sketch of a really good hive-tool I have made. Subscribers to GLEANINGS are welcome to copy it. It is made of file steel, 1 inch wide, $\frac{3}{16}$ thick, drawn out as in sketch. The broad end will open hives, clean bits of comb off the frames, clean bottom-boards, cut bits of comb off the inside of hive-bodies, and perhaps be handy to kill a cross bee now and then. The wide edge is made nearly sharp enough to cut. The sides of the tool for one inch from each end are left square, as they clean the side pieces of the bottom-boards and tin rabbets better. The small end is just right to clean the inside of the tin rabbets, or to use for a screwdriver, etc., and the hook above is just perfect to lift the end of a division-board or frame. It is cut just a little under to form a slight hook, as it is then less liable to slip. The small end is also used to

separate Hoffman frames, by pushing in 2 inches, and giving a twist. You will see the steel is left $\frac{3}{16}$ thick as far as the hook, and is

ENGLAND'S HIVE TOOL.

MANNER OF USE.

then gradually tapered. Perhaps $\frac{1}{8}$ -in. steel would be heavy enough.

CHARLES F. ENGLAND.

Foxton, Australia.

[This tool, in its general design, is one of the very best I have yet seen. Any hive-tool, to be really serviceable, should be of such construction as to be a pry, screwdriver, hook, and scraper, all combined. Mr. England has come very near giving us that kind of tool—perhaps nearer than any one else. If we could be satisfied that this implement would equal the best yet devised we would have them made by the quantity, and all of them drop-forgings. One of malleable iron might do for a cheap article; but something really serviceable should be tool steel.—ED.]

HARRISON'S SEPARATORS FOR PLAIN AND SLOTTED SECTIONS.

I send you by this mail a sample of the separators I have been using for the past three years in the production of comb honey—separators which I find to be quite an advantage in several ways. I think I get more honey per colony; whiter; sections better and more uniformly filled; while any thing that can be said of the fence will apply to No. 1, which I use with plain sections. No. 2 I use with common beeyaw sections, open on three sides. As I do not tier up, I have closed tops. No. 3 simply gives a beeway in connection with No. 1, at end or side of super to suit the user, as per style and size of super, one at the

side, or end, using a plain follower at the spring side. I use the same follower with No. 1, which I use with plain sections. You will see that the openings in the separators are at a point where the sections meet, giving free passage each and every way through the super, also giving the cappers a chance to close up their bees in fine and uniform style, and giving them a chance to recede and get out of the

No. 1.—Plain sections.
No. 2.—Grooved sections, top closed, 3 sides open.
No. 3.—Follower.
Arrows show beeways.

way while changing sections. I do the work of taking out full and replacing empty sections at same time, taking out none but well-filled ones. I work only for comb honey.

Last season was an off one, yet I averaged over 65 well-filled sections per colony, most of which would class as "fancy white." I call my separator the "Harrison" for want of a better name. GEO. W. HARRISON.

Susanville, Cal., Mar. 3.

[The peculiarity of your mode of using sections is that they can not be tiered up—that is, I judge your honey-flow must be of such a nature that you require only one tier of sections at a time; but in most places in California the practice is to use two tiers of sections—sometimes three and four, and it is certainly a great advantage to do so, or at least I so considered it in the localities I visited. However, you can get very nice honey, beautifully well filled, on the plan you describe. With the exception that the openings through the top are closed, your method is the same as that which has been used in England, for a good many years in connection with slotted separators. It is also practically the same, with the exception of the open top, as that used by L. A. Aspinwall, and by Louis Scholl and H. H. Hyde, mentioned in this issue. All things considered, I think you will find it an advantage to practice tiering up.—ED.]

WHY THE QUEEN WOULD NOT STAY IN THE HIVE.

June 27th I introduced a clipped queen in a hive of bees. On the 28th, about 4 o'clock, she came out of the hive with quite a number of bees gathered around her on the grass. I put her back into the hive. The next day, at about the same hour, she came out again with bees around her as before. I put her back again. The next day, 30th, she did the same as before, and so on for four or five days. July 4th she came out twice. I caged her and introduced another queen. The bees seemed to be very uneasy until I introduced the second queen, but are all right now. Before I introduced the second queen I opened the hive, taking out the frames, some of which were two-thirds filled with comb with considerable honey, but could not find an egg. What do you think was the trouble? L. C. UPP.

Mt. Pulaski, Ill., July 6.

[Friend U., you do not tell us where you got the queen that behaved so queerly. Unless you know she had been laying in some other hive I should say she had never been fertilized. Then the question arises, "Who was so foolish as to clip a queen without knowing that she was a laying queen?" Unless you tell us what you know about her before this queer behavior, we should hardly want to conjecture a reason. I *have*, however, known laying queens, when introduced into a new hive, go out in the manner you mention, as if they were displeased about something; but I never knew one to hold out so long in the way you describe. I should say she was not worth bothering with any way, and you did the proper thing in giving the bees another queen.—A. I. R.]

HIVING SWARMS IN ROOMY HIVES.

Say to Chris. Kinsel, p. 556, if he will use two hives instead of one in hiving his large swarms he won't be troubled by their leaving the hive. The upper hive should contain the frames, and the lower hive should be empty. Shade the hive well, and the third day take away the bottom hive and lower the top hive on to the bottom-board. WM. CRAIG.

Luce, Mich., July 8.

[Very likely, friend C., more room inside of the hive, especially during exceedingly warm weather, would have a tendency to prevent the bees from leaving. Of course the hive should be in the shade if the sun is shining very warmly.—A. I. R.]

B. M. H., N. C.—If your bees have plenty of honey in the hive, don't bother about feeding them now. In fact, feeding should not be resorted to at all unless there is a liability of the bees becoming short during the coming winter. In your locality the bees should have, along about November, at least 25 lbs. of sealed stores, or what would be the equivalent of six frames, Langstroth size, or honey partly capped over.

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Atkin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chapinville, N. Y.; J. M. Hambaugh, Esccondido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

OUR subscription-list is increasing more rapidly than we have ever known it to before. For this we are grateful.

WE are compelled to give eight extra pages again, as we have so much good matter on hand that has been awaiting insertion.

I SUCCEEDED in catching Rambler on a genuine ramble. He was on the bicycle; and, although he has passed his threescore years, he has acquired the regular bicycle hump. I will show you the picture later.

I HAVE been told that the very excellent anti-adulteration law that was recently enacted in California is now being made a dead letter. The same informant says that a large corporation owns the glucose interests in that State, and is seeing that its interests are not hampered by this recent piece of legislation. I hope this is a mistake.

UNTIL one makes an extended tour of the South and West he can form no adequate comprehension of the immensity of the bee-keeping industry in those sections, nor of the big scale with which the Westerner, including bee-keepers, does things. I kept my kodaks snapping right and left; and if the negatives are good I'll give you more peeps at some of the things I saw.

THE black locusts, in California, in some localities, seem to kill the bees when these trees are in bloom; at least in the vicinity of Hanford I was told there would be hundreds and thousands of dead bees found under them. But in other localities, as, for example, in Colorado, the same trees were considered one of the important sources of honey; and, what was peculiar, they had no bad effect on the bees that gathered the nectar.

SOME little time ago I promised to tell about the bee-keepers' paradises in Texas. I have this on the docket, and it will appear as I take up the line of my travels. But since running across that paradise I have run into two or three others. There is one west of the Rockies, in Colorado, that is not yet over-

stocked with bees or bee-keepers; another one in Central Idaho—in fact, I do not know but the whole State. These will be described in turn. The fact is, millions of capital are being invested in irrigation; irrigation means alfalfa; alfalfa means a paradise for bees; but I found all along my trip that alfalfa-growing preceded bee-keeping by two or three years, for it seems to take about that length of time before bee-keepers find these gold-mines that have been hitherto unoccupied.

MR. H. W. COLLINGTON, editor of the *Rural New-Yorker*, will be one of the speakers to represent bee-keepers at the joint session of the bee and fruit men, at Buffalo. This session will be made up of the members of the American Pomological Society and of the members of the National Bee-keepers' Association. The *Rural New-Yorker*, according to A. I. Root, is one of the best agricultural papers published. It is practical and up-to-date, and Mr. Collington, its editor, a pleasing speaker, has been an open friend of the bee-keeper. He manifested much interest, as it will be remembered, in the Utter v. Utter case, urging that it be carried up to the higher court for appeal, which was done.

A LIST OF THE GREAT HONEY-PLANTS WITH LONG COROLLA-TUBES.

IN addition to the great honey-plants, red clover, buffalo clover, and horsemint, of Texas, that have long corolla-tubes, I can now add to the list the mountain sages of California, especially the white sage. This last has quite deep corolla-tubes; and I was told, while on the coast, that unless these corolla-tubes are very full the bees do not get much honey from this source. This is exactly the case with red clover. So it appears that long-tongued bees, if good in the North, will be in great demand all through the South, throughout Central and Southern California, as well as throughout all those States that grow red clover; and I have been surprised to find so much of it in the West. It appears, then, that, if long-tongued bees are an advantage on red clover, they will be equally advantageous in the case of all the other honey-plants I have named.

GENERAL IMPRESSION OF THE IRRIGATED REGIONS OF THE GREAT WEST.

I ARRIVED home from my trip, of some 6000 miles in the cars and 500 miles in a buggy, on Tuesday, the 16th, just after our last issue went to press. The whole trip seems like a dream to me now—a beautiful dream of paradises for the bee-men and ranchers whom I visited. I did not take in all the best bee country of the great West, but I went through some of the very best of it.

Some things that I could not have believed, had they been told me, I now credit because I saw them. When they told me, for example, that fence-posts planted in the ground would grow into trees in those irrigated sections, I did not believe it; but when I saw some posts that were sprouting—that is, leafing out, and

when I saw trees 20 inches in diameter, once fence-posts, that were said to be only 10 years old, with a barbed wire running right through the center of them, around the big fields, then I began to think there must be something in the fence-post canard. Again, when I was in Arizona and saw hens and chickens that had been hatched on pantry shelves under the influence of the climate alone, I was pretty nearly prepared to believe any thing they told me.

But speaking about hot climates, I have been where it was up to 120, and ranged from that down to 110 on the irrigated lands; but I did not feel the heat nearly as much in those places as I do here at 90. The reason is the excessive amount of humidity in the East compared with the West. A high temperature with high humidity is killing, especially when there are hot nights. A high temperature with low humidity is quite endurable—indeed, it is quite pleasant. A high humidity with low temperature is chilling and killing, as those of us in the East know.

But the great West does not have all that is nice and pleasant. I missed the ever present shade-tree in the open fields, of which we have so many here. I missed the large areas of woods, or hard-wood forests, some might call them. In much of the West, trees grow only along irrigation-ditches. One can leave some Western towns, beautifully shaded, and in an hour's drive get out into the desert where, if he should lose himself, he would die from want of water or food of any kind unless he could knock down a jack-rabbit. And then the great West, at least many portions of it, has hot winds and sandstorms; and the tenderfoot who has been through one of these, almost concludes he will put up with a foot of Eastern mud in the road; damp and chilly weather; rains, floods, hail, snow, sleet, zero weather, and every thing else, rather than go through another sandstorm; and the worst of it is, these sandstorms have a way of filling the houses full of dirt and grit. One can not screen it out, nor shut it out with the windows. He has to live and endure it. If there is a person who has ever eaten a "peck of dirt" in this world it is the one who lives out west in localities subject to sandstorms. I ardently hoped for a genuine sandstorm, and my wish was gratified the very next day. My face smarted from the sharp blasts of cutting sand. It poured down my back; it filled my ears, went all through my clothing, into my shoes; and see? One might just as well shut his eyes, plug up his nose, ears, and mouth, occasionally catching a breath of air through the dust and grit.

There is another thing I did not like in the great West in some places; and that is, a sort of weed known as foxtail. These peculiar spears will rub off on one's clothing, come clear through, and then turn around and come out backward. I have been for weeks picking the ugly things out of my clothes. They are about $\frac{3}{4}$ inch long, and bearded in such a way that they slide easily one way but not the other.

While the nights in most portions of the West are cool and delightful in spite of the

noonday heat, I was most disagreeably reminded of the presence of fleas and mosquitoes; and occasionally some other nocturnals that neither fly nor hop.

But with all the disagreeable features that I have described, if I were a young man, and desired to seek an occupation outdoors, I would take Horace Greeley's advice and "go west," for there is plenty of room in the irrigated regions, and the most of the time a delightfully pure air; little or no rain; and, where when the ground gets too dry, one can irrigate. Many and many a place that I saw, once a barren desert, is now, thanks to the mountain snows and irrigation, a veritable garden of Eden. The luxuriant vegetation and fruits of the tropics make one feel that these beautiful ranches could never have been any thing but beautiful and fruitful.

THE HONEY SEASON FOR 1901; HOW WILL PRICES RULE?

BEFORE going into detail I would say that the reports show that there were fewer bees that produced honey this year than the year before. In fact, the number has been dropping down from year to year, owing to the poor seasons that have prevailed in so many of the good honey localities. This is particularly so in Southern California, where probably three-fourths of the bees have died through neglect or starvation, just because the owners could not afford to keep on feeding them from year to year—at least they thought so.

In a general way we may say that white clover yielded better this year in the States where it grows than it has done for several seasons past; but the trouble was, there were not the bees to gather the nectar that there have been in years when clover was in abundance; so that, notwithstanding there has been a fairly good clover yield in the northern and central States, the actual amount of clover honey is not as great as it ordinarily is. It also appears from the reports that there is less basswood honey than a year ago. There will be less alfalfa honey from the western States, and so, as a natural result, the tendency of the market in the East, so far as the fine grades of honey go, should be as high as last year rather than lower; and I should not be surprised to see it advance.*

While Southern California has had a good year for honey, there have been so few bees to gather it that the amount of California sage that will be offered in the eastern centers will be comparatively light. Buyers in California have been trying to scatter broadcast the impression that there was a tremendous crop of sage honey, and that, therefore, prices would rule low. But that is a great mistake. Prices should be the same as last year, and will be, if I am not very much mistaken. The large producers, rather than sell at a low figure, will

*There has been, up until now, a general impression that this would be a big honey year, and, as a natural result, the market on extracted has been temporarily weak; but we are expecting it to stiffen up very soon now. Comb honey has not been put on the market yet to any extent, and it ought to start off at good prices.

hold their crop till next season; and I know of at least five or six carloads that will be held absolutely rather than sell at a low price.

In Colorado the crop of alfalfa honey, east of the Rockies, will be from one-half to two-thirds as heavy as it was a year ago, while west of the Rockies the season will probably be as good. Last year there was considerable alfalfa honey offered in the eastern markets, and there will be this year, but not so much, probably.

Two or three weeks ago our people were prepared to believe that prices would be lower for honey this year than last; but a careful analysis of all the reports seems to indicate that prices, instead of being from a cent to two cents lower than last season, should and probably will seek the level of 1900, for the simple reason that the entire honey crop of the country, probably, is no larger than it was a year ago.

But, aside from the report, we find that no more honey has been offered us than last season at this time—a fact that seems to prove the statements given by the reports. It may not be generally known, but the Root Co., perhaps, buys more *small lots* of honey than any other concern in the United States, and, as a general rule, we can get some idea of the amount of honey produced by the number of offerings, and the price asked for the honey. Every thing considered, then, it appears to us, from a careful survey of the whole field, that prices should rule the same as last year. If they should take a decided slump it will be because the big buyers succeed in conveying the notion that there has been a large crop, in order to get the honey at low prices, and then when prices stiffen *they* and not the producers will get the advance. Bee-keepers should, therefore, take it on themselves to inform each other.

Let me give one interesting fact in this connection. The Root Co. finds it can buy honey, from those who do not read bee-journals, at a lower figure than from those who take one or more and keep track of the market. It is not our rule to set prices. We ask for a sample and the prices asked; and it is a fact that *the fellow who thinks he can not afford to take a bee-journal will sell his honey enough lower in one season to pay for all the bee-journals for ten years.*

A careful analysis of the season in the principal honey States below, will, perhaps, give one a better idea of the actual situation.

From Michigan it appears from something like 30 reports, covering the entire State, that the season is not as good as that of last year. It will be remembered that, in 1900, our sister State produced a pretty fair yield of honey; and all the clover honey the Root Co. could buy came from Michigan. With very few exceptions the reporters for that State assert that the season is poorer than last year; and yet it has produced some honey this season.

New York, on the other hand, that has been having a series of poor seasons, comes up with a smiling face. The clover crop in that State has been universally good; and the York Staters, if their bees have not largely

died on account of black and foul brood during the several poor years, will, if they are not in too much haste, find a good market.

Pennsylvania does not make a good showing. While it is true that some honey has been produced, it appears that the season has been even poorer than last year, and that was about as poor as it could be.

Some bee-keepers in Illinois have had an absolute failure, while others have apparently obtained some honey, and the same may be said of Iowa.

Kansas, Nebraska, and Missouri, as well as Arkansas, have, as every one knows, suffered from a terrible drouth; and the reports in those States indicate little or no honey.

Wisconsin, a State that usually shows up well with basswood, if it does not with clover, does not seem to have been blessed with a good season; while its sister, Minnesota, seems to have had generally a good yield.

Some parts of Texas, usually one of the best bee States in the Union, have had a poorer year than last. But Texas never seems to have a complete failure; for, so far as I could learn while in that State, the bee-keepers always make a living, and generally a good one.

Utah, going to the extreme west again, has had a rather flat failure. The bees died off very badly in the spring. At the time I was there, the prospects were not encouraging.

Virginia and West Virginia, have not had a very favorable season.

Only two or three reports have come from Vermont, but they pronounce the season better than last year.

I have tried to give the situation fairly and impartially, and I believe I have stated the facts not far from the real truth.

GERMAN WAX-PRESS.

In another column we show the new wax-press we are putting on the market. The introduction price is \$10.00. We are likely to catalog it at a higher price than this, and are offering it for only a short time at this rate. So far as tried, it seems to fill the bill.

HONEY, COMB AND EXTRACTED.

We are again in the market for both comb and extracted honey. We are having a brisk demand already for a choice article, and shall be pleased to hear from those having any for sale, with a sample of extracted. Write us how much you have, how it is put up for shipment. We prefer extracted in 60-lb. cans. In offering comb honey, tell us how it is packed, how much you have of each grade, and what you ask for it. We have a lot of unfilled orders waiting for stock to arrive.

NO. 25 JARS AND MASON JARS.

Of the carload of jars received about a month ago we have already sold all of the pint size, both flint and green, and almost all of the 60 gross of No. 25 jars. We have ordered another car, consisting of 100 gross No. 25 jars, and more pint Masons. We hope to have these here by Sept. 1. In the meantime we still have a good supply of quart and two-quart Mason jars, which we will sell, while they last, at prices last quoted. The supply of quart jars is not so large as of the two-quart, and may not last very long. Send on your orders while the supply lasts. They can not be replaced at these prices.

If thou turn away thy foot from the sabbath, from doing thy pleasure on my holy day; and call the sabbath a delight, the holy of the Lord, honorable; and shalt honor him, not doing thine own ways, nor finding thine own pleasure, nor speaking thine own words, then shalt thou delight thyself in the Lord; and I will cause thee to ride upon the high places of the earth, and feed thee with the heritage of Jacob thy father; for the mouth of the Lord hath spoken it.—ISA. 58:13, 14.

Create in me a clean heart, O God, and renew a right spirit within me. Cast me not away from thy presence, and take not thy Holy Spirit from me. Restore unto me the joy of thy salvation, and uphold me with thy free Spirit. Then will I teach transgressors thy ways, and sinners shall be converted unto thee.—PSALM 51:10—13.

I was up in the Traverse region, on the very summit of one of the high hills. My boarding-place was about a mile and a half from my little ranch in the woods, and each morning my wheel and I climbed this hill. It was just a little after sunrise. Cool breezes were coming from across the water; in fact, water was visible more or less in every direction. But before one gets to the water there are fertile fields, and homes of the tillers of the soil, scattered here and there in the valleys and on other hills. I was all alone. No human being was anywhere near, and there was nothing to hinder my speaking out loud as I thanked God (as I often do) for having given me a human life to live. Then I thanked him for my privileges, and almost unconsciously I began praying aloud for the different ones of my friends and acquaintances.

Some of the friends who read these pages may think it a singular thing that I enjoy talking out loud to the Maker of this universe. But the fact is, for many years I have greatly enjoyed this sort of communion, whenever I am sure no human being is near; and really is there any seclusion—that is, if we take it in the sense of freedom from interruption—like being on a hilltop when the hill is far away from all human beings? If I am correct, the Bible tells us of several cases where Jesus went up into a mountain to pray. There were several reasons that morning why I needed an opportunity for communion with God. You know what I said about that neighborhood, and being neighborly. Well, I had already got into an entanglement with a neighbor. I did not mind the few dollars involved, for I would have freely given the money to him; but I did not feel it would be right to let him think he succeeded by means that were not (as it seemed to me) fair and honorable. I prayed that God would give me grace to do just right in the matter.* Then I prayed for the inmates (whom I knew) of the differ-

ent homes that were right in sight in different directions.

I went down the hill through the cool shade of the old lumber road, through the ravine, very happy. In a few hours more I was working pleasantly side by side with the man with whom I had trouble, and I did not let him have his own way either. The Holy Spirit seemed to be with me.

After several days of hard work on the ranch I decided to take a rest by visiting some of the summer resorts further north. Bay View, just one mile north of Petoskey, is a sort of Michigan Chautauqua. Here religious people and some of our great divines address the people in the auditorium, not only every day but *several times* a day. I reached there Friday evening. I rather wanted to spend Sunday at Bay View because of the religious instruction; but what should I do with Saturday? My eye soon caught on a little bulletin that read, "An excursion of 170 miles for only 50 cents, to Mackinac Island and return, July 22." This would hit me exactly right, but I wanted to start home Monday. During the evening we had a splendid address, illustrated by a magnificent stereopticon, in regard to a trip over the route, as nearly as can be made out, where the children of Israel wandered for forty years. After the talk was over I noticed some new bulletins swinging in the breeze under the electric lights. I stopped to read them. It was something like this:

"The steamer Fanny Hart will touch at Petoskey at 9 o'clock Saturday morning. She will give passengers two hours at Mackinac Island, six hours in the middle of the day at the Soo, returning Monday. Price only \$5.00, including board and lodging."

Now, this gave me Mackinac Island with the "Soo" thrown in. It was to start Saturday morning, and that would let me make my trip back home Monday morning. The only trouble was, it was, at least in some sense, a Sunday excursion, and you know how pronounced I have been all my life against such things. But there was to be a stop of six hours at the Soo. This would take in church time, and why couldn't I attend church there as well as anywhere else? I debated the matter more or less all night, and finally decided to take the trip, although I did not feel quite easy about it. We had a very pleasant trip on Saturday, and reached Mackinac Island just a little before sundown; but we could not look over the celebrated objects on the island as we had planned, on account of a thunderstorm. We reached the Soo rather late Sunday morning, on account of the great number of vessels passing to and fro through that wonderful canal, cut through Saint Mary's River; but for some reason, unknown to the passengers, the captain announced that the boat would leave the Soo at 10 o'clock A. M. sharp. This shut off all chance of attending religious services. I inquired if there were any Sunday-schools before church, but did not find any. I also inquired if there was a Y. M. C. A. building there. A policeman told me the city had been talking about it, but hadn't got around to it yet. So I wandered

* I also prayed for that little Sunday-school where I talked to the young people the day before, nestled down in the valley, scarcely half a mile away. It seemed then an easy matter to pray for every thing and for everybody, for my enemies as well as for my friends; and there was a sort of feeling of confidence or faith given me that at least some of these prayers would be answered.

about with a conscience heavier and heavier every hour. Of course, I was interested in the wonderful sights of the great locks where boats toward 500 feet long are all the while awaiting their turn to be passed through. The passengers on board the boat were all very nice people. There was not any thing objectionable going on; but, at the same time, it was evident that none of the passengers were particularly spiritually minded. I found a very nice plain-print Bible on the piano, and I read in it a good part of the day. One young man admitted that he, like myself, was a church member, and that, although he was going to stay over till the next day, he did not propose to go to church while there were so many wonderful things to see and inquire about.

As we left the Soo, the mate informed us that, in consideration of the fact that we did not have a chance to go over Mackinac Island the day before, they would drop passengers—at least as many as wished—for four hours on the island while they went to unload some freight at Cheboygan. Here was a chance to attend the evening services; but the passengers were discussing the wonderful sights on the island—Arched Rock, Devil's Kitchen, Lover's Leap, beautiful cold-water springs, etc.

It was not church time when we landed, so I thought I would go with the rest and see some of these wonderful things, and get back in time for church service. Yes, it is true your old friend A. I. Root was not only off on a Sunday excursion, but he was out sight-seeing when he ought to have been getting ready to be promptly on hand with God's people, at the place of worship. As I passed along the beautiful macadamized roads between the water and the cliff I was somewhat nervous and excited. I imagined I heard Dr. Miller's voice saying, "Mr. Root, when you tell us of these wonderful sights you saw up here, you will, of course, remember to mention that it was on Sunday you 'took them in.'" Then I thought I heard the children discussing the matter, and it seemed to me I could hear Ernest laughing in his sly way (for he has always been more or less up to mischief), to think *father* was off sight-seeing on a *Sunday* excursion. These things troubled me so much that I passed by the Devil's Kitchen, and did not see it. A man I made inquiry of said he thought I certainly would have heard the running water from the springs right where you turn off and climb up among the cliffs. I turned and went back hastily. The evening was quite warm, and I was getting sweaty. I found the spring, and the water of it was certainly most refreshing. I saw the wooden steps that led up to the kitchen; but at first I said, "No, I am going straight back to church, even if I have come hundreds of miles to visit Mackinac Island, and stand just on the threshold of the 'kitchen.'" Then somebody or something suggested that I take just "one look" inside. I think it must have been the same person who suggested to mother Eve that she simply take "one bite" of that beautiful apple.

I climbed up the wooden stairs, but the kitchen was evidently further up. I followed a steep footpath; but the foliage was so dense, and it was so near night, I could not see very well. The pathway became more intricate and dark. Finally I emerged into an open grassy plot. I thought the kitchen must be down at my right, and I hurriedly pushed on that way, and then decided it must be at the left. Then I gave it up and tried to go back the way I came. But I could not find the opening where I came through the thicket. I tried quite a spell, and then meditated pushing down over the cliffs, without any path. But I only tore my clothes, got into a tangle, and got more sweaty, and I hadn't found any kitchen at all; but I mentally decided I was in the Devil's "*trap*" in good earnest, even if not in his "kitchen." A guilty conscience was making me more and more nervous and excited. Finally I slid down along a water-pipe I had noticed in climbing up. I had come further from the town than I supposed. I thought if I only succeeded in getting to church just before the services closed, or could get near the church doors among Christian people, I should feel better; but after visiting two different places of worship I only succeeded in going home with the crowd from one of them.

Just a week before, at that little Sunday-school over among the hills I gave the young people a talk about holding fast to their spirituality, or, if you choose, to the influences of the Holy Spirit. I told them a clear conscience and a sense of God's presence is worth more in life than any thing money can buy. With it they would be happy anywhere under almost all circumstances; and without it they could not be happy, even with all that wealth could furnish. Then I spoke to them about grieving away the Holy Spirit by doing things that their conscience told them were wrong; and yet after all this talk, within one week I *myself* had driven away all happiness just by chasing after the things of this world.

The steamer left us a little after five. The four hours would take us till something after nine; so we went out on the dock and waited for the steamer to show up. It was ten o'clock, and she had not come; eleven, and she had not come; midnight, no steamer. A little after one o'clock the electric lights from the upper bow could be seen away off across the waves. About half-past one we were on board. Besides the half-dozen passengers who decided to stop on the island, there were the dining-room girls who waited on the table. There in the night we had quite a chance to become acquainted; and had the circumstances been any different I might have exhorted those girls to lead Christian lives; but with what consistency could I then hold up Christ Jesus to them? Under other circumstances I might have done so; but I felt, for the present, myself ruled out. I passed them several times on the island, and they recognized me. *They* knew that I was of the world and among the worldly crowd and not with the church-goers.

Years ago I told you about riding twenty miles after dark over sandy roads rather than

even take a wheel-ride early Sunday morning. I said then that I tried not to do any thing that would make me feel ashamed to tell people my name and where I lived. Saturday night after dark, I was not ashamed nor feared recognition; but on Sunday morning, even if only a little after daylight, I would a little rather not be seen by any one who knew me. I said then, "Since I have become a Christian I can always and everywhere say to everybody I meet, 'I am A. I. Root, of Medina, Ohio. Who are you?'" But on this Sunday I do not think I told anybody my name. Several asked me, "Where do you come from?" I replied, "Ohio." In response to a further question I said, "Medina, Ohio, near Cleveland;" but I did not tell anybody I was A. I. Root. It was the first time in many, many years when I felt at all backward in giving my name and full address.

Many of you, perhaps, will remember that Sunday evening, July 21, was during one of our hot periods—at least so I have been told by the papers. Perhaps I might add my testimony in regard to the cooling winds of that northern region. The wind blew right across the water that night.* I had forethought enough to take my overcoat when I left the boat; but even with that overcoat, after midnight I became chilled to the very bone. When I got into my neat pretty little stateroom I thought I should get warm with the abundance of woolen blankets provided; but I did not get really warm before daylight, and I was used up physically as well as spiritually for the new week that opened before me. Years ago we had here in these Home Papers a little verse which read:

A sabbath well spent brings a week of content,
And strength for the work of the morrow;
But a sabbath profaned, whatever is gained,
Is a sure forerunner of sorrow.

Now, why should I tell all this? For one thing, it illustrates how easily one is led out of the straight and narrow path. Christian, in the Pilgrim's Progress, tells of getting over into another road that he felt sure was not the right one; but his companion declared it was all right. Pretty soon they met a man, and asked him about it, and he declared very positively they need not worry a bit, for it was *the* road. But by and by all three got deeper and deeper into trouble. I know there are many among our readers who will think I make a big fuss about a very little thing. They will say, "Why, the best church-member in the world does not expect to go to church *every* Sunday; and, besides, when peo-

ple are out on a vacation, or an outing, very few attend church *at all*. Even the ministers do not have any Sunday at such times. They are taking a *rest*." Well, you can have it that way if you like; but I do not want any such "rest."

Well, suppose you *have* followed after worldly things and worldly people, and made a mistake. What shall you do? Wait till the guilty feeling wears off? or perhaps, as the children might say, shall we wait till God forgets about it? God forbid. Such an experience fits us to appreciate the wonderful thought in the second of my texts. Again and again have I wondered that human language can so well express what a sinner feels. "Create in me a clean heart, O God." Any penitent sinner, under *all* circumstances in life (or even in death), could use this prayer; and the latter part of it, "renew a right spirit within me," is fully equal to the first. David recognized that his heart was not right. He was not what he ought to have been. But God himself is equal to the task of taking the wrong feelings and putting back the right ones. And then, again, we have the expression, "Cast me not away from thy presence." Those who have been in the habit of living near the Holy Spirit can realize what a punishment it is to be cast away because of sin. There is only one remedy; and David seems to comprehend it when he says, "Restore unto me the joy of thy salvation." And after God has thus given a new heart and a new spirit, and restored the lost joys, *then* may we point out to sinners the straight and narrow path. How grandly that point comes in, "Then will I teach transgressors thy ways, and sinners shall be converted unto thee." In my talk with the girls in the little crowd that was there waiting for that steamer I urged (as well as I could under the circumstances) pure and upright lives; but how could I exhort anything in the line of either of my texts after the way they had *seen* me spend the Sabbath; and since that experience I value, as I never did before, having a life and *character* back of me so that I can consistently plead with people in the way suggested in the text, "*then* will I teach transgressors thy ways; and sinners shall be converted unto thee."

THE SUMMER RESORTS OF NORTHERN MICHIGAN.

Nearly a year ago I told you considerable about the beautiful resorts in the region of Grand Traverse Bay; but now I wish to speak of some of the celebrated places a little north of Traverse City, especially of the region round about Charlevoix and Petoskey. Charlevoix is situated just between Lake Michigan and Pine Lake. It is often called Charlevoix-

* In regard to the cooling winds, at one point on our trip on the steamer a lady at my elbow remarked, "Why, what a funny country this is! One time the wind blows hot, and sometimes cold." Sure enough. A hot breeze would come from off the land, that would make one feel almost faint; and, immediately after, a breeze from a slightly different direction from off across the water would brace one up with a delicious coolness that was really enjoyable. Sometimes when there does not seem to be any breeze at all from off the water an excursion is planned to some point where they can easily, at a slight expense, get the cool breeze, either on the boat or on some point of land that extends out into the water. The Traverse peninsula, where my ranch is situated, is one of these latter points.

the-Beautiful, and was named after F. X. Charlevoix, an early missionary there, from France. The Indians seemed to have recognized it as a beautiful spot before the white men ever had a glimpse of it. The station on the Pere Marquette Railway is itself a spot of wonderful beauty. Between the station and Pine Lake there is a fine lawn interspersed with flowers; and just back of the station is the Charlevoix Inn. You go up a broad flight of stone steps that look as if they might be made of marble; and just before you is a fountain that drops its waters into a large stone basin of this same white marble-like stone, with beautiful speckled trout so tame one can almost touch them, making it seem like a fairy land. All about the place are beautiful residences of the summer resorters as well as magnificent hotels. Electric lights are seen everywhere along the shores of Little Traverse Bay. The current is mostly furnished, I believe, by streams of great coolness and crystal purity that come from springs at the base of the hills. In fact, all along the northern part of the shores of Lake Michigan there is almost unlimited water power, and the water is so clear and pure that the waters along the pebbly beach of Little Traverse Bay look like clear spring water rather than lake water. The water is so clear in Little Traverse Bay that in many places you can see objects plainly at a depth of thirty or forty feet.

Charlevoix is only 16 miles from Petoskey, which is situated just within Little Traverse Bay. Here we have quite a large city on the side of the hill fronting the bay. Beautiful hotels with spacious grounds in front, and princely summer residences, are all along the bay. No matter how hot the weather, cool breezes are almost constantly coming from over the water from the north or northwest. During one of the hottest July days I took a trip off over the hills about seven miles, in the vicinity of Bear Lake, to hunt up a bee-keeper. Well, over among these hills the July weather seemed very much like that in Ohio and Southern Michigan away from the great bodies of water. It was really unpleasantly sultry. When I got back to the shores of the bay and the great lake, it seemed like a different climate.

One mile north of Petoskey is Bay View, a place that has been celebrated for years past as the special resort of literary people. The university has a faculty of 42 instructors from the leading colleges; and then it has what is called the "Bay View Reading Circle," enrolling thousands of members.

Although electric lights are everywhere in Bay View, Petoskey, and Charlevoix, they have not yet caught on, if I may use the expression, to electric railways. There is, however, a very pretty arrangement of steam-cars, made much like our best trolley cars, that make trips to the surrounding resorts at a very low rate. For instance, they run every half-hour at the very low rate of 25 cts. for an eight-mile trip and return. Beautiful little steam ferries make a similar price; and the tickets will carry you either by steam or rail, as you choose. Besides this, there is a beautiful bi-

cycle track constructed at considerable expense from Bay View to Roaring Brook, and of course I had to try my wheel on the beautiful track. I forgot to time myself, but it seemed to me I never rode so many miles before in so short a time. Roaring Brook is six miles from Bay View. A stream of wonderful clearness and purity comes tumbling down the hillside through thickets of cedar and other evergreens. Walks have been cut all along through the tangled thicket; and one can scarcely imagine finer places for a picnic dinner than there are all along here. The ground under our feet is carpeted with the most beautiful moss. The air is perfumed with evergreen cedars—I think the same kind that furnishes the wood for our lead-pencils. Drinking-places are everywhere; and I can add my testimony to the statement that the water bubbling from these springs is nearer ice water than any other spring waters in the world. I regret I did not carry along a thermometer. The statement is made that the gushing springs along the shore are only 12 or 15 degrees above the freezing-point all the year round.

After riding my wheel it seemed as if I could never drink enough of that water, and I really feared several times that so much cold water might interfere with my digestion, but it did not a bit. The crowds around me seemed to feel as I did. They drank and drank, and evidently decided in their own mind that there was no more delicious drink to be found on the face of the earth than this pure cold spring water. By the way, I do not remember seeing a saloon anywhere along those resorts. In fact, if one were to start a saloon I am inclined to think the surroundings would persuade people that the spring water is better, and more to be desired than any thing to be found in those dens of iniquity.

Now, I wish to give Harbor Springs a good write-up; but I am afraid I can not do it justice. I should call it a little island about a mile long and half a mile wide. It *would* be an island if there were not a little neck of land connecting it with the shore. But clear around this island are summer cottages. They are as close together as they can be placed—that is, and not be too much crowded against their neighbors. They are all around fronting the water, and close to it, like cottages along a suburban street. These cottages are all different. Each one has some peculiar piece of architecture and fancy painting. In front of each cottage, right out in the crystal water with its pebbly beach and bottom, there is a boat-house covered with canvas or light painted woodwork. Every resident owns a boat of some sort. As the sand is rather soft to walk in, wooden walks curve along with the irregularities of the shore, and narrow walks lead up to the doorway of each residence. Not only does Nature seem to have put on her holiday attire, but all the people—men, women, and children—are dressed in light summer garb. As I gazed in astonishment I fell to wondering if all the pretty women congregated at Harbor Springs, or was it their attractive and novel attire and the sur-

roundings that would have made any woman look lovely under similar circumstances? Perhaps they looked lovely because they were good people. "Handsome is that handsome does," you know.

Every little while the motor cars and the ferry-boats were loading and unloading their cargoes of people who were in summer attire enjoying their vacation. Of course, electric launches, costing all the way from a few hundred to a few thousand dollars, were flitting in and out everywhere. For 15 cents you can take short trips and back again; and those dainty launches, upholstered like a Pullman car, easily gathered a crowd of passengers almost everywhere they stopped.

I have told you before that I am in love with "babbling brooks." Well, Roaring Brook is a "babbling brook" indeed, and on a considerable scale, for there are waterfalls every few rods. Now, there are other resorts all along the northern part of the east shore of Lake Michigan. Perhaps, however, the center of all this work is more in and about Little Traverse Bay than anywhere else.

Some of you may say, "Oh, yes! that is all well enough for *rich* people." But, wait a little, my friend. I had this matter especially in view when I made the trip. The railroads are making exceedingly low rates all the while up to this vacation region, and return. While there are hotels that charge several dollars a day for board and lodging, there are great numbers of private residences advertising furnished rooms. You will see there little shingles hanging out from almost every cottage in some streets. At Traverse City I had a letter of introduction to Mr. Frank A. Risley (a college student), who is employed during his vacation by the American Sunday-school Union to look after the Sunday-schools of Northern Michigan. Well, he has his headquarters in Traverse City in one of the very pretty little cottages on West Seventh Street. While talking with him about his work, his salary, and his expenses, he gave me the following information: The little sleeping-room where he and I were talking cost him 75 cts. a week. He was at liberty to occupy the room every day and every night if he chose; but in his mission work he was, of course, absent a great deal of the time. Well, now, mind you, this nice pretty little room with dainty bed, washstand, towels, etc., cost him only 75 cents a week. Then at the same house he purchased 21 meal tickets for \$2.50—only about 12 cts. a meal, you will notice. Now, he could use these meal-tickets just when he chose. He was going and coming every day. The room was, of course, to be paid for any way; but no meals, only when he was present. When I suggested that it must be rather plain fare for so small a price he invited me in to supper, and it was just as good a meal as I would ask for. In fact, I think I would enjoy better health with such fare, and, as a consequence, more happiness, than if I could be at a hotel where meals cost 50 cts. each, and a bed the same. I am told that similar prices can be obtained in almost all of these towns and cities. Of course, you will have to choose

a cottage somewhat away from the center of the town, where rents for that kind of property are low, to get these low rates.

At every stopping-place I easily found nice clean restaurants where a good meal could be had for from 15 to 25 cts. In this respect Northern Michigan is certainly away ahead of some other parts of our country. The people are also pleasant, civil, and accommodating. Their bread and butter largely depends on securing boarders and lodgers, and in treating them so well that they will want to come to the same place again next year; and hundreds and thousands of people are making trips regularly every summer to these northern resorts.

I have told you elsewhere something about my trip further north. Mackinac Island is much like Harbor Springs, but not quite as retired among the cedar-trees and thickets; but just about sundown you can perhaps see more women, girls, and children, in fantastic holiday attire, on the side hill on Mackinac Island than in any other spot on the face of the earth. It made me think of collections of gaudily painted butterflies we often see in entomological collections. You gaze at one, and think she is about the most attractive woman you ever saw. Then you look at another, and finally conclude she is rather ahead of her sister, although in a different way. Then a third eclipses both, and so on until you are utterly bewildered. Now, such scenes do not give me unalloyed pleasure. I often fall to wondering if these lovely women have the love of Christ Jesus in their hearts; and then I begin wondering, again, if such is the case how can they consistently spend so much money in dress and so much of their time in display? Now, I try not to be too critical in this direction, for I believe God intended that women—yes, and men too—should use quite a little time and money in making themselves look neat and well, in the eyes of their fellow-men. I have sometimes wondered just where the line should be drawn, especially when I pay ten cents to have my shoes nicely shined, and then have some adventure a few minutes later that takes the shine all off again.

The Soo canal is the most wonderful spot in Northern Michigan, in my opinion. While it has some of the attractive features I have been speaking about, the Soo and its surroundings remind us more of the great progress that has been made and is being made in transporting the merchandise of the world. All the way up through that canal cut in the solid rock of the St. Mary's River, we pass great boats laden to their utmost with iron and copper ore, wood pulp from the Canadian forests, and other articles of merchandise. I never knew before that there were hundreds of great steamers, made almost entirely of steel, pretty well toward a quarter of a mile long, engaged in this great traffic. These steamers, when laden, are mostly under water except the little turret that the pilot and the officers of the boat occupy. They call them whalebacks; and, in fact, the waves are expected to pass right over them without hindrance. These boats are going and coming at such a rate that the great double Soo canal

has all it can do, and sometimes more than it can do, to let them through without expensive delays. These canals are cut in the solid rock, right beside the celebrated Soo Rapids. This rapids is in the Saint Mary's River, that permits the waters of Lake Superior to pass down to Lake Huron. The rapids is, I should say, a river half a mile wide and perhaps a mile long where it splashes and foams over the rocks. The fall is about 20 feet. Each side of this mile in length, not only the walls of the canal but the pavement over the ponderous machinery are solid hewn stone, the peculiar white building stone I have mentioned, that looks so much like marble. The buildings containing the machinery for operating the locks are little houses made entirely of glass and stone. The power to move the ponderous gates all comes from water-motors driven by the enormous water power of the Soo canal. Just back of the city a new canal is being constructed 200 feet wide at the bottom, and 30 feet deep. This canal is sawed out of solid stone. The walls are cut down by appropriate machinery as true as the walls of a building. Railroad tracks run along the bottom, and cars carry out the broken rock. The work has been in progress for two years and a half, and it is estimated it will take two years more. This canal is to furnish water power, and the power-house is now partly finished, almost a quarter of a mile long, and is said to be the longest single building in the world. An electric-power plant is to be installed that will rival the great electric plant at Niagara Falls.

When I expressed surprise that there was enough shipping to keep two great canals constantly busy, one of the officers informed me that the old canal, built many years ago, was soon to be enlarged, because the capacity of the two was not sufficiently great for commerce.* The material on which all daily papers are printed—yes, the very paper on which you read these words—probably comes from the Canadian forests through that great Soo canal. The officer mentioned told me the traffic in paper pulp was getting to be so great that a project was on foot to bring the pulp from Canada to the United States through an immense viaduct, something like the great tunnels that bring water for our large cities. This pulp was to be pumped through to paper-mills run by the great power-plant I have mentioned, and they expected to furnish paper enough, not only for all the newspapers, but for all the books to be made in the United States. When I asked how long the Canadian forests would hold out, my informant said that there were miles and miles of the spruce timber, and that there was raw material enough in Canada to supply the United States for at least a hundred years.

At the close of my visit to the great Northwest, I wish to mention once more my in-

* Besides the two great canals with their ponderous locks, on the American side, I must not fail to mention that there is also a similar canal on the Canadian side; and these three together are not able to pass the great boats so as to prevent navigation at times from being blocked, and suffer delays that are enormously expensive.

debtedness to the officers and employees of the Pere Marquette Railroad. I suppose most of the friends know already that I am always making blunders, in traveling. I have fits of doing things absent-mindedly. On one occasion a baggage-master gave me a check for my bicycle. I suppose I must have taken it and put it in my pocket; but I was so sure I *didn't*, I looked another baggage-master squarely in the face and declared I never received any sort of check. They thought it very strange, and gave me another. Afterward, in *another* fit of absent-mindedness, I put both checks in my overcoat pocket, and when I wanted the wheel (at the Traverse City station) my overcoat was out at my ranch in the woods, ten miles away. I explained matters, and got my wheel without a check at all. Now, these Pere Marquette people *all* seem to be good-natured. I think they must take it for granted that, in carrying people off on an excursion, they must put up with a good deal, so the excursionists can have a good time and want to come again.

Just one thing more: During this hot dusty period I have always found plenty of clean water in even the common railway coaches; and not only that, two great big roller towels to every coach, that were *certainly* nice and clean every morning when they started out.

In the next issue I will tell you something about strawberries, peaches, and potatoes in the Traverse region—especially about ripe strawberries for the markets of Chicago after the middle of July.

Special Notices by A. I. Root.

WHAT CAN WE SOW OR PLANT ON VACATED GROUND DURING AUGUST?

Well, August is the great month for turnips. The Purple top White Globe seems to be the special favorite. A good many sow the seed the last of July; but if grown during hot weather they are apt to be too strong for table use. If you want real nice turnips for the table, sow them several times during August—yes, even up into September. They will not be real nice until they are out in a frost or two; and those sown so late that they do not get very large are best for table use. The White Egg is a good deal like the White Globe, but a good many think them more tender and sweet.

Of late there has been considerable said in the agricultural papers about sowing turnips on spare ground, to plow under as a fertilizer. Now, turnips are not worth as much as clover, by any means; but they are better than nothing at all, and for this purpose the long White Cowhorn is recommended. Its roots go away down and bring up fertility that the round turnips growing on top of the ground will probably miss. They will also stand a drouth better when they once get started.

We can furnish seed of the turnips mentioned above, at 5 cts. an ounce; 1 lb. 30; 5 lbs., \$1.25. If wanted by mail, add 9 cts. per lb. for postage and packing.

DWARF ESSEX RAPE.

This is something after the turnip family, or perhaps, rather, the cabbage family. It will stand more frost than either cabbage or turnip. It can be put in among corn at the last cultivating. I have seen it sown in this way so as to stand 3 feet high after the corn was cut and out of the way. It may be sown at any time from May to August. In my trip through Michigan I saw field after field of it, some of them ten acres or more in extent, and sheep and lambs were feeding off the crop during the last of July. Where the drouth was very severe this plant seemed to stand up bright and green.

Prices: 1 lb., postpaid, 20 cts.; 50 lbs., by freight or express, 7 cts.; 100 lbs., \$6.00.

SEVEN-TOP TURNIP FOR HONEY OR TO PLOW UNDER.

I omitted mentioning in the proper place that the seven-top turnip is perhaps the best one to plow under for fertilizing the soil. It will also give a good crop of honey before it is turned under in the spring. If sown any time in August or the fore part of September it will get rooted so as to stand any winter. In fact, I never knew it to be thrown out by the frost here in Ohio when it gets a good start. It comes into bloom between apple-blossom and white clover. It may be plowed under for potatoes or any other crop. Price, ounce, 5 cts.; 1 lb., 20 cts.; 10 lbs. or more at 15 cts. If wanted by mail, add 10 cts. per lb. extra.

CRIMSON OR SCARLET CLOVER, ETC.

With a fair amount of rain this will do all right on almost any good ground, sown during the fore part of August; but the earlier the better. For prices, etc., see our last issue.

In the Traverse region in Michigan, medium and mammoth clovers catch all right and stand the winter when put in during August. Some experiments have been made here in Ohio, but I can not find any thing very definite about it. But I have tried it on small patches where strawberries were turned under. I think that, with good ground and favorable circumstances, all the clovers will make a stand when sown in August.

WINTER OR EGYPTIAN ONION-SETS.

We are just now gathering a fine crop of these. Quart, 10 cts.; peck, 50; bushel, \$1.50. If wanted by mail, add 10 cts. per quart for postage and packing. As we are getting a good many orders, if you want them at the above price you had better get in your order at once. Now is the time to plant them, and the sooner the better. They never fail to grow, and they will stay in the ground for years unless you dig them out. It takes a very smart weed to crowd the winter Egyptian at any season of the year; but, of course, they do very much better where the weeds are kept out, and clean cultivation given. Perhaps I might add, in conclusion, that, if the weather is not too hot and dry, almost all kinds of peas will give a nice crop for table use if put in during the fore part of August.

SEED POTATOES FOR 1902.

The prospects are just now that potatoes for any purpose will be scarce and high. The Cleveland market quotes potatoes for table use at \$4.50 per barrel; seconds, from \$1.00 to \$1.25 per bushel. In our own market new potatoes are retailing at 40 cts. a peck, and they are small and poor at that. The only kind we have that are harvested and ready to ship is the White Bliss Triumph. Prices at present will be, $\frac{1}{2}$ peck, 35 cts.; peck, 50; $\frac{1}{2}$ bushel, 85; bushel, \$1.50; barrel, \$4.00. Small seconds, half above prices. This is probably the earliest potato in the world. If it were not for its susceptibility to blight, it would easily take the place of every thing else. The above prices are just about what they are worth for table use. They may be cheaper later on. No one can tell just now. Red Triumph, same price as above.

We compress cells in removable wooden shells at 2c each; or you can own a Grace cell compressor for \$2.00, post-paid; blank shells, 1c each; started queen-cells, 5c each. Get a queen-rearing outfit and rear your own queens. All by mail. New circular ready.

The Swarthmore Apiaries, Swarthmore, Pa.

A Superior Red-clover Queen for 25 cts.

An Offer for New Subscribers:

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL list during August and September. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.25, and we will mail you the Bee Journal for a whole year, and also one of our SUPERIOR LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red-clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. All queens mailed promptly.

Headquarters in Chicago for Root's bee-supplies at Root's prices. A free catalog and sample of the American Bee Journal on request.

George W. York & Co., Chicago, Ill.

144, 146 Erie Street.

Standard - Bred Queens!

Acme of Perfection; Not
a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$4.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover hustlers of America. 75 cts. each; six for \$4.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

Fred W. Muth & Co., Cincinnati, Ohio.

South-west Corner Front and Walnut Streets.

QUEENS! Fine, large, gentle, and prolific; long-tongue reach; either 3 or 5 banded; 75 cents each; six for \$4.25. Try them and be pleased.

To Our Shippers.

We were obliged to notify you a few weeks ago that one Joseph M. McCaul had leased our old quarters at Nos. 120-122 West Broadway, New York City, and had there started up business under the name "Hildreth, McCaul Co.," and had distributed a multitude of circulars so worded as to create the impression that his business was a successor to or a branch of the business of Hildreth & Segelken.

For the protection of our shippers and ourselves, we at once instructed our attorney to commence action to enjoin the said McCaul from using the name HILDRETH in any manner whatsoever in connection with his business. On the 10th day of July, 1901, Hon. David McAdam, Justice of the Supreme Court of the State of New York, after a full argument upon the merits, issued a peremptory injunction, of which the following is an extract:

"And it appearing that the plaintiffs have for a long time been and now are carrying on business under the style of "Hildreth & Segelken," and that the defendant has recently opened a business at 120-122 West Broadway, in the Borough of Manhattan, City of New York, and is carrying on the same under the style of "Hildreth, McCaul Co.," and that such act is in violation of the plaintiffs' rights, and that the commission or continuance thereof, during the pendency of this action, will produce irreparable injury to the plaintiffs; . . . it is

ORDERED that the defendant (Joseph M. McCaul) and each of his agents, servants, and employees, and all other persons acting under his authority and direction be, and he and they are hereby restrained and enjoined from showing, displaying, or otherwise using during the pendency of this action in or upon any papers, devices, sign or signs, or otherwise, in the business conducted by the defendant at No. 120-122 West Broadway, in the Borough of Manhattan, City of New York, or elsewhere the name of "Hildreth" separately or conjunctively with any other name, designation, or description."

Outside of our desire in our own interests to protect the name which we have built by years of satisfactory dealings with our customers, we hastened to procure this injunction as soon as possible, to prevent our shippers from being misled into sending their goods to one who would make an attempt to gain their trade by such a trick and device.

With thanks for the many expressions of good will we have received from our shippers concerning this attempt to trade under our name, we are

Sincerely yours,

HILDRETH & SEGELKEN.

any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address **EMPIRE MFG. CO., Quincy, Ill.**

Long Tongues Valuable
South as well as North.

How Moore's strain of Italians roll in the honey down in Texas:

Hutto, Texas, Nov. 19th, 1900.

J. P. Moore.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, **HENRY SCHMIDT.**

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 23-100 breeder, the prize-winner: Untested, 75c; six, \$4.00; doz., \$7.50. Select untested, \$1.00; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, Lock box 1, Morgan, Pend. Co., Ky.

(Mr. J. P. Moore is entirely reliable.—A. I. R. Co.)

Belgian Hares

Fully pedigreed of the highest breeding, at prices that will suit. With every hare sold goes a full pedigree, register number, and score-card, scored by an official judge; and, when desired, does will be bred to one of our famous high-scoring bucks before shipment. Address **J. B. MASON,** Mangr. of The A. I. Root Co., Mechanic Falls, Me.

Belgian Hares

I have some fine hares for sale at reasonable prices.

J. F. Moore, : Tiffin, Ohio.

BELGIAN HARES!

Either domestic or imported, of any grade from a pedigreed prize-winner to a common rabbit, at prices that are right. Write **GEO. M. TEETER, PENNVILLE, IND.**

1200 FERRETS. All sizes; some trained; first-class stock. New price list free. **N. A. Knapp, Rochester, Lorain Co., Ohio.**

Twice as Much Honey!

Dr. Mason's Experience with Superior Stock.

Dr. Mason, Secretary of the National Bee-keepers' Association, writes me, on date of June 28, as follows:

"I think that I am safe in saying that the colony of bees that has the \$1.50 queen that I got of you about a year ago, although not as populous as most of our colonies, is gathering nearly, if not quite, as much honey as any *two* of our most populous colonies. I never use any smoke in handling them and never get stung.

It's just fun to handle them. When I remove a comb unless it rubs against another, they don't run and make a fuss about it, but keep quiet and attend to their business."

Price of a queen, \$1.50, or the Review one year and a queen for \$2.00.

W. Z. HUTCHINSON, Flint, Mich.

\$1-TESTED QUEENS=\$1.

A nice lot of young golden tested queens at \$1.00 each while they last; selected, \$1.50; warranted queens, 60c; —6 for \$3.50; select warranted, 80c—6 for \$4.50. My bees are a five-band strain, selected for size, energy, working qualities, long tongue-reach—and, lastly, beauty. I have never tested a strain that excels them. A pile of letters assert the above claims are true, and also that they winter well north. Queens are sent promptly.

J. B. CASE, Port Orange, Fla.

30 COLONIES Italian bees for sale cheap; in good condition; no disease. Also S. C. B. Leghorns; no better; circular free. H. M. Moyer, Shanesville, Pa.

FOR SALE.—7500 lbs. clover and basswood honey, in 60-lb. cans, at 7 to 8 cts. Also fine tested Italian queens, \$1.00 each.

ELIAS FOX, Hillsboro, Wis.

FOR SALE.—Nuclei, in chaff-hive frames; three frames with queen, \$1.75. Good Italians.

H. L. FISHER, New Paris, Ind. R. D. No. 2.

FOR SALE.—One 2 frame Cowan extractor in good order at half price.

H. W. THOMPSON, LaPorte, Texas.

Forty more mismatched queens reared last fall and this spring, 25c each. B. F. AVERILL, Howardsville, Va.

Wants and Exchange.

Notices will be inserted under this head at 10c per line. You must say you want your ad. in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We cannot be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange worker combs, in either Hoffman or Simplicity frames, for Italian queens.
L. D. GALE, Stedman, N. Y.

WANTED.—To exchange 25 Belgian hares—Fashodas and Yankans—for bees or supplies.
GEO. R. CRANDALL, 5707 N. 20th St., Omaha, Neb.

WANTED.—Lot of L. brood-frames (Hoffman if possible) before winter. Must be free of any bee-disease.
E. HOCHSTADTER, Poughkeepsie, N. Y.

WANTED.—300 to 500 colonies bees on shares in Cuba; or would work for salary; references given and required.
FRED E. MUNSON, W. Grotton, N. Y.

WANTED.—A strong, healthy young man of good habits to work in bees by September. Must have had some experience. Write at once, stating particulars and salary wanted. Permanent job for right party.
GLEN E. MOE, Candelaria, Cuba, W. I.

WANTED.—Location for a custom saw and feed mill.
W. S. AMMON, Reading, Pa.

WANTED.—A few bushels of Egyptian onion-sets or roots. Who can furnish them cheapest? Send sample and price by mail.

E. B. BEEBEE, Oneida, N. Y.

WANTED.—Apples. I wish to correspond with some bee-keeper in the middle West, or elsewhere, in section where there is a good crop of apples.

F. W. DEAN, New Milford, Pa.

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a select daughter of their \$200 queen that they refuse to quote me prices on. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

Prices: Untested, 75c; 6, \$1.25; 12, \$3.00. Selected, \$1.00; 6, \$5.00; 12, \$9.00. Tested, \$1.00; 6, \$6.00. Selected tested, \$1.50.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20 100, \$3.00. Breeders, whose best bees show 21-100, with an average of 20½-100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100, \$7.00.

I have discovered 2 breeders whose best bees show 23-100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2. Imported queens, daughters and grand-daughters. Have just received an importation direct from Italy which has been introduced into this apiary.

Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

W. O. VICTOR, WHARTON, TEXAS.
QUEEN SPECIALIST.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. LEY'S POULTRY CONDITION POWDER puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls —big and little get all there is in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. St. Louis's Thoroughbred Minorca eggs, \$1 for 13. Thoroughbred Belgian Hares.
Geo. J. Ley, Florence, California.

Queens! I have now some very fine queens for sale, either 3-banded or 5-banded goldens, at the following prices: Untested, 75c; 6, \$1.25; 12, \$3.00. Tested, \$1.25; 6, \$6.50; 12, \$12.00. Selected tested, \$2.00. Golden breeders, \$5.00. We have Root's bee-supplies at Root's prices. We have a special low price on honey-cans. Give us your orders, and I will guarantee you satisfaction.
Robert W. Rogers, Hutto, Tex.

QUEENS IN THE STATE OF WASHINGTON.

Experience teaches me that only those queens raised by the natural-swarming method are larger and superior. Such are mine, and you will be satisfied with them. Untested Italian queens from now on 75 cts. each. Tested, \$1.00 each.
Robert Mirring, Dryad, Wash.

WANTED.—Customer for farm of 65 acres; good land; good buildings, and water; one mile from railroad station, and four villages and college; 125 colonies bees; \$1600. Ten head of cattle, team, farming tools, 5000 lbs. extracted and comb honey. Write for description and particulars.
N. A. BLAKE, Beebe Plain, Quebec, Canada.

3 Good Points

Good Stock :
Low Prices :
Prompt Service.

My stock is from J. P. Moore's long-tongue strain, A. I. Root's famous \$200 queen, and from the stock of J. F. McIntyre that filled supers when other colonies were starving. I sell warranted queens in any quantity, at 50 cts. each. If a queen proves impurely mated, another is sent free of charge. All queens go by return mail unless otherwise ordered. I guarantee safe arrival and entire satisfaction. Otherwise, the money is refunded.

L. H. Robey, Worthington, W. Va.

YOU CAN NOT afford to let the season pass without introducing some of Moore's 23-100 stock into your apiary. See advertisement on page 659.

GUS. DITTMER, AUGUSTA, WIS.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:

Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldens, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper. \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

BINGHAM SMOKER.

Dear Sir—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.

Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm ly attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 2.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 3.—Three-fourths of the total surface must be filled and sealed.

No. 4.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

BOSTON.—The honey market is practically nominal, demands being nothing, owing to the warm weather. We have had one lot of new honey in that sold at 17. Extracted light amber, 8; amber, 6@7.

BLAKE, SCOTT & LEE,

Aug. 3. 31, 33 Commercial St., Boston, Mass.

CHICAGO.—For choice white comb demand is equal to the receipts at 15c, but off grades are slow at 1 to 3c less. Extracted is selling more freely at 5½@6; white amber, 5@5½. Beeswax steady at 30.

R. A. BURNETT & Co.,

Aug. 7. 199 South Water St., Chicago, Ill.

DENVER.—New comb honey, No. 1 white, \$5.00 per case; No. 5, \$2.75 per case. Extracted, white, 7; beeswax, 22@24.

THE COLORADO HONEY PRODUCERS' ASS'N.,

Aug. 10. 140 Market St., Denver, Col.

SAN FRANCISCO.—The following are the quotations of the San Francisco Chronicle, of July 23d:—To the trade: Comb honey, per lb., 10@12. Extracted, water white, 5½@6½; light amber, 4½@5½; dark amber, 4@5. Beeswax, per lb., 25@27.

Aug. 7. E. H. SCHEFFLE, Murphys, Cal.

NEW YORK.—There is some demand for new-crop comb honey, and receipts are quite numerous for this time of the year. They have been principally from the South, but we are now beginning to receive shipments from New York State and near by. We quote fancy white, 15; No. 1 white, 13@14; amber, 11@12. No new buckwheat honey is on the market as yet, and do not expect any before next month. Extracted is decidedly dull. Plenty offerings with only a limited demand, and quotations are rather nominal. We are selling at from 5@6½, according to quality; Southern in barrels at 55@65 per gallon. Beeswax dull and declining. For the present we quote 27@28.

HILDRETH & SEGELKEN,

Aug. 7. 265 Greenwch St., New York City.

MILWAUKEE.—The receipts of new honey are not large at this writing, and the demand very moderate indeed. The quality thus far has been very fair, yet the demand is not what we expect will soon come as the bad spell is past, and fruit not so abundant. New comb sells mostly at 17@18. We quote fancy white 1-lb. sections, 16@18; A, No. 1, 15@16; amber and old, nominal, 10@11. Extracted white, in bbls. or kegs, 7@8; amber, 6@7. Beeswax, 26, 28, 30.

A. V. BISHOP & Co.,
 Aug. 9. 119 Buffalo St., Milwaukee, Wis.

NEW YORK.—Market dull, very little demand. Quotations only nominal. Fancy white, 15c; No. 1 white, 13@14; No. 2, 12; extracted, white, 6@6½; light amber, 6; beeswax, dull and lower, 27@28; fancy, 29.

CHAS. ISRAEL & BROS.,

Aug. 10. 486, 488, & 490 Canal St., Cor. Watt St.

CINCINNATI.—Market is rather dull, on account of the warm weather. Extracted sells only to manufacturers from 5@6c. Better grades, alfalfa water white, from 6@7. White clover, 8@9; fancy white comb honey sells from 13½@15½.

C. H. W. WEBER,

Aug. 10. Cincinnati, O.

BUFFALO.—Fancy new white-clover comb, 17@18; choice, 16@17; No. 1, 15@16; No. 2, 14@15. Extracted, white, 7@8. Hardly any old left, and no demand for it. Pretty good call for new honey.

W. C. TOWNSEND,

Aug. 6. 84, 86 W. Market St., Buffalo, N. Y.

WANTED.—Comb and extracted honey. State price, kind, and quantity.

R. A. BURNETT & Co.,

199 South Water St., Chicago, Ill.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati.

FRED W. MUTH & Co.,

Front and Walnut Streets, Cincinnati, Ohio.

WANTED.—Extracted clover honey in cans; cans furnished if desired. Quote price.

I. J. STRINGHAM, 105 Park Place, New York.

WANTED.—To buy your honey. State your lowest cash price, kind, and quantity.

EDW. WILKINSON, Wilton, Wis.

WANTED.—To buy quantity lots of fancy and No. 1 white-clover comb honey in no-drip cases.

BYRON WALKER, Clyde, Cook Co., Ill.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.

THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Comb and extracted honey; will buy your honey, no matter what quantity. Mail sample of extracted: state quality of comb honey, and price expected delivered at Cincinnati. I pay promptly on receipt of goods. Refer you to Brighton German Bank, this city.

C. H. W. WEBER,

2146-2148 Central Ave., Cincinnati, O.

FOR SALE.—Extracted honey in 60-lb. cans, No. 1 alfalfa, 7½c per lb.; partly from other bloom, 6½c.

D. S. JENKINS, Las Animas, Colo.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere that they will have to offer.

SEAVEY & FLARSHEIM,

1318-1324 Union Avenue, Kansas City, Mo.

NO MORE SPOILT FRUIT.

Canning made easy and sure by using my Standard Patent self-melting, self-sealing wax strings. Very economical, and easy to apply. Valuable fruit information and 100 strings, by mail, for (forty-five) 45 cents in stamps.

C. C. Fouts, Middletown, Ohio.

Write Me for price if you want 100 or 200 colonies of bees in 8 frame hives, delivered in New York City or Havana, Cuba. I want 25 Carniolan queens October 1st.

W. L. COGGSHALL, W. Groton, N. Y.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

BEE CULTURE

ILLUSTRATED SEMI-MONTHLY
Published by THE A. I. ROOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

AUG. 15, 1901.

No. 16

WHEN A COLONY is ripe for swarming, says *Oesterreichische Bienenzeitung*, smoke is a reliable means to make the swarm issue. Sometimes a few puffs will start the swarm at once, sometimes it takes several minutes. This helps against several swarms issuing at once.

A BIG VEIL, I thought, would be a fine thing, so I had one made wide and long. Didn't like it at all. It flopped around loose and got in folds so I couldn't see well through it. I now prefer one as narrow as it can be for the hat-brim, and as short as it can be to pin down tight in front with a safety-pin.

DRONE DESTRUCTION is thus advised in *Revue Eclectique*: After dinner put a strip of excluder zinc at the hive-entrance; very early next morning, while the drones are chilled at the entrance, scrape them with a trowel into a dish of cold water. [This plan is all right if one happens to have chilly weather toward morning; but during the last two or three weeks, in most localities, drones would have been any thing but chilled.—ED.]

"IF YOUR BEES have plenty of honey in the hive, don't bother about feeding them now," p. 646. That's what I should have said two months ago; but I find there may be exceptions. The last half of July brood-rearing largely ceased in my colonies. In some of them were eggs and sealed brood, but no unsealed brood. In some were eggs, but no brood of any kind. Heavy with honey. I fed, not to start the queen to laying, but to start the workers to rearing brood, because I want bees for a possible moderate fall flow.

HERE'S THE WAY I fed my bees to start brood-rearing about July 22 (ought to have done it sooner); I laid 53 empty brood-combs on the bottom of the shop-cellar; filled them with water with a water-sprinkler; sifted handfuls of sugar over them; then several times a day sprinkled them again with water. Sprinkling water on the bees didn't hurt them a bit. The sugar was put on at night—about

25 lbs. each night. [I believe your plan is all right; but should not the beginner use some method of feeding in the hive rather than in a wholesale way as you describe, where all the bees can help themselves?—ED.]

I WONDER if that charge against black locust, p. 647, is not like the hue and cry raised against silver linden in Europe. Thousands of dead bees were found under the silver lindens, but it seems to be now agreed that the lindens had nothing to do with killing them. [I hardly think this can be true in this case. Several at Hanford, Cal., called my attention to the fact that the bees were found dead under the black locusts. I thought there must have been something wrong somewhere; but when F. E. Brown, a careful bee-keeper, corroborated the statement, I believed it; and yet the bee-keepers in Colorado told me the black locust was one of their good honey-plants, and that the bees had never been found dead under it.—ED.]

READING, p. 653, about that spring water at 44° to 47°, I fell to wondering at what temperature it would be best to have our drinking-water. Ice water, we are told, is certainly not the best to quench thirst. I went to the pump, and found the water fresh from the well was just 50°. I wonder if any thing colder than that is really desirable. [Perhaps you will remember that, about 15 years ago, I tested a good many wells for their temperature. The average, in and about Medina, was 50° Fahrenheit. Some went down as low as 45, and the temperature of the well seemed to be the same winter and summer, providing the water from the surface of the ground was 20 feet down. In California and Arizona, well water would be as high as 70°, and sometimes it would be almost as cold as it is here.—ED.]

COMPLAINT is occasionally made that bees do not gnaw the pasteboard off shipping-cages. Possibly that is because the cage is put in the wrong place. Bees can hardly be expected to gnaw the pasteboard if it is where they must go out of their way to get at it. The pasteboard end of the cage should be right on the brood, where bees are sure to be all the time. [You are probably right; but

to provide against the dying of the queen we now add to our directions specific instructions, when the pasteboard has not been gnawed within 24 hours to tear it off. By that time the queen and bees have had 24 hours' acquaintance; and even if they do release her within five or six hours she will probably be accepted all right. The object of the pasteboard is to prevent the bees from gnawing in to the queen before they have had an opportunity to become acquainted with her. As a general rule, when the cage has been properly placed the fibrous material will be eaten away, the candy consumed, and the queen released. The pasteboard, under the right condition, is a great improvement.—ED.]

A PUTTY-KNIFE seems the favorite hive-tool at Medina. Have you given the Muench hive-tool a fair trial? After using one for two years I wouldn't give it for fifty putty-knives. [Yes, I have used the tool, and so have our men; but in the course of two weeks they will lapse back to the putty-knife. This very morning I went out to the apiary to ask Mr. Wardell why he preferred the last-named tool. "Mainly because it is flexible," he said. By putting the square end of the knife on top of the top-bar, at a very acute angle, he can scrape off propolis and burr-combs, with less effort and jar to the frames, than if he used a blunter tool that will not bend. A thin blade will bend, forming an arc of a circle on the surface scraped. In this shape it will shave the surface clean and easily. If the steel is good, the thin blade can be inserted between the super and brood-chamber, and a very light twist of the handle causes a separation. Then a thin blade—one that is flexible—he thinks would enter a crack better than a sharp blunter blade that will not bend. The Muench hive-tool has a scraper on it at right angles, like the blade to a hoe; and when in the act of scraping, the scraper-blade necessarily has to stand at quite an obtuse angle, with the result that it jars the frame.—ED.]

WHEN BEES rear a young queen for swarming or superseding, a cell is built whose bottom is quite different from the bottom of a worker or drone cell, being smoothly concave like the inside bottom of a teacup. The cell is much larger than a worker or drone cell, its diameter being about $\frac{3}{16}$ of an inch. Because it is built of this large size *before* it is occupied, it is called a *pre*constructed queen-cell. After a *post*constructed cell is built out to a certain extent it is called a cell-cup, and many cell-cups are started that are never occupied. If a colony becomes queenless when no occupied queen-cells are present, the bees proceed to rear one or several queens from larvæ in worker-cells. The first change noticed in one of these worker-cells is that the outer part of the cell is enlarged, the walls having the appearance of being pushed apart so as to increase the diameter. Then a hood is built over the cell, and this is built downward to make the full size desired. In the meantime the larva has been lavishly fed so that it is floated out of the narrower part of the cell. Because such a queen-cell is built

from a cell *after* it has been started as a worker-cell and is occupied by a larva, it is called a *post*constructed cell. You may not always be able to tell from outside appearance whether a cell is *pre*constructed or *post*constructed, but you can always tell by tearing it down and seeing whether it has a smoothly concave base, or an angular and smaller base like a worker-cell. A *pre*constructed cell has an egg deposited in it, never a larva at the start. A *post*constructed cell is built over a worker-cell containing a larva, although in very rare cases it may contain an egg. [There, now we understand what is meant by *pre*constructed and *post*constructed cells. But there is not one reader in ten who has any knowledge of Latin; and if he does not, he may become confused as to the meaning of the terms; and, what is more, I do not remember to have seen the terms used outside of your own writings in any American bee literature. It strikes me that far better terms would be "emergency cells" and "swarming cells." The last named would take in the superseding cells as well as those built during the height of the honey-flow, when the bees are not compelled to do something on the spur of the moment. The first-named, emergency cells, would apply to those cups that are built when the bees find themselves suddenly deprived of a queen; for, under the stress of the condition, they hurry things. Why not adopt the simpler and more descriptive terms—or, rather, terms that will be more easily grasped and retained by the average farmer bee-keeper? You say that a *pre*constructed cell, or what I should prefer to call a swarming-cell, never has a larva deposited in it. Would that not seem to argue that, if the bees were given their own way, they would prefer an egg?—ED.]

August, month of drouth and heat,
Now o'er all holds sway;
Fields are brown as touched by fire—
All for showers pray.

L'APICOLTORE.

In the April issue, Mr. Dubini takes the following figures from GLEANINGS:

In the United States, out of 30,372 colonies visited by the inspectors 7253 were found to be infected with foul brood. They ordered 5972 to be disinfected, and 1281 destroyed.

Mr. Rauschenfels, the editor, says:

We should like to know what Mr. Charles Dadant would say to that, who, in 1895, wrote in the *Revue de Lyon*:

"I do not know on what document Mr. Rauschenfels based his assertion that the pest follows the American hive like its shadow, breaking out more rapidly there where the hive with movable bottom is in use; for, although I have used such hives for 33 years, and although I have opened them often to look for queens, etc., the very thing which, according to

Mr. Rauschenfels, will give foul brood, I have never yet seen a case of foul brood in my life, although this malady exists to a slight extent *here*, but is confined to a few districts; and, instead of tending to spread, it is disappearing, thanks to watchfulness and the ease with which frame hives with movable bottoms can be inspected."

Mr. Rauschenfels adds :

So frightful a proportion of infected hives among healthy ones is found in no other country.

Mr. Dadant replies as follows, which I translate from the French :

To reply to Mr. Rauschenfels, I should add that the under-scored word *here* does not refer to my home, but to the State of Illinois, as is shown by the words "few districts." I will add that the four inspectors appointed by the government went to New York, as, after having assisted at several apicultural congresses, it was decided that New York was the most badly affected. And even there they found the disease confined to a narrow district in the eastern part of the State, the middle and west having no traces of the trouble.

As to the proportion of foul-broody hives in the United States as compared with that of foreign countries, I may cite the case of Mr. Dzierzon, who lost, in one single year, 500 colonies, being able to save but 10, or only two per cent. One may read this in a letter written by Mr. Samuel Wagner, a German, who, some time after, founded the *American Bee Journal*. This letter was published by Mr. Langstroth in the third edition of his book.

In New York according to the citations above, the colonies attacked did not reach 25 per cent, and even the greater part of these were saved.

The thing that incites Mr. Rauschenfels to write those few lines is his belief that foul brood is of spontaneous generation; for we read in his "Bee and its Cultivation," 1901, page 100, that experience actually shows that the bad management of bees, etc., may lead to this disease without there having been actual contact. He cites, as proof, a certain bee-keeper who made an apiary, and carried to it, in June, 30 colonies. These were all attacked by foul brood, and died, as well as ten which he bought to replace them in the fall, and which he fed with honey from the colonies that died.

These things prove absolutely nothing. It is enough that one single colony should be diseased in order to impart to the others the disease. After hauling them, especially in summer, it is a common thing to find the bees of one colony mingled with those of another.

We have had hives the frames of which were broken in hauling, and others in an apiary which, not being sufficiently sheltered from the direct rays of the sun, had their combs melted; but none of these hives produced foul brood.

This disease is so rare in the United States that Langstroth never saw it; and although my son and I have visited numerous apiaries, neither one of us has ever yet seen a case of foul brood.

The hive with movable bottom, according to Mr. Rauschenfels, will not winter bees well outdoors. After having tried the cellar and the silo, we keep our bees outdoors, and our losses never exceed 5 per cent, yet the winters here are long and severe. A winter in this part of Illinois is considered mild when the mercury does not go below 4 degrees below zero, Fahrenheit; and 30 to 35 is not rare.

Aside from the points involved in the above, it is interesting as showing the tenacity with which old ideas cling to nations as well as to persons.

R. J. H., Ill.—It is hardly probable that the swarm you refer to in your letter of July 30 came out without a queen. The fact that you could not find her would hardly be evidence that the virgin or something that the bees regarded as a queen was not in the swarm. Some virgin queens are very small, and look so much like the worker bees that one might very easily overlook them.

CONFINING LAYING QUEENS A BAD PRACTICE.

Why Brood-combs should be Kept Out of the Extractor; the Difference in Colonies; Some Fair Criticisms from a Fair Man.

BY F. GREINER.

Mr. Editor.—I have just read your issue for June 15th, and I feel prompted to do a little criticising, or call a halt, as Mr. Doolittle puts it. Swarthmore says, on page 506: "The cut below is a drawing of an improved nursery-cage for the incubation of cells and the confining of virgin or laying queens." The words I wish to draw the attention of bee-keepers and queen-breeders to are at the end of the sentence quoted. They give rise to the questions, "Is it safe to confine laying queens?" and, "Do queen-breeders practice any such thing?" I have nothing at all to say against Swarthmore's cage. I believe it is good if rightly used; but against caging laying queens in them I must raise my voice. I have repeatedly proven to my satisfaction that a laying queen is more or less injured by confinement during a season when she would be most active. It does not make any difference, either, whether she is absolutely confined, or simply restrained by means of queen-excluding zinc. The injury is in proportion to the length of time a queen is kept confined. I believe queens suffer less by the rough handling in the mails than they do from the length of time the confinement lasts. The confinement in the mailing-cages during transit can not well be avoided, as bad as it is; but if to this we add days or possibly weeks of unnecessary confinement in nursery-cages, then good-by queen business. I for one would quickly drop any queen-breeder who stores queens in this wholesale fashion. The only proper place to keep laying queens is in small colonies; or, if they can be thus safely kept, in separate compartments inside of a hive where they may follow their natural inclination by depositing eggs.

I do not know that Swarthmore meant to have it understood that he advised or sanctioned the confinement of laying queens; but some queen-breeders who have not had the experience may conclude that it is a good way, and practice it. To sell such queens after some confinement would seriously injure his trade and his customers. I wish to denounce the method *before* it becomes a practice.

As to using these or any blocks for queen-cell starters, I am not so sure that they are the best thing for the purpose. I confess I don't like my cells *set into* a block or any thing else; and it seems to me more natural, and for the best development of the queens, if the bees have access to the cells on all sides, bottom included. Little blocks of wood with

cells attached to them are convenient in handling, and regular Doolittle cell cups may be attached to them instead of imbedding them. I greatly prefer it, any way, and I thus save the price of the press for making the depressions.

On page 507 E. H. Schaeffle says in regard to the difference in the working qualities of different colonies, "It is a well-known fact that some stands will put up several hundred pounds of honey in a season, while others in the same apiary will not give a pound of surplus." Really, has such a thing ever happened anywhere? If it did, would it not be jumping at a conclusion to say the reason for this difference is in the greater business integrity of stand No. 1? In another season stand No. 2 might outstrip stand No. 1. There are often some other conditions we do not understand that bring about different results. But now to the fact: According to my experience, *no such difference in stock exists*. If there is ever a very wide difference in the yields of two colonies, the principal cause lies somewhere else, and may have been overlooked. If we search carefully we may be able to find the real cause. I do not mean to say there is no difference in stock, but we need not look for such a wide difference. Progress is always slow. One of the best ways to test different strains of bees as to their honey-gathering quality is to hive new natural swarms of equal strength at the same time into empty hives, and watch results.

In speaking of straining extracted honey, Mr. Schaeffle says, a little further on, "When the honey is extracted it is run into a wire-cloth strainer that catches all small particles of wax, bees, and *grubs*." For the purpose the wire-cloth strainer is a good thing; but I am sure the great majority of consumers of honey would object to Mr. S.'s product provided they knew that a lot of *grubs* had been fished out of it. I myself don't think a bee-larva any thing horrible, yet I don't want it in my food any more than I do flies or fly-blows. Aside from this, if we extract from combs containing open brood, some larval food will find its way into the honey. Even in small quantities it will not serve to make our product any more appetizing. This extracting from combs with open brood in them should be denounced on all sides, no matter how widely it is practiced.

[It may be that the confinement of queens is injurious to them. If so, sending them by mail has its bad effects. It was Mr. W. Z. Hutchinson who once showed me his little three-section nuclei, 8 of them in one super, and above the screen of wire cloth, the same thing as is shown in the hands of Herman Raufuss in last issue, on page 633. When I called on Mr. Hutchinson he showed me how he was keeping a surplus of queens in these little nuclei over strong colonies—that is to say, he utilized the heat from powerful stocks to take care of eight queens. Each of these queens would lay a very few eggs, and, having a few bees, were confined by means of zinc until such a time as he might have an

order. While we have never confined queens in this way I should not have supposed that such a practice would have been at all injurious, because a queen can lay a few eggs; and to give her a little rest for a week or ten days I should suppose would be beneficial rather than otherwise.

With regard to Mr. Schaeffle's statement concerning one stock that would produce three or four hundred pounds of honey while another one would not produce a single pound of surplus, I suppose he had in mind the difference there is between colonies in the same yard, for there is a difference; but Mr. Schaeffle has, perhaps, made it much too strong. Some colonies, as we know in our own yard, will gather honey and fill supers while others will be disinclined to go into supers, or would store comparatively small amounts of surplus. Mr. Doolittle calls attention to the fact that one colony will store 30 lbs. more than another; and if this is so, it is important for us to breed from the strain that has more energy. For instance, the bees of our red-clover breeder keep on storing honey, even after the honey season; and this thing is true of the bees of the daughters of this queen. But it would hardly be fair to say that this one queen would produce 300 lbs. of honey while the mediocre stock would not produce one pound. But I think we do need to pay attention more to strains of bees than we have been doing of late; and the fact that beedom is now getting awakened is a rather healthy indication.

About straining extracted honey, I notice that, even when an effort is made to extract only from combs in the extracting-super, there will be occasionally a grub on the wire cloth of the strainer. This I saw in some of the best apiaries in California. The fact is, there will be occasionally little patches of brood unless perforated zinc is used under the super combs. But I believe your point is well taken, that it is a bad practice to extract from brood-combs, especially when those combs constitute all the brood-nest. There may be conditions that warrant it, but as a rule the practice should be condemned.—ED.]

SUGAR.

The Difference between Beet and Cane Sugar;
which is Better to Feed Bees?

BY W. K. MORRISON.

There seems to be a doubt in the minds of some that cane sugar is better than beet for feeding purposes, though European bee-masters have long since arrived at the conclusion that cane saccharine matter is always superior to beet. Though the bulk of the bee-keepers who use cane sugar could not give a sound scientific reason for the faith that is in them, I do not think that their experience lacks scientific proof.

In the first place, cane sugar is sweeter, just as Jersey milk is richer than Holstein milk; and for this reason alone it commands

a higher price. In the London market, Demerara yellow crystals always command a higher price than any other sugar; and, knowing this, the German refiners color their sugar with aniline dyes so as to imitate very closely cane sugar; but, like all imitations, it is not so good as the original.

Only a few days ago a grocer in England was tried for selling dyed beet sugar as "Demerara yellow crystals," and he was heavily fined. It was a test case, and the best legal talent was retained on either side; but the judge very properly decided that dyed German sugar was not Demerara yellow crystals as the customer had ordered, therefore the grocer was guilty of a fraudulent transaction.

According to the "theory" of expert chemists like Prof. Wiley, cane sugar is beet sugar, and beet sugar is cane sugar; but in practice this idea is worthless. The fact is, that plain common sense is a better guide. By the same process of reasoning, "saccharin," which is 500 times sweeter than ordinary sugar, ought to be "cane sugar" also, but it is not; and some countries have gone so far as to prohibit its use altogether as dangerous to the public health.

Some chemists, among whom stands Prof. Wiley, maintain that honey is glucose and glucose is honey; but he is a very poor judge indeed who can not tell the difference between the two. The chemists have been altogether too hasty in this matter, and I believe the very latest theories give the bee-keepers much more standing-room. What the chemists seem to forget is that honey contains small amounts of powerful substances that are not present in manufactured sugar, and, hence, to compare them is odious. Because the chemists can do nothing with these ethereal substances they have neglected them altogether, or set them down as "extraneous substances."

I do not believe any living chemist is smart enough to tell us what gives basswood or any other honey its distinctive flavor; therefore I hold that, until they can, all chemists should be careful in making round assertions with regard to honey. It is the same with sugar. The chemistry of sugar has been largely created by French and German chemists, and therefore favors beet sugar; yet we can read between the lines and see for ourselves "whether these things are so."

The best *white* sugar sold is very highly refined, be it cane sugar or beet. The bee-men of Europe carefully avoid it because, in the process of refining, it has been robbed of some of its finest constituents.

Here is an analysis of a good quality of highly refined cane sugar.

	Per cent.
Cane sugar, - - - - -	98.00
Glucose, - - - - -	.50
Water, - - - - -	1.00
Ash, - - - - -	.30
Organic matter, - - - - -	.20

Now notice the difference in a sample of muscovado sugar which has not been refined to the same extent.

Cane sugar, - - - - -	84.00
Glucose, - - - - -	6.00
Water, - - - - -	5.50
Ash, - - - - -	1.50
Organic matter, - - - - -	3.00

Notice the difference. The large amount of glucose makes it more agreeable to the bees, and the 3 per cent of organic matter contains flavoring extracts or ethers that give to muscovado sugar its honey-like flavor, so much appreciated by the bees. The first sugar is the best from a chemist's point of view, but from the point of view of a good Italian bee the muscovado is healthier, and nicer to the taste.

I believe that, in this matter, we have been too hasty in following the crowd. American and English housewives buy sugar from its look; but the careful bee-man ought to consider that bees do not judge by looks; and in buying a sugar with a high percentage of natural glucose he is pleasing the bees and conforming to their wants. For my part I believe the larger the percentage of glucose in sugar the better it is for the bees; and, seeing that it is cheaper than white sugar, why should we not use it?

Barbados makes large quantities of this kind of sugar, which is exported to New York to be refined into white sugar. It is the old-fashioned sugar, but nevertheless a good one for some uses. Jaggery, or palm sugar, would be better still; but it is not easy to get, being mostly produced in India. But any sugar having a high percentage of glucose ought to have the preference, as it is more readily assimilated by bees, being nearer their natural food, and therefore less likely to cause derangement to their intestines, ending in bee-diarrhea and perhaps other troubles. There is no trouble in getting all the muscovado sugar that is required, hence the way is plain.

Bridgetown, Barbados.

[This is one of the best if not the very best articles on the subject of cane and beet sugar we have ever published; and, moreover, it is stated so simply that any one, be he scientist or layman, can understand every point that is made.]

I have till recently believed that beet sugar answered all the purposes of general cane sugar; but while on my trip through California I was told that the large canning-factories on the coast positively will use nothing but *cane* sugar, because beet sugar does not give them the desired results.

Mr. Thos. Wm. Cowan, editor of the *British Bee Journal*, and, in fact, a great many of the bee-keepers in England, recommend cane sugar for feeding bees, in preference to beet, as they consider it a higher grade of sweet. But it seems to me reasonable that a beet sugar such as we have used here at the Home of the Honey-bees with excellent results for fifteen or twenty years will be equally good if not better. I have always supposed that nine-tenths of the granulated sugars on the market were beet, and that the average bee-keeper, in the United States at least, when he buys sugar for feeding, receives that sugar.

The table showing the analysis of the two sugars is very interesting. Now, I should also like to see an analysis showing the chemical constituents of refined beet sugar made in the United States. It probably would be very much like the muscovado sugar. Perhaps some of our readers are in position to give us a table that will show the exact analysis, for the purpose of comparison.

I have had several conversations with Prof. Wiley; and while I believe he has said that cane sugar and beet sugar were the same chemically, yet I feel satisfied that he recognizes that there is a difference. I also feel confident that he would not consider honey and glucose as one and the same. Indeed, he has published a pamphlet on how to detect glucose in honey.—[Ed.]

THE BEE IN LAW.

Qualified Property Right — How Acquired; Pursuing, Reclaiming, Replevin.—Article 2.

BY R. D. FISHER.

Having in a previous article laid down the general rules that govern property in wild animals, we shall endeavor to show how the general nature of this class of property is applicable to bees.

Bees are classed with and regarded as wild animals; therefore, as previously stated, a qualified property right may be obtained in them by reclaiming them and making them tame by art, industry, and education, or by so confining them within one's own immediate power that they can not, as a body or swarm, escape and use their natural liberty. Therefore, since bees are wild animals, and until reclaimed and hived no property right can be acquired in them, hived bees are the *bona-fide* property of the one who has reclaimed them, notwithstanding a temporary escape. So long as the owner can identify them they belong to him, and not to the owner of the soil to which they escape, although he can not enter the land to retake them without consent or committing a trespass. But even in such case it will be seen, during the existence of this qualified right, bees are under the protection of the law the same as any other property. Every invasion of this property is redressed in the same manner, and reclaimed after the same forms of law, as any other property of the same class.

Bees are regarded in law as a common species of property, an article of trade or barter, and the wildness of their nature by practice and art has become essentially subjected to the will and power of man.

FLIGHT AND PURSUIT.

In case a swarm fly from the owner's hive, his qualified right continues only so long as he can keep them in sight, and possesses the power to pursue them where he has a right to pursue, or otherwise positively and distinctly identify them. The difficulties in reclaiming bees after taking flight are many. The decisions of our courts furnish numerous peculiar

circumstances, and unfold the difficulties in reclaiming bees that have escaped from the hives or soil of the original owner. In the case of *Goff vs. Kiltz* (15 Wend. N. Y., 550), the New York Supreme Court held that, where a swarm of bees left the hive of the plaintiff, and went into a tree on the land of another, he having followed the bees and marked the tree in which they entered, while he had no right to enter upon the property to recover them without the consent of the owner, yet he could maintain an action of trespass and damages against a third party who entered the land, cut the tree down, killed the bees, and took the honey away.

Puffendorf, in his *Law of Nature*, chapter 6, says: "While bees are no doubt wild by nature, since their custom of returning to their hives doth not proceed from their familiarity with mankind, but from their secret instinct, they being in all other respects utterly unteachable, it is, nevertheless, one of Plato's laws, whoever shall pursue the swarms which belong to others, and, by striking on the brass, shall draw them with the delightful sound to settle near himself, let him make restitution to the owner." But it is held in a Scotch case (*Harris vs. Elder*, 57, J. P., 553), that reclaimed bees remain the property of the owner only so long as he is pursuing them where he is entitled to go, and that, if they come upon another's land, that person is entitled to prevent pursuit on his land, and becomes the owner of the bees if he hives them. This is not good law. As a general proposition, and by the weight of authority in this country, it seems that bees belong to the first party reducing them to his possession, and, while followed from the hive of their owner, and located by him, are held to be his property unless he abandons them.

The New York court, in the case of *Goff vs. Kiltz*, above, said: "They remain his property notwithstanding a temporary escape: the owner keeping them in sight, and marking the tree into which they entered, they belong to him and not to the owner of the soil." It was argued that the owner of the soil was entitled to the tree and all within it. The court said: "This may be true so far as respects an unreclaimed swarm. But if animals *feræ nature*, that have been reclaimed, and a qualified property right obtained in them, escape into the private grounds of another in a way that does not restore them to their natural condition, a different rule obviously applies. They are then not exposed to become the property of the first occupant or possessor after their escape. The right of the owner continues; and, though he can not pursue them without due process of law, without being liable for trespass, still this difficulty should not operate as an abandonment of the bees to their former liberty."

HOW RECOVERED — REPLEVIN.

Replevin is the universal remedy in the United States when chattels have been wrongfully taken or are wrongfully detained from a claimant, and he seeks to recover them *in specie* instead of satisfaction in damages. It is a

statutory action, and the statutes are considerably variant. (See Cooley's note to Blackstone Com., p. 144.)

Trover is the remedy by which, under the same circumstances, to recover satisfaction in *damages*, the defendant being allowed to retain the chattels as of his own property. Of this subject, however, we will speak later on.

Replevin, in modern practice, being a remedy for any unlawful detention of personalty, the same being delivered to the claimant upon security given, either to make out the injustice of the detention or to return the property, may be employed to recover bees which have swarmed and left his hive. Replevin lies for a swarm of bees. Fitz, N. B., 68.

RAMBLE 189.

Old Combs vs. Foundation; the Russian Drone Story.

BY RAMBLER.

"How d'ye do, Mr. Smith? Better get up here and ride if you are going my way."

"Why, bless me! how d'ye do, Rambler? certainly I am glad to ride with you. I am getting tired of this walking; and if you are going through Hollywood I will sit by you for a few miles."

"Yes, Mr. Smith, I am going through Hollywood, on over the Caluenga Pass, across the San Fernando Valley, over the San Susanna Pass, down the Simi Valley to Mr. Richardson's, a little short of 50 miles."

"I must say, Rambler, you have quite a drive ahead of you with a late start, slow road, and (I should judge) not a speedy horse. Don't believe you will make it to-day."

"Well, if I don't, Mr. Smith, I will make two passes at it."

"On some bee business, I suppose?"

"You may be sure of that, Mr. Smith. Bees and honey seem to be second nature to me. Whenever I try to get out of the business I get put back into it with such a sudden jolt that I am now inclined to stay there; and there is more and more developing in bee-keeping now than at any time before, and the business is decidedly interesting as well as profitable; and this journey of mine I suppose some of the progressives would call an old-fogy piece of business. You know I told you about the great scrape I had at Richardson's. Well, he had so many good combs that I thought might get moth-eaten before he could use them that I had a great hankering for them, and finally made a bargain with him for 500, and that is what I am after this very minute. The 500 will fill 50 supers, and you know that will give the bees a big boost right now."

"But, Rambler, you use the Heddon frame, and I suppose R. uses the L., and you will have to cut and trim and waste."

"No, Mr. Smith; R. uses a frame about 12 inches square; and by cutting through the center the combs will fit with but little waste."

"Ha, ha! Why, you are indeed an old fogy.

Don't you know it is a waste of energy to be transferring old combs when you can get plenty of foundation nearer home?"

"I am happy to say, Mr. Smith, that I don't know any thing of the sort. You see, bees will not draw out foundation for some weeks yet, and these combs can be put to use immediately; and then as far as combs are concerned I have used them when they were 20 years old. A comb is never too old for my use."

"My, my, Rambler! I have been led to believe if the combs are not renewed often the cells will get smaller and smaller, and the bees ditto, until they are no larger than gnats."

"Who led you to that belief, Mr. Smith? How long have you kept bees, and how many colonies have you?"

"Le'me see. I have 25 colonies; bought ten three years ago of Mr. Podovosky. He is an expert, and I have been led by him, as it were. He says we don't know much about bee-keeping in this country; but in Southern Russia, where he came from, they are very expert."

"Well, now, Mr. Smith, don't you be led by any such foolish notion as that. I will loan you a late issue of GLEANINGS, where there is an account of combs 40 years old, and still fit for use. And by the way, Mr. Smith, you need to take that bee-paper. It will be dollars for your pocket and sense for your head; you will then have no use for Russian experts."

"I'll think the matter over, Rambler, and talk with my wife about it; and if we agree on the subject we'll take the paper. And, by the way, that Russian told me that the drones commit suicide. What do you think about it?"

"What an idea, Mr. Smith! Why, anybody can see that the bees drive them out of the hives—actually tumble the poor things out."

"That's how it always appeared to me; but this Russian says the struggle between bees and drones is when the bees try to prevent the suicide, and that the cause of suicide is owing to their having a female to rule over them."

"That is a sad condition, Mr. Smith; but of all the queer ideas about bees, that takes the cake. I guess that Russian is an anarchist, sure. I know you do not indorse such things, Mr. Smith."

"Oh, no! I do not believe in these anarchistic ideas; but I didn't know but Mr. Podovosky was correct about the bees, seeing he claims to be an expert. I think my wife and I will have to take that paper; but, whoa! halt your horse, Rambler. Here I am, a whole block past where I ought to get off—got so interested in bee-talk I forgot where I was at. Good by, Rambler; hope you a pleasant journey and a profitable venture."

"Thank you, Mr. Smith; I am sure those combs will be of immense value to my bees. Sorry to lose your companionship."

As Mr. Smith surmised, I was late getting into the Simi Valley, and the shades of night settled down heavily when there were several

miles of the most difficult part of my journey to perform.

To ford a river several times, follow various windings in a canyon, and do several other things not comfortable to do in the dark, led me to consider the matter seriously, with the result that I drew up to the many buildings upon a big California ranch.

"I was assigned a portion of a bunk with a light-hearted Frenchman."

It was nearly 9 o'clock; but the men came rustling out with their lanterns, and the dogs set up a chorus of welcoming howls. I am not sure but the roosters began to crow. It is what they are likely to do in this land.

In answer to my inquiry about the road, the men said it would be utterly impractical to get through in such a black night as this. "Why," said one of the young men (the rancher's son, as I afterward learned), "I tried to ford the river a day or two ago at the old crossing, and came near drowning a horse. You are welcome to stay here, stranger; we have room in the bunk-house for you."

So these men did a "good Samaritan" act—took care of the stranger and his tired beast.

This was my first experience in a bunk-house with a crowd of ranchmen and cow-punchers, for this was a cattle-ranch with not less than a thousand head.

The buildings on a 5000 or 10,000 acre ranch approximate quite a village in appearance—the residence, several barns, tool-houses, shops, big corrals, and (the most interesting to me just now) the bunk-house. This is not a very elaborate or ornamental affair. This one was about 12×8 feet. The floor was somewhat littered with dogs, a saddle, now and then a strap or a lariat; but the distinctive feature was a series of bunks along one side, arranged one above the other like berths in a ship; but these, instead of holding one man, were designed for two in a berth or bunk. There were no spring mattresses in these bunks. In place of springs there was the soft side of a board made a little softer with a few blankets.

When bedtime arrived I was assigned a portion of a bunk with a light-hearted Frenchman. He turned in on the back portion of the bunk, hung a lighted lantern over his head and an alarm-clock over mine; lighted his pipe, and, as a preliminary to going to sleep, proceeded to smoke, and read the *Examiner*.

Well, between the novelty of the situation—dogs, fleas, and the alarm-clock, my sleep was in the nature of cat-naps, and I was, perforce, up early in the morning.

The men who gathered around the breakfast-table were a motley crowd—American, Spanish, Irish, and French. Each gnawed his bone in comparative silence; a large somber room, a large somber table, no table linen, no flowers, no ladies. The only redeeming feature was a young girl to bring in the hash.

The men were soon off on their horses for the distant cattle range, and that is the way things run on a big ranch, day after day. When I offered to pay for my entertainment, the young man refused acceptance—every thing was free.

I was soon crossing and recrossing the Simi, and it was almost as much as I could do to keep the trail in the daytime; but what would I have done in the night? Simply camped; and when we have the tools with us it is infinitely better than bunk-houses.

I surprised Bro. Richardson at an early hour in his 40-acre olive-orchard, and was forthwith given *carte-blanc* rights to take empty combs from the home apiary.

The 500 combs just fitted my wagon, the power of my horse, and the climb over the San Susanna Pass.

CROSSING SAN SUSANNA PASS.

In almost a week after my return those combs were all in use, and, from their acceptance by the bees, they were away ahead of foundation.

Whatever, whoever says to the contrary, when I can fit two pieces of good worker comb into a frame it will be done at any season of the year.

I will give your readers a glimpse of a portion of the Simi (*sc-me*) Valley and Mr. Richardson's home apiary. Note the largeness of the apiary. When the photo was taken there were 400 colonies. It is intended, I believe, to accommodate over 500. Note the vegeta-

tion—a variety—buck-brush, artemisia, purple and white sage, cactus, live oak, and away beyond. Yes, that valley used to be covered with the same vegetation that is near the apiary—lots of sage; but see what a usurpation the plow has made upon the rights of the bee, and the bee has no right to protest. The usurped land is now devoted to grain culture, and it is only a question of a little time when the rest of the level land will be usurped, and then the bees will hie away to the distant hills which are covered with a variety of vegetation; but even here on the accessible portions hundreds of cattle range to the detriment of honey-pasturage.

Away across the grain-fields, nearly three miles, Mr. Richardson has another large apiary, right in the hills, where the plow can not usurp, illustrated in GLEANINGS some time ago, and also in the A B C. A corner of the

NOTES OF TRAVEL.

A Visit with Udo Toepperwein and G. F. Davidson.

BY E. R. ROOT.

Everywhere I went it seemed as though I brought rain. When I got into Alabama I learned there had not been any showers for two months. The morning I left home it had poured hard, and for that matter all the way; and on arriving at the home of friend Jenkins I found I had brought the rain with me. Surely I would leave it behind I thought when I got over into Texas; but I had not been in the region of San Antonio for more than two or three days when it began to rain there. Prior to that, there had been a continuous drouth for two or three months. It got so that I told my friends along the way, that,

RICHARDSON'S HOME APIARY, SIMI VALLEY, CAL.

40-acre olive-orchard is shown at the right. The olive-tree has a little insignificant blossom, but the bees work upon it to advantage. Across another corner of the olive-orchard there is a new year-old railroad, the S. P. Coast Line; and instead of hauling his many tons of honey 20 miles or more he ships right from his door, so to speak, and so progress advances with steady tread.

The small photo shows the Rambler's load of empty combs crossing the San Susanna Pass. There is a clump of sage by the roadside, and many more among the rocks. Plow nor cow will ever usurp the bees' rights here. And, by the way, allow me to remark that this same San Susanna Mountain is being punctured with one of the largest tunnels in the country—over four miles in length, and on the before-mentioned Coast Line R. R.

if they needed showers any more, just send for me and I would bring them. Well, when I arrived at San Antonio, after calling on Mr. Scholl, as described in our last issue, there was every indication that there would be a hard shower; and, sure enough, there was one—a good hard downpour. But in the meantime my friend G. F. Davidson, of Fairview, who, knowing that I was to be in San Antonio at a certain time, had come up to make me a visit. He had been hunting for two days, not knowing I had gone up to see Mr. Scholl. When I reached San Antonio the second time he was awaiting me.

Mr Davidson, it will be remembered, is a queen-breeder as well as a honey-producer. I believe he owns, or did own, something like 800 colonies. He almost needs no introduction to the readers of GLEANINGS, yet I am

UDO TOEPFERWEIN.

glad to present him, not in his everyday work clothes, but in his go visiting dress. Perhaps there is no bee-keeper better known within 100 miles of San Antonio than Mr. Davidson, for he has traveled over a great deal of the territory, buying and selling honey as well as selling bee keepers' supplies. He had never visited Mr. Toepperwein, and so we together made arrangements to call on him at Leon Springs.

G. F. DAVIDSON.

But, who is Mr. Toepperwein? He is a young man fully six feet high, a giant in strength, full of enthusiasm, ambitious and honest. He has been in the bee business a number of years, but during the last year or two he has been devoting his whole attention to bees.

At the time of my visit he had only a small number of colonies; but since leaving there I understand he has, with his partner, Mr. A. Y. Walton, come into possession of over 400 colonies, and in the very near future will have

nearly 1000. The two have formed a partnership to take the business of the A. I. Root Co., and have opened a store at San Antonio for buying and selling honey, as well as for handling the Root goods. With them will be associated Mr. G. F. Davidson, and the trio expect to do a good business. So much for Mr. Toepperwein and his business connections.

It had been raining at Leon Springs, and it was not possible, therefore, to use the camera to any extent; but as soon as the drops had ceased to fall, and the clouds had cleared away a little, I asked Mr. Toepperwein and Mr. Davidson to step out into the bee-yard, as I desired to take pictures of them. Mr. Toepperwein came first on the docket. I asked him to stand near one of his favorite colonies in his apiary, stretch himself up to his full height, put on his blandest smile, and to assume for the time being that his best girl was looking at him, as I expected to turn on him all the eyes of the great GLEANINGS family.* He did so, and the camera records the result. The picture is a fairly good one, and shows him to be just what he is, one of nature's noblemen, a perfect specimen of rustic health, capable of any amount of hard honest work, and good enough to win the heart of any "best girl." His partner, Mr. Walton, I saw for only a few moments; but from what I can learn the two are well matched.

Just as I had finished taking the picture we heard the rumbling of distant thunder. Some more black Medina clouds were hanging ominously low. Over in the distance we had heard the patter of big drops. I told Mr. Davidson to fix himself up quickly—I wished to get a shot at him. There was no time to think—no time to do any thing; but I poised the camera as best I could, pressed the bulb, and then we three started on a run for Toepperwein's bee hive shop, in between the big drops that were beginning to come thick and fast. On arriving home I was sorry to find that the picture was "no good"—at least so poor I did not like to disgrace my friend Davidson, and I accordingly asked him to sit for a picture and send me one, which he did, which and we reproduce.

A NEW UNCAPPING-BOX.

How to Extemporize one Out of Old Hive Bodies;
Something about the Most Extensive Bee-keeper in the World.

BY HARRY HOWE.

Take a good tight hive and nail a cover to the bottom; then wax the track, and you have a fair capping-tank. For the box to cut the cappings into, take another and tack a piece of wire cloth over the bottom. Bring the edges of the cloth up inside of the hive-body some two inches or so, and tack a strip over it all the way around. This will leave it

* To be honest I don't know that he has any "best girl," but I thought if he hadn't any, that possibly, perhaps, I might find one for him, or, better still, one who, attracted by his good looks, would find him.

so that the bulge from the weight of cappings will come down into the lower body, which is used as a tank. By tacking the screen inside, the two bodies will fit close together and make a good joint. Then, too, none of the dripping honey will fall outside.

Put a piece of board across the top to rest the frames on while they are being uncapped. Then when you wish to leave it, a cover closes it bee-tight. This will hold enough for half a day's work if the cappings are cut up once in a while with the uncapping-knife, and this cutting helps very much in the draining.

In this way one gets the lower hive-body just about full from the cappings that the upper one will hold.

Have a pail of water and a good whetstone handy by, and keep the knife in perfect cutting order. Then when you cut, *cut*. Many people take off the cappings as though the combs were something precious, and not to be handled roughly. By cutting just into the honey one can cut much faster, and will have more wax. If a comb bulges, cut it down level. By putting eight in a ten-frame super they mostly do bulge some; but it is easier to take the honey from eight big thick combs than from ten thin ones.

W. L. Coggs shall has been listening to the fellow who advises out-apiaries. He now has them in Wisconsin, New Mexico, and Cuba, besides seventeen or twenty in New York. It is said that he also has his eye on the Philippines, and is planning a system to keep the boys extracting the year round. But he can not get *all* the honey. There are others. Doo-little seems to feel bad because we are selling more than we buy. His idea seems to be that true prosperity consists in producing \$500.00 worth of honey a year and buying \$600.00 worth of groceries and clothes. Then perhaps he has been hearing Niver talk about single tax. A man who can talk people into buying buckwheat honey in preference to Cuban bellflower, and who can sell "blue sky" by the township, should not talk politics.

Osburn's figures on increase and bee-loads is a trifle startling, but he meant all right. In this locality one bee often gets a load from one bellflower in the morning, and in the afternoon it may take very many.

When the long tongues are a fixed fact, then breed from the best hustlers among them, and there you have it. One of nature's laws seems to be that the offspring from parents that vary from their parents are more apt to vary. Or, to put it another way, variation is a characteristic itself. For instance, "five-banders" would be more apt to vary than black; and five-banders with long tongues more yet. For this reason, in-breeding is necessary to fix the desirable change when once it is achieved.

Artemisa, Cuba.

[Your uncapping-box is so simple that any one can make a good one out of the material at hand.

That man Coggs shall if he keeps on will have more bees than any one else in the world, if he has not already; but one should

look out and not get too many at "long reach." It is one thing to manage a business when one can give his personal supervision, and another when he has to depend on hired help a thousand or more miles away. This is not intended as "gratuitous advice" to Coggs shall, but to some others who might attempt to follow his example. Coggs shall is a good business man, and where he would succeed others might fail.—ED.]

HOME-MADE HIVES.

Suggestions for a Simple Method of Transferring; Hive-covers Boiled in Linseed Oil; that Cheap Land in Florida; Comb Honey vs. Extracted.

BY E. H. SCHAEFFLE.

In home-made hives the strip cut out at the ends warps badly. To remedy this defect I have made some hives in which the ends come up to the bottom of the rabbet, and a strip is then nailed on that extends across and secures both the end of the rabbet and the side of the hive. This saves material, labor, and effectually prevents warping.

I have this season transferred bees by smoking them down on to other frames, then slipping a queen-excluding zinc under, and, when the brood has all hatched out, placing a bee-escape board on, running the bees all down, and leaving the old combs free from bees to be taken to the bee-house and cut out at leisure. No dead bees, no smear, no stings.

Bottlers of honey tell me, "We can take one can of your honey and add three of glucose to it, as it has a strong honey flavor,

while the honey from other sections will not take more than can to can." I think this difference is largely due to the fact that the tasteless honey was thrown out by the extractor as fast as it was brought in, and then evaporated by sun heat. The heat of the sun dissipated the flavor. With me the honey is allowed to remain on the hive until it is heavy in body. Honey with an objectionable flavor I have corrected by heating, thus evaporating the rank taste and odor.

If it is desired to have the bees build comb while storing honey, I find placing a frame with a starter only, in the center of the brood-nest, where the cells will all be worker, a better plan than to "cut deep" in extracting. The cappings are worth but 26 cts. when melted into wax, while the drawn combs are worth \$1.00 a pound. I do not mean that old combs are worth this per pound, as they are heavy, but light new combs the same weight as the cappings.

Lumber boiled in linseed oil is almost waterproof. Why not make hive-covers of the ventilated type, and boil all the parts in oil? It would cost a little more at the start, but the wood would absorb but little paint, while the covers would be almost indestructible. If you would test the matter, take two pieces of a section; boil one in oil, and soak the other in water; now expose the two to the sun's heat, then soak both in water, and observe the difference when exposed to the sun.

Mr. Root's description of the 50-cents-an-acre lands of Florida, with water on tap, caused me to ask, "Why don't they raise alfalfa, and feed it to stock?" Land of that description is worth a hundred dollars an acre for alfalfa, anywhere in the United States. Alfalfa would in that climate produce four to six crops, and make four to eight tons of hay to the acre. Fed to stock it would bring, in cattle or pigs, \$5 to \$10 a ton, at the least. Hogs thrive as well as cattle on green alfalfa, and do well on it when dry, if cut and steamed.

There may be sections where comb honey can be produced to as great a profit as extracted. Where this is the case, comb honey should be given the preference, as it commands a better sale, and can not be injured by the substitution of glucose. With me, while all stands produce a certain amount of extracted honey, only the very strongest will build comb honey; and the proportion of comb, when compared with what they would produce of extracted, is so small that extracted at 5 cts. a pound pays better than comb at 25. For this reason starvation would stare the bee-keeper in the face who ran all for comb honey, in this section. What is wanted is not less extracted honey, but less glucose sold for extracted honey.

Murphys, Cal., May 15.

[Very possibly your method of making a rabbit would be an improvement; but I should expect checking or splitting at the nails in time, in your climate—the nails that secure the rabbit in position.

The next time bottlers of honey tell you that they can take one can of honey and

three of glucose, etc., quietly give me their names, if you can get them to make the statement in the presence of several witnesses. They are just the chaps we should like to get hold of. I am aware that your California pure-food law has recently been made a dead letter; but if we get strong enough evidence we may be able to do something, even under the law, emasculated as it is.

I have no doubt that hive-covers boiled in linseed oil will prove to be very durable. This suggestion may be worth a great deal to the bee-keepers of California and Colorado, as well as other States where the climate is very dry and warm.

If extracted honey brought 5 cts., and comb honey 25, I do not see why it would not be more profitable to produce the latter, twice over.—ED.]

MARKETING HONEY; MARKET QUOTATIONS IN GLEANINGS ENDORSED; SELLING OUT-RIGHT AND SELLING ON COMMISSION; ORTHODOX ADVICE.

"You know, Doolittle, that you told me to grade, crate, and get my comb honey ready for market a few weeks ago."

"Yes, I remember."

"Well, I have it all done, and now I come over to have you tell me how I'd best market it."

"In telling you regarding this matter I would say that much depends upon the amount of honey you have and your surroundings. If not more than from 100 to 500 pounds, probably you can dispose of it in our nearby towns and to the farmers."

"Perhaps I might dispose of part of it that way."

"Yes, I think you can; but before disposing of any of it you wish to know what to ask for it, not selling it too low, nor ask so much for it that you can not dispose of it at all."

"But how am I to know about what price to place on it?"

"To know in this matter you should take some paper which gives a reliable report as to what honey is selling at in our large cities; and I know of nothing more accurate as to reports, or that takes more pains to ascertain the truth in these matters, than GLEANINGS IN BEE CULTURE."

"I am glad to hear you say this, for I take GLEANINGS."

"Very well. Find the quoted price for each grade of honey which you have, in the city to which you would send your honey, did you ship any away, and then figure the expenses for freight, cartage, and commission out, and you will have what it is worth at your nearest railroad station. For example, the rates on comb honey from Skaneateles to New York city is fifty cents per 100 pounds.

As this is gross weight, we find by a little figuring that about 55 cents per 100 lbs. is what the freight will cost, and the cartage will bring it up to 60 cents. Quotations during the months of July and August are generally little more than nominal; but from them we will guess that fancy honey will bring from 13 to 15 cents this year. But unless your honey is exceptionally fine I should not put it above 14. Then as most commission men charge 10 per cent for selling, we have \$1.40 as the cost of selling 100 lbs. This, added to the 60 cents freight and cartage, makes a cost of about 2 cents per pound to get our product to market, and the cash for it in our possession, so that, on the basis of these figures, if you can not sell the honey you have in Skanateles and surrounding towns at 12 cents per pound, you had better send it to New York."

"Well, I had never thought of reasoning it out in that way. I thought I ought to have 13 cts. for it, or only one cent less than New York quotations."

"It is an old saying, that 'a nimble sixpence is better than a slow shilling;' and I fear you will find that your honey will go very slow at 13 cts., while it would sell rapidly at 12 cts. Then there is a possibility that, when the market comes to be established this fall, honey may go still lower than the nominal prices we have used, in which case it would be better to move it off rapidly by putting the price at 11½, where a party would take a whole crate. But there are some other things I wish to talk about a little."

"What are they?"

"You said, the last time I saw you, that you had thought you would have three or four thousand pounds of white comb honey."

"Yes, and upon getting it crated I find I have nearly 4700 pounds."

"You do not think you can dispose of all of that in the towns about you, or in the 'home market' as it is called?"

"No, probably not more than 1000 pounds."

"Well, what are you going to do with the rest?"

"I thought I might sell it to some dealer, if I could get the price I asked for it."

"And what were you going to ask for it?"

"I had calculated to ask 13, the same as in my home market. Would not this be right?"

"After getting at the real value of my crop, as nearly as I can by the line of figuring we have been using, I have always placed the selling price, at my nearest railroad station, at one cent per pound less than I thought it would bring when sold on commission."

"What is that for?"

"My reasons for so doing have been that there is some risk always in shipping on commission, which risk you do not have to run when you sell for cash. Then in selling outright I have the money at my disposal and can often invest it so as to make more than the penny a pound would amount to before a return was made from the commission men, because this selling on commission sometimes proves to be a slow process of disposing of our product."

"But can you always get cash at the railroad?"

"No, not always, and I might say not often; and this is the reason why I have not oftener sold my product, instead of shipping on commission being the rule. I always demand cash at the railroad, when sending to a person I do not know; and if I spoke my mind freely I should say that this is best always, as right wrongs no man. I much prefer to wait a few weeks or months on the commission men to waiting a few years, or never getting any pay of a dishonest buyer."

"Did you ever have any experience with dishonest buyers?"

"Years ago I not only sold my own crop to a buyer in Philadelphia, but bought several thousand pounds from neighboring bee-keepers for the same party, and was foolish enough to let it go with the promise to pay on its arrival at Philadelphia, but 'arrival' proved to mean five years, and I got it then only through strenuous efforts. Thus I learned a lesson which I have tried to profit by."

"I am very glad to have had this talk with you, and I will try to profit by your experience also."

"Before you go, allow me to sum up a little: I would say always, put up your honey in the most attractive shape possible, grading each kind of honey into at least three grades, and sell as much in the home market as possible at from 2 to 2½ cents less than reliable market quotations from the large cities. If you have more than can be disposed of in this way, sell the rest for cash if you can obtain as much for it into a cent a pound as you think it will bring you when shipped on commission. If you can not thus sell what you have above what your home market will take, ship on commission to reliable parties."

QUESTIONS ON SWARMING.

Mr. Root.—Will you please publish the full law on bees in the State of New York?

1. What is the reason bees cluster out on the front of an old hive, as mine have been doing for the last week?

2. Is there any way of telling from which hive a swarm issues if you do not see it come out of the hive?

3. What is the cause of swarms leaving the hive after they have been hived? They have been hived three times within three days, and each time left.

4. What is the cause of water on top of super of sections in summer, as the roof doesn't leak? It is one of those ventilated gable roofs, with an air-space; and in the winter, when the snow is blowing, it will collect in the air-space, and stay there until there comes a warm day; then it will melt, and run down through the bottom of the roof and on to the

bees; and the frames too are wet with it. Is there not a way to remedy it?

CHAS. MAC DONOUGH, JR.

Shokan, N. Y., July 22.

[The New York State law to which you refer is doubtless the one relating to foul brood and other brood diseases. We gave the whole text of it on page 365, May 1, 1899.]

1. There are several reasons why the bees may be induced to cluster out: Too small an entrance; a hive that is not protected from the glaring rays of the sun; a hive that is too small; a poor season. Any one of these, especially if there are two or three in combination, will force the bees out of the entrance and cause them to loaf during the day. The remedies are obvious.

2. No, not unless you can discover the hive, around the entrance of which the bees are acting queerly. A few bees will become demoralized, run about, and there may be a string of bees from the swarm in the air to the entrance of this hive. A practical bee-keeper will often locate the hive from which a swarm has issued by the way the bees behave around that particular hive.

3. Very often a newly hived swarm will come out again, not once, but two or three times after they have been hived. It is usually advisable to give swarms a frame of unsealed brood, with a little honey; but even then they will sometimes come forth. It is then advisable to hive them in an entirely different location—one that is well shaded, and in a hive that is roomy, with a large entrance, not forgetting the brood. But when any swarm behaves in this way it is advisable to clip the wing of the queen at the time of hiving, if she can be found.

4. The water could hardly have come from melted snow as late as summer. If I understand your locality, the snow would have all melted months before. The moisture is probably due to the warmth of the bees coming against the super cover, and in contact with the cool air of the previous night. Many and many a time I have noticed the exact size of a cluster of bees by the moisture on top of the cover. In such cases the night had been cool, and in the morning there would be a sort of sweat, as around an ice-pitcher, right over the exact spot under which was the cluster of bees—ED]

WINTERING BEES IN A LARGE CELLAR; THE EXPERIMENT AT THE HOME OF THE HONEY-BEES.

I was very much interested in your indoor wintering as described in GLEANINGS, in your cellar partitioned off from the main apartment. Now, do I understand that the only provision for ventilation was what would percolate through the sacking? How did they compare with the outdoor colonies, as to building for the harvest?

I am thinking of partitioning off a space like that in one end of my cellar under the store. Vegetables, etc., are kept in the main part of the cellar. Would you recommend it with your present light? I have always win-

tered outdoors with hives packed, but do not like it. The winters are too severe.

GEO. SHIBER.

Franklinville, N. Y., Aug. 6.

[We were very much pleased with your experiment in wintering bees under the machine-shop, as described in GLEANINGS, pages 195, 246, and 400. They came out in fine condition, were much stronger, and were in better condition for the honey-flow when it came—much better.]

There is no reason why you could not secure the same results we did, providing you see to it the temperature does not go below 40 nor above 55, for that is the range that prevailed in our cellar; but on account of the large number of potatoes we had in other parts of the cellar we opened and closed the windows quite frequently. During very warm spells, when the temperature was above freezing we kept the cellar closed to keep in the cold air; then when it became quite cold, and the temperature went up a little too much, the windows were opened.

But it should be understood that the bees were in a compartment *wholly within the cellar*, and the potatoes were stored in the space around the compartment or room in which the bees were. We closed up the space or ends of this room by means of sacking or burlap, two or three thicknesses, one over the other. The bees were scarcely examined all winter except to note the variation in temperature occasionally; and the number of dead bees was the smallest I have ever seen. In fact, one could almost walk on his tip toes without stepping on dead bees. The colonies were kept in the cellar until it was so warm outside that one could almost rear queens, and we kept them there late just to see how long they would remain and keep quiet, even after other bees were gathering pollen from natural sources outside. We shall, the coming fall, put in twice the number of colonies; and as the cellar is 36×96 we do not consider that the increase in numbers will make any practical difference so far as the atmosphere of the general cellar is concerned.

I think one secret of the successful wintering is due to the fact that the cold air came into the outer compartment of the cellar, and then gradually percolated through the burlap (after it got warmed up) into the place where the bees were. The result was, there was no sudden change of temperature, and plenty of fresh air.

I am satisfied now that one trouble from indoor wintering is that cellars are often too small for the number of colonies accommodated. One may put 150 colonies into a cellar 10×10; but the cubic capacity of air for so many bees is altogether too small to get good results. In our machine-shop cellar there were only 30 or 40 colonies in a cellar 36×96, although the bees themselves were confined in a room the two ends of which were shut off with burlap, not larger than 8×8. But, understand that, although this room itself was small, the air could circulate through it and into it from the big cellar on the outside.

I imagine one would get about the same result with only 10 colonies in a 10×10 cellar; or in the cellar you speak of, under the store, you could probably put as many as you required, as the cubic feet of air would be sufficient to keep the bees in the inner compartment in good condition, provided the windows were opened and closed occasionally to keep the cellar as cold as possible, and above the freezing-point for the protection of vegetables. I do not think that the presence of vegetables, provided there are no bad smells, would do any harm.—Ed.]

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chapinville, N. Y.; J. M. Hambaugh, Escondido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

QUEEN-REARING this year at the Home of the Honey-bees has been progressing very smoothly. The honey-flow was good; then after the main crop was secured, red and sweet clover came in, giving the bees something to do every day, and they are still working so that robbing is not annoying to the extent that it interferes with our queen-rearing operations.

We are beginning to get good reports of the German wax-press. Already it would appear that in most cases the machine will pay for itself in one or two days' time because it makes use of and turns into cash the material that hitherto has been thrown out in the garden, and considered as so much waste. A machine that can coin gold dollars out of nothing is worth its price and keep.

The Root Co. especially invite visitors on the way to or from the Pan-American to stop at Medina and see their apiaries as well as inspect their methods. We have one yard of over 500 colonies, and another one of about 50. Both are in exceptionally fine condition, and are almost as orderly and neat as a city park. Our Mr. Wardell has charge of the bees, and is beating all our previous records.

ON my spare evenings I am developing the pictures that I took on my western trip. I have gotten about half way over the series, and I am glad to say they are fine. Most of the pictures were taken with the time-shutter and smallest stop, with the result that there will be a sharp focus and good strong con-

trasts. Many of them will be reproduced in GLEANINGS.

WE have not yet put up our queen-mating cage, for three reasons. First, the great expense involved; second, the doubt as to whether it will work after the money is paid out; third, lack of time. To make a thing of that kind work, one must have infinite faith in it. I still believe that it will work; and if I can get time to give it my personal attention I will try it on a small scale and then on a larger one.

THE Home of the Honey-bees is being enlarged again this year. We expect to have masons at work in a few days putting up a wax-working building, one that will be fire-proof, and devoted exclusively to the manufacture of fine grades of foundation. There will be other additions to some other departments. Another new printing-press has been ordered. A new automatic machine is just being completed, and some special machines will be purchased in the near future.

Do not forget the big convention at the Pan-American, Sept. 10, 11, 12, Tuesday, Wednesday, Thursday, commencing on the first day in the evening. The place of meeting is the Buffalo Library Building, corner Washington and Clinton Streets, near the business center of the city. This promises to be one of the best-attended conventions we have ever had. The meeting at Chicago was nearly 500 strong. Let's break the record at Buffalo.

IN our last issue I referred to the fact that the editor of the *Rural New-Yorker* would speak at the joint session of bee-keepers and fruit-growers, on Thursday evening, Sept. 12. In doing so I referred to his name as Collington instead of Collingwood. Our readers will please take note of the correction, and remember that Mr. Collingwood's address will be something exceptionally interesting. At this session there will be other speakers who will be well worth hearing.

MR. W. A. SELSER, the honey-man of Philadelphia, writes that, so far as his locality is concerned, there is more honey than last year; and he fears that, if bee-keepers in the East go on the assumption that the crop is as scarce as last year, they will be waiting in vain for high prices. He says he has had many more offerings up to date than a year ago.

But this would apply only to the extreme East. The central and western markets, as nearly as we can judge, will be about on a level with last year.

A PARAGRAPH of the honey reports as given in our last issue was inadvertently omitted. In substance it stated that the information was based on a 6000-mile trip in the West, and on something like 400 or 500 reports that had been received from all sections of the country. Our honey-man, Mr. Boyden, sent out blanks to many of the largest honey-producers and buyers of the country, represent-

ing all the best honey territory of the United States. The statement that we gave in our last issue I think, therefore, was as nearly correct as it is possible to make it after making every effort to get all the information possible.

A CORRESPONDENT asks if we have ever seen drone brood affected by the disease known as foul brood. Personally I have always been under the impression that this malady is no respecter of persons; but just at this moment I can not be positive that I have ever seen a case of rotten drone brood. If there are any of our subscribers who have found combs of worker brood that were badly diseased, and in the same frames patches of drone brood perfectly healthy, will they please let us hear about it? I can not believe that the microbes would destroy the larvæ of one sex and leave those of the other untouched. If they do, then it must be because the drone brood has slightly different food, rendering it immune.

IN our last issue and this, the Rambler seems to have struck some of his happiest veins of writing. As I went through California some of my friends would say, "Why, that man Rambler is an ordinary-looking sort of a duffer, isn't he? One would not think, to see and talk with him, that he could get off so much fun in his writings." At other places I heard a remark something like this: "Why, when I saw Rambler I expected to hear him talk funny all the time; but he didn't. He talks kind o' quiet, and is just as sober as an old deacon." But J. H. Martin hardly ever goes through any territory without being recognized at once. "Why, this is Rambler, isn't it?" and Mr. Martin, who introduces himself as Martin, very modestly pleads guilty.

THE TAUNTON BEE-CASE; BEES VINDICATED AND DEFENDANT DISCHARGED.

THE following note, just received from W. F. Marks, a Director of the National Bee-keepers' Association, will explain itself:

Mr. E. R. Root.—The Rochester bee-keepers win! See inclosed clipping from a Rochester paper.

I notice that you are publishing a series of articles on "The Bee in Law." I hand you herewith a copy of a New York case. As the court wrote an extended opinion, citing many authorities, I consider it one of the most satisfactory court opinions in a bee way on record.

Chapinville, N. Y., July 22.

W. F. MARKS.

This is the clipping to which Mr. Marks refers:

The celebrated case of Mrs. Eliza Taunton, charged with keeping bees within the city limits in violation of a city ordinance, was called in police court yesterday morning. The arrest was made May 28th, and since that time the case has been called and adjournments granted until both sides finally announced themselves ready for trial. Attorney Callahan prosecuted the case, and Attorneys Dutcher and Barhite acted for the defense.

The case was argued at some length a week ago. Attorney Barhite declared that the ordinance was unconstitutional, as it tended to give administrative powers to private individuals in a case where the law did not work with equality to all. It was held that the council had no right to so delegate such powers, therefore the ordinance was invalid.

On the other hand, Attorney Callahan cited the barbed-wire ordinance as a sample of what could be done in the line of administration by consent. The court requested the attorneys to file briefs, which was done.

Yesterday Attorney Barhite made a motion for the discharge of Mrs. Taunton, and the motion was granted. The court agreed with the attorney that the council had exceeded its rights in granting administrative powers to private citizens, and for this reason the ordinance was said to be invalid.

The ordinance says that no person shall keep bees within the city limits, and at the same time provided that if the consent of all the people within 100 feet of the place where the bees are kept is obtained, it is within the law to keep bees. This delegation of power on the part of the council was the part which Judge Ernst thought made the ordinance void.

Next follows the decision, which is very full, and so valuable that I place it before our readers in its entirety. I will have copies of this struck off, and furnished to the General Manager of the Association, who can use them in other cases that may arise.

SUPREME COURT, STATE OF NEW YORK—EARL VS. VAN ALSTINE.

One who owns or keeps an animal of any kind becomes liable for any injury the animal may do, only on the ground of some actual or presumed negligence on his part.

It is essential to the proof of negligence, and sufficient evidence thereof, that the owner be shown to have had notice of the propensity of the animal to do mischief.

Proof that the animal is of a savage and ferocious nature is equivalent to proof of express notice. In such cases notice is presumed.

The owner of bees is not liable, at all events, for any accidental injury they may do.

Where, in an action against the owner of bees for an injury done by them to the plaintiff's horses while traveling along the highway past the place where the bees were kept, it appeared that the bees had been kept in the same situation for eight or nine years, and there was no proof of any injury ever having been done by them, but, on the contrary, witnesses residing in the neighborhood testified that they had been in the habit of passing and re-passing the place frequently, without having been molested. It was held that this rebutted the idea of any notice to the defendant, either from the nature of bees or otherwise, that it would be dangerous to keep them in that situation, and that he could not be made liable.

This action was commenced in a justice's court. The complainant alleged that the defendant was the owner of 15 hives of bees, which he wrongfully kept in his yard adjoining the public highway, and that the plaintiff's horses, while traveling along the highway, and passing the place where the bees were kept, were attacked and stung so severely that one of them died and the other was greatly injured, etc. The answer denied the charge contained in the complaint.

Upon the trial the keeping of the bees as alleged, and the injury to the horses, were proved, and the plaintiff recovered judgment for \$70.25 and costs. Upon appeal to the county court of Wayne County this judgment was reversed, and the cause was brought to this court by appeal from the judgment of the county court.

By the court, Selden, J. This case presents two questions: 1. Is any one who keeps bees liable, at all events, for the injuries they may do? and, 2. Did the defendant keep these bees in an improper manner or place, so as to render him liable on that account?

It is insisted by the plaintiff that, while the proprietor of animals of a tame or domestic nature, *domilia natura*, is liable for injuries done by them (aside from trespasses upon the soil) only after notice of some vicious habit or propensity of such animal; that one who keeps animals *feræ naturæ* is responsible at all events for any injuries they may do; and that, as bees belong to the latter class, it follows, of course, that the defendant is liable.

In order to determine this question, upon which no direct or controlling authority exists, that I have been able to find, it becomes necessary to look into the principles upon which one who owns or keeps animals is held liable for their vicious acts. It will be found, on examination of the authorities upon the subject, that this classification of animals by the common law into animals *feræ naturæ* and *domilia naturæ* has ref-

erence mainly, if not exclusively, to the rights of property which may be acquired in them, those of the latter class being the subjects of absolute and permanent ownership; while in regard to the former, only a qualified property can exist, and the distinction is based upon the extent to which they can be domesticated or brought under the control and dominion of man, and not at all upon the ferocity of their disposition, or their proneness to mischief. For instance, the dog, some species of which are extremely savage and ferocious, is uniformly classed among animals *domitæ naturæ*, while the hare, the rabbit, and the dove are termed *feræ naturæ*, although comparatively harmless. It would not be rational to suppose that a classification adopted with exclusive reference to one quality of animals could be safely used to define and regulate responsibilities growing out of other and different qualities; nor would it accord with that just analysis and logical accuracy which distinguish the common law, that it should be resorted to for that purpose. And although some dicta may be found in the book which might seem to countenance the idea, the decided cases do not lead to any such conclusion.

It is unnecessary to enter into any examination of the cases which establish one branch of the proposition contended for, to wit: that, in order to make the owner of a domestic animal liable for any violent injury done by them unless connected with a trespass upon land, it must be averred and proved that the defendant had notice or knowledge of the mischievous nature of the animal. This, as a general rule, is settled by a series of decisions which have been entirely uniform from the earliest days to the present time. But although, in many of these cases, most of which are cases of injuries done by dogs, the words *domitæ naturæ*, or equivalent words, are used to describe the animals for the mischief done, by which their owners would not be liable without notice; yet it is not alone because they belong to that class that the exemption arises, but because animals of that class are usually of a harmless disposition. I apprehend that, if a person chooses to keep a domestic animal, as a dog, which is naturally savage and dangerous, he does so at his peril, and that he would be liable for any injury done by such dog without evidence that he had ever done mischief before. This position is not without authority to support it, although it does not rest upon any adjudged case. In *Judge v. Cox* (1 Stark, 285), Abbot, J., suggests the question, but expressly reserves his opinion upon it as unnecessary to the decision of that case. But in *Hartley v. Harviman* (1 Barn & Ald., 6.0), which was an action for an injury done to sheep by dogs, the declaration contained a special averment that the dogs were accustomed to worry and bite sheep; and the court held that this averment was not supported by proof that the dogs were of a ferocious and mischievous disposition. But Lord Ellenborough and Mr. Justice Bayley both said that it would have been sufficient to allege generally that the dogs were of a ferocious nature, and unsafe to be left at large, and that evidence of that fact would support the action. These dicta are so obviously in accord with common sense and reason that they will undoubtedly be sustained whenever the question shall arise. It is true that, in a case of injuries done to sheep, our statute makes the owner liable without notice, provided the sheep are killed, but principle would apply to any other injury.

But while, as I have said, the cases which define the responsibilities of the owners of domestic animals are very numerous, those which apply to the liability of the proprietor of wild animals are rare. It has been assumed, rather than decided, that the latter class are kept at the peril of their owners. In *Rev v. Huggins* (2 Ld. Raym 1583) it is said "There is a difference between things *feræ naturæ*, as lions, bears, etc., which a man must keep up at his peril, and beasts that are *mansuetæ naturæ* and break through the tameness of their nature, such as oxen and horses. In the latter case the owner must have notice; in the former, an action lies against the owner without notice." The case in which this was said was an indictment for murder; but the language here given is copied and adopted by Buller, in his *Nisi Prius*. (Bull. N. P., 77.) It will be observed that, while these authorities speak of a whole class, "things *feræ naturæ*," yet the example given is that of lions, bears, etc.

So in a late case in our own courts, *Van Leuven v. Lyke* (1 Comst., 516), Judge Jewett, after stating the rule in respect to domestic animals, says: "But as to animal's *feræ naturæ*, such as lions, tigers, and the like, the person who keeps them is liable for any damage they may do, without notice, on the ground

that by nature such animals are *feræ* and *dangerous*." Here the learned judge, although adopting the same classification, yet states the true ground of the owner's responsibility. The substance of the rules as given by him is, that one who keeps lions, tigers, or other fierce and dangerous animals, is liable at all events for any injury they may do. The words *feræ naturæ* add nothing of any value to the rule, but rather tend to mislead, as they are descriptive of many animals that are not ferocious or dangerous.

Peake, in his work on evidence, under the head of "Actions Founded in Negligence," has the following: "If one man keeps a lion, bear, or any other wild and ferocious animal, and such animal escape from his confinement and do mischief to another, the owner is liable to make satisfaction for the mischief so done, without further evidence of negligence in him; for every person who keeps such noxious and useless animals must keep them at his peril. On the contrary, if a man has a dog, a bull, or any other domestic animal such as are usually kept, and are, indeed, necessary to the existence of man, no action is maintainable without proof of knowledge, etc.; for without such knowledge no negligence or fault is imputable to the defendant." (Norris Peake, 486.) Three things are worthy of notice in this extract. In the first place, the author mentions animals that are not only wild but ferocious, and speaks of them as not only noxious but useless. In speaking of domestic animals he dwells upon their utility and value; and, lastly, he makes negligence the foundation of the liability of the owner.

Again, Chitty, under the head of actions on the case for negligence, gives the rule as follows: "The owner of domestic or other animals, not naturally inclined to do mischief, as dogs, horses, and oxen, is not liable for any injury committed by them to the person or personal property unless it can be shown that he previously had notice of the animal's mischievous propensity." (Chit. Plead. 82.) This accurate elementary writer did not fall into the error of applying the rule to the whole class of animals *domitæ naturæ*, but adds the qualification, "not naturally inclined to do mischief." By his arrangement of the subject, too, he confirms the view of Peake, that the liability is based upon negligence.

These authorities seem to me to point to the following conclusions. 1. That one who owns or keeps an animal of any kind becomes liable for any injury the animal may do, only on the ground of some actual or presumed negligence on his part. 2. That it is essential to the proof of negligence, and sufficient evidence thereof, that the owner be shown to have had notice of the propensity of the animal to do mischief. 3. That proof that the animal is of a savage and ferocious nature is equivalent to proof of express notice. In such cases notice is presumed.

These views derive some support from the case of *May and wife v. Burdett* (9 Adol. & El. N. S., 101). That was an action on the case for an injury done to the wife by the bite of a monkey. The declaration alleged that the defendant kept the monkey wrongfully, well knowing that it was of a mischievous and ferocious nature, and accustomed to bite, etc., but did not aver that the defendant had been guilty of any negligence. A verdict was found for the plaintiff, and the defendant moved in arrest of judgment, on the ground that, as the action was founded in negligence, the declaration was defective in not containing any averment that the defendant had been guilty of negligence. The motion was overruled, it being after verdict. Ch. J. Denman says, "But the conclusion to be drawn from an examination of all the authorities appears to us to be this, that a person keeping a mischievous animal with knowledge of its propensities, is bound to keep it secure at his peril; and that, if it does mischief, negligence is presumed. The negligence is in keeping such an animal after notice." The injury for which this action was brought was done by an animal clearly *feræ naturæ*, and yet it was deemed necessary to aver the mischievous nature of the animal, together with knowledge on the part of the owner; and the question which arose and was very elaborately discussed was, whether the plaintiff should not have gone still further and inserted an averment of negligence.

Having shown, then, as I think, clearly, that the liability does not depend upon the classification of the animal doing the injury, but upon its propensity to do mischief, it remains to be considered whether bees are animals of so ferocious a disposition that every one who keeps them, under any circumstances, does so at his peril. If it is necessary for the plaintiff to aver and prove the mischievous nature of the ani-

mal, nothing of the kind was done in this case; but if courts are to take judicial notice of the nature of things so familiar to man as bees, which I suppose they would be justified in doing, then I would observe that, however it may have been anciently, in modern days the bee has become almost as completely domesticated as the ox or the cow. Its habits and its instincts have been studied, and, through the knowledge thus acquired, it can be controlled and managed with nearly as much certainty as any of the domestic animals; and although it may be proper still to class it among those *feræ nature*, it must nevertheless be regarded as coming very near the dividing line; and in regard to its propensity to mischief I apprehend that such a thing as a *serious* injury to persons or property from its attacks is very rare, not occurring in a ratio more frequent, certainly, than injuries arising from the kick of a horse or the bite of a dog.

There is one rule to be extracted from the authorities to which I have referred, not yet noticed; and that is, that the law looks with more favor upon the keeping of animals that are useful to man than such as are purely noxious and useless. And the keeping of the one, although in some rare instances they may do injury, will be tolerated and encouraged, while there is nothing to excuse the keeping of the other. In the case of *Trooman v. Lawyer* (13 John. Rep. 339), the court says, "If damage be done by any domestic animal kept for use or convenience, the owner is not liable to an action, without notice." The utility of the bees no one will question, and hence there is nothing to call for the application of a very stringent rule to the case. Upon the whole, therefore, I am clearly of the opinion that the owner of bees is not liable at all events for any accidental injury they may do. The question is still left, whether the keeping of these bees so near the highway subjects the defendant to a responsibility which would not otherwise rest upon him. I consider this question as substantially disposed of by the evidence in the case. It appears that bees had been kept in the same situation for some eight or nine years, and no proof was offered of the slightest injury ever having been done by them. On the contrary, some of the witnesses testify that they had lived in the neighborhood, and had been in the habit of passing and repassing frequently with teams and otherwise, without ever having been molested. This rebuts the idea of any notice to the defendant, either from the nature of the bees or otherwise, that it would be dangerous to keep them in that situation; and, of course, upon the principles already settled, he could not be held liable.

The judgment of the county court must be affirmed.

And it came to pass the same day, that Isaac's servants came, and told him concerning the well which they had digged, and said unto him, We have found water.—GEN. 26:32.

He maketh me to lie down in green pastures; he leadeth me beside the still waters.—PSALM 23:2.

Mrs. Root did not go with me to my ranch in the woods during July. There were several reasons why she begged to be excused. First, the bargain was she was to go and take care of me because my health is poor; but during the past July there was not a thing the matter with me. In fact, one day when I alighted from my wheel up town an old friend of mine said, "Why, look here, Mr. Root, you get off from that wheel as if you were a boy. Are you not forgetting that you are an old man, and gray-headed?"

Well, I do not know but it is true that I do act like a boy, and, in fact, I do not believe I ever felt much spryer when I was a boy in my teens than I do just now. May the Lord be praised for health and strength.

In the second place, we were going to take Mrs. Root up to the Traverse region to escape the hot July weather of Ohio; but our daily papers—yes, our daily papers do sometimes tell the truth—said they had had a higher temperature in Traverse City than in Cleveland.

Third, Mrs. Root worried about the water supply near our new home. She has all her life been in the habit of having pure soft water in unlimited quantities, especially in hot weather. I was obliged to tell her there was no real nice cold spring water within less than a quarter of a mile of our ranch. Of course, the spring that runs 300 barrels a day was on higher ground than the ranch, but it would have to be carried in pipes a quarter of a mile. These pipes would cost a good many dollars, and she said the water would be warm by the time it reached the house. It is true there was a little spring within 500 feet of the house. The cows had been in the habit, however, for years, of wading into this spring to get a drink. They had stamped it full of leaves and filth, and it was any thing but an inviting place. She did not believe such a spring could ever be made wholesome.

Fourth, when she began to inquire about green grass around the new house I had to admit there was not a blade of grass anywhere much nearer than the spring. Who would expect to find grass right out in the dense woods?

Well, Mrs. Root did not go in July, but I have faith to believe she will go a little later on when it is cooler and more pleasant to travel. I captured her more than forty years ago when she was a girl in her teens. I came pretty near using the word "captivated," but I guess that is not what I mean. I captured her over forty years ago, as I have just said, and induced her to take up with me and my home for better or worse; and I rather think I can capture her again; and during my July trip I had this purpose in view.

The garden in the cleared-off spot in the wilderness was doing finely. After I had fixed it up according to my notion a little more, it was really a thing of beauty—to me at least. Our very first work was to tackle the spring. I secured the services of a stout German near by, named Burdo, who said he had dug wells and fixed up springs, and he knew he could fix mine all right. In the first place, he dug up carefully and scraped out every bit of filth and mud—yes, and even the dark-colored sandy soil around the spring was cleaned away till we came to the clean white sand or clean yellow clay in the bottom; and we found the water oozed out all around where the sandy and gravelly top soil rested on a stratum of impervious clay. We made a dish-shaped excavation down into the clay, but I told the man not to go down through it, for I feared we should strike sand again, and that would let all of the nice clear water escape; so we just made a bowl-shaped cavity, perhaps 20 or 24 inches deep, below where the water came in. Then I timed it by my watch, and found that, even in this dry July, with its tremendous heat, the water ran in half a barrel an hour,

or at the rate of 12 barrels a day. I first drank the water boiled. Of course, it was all right then. Then I commenced drinking it just as it runs out of the sandy ground, and I had one of my pleasant surprises. That cold spring water did not interfere with my digestion a particle—at least not while I was at work on the ranch.

Now, when I describe to you with great minuteness the way in which Mr. Burdo fixed my spring, I hope it may be helpful to thousands of others who have like springs or like springy places. He got some pieces of 4×4 hemlock, long enough to reach about two feet above the level of the ground, and down to the bottom of the spring. Then he made a square crib or curb by nailing on hemlock boards 3 feet long. He said hemlock would not give the water a taste, and that it is the only kind of wood in that region that can be safely used for curbing a spring. Of course, a stoneware sewer-pipe two feet or more in diameter would be better; but I did not choose to go to that expense then and there. The hemlock boards, you see, let water through all along the sides—that is, if they are nailed on a little piece apart where they come under water. After the curb was in place we filled all around it with cobblestones up to within, say, 18 inches of the surface of the ground, putting large stones in the bottom, and smaller ones gradually on the surface. Then on top of this surface of small stones or gravel he put the impervious clay that he dug out of the bottom of the spring. This was stamped down hard, and made to slope in every direction away from the well. Then a ditch was run around the spring on all sides, with an outlet at the lowest point. This was so that all rain water would run away from the spring and down *around* it instead of running *into* it. We did not want any sort of seepage from the rotten logs and dead leaves above the spring in the woods. Then the clay was covered with sods of a heavy turf of June grass cut from a cleared place some little distance away.

"Now," said Mr. B., "whoever comes here for a drink of water should dip out a good lot and give this turf a good wetting. After it once gets started and rooted into this clay it will keep *green* and *clean*." So Mrs. Root will have *some* green grass around the spring, any way.

During the week or more that I remained at the ranch this grass took on a lively green, and I really enjoyed myself in lying down on that green turf and looking into "*my* spring" while I lay in the shade of the trees that overshadow it, and looked down into its crystal depths. By the way, there is a dense growth of basswoods all around that spring. The roots, no doubt, go down into the damp sand and gravel that overlies the hard clay. And, by the way, will not such a location be tiptop for many kinds of fruit? I have before spoken of the Downing everbearing mulberry grown under such circumstances. Well, the trees and every thing else grow with wonderful luxuriance all around this spring. During my visit at all other times of the year a little

stream has been running away from the spring. This time, owing to the severe drouth, no water ran away while I remained there. No doubt the vigorous basswood and other trees all around the spring took up a large quantity of this water during the height of their growing season. After their leaves drop, and the trees take on their rest, I shall expect to see the stream of water running away from the spring again as it was last fall.

Now, I made some (at least to me) very interesting and valuable discoveries in studying that spring and playing with it. When I became very warm and tired in working at my lawn around the house, for instance (oh, yes! we are going to have a lawn—I will tell you more about it further on), I used to go down there and not only get a cool drink but wash my face and hands and arms in the cooling fluid. For ten cents I bought a very pretty little wash-basin. By the way, is it not a wonder that we at the present day have so many luxuries in the way of neat and pretty utensils for such a small amount of money? This enameled iron wash-basin has such a smooth and glossy surface you can keep it clean enough to eat or drink out of, almost without any trouble at all. That basin seemed to be a special accompaniment to my spring. I used to keep it hanging on the limb of a basswood-tree. A tin cup and a tin pail are likewise hanging near by.

Oh! I forgot to say that Mr. Burdo made a board cover over the spring. This is to keep out leaves and dirt when the wind blows hard, and to keep out the sun. He says the sun should never shine on the surface of the water of any spring or wherever drinking water is kept. The sunlight induces the development of a plant-like substance called *algæ*, commonly known as green scum, which is seen on soft-water ponds and brooks. He said, however, that, even though the sun, leaves, and dirt, are kept out, the spring must have a certain amount of ventilation, so the board on the front side was made about six inches lower than the other boards. This made it a little easier to kneel down in the grass, to reach down and dip up a pail of water.

Now for my discovery. Whenever I got hot and thirsty at work in the garden during those very warm days in July (yes, it was very warm up along Traverse Bay as well as other places) I used to go down to the spring, take a big drink, and wash my hands and face in the cool soft water. For years I have not been in the habit of drinking cold water, as I have told you; but I found I could drink that water just as it came from the spring all right, providing I drank it slowly; but as the temptation was quite strong to drink a great deal in order to get cooled off quicker, I began pouring it on my hands and arms, the arms being pretty well bared up to the elbow. Mr. Burdo said, you know, that I must pour some water on the grass around the spring every day; so I took my enameled wash-basin and poured water on my hands and arms before it ran off on the grass; and my discovery was that, by pouring it on my wrists, and cooling them, the cooled-off blood would very soon

go all over my body. I thought I was original in this idea; but somebody at the dinner-table spoke of doing the very same thing; and in the last number of the Philadelphia *Farm Journal* I saw that Judge Biggle also recommended pouring cold spring or well water on the wrists to get cool, without drinking too much cold water. Well, after I received so much help and refreshment in this way I began to pour the cold spring water over my head, keeping my head low over the grass that needed irrigation. Finally one evening, after a very warm day, I wanted to ride over to Mr. Hilbert's, across the hills; but I had worked so hard I felt too tired to even ride my wheel. But there was a particular reason why I wanted to go just that night. As I passed by the spring I picked up my wash-basin and bar of Ivory soap, thinking I would try the big spring on the other side of the ranch, and see how its waters compared with those of the new one. Of course, I had to wash my hands and face. Well, this spring is over in the dense woods. In fact, it is quite dark in that close thicket, even at noontime. I bathed my arms and head and neck as before; and this sort of shower bath did me so much good I was struck with the idea of a similar shower bath of cold spring water over my entire body. I remembered what Father Kneippe, of Germany, had said about it in his book, and others in other parts of the world since then. In a twinkling I was stripped of my light summer clothing. The spot is so retired that there was no need of a bathing-suit or bathing-house. After taking a good wash with the soap I began to practice on the cold shower bath by pouring water from my basin on my head. At first it made me gasp for breath, the water was so cold; but every succeeding basinful gave me less and less unpleasantness on account of the cold water, and in a little time I was delighted to find that my system had become so inured by the repeated dashes of cold water that all unpleasant feeling was gone. I drenched myself again and again with basinful after basinful, and I thanked God meanwhile that, as there was 300 barrels a day going to waste, I need not worry about extravagance in the way of using water. Finally, after I had fully satisfied myself that it is not only a safe thing to bathe in cold water—yes, even take a shower bath—I decided it was one of the most enjoyable things I had ever discovered. I put on my light clothing, and started off on my wheel. Then came one of my happy surprises. All the tired feeling was entirely gone. I felt like a boy in his teens when school is out. I went over to Bro. Hilbert's, exulting in my new-found strength, slept soundly, and did not feel a particle of reaction. I tried the same thing several times afterward; but to get this exhilaration I have been speaking of, the bath should be taken when you are warm and sweaty—say after a hard day's work. I first washed myself thoroughly by taking water from the wash-basin with my hand and applying it to every part of the body. Of course, this left me more or less soapy. Now, I feel sure from

many years' experience that soap should never be left to dry on the body. Soap should all be rinsed off with plenty of pure soft water, either hot or cold. Now, my discovery is not, of course, any thing particularly new. A cold-water shower bath was quite a craze fifty years ago, as I can well remember. Notwithstanding, I never before realized what a wonderful change it makes one feel in exceedingly warm and dusty weather.*

Pure soft-water springs are appreciated to a great extent; in fact, many homes have their especial locations just because of such springs; but I do not believe we have realized the comfort and the bearing on the health of the inmates of the family that these springs, especially when brought right into the home, may be. Many of the springs are high enough above the homes so the only expense is suitable pipes to carry the water where wanted. Where they are not high enough in location a hydraulic ram will lift the water sufficiently to bring plenty of it right up beside the cooking-stove if you choose to have it so near; but if your well is like the new one I have described, and there is not really enough water to run up over and overflow, then the wind-mills that are offered at from \$15.00 to \$20.00 will do the work very well indeed. The only trouble is, the wind does not always blow; but by having a pretty good-sized reservoir you may always have water to use and waste or get away.

At Petoskey I visited a bee-keeper's home where a large family of children have been brought up. A spring of beautiful water, of a considerable volume, is only a few hundred feet from the house, and perhaps 20 feet below it. But their water, during all these years, has either been brought by hand or drawn up by the barrellful by horses. Why, I fairly ached to go to work myself and put a hydraulic ram in that spring, just to show those people what it would do.

One very warm July evening I went over to a schoolhouse a few miles southeast of Traverse City, where they have comparatively level land; but a supply of nice drinking-water is all around just the same. Within a mile of the schoolhouse there is a watering-trough beside the road, where pure soft water pours

*Dr. J. H. Kellogg, of the Battle Creek Sanitarium, is just now engaged in writing a new book on medicine. His brother, Will Kellogg, has been kind enough to send me some of the advance sheets, and from these I make the following extract:

"A person who has never experienced the glow of exhilaration, the invigoration and buoyancy of body and mind, which accompany the state of reaction from a short, general cold application, can not well appreciate the value or significance of the cold bath as a physiological stimulant. It is not too much to say that it is, of all measures known to man, the most valuable as a means of arousing to activity the flagging energies of the body, and lifting the enervated invalid out of the morasses and quagmires of chronic disease.

"The reaction produced by tonic applications fills the skin with blood; and if it is daily repeated, the blood is finally fixed in the skin, thus permanently increasing its vascular activity, and relieving internal congestion.

"Of the several forms of douche, the *rain douche*, or shower bath, is the most strongly refrigerant, since it impresses at each instant the largest portion of the surface."

over the sides of the trough all around its whole length. Not only this, but the V-shaped trough of boards that carries water from the spring to the trough seems insufficient to take care of all this wealth of cold spring water; and it pours over the sides of this trough almost its whole length. This water all comes from one spring. Mr. E. Black told us there had been talk of carrying the water in pipes to Traverse City.

A little way north of this schoolhouse, where the superintendent of the Sunday-school lives, we saw irrigating-pipes all through his garden, just as if he had water under pressure. I wondered why his place was thus equipped when his home was on a level plain, comparatively, with nothing that would indicate a spring or city water-works in sight. We were out so early the family had not finished breakfast; but he smilingly marched us into the pantry, right close to the kitchen stove, and there a stream of water was pouring forth under pressure from a pipe that I should call $1\frac{1}{4}$ or $1\frac{1}{2}$ inch. It was from an artesian well, and he said he put the pipe down *only 28 feet*. When I suggested that it might not hold out if left running with such volume, he said the stream had been going just like that for *nine years*.

Well, our good friend W. F. Silsby, one of our subscribers in Traverse City, has just purchased 20 acres of land in that neighborhood, for less than \$20 00 per acre. Shall I tell you why he bought it? There is more alsike clover grown in that vicinity than for many miles around; and he is establishing an out-apiary on his newly acquired land.

I had a curiosity to see the speckled trout in the cold spring brooks in that region, and so our good friend got some hooks and lines, and we went over into a field a little beyond the house, where we found a babbling brook hurrying and scurrying through the clover-field, and in a little time we had caught several of the speckled beauties. I expressed surprise that fish of that size should be found in so small a rivulet; but I was told that little runs like that, of cold spring water, were just the place for them. On our way back a man was cutting alsike and timothy for hay; and he said he was having a great deal of trouble because there was such a growth of alsike in with the timothy. It was so heavy he feared he could never cut it at all.

The last of my texts refers to green pastures and still waters. A part of my July work was to make some June grass grow around our rude summer cottage. Perhaps many of our readers know as well as I how to make a nice lawn. If so, they all know that it requires a great deal of hard work. Notwithstanding, I have decided again and again it is worth while. Many of our cities are now spending large sums of money in making parks and boulevards; and often the first thing they do is to set a lot of men at work smoothing off the rough inequalities of nature, fining up the ground, and then grading and leveling it preparatory to making lawns. We did the same thing at our ranch. We dug the ground over thoroughly, then raked out

the roots and stones, raking it over again and again, filling in here and cutting down there. Of course, we can not always have a lawn exactly *level*; but to be handsome it needs to be smooth. There must be no ups nor downs, nor inequalities. How wonderfully it rests the eye, and rests the person, to get just a glimpse of a beautiful lawn in front of or adjoining a home! In the outskirts of Traverse City there are some of the finest lawns I ever saw in the world. Mr. Hilbert said his impression was they were made of June grass and nothing else. After our lawn was finally graded and raked to my satisfaction, I gave Mr. Burdo some lawn grass and white clover to seed it down with. He said it wanted to be raked in just before a good heavy rain. While I was up in the Soo, as you may remember, a good rain came, and the seed is all in; so I suppose on my next trip, or, if you choose, *our* next trip, Mrs. Root and I will have the pleasure of seeing at least a little green grass around the door among the trees and garden stuff. By the way, you can not have a real nice flower-garden without having at least some green grass for a background; and to have this lawn nice, especially during real warm weather, without rain, like the past season, for instance, you need water for irrigation. A running spring, a hydraulic ram, or a windmill, will, any one of them, furnish abundant water to water the lawn. Of course, you want a reservoir, and one of the revolving sprinklers we see so often in front of the cottages in the suburbs of nearly all of our cities, large or small.

Since dictating the above I find that T. B. Terry, in the *Practical Farmer*; W. I. Chamberlain, in the *Ohio Farmer*, and Judge Biggle, in the *Philadelphia Farm Journal*, have been writing about what to do in warm weather—what to eat, what to drink, how to keep cool, and how to keep well. It was an agreeable surprise to me to find that this Home Paper is so much in line with what some of our great rural teachers have been talking about.

CONVENTION NOTICE.

All arrangements for the next convention of the National Bee-keepers' Association have been completed so far as possible, and the convention will be held in the audience room of the Buffalo Society of Natural Sciences, Sept. 10th, 11th, and 12th; commencing on the evening of the 10th. The place of meeting is in the Buffalo Library building, corner of Washington and Clinton Streets, near the business center of the city. The president of the Natural Sciences Society, Mr. Smith, has also kindly offered our Association the use of their library and other committee rooms during the time of our convention, and to do all in the power of the society to help make our meeting a success.

Railroad rates will vary in the different passenger association territory, from one cent per mile each way to one and one-third fare for the round trip. Each person can readily learn the rate on inquiry at his railroad station.

The Buffalo bee-keepers will try to provide entertainment at reasonable rates for all attending the convention, who will notify Mr. Sydney S. Sleeper, of Holland, N. Y., by Sept. 2d, of their wish for entertainment.

In a letter just received from Mr. Sleeper he says, "We want all to come who can, for we wish to make the Buffalo meeting the most pleasant and instructive one that was ever held in America. We will have the

co-operation of all the sciences as well as the school board," and names some professional men who are interested in our specialty and will be at the convention to help.

In a long letter from Mr. Hershiser, just received, he closes by saying, "Call upon me for whatever further assistance I am able to render;" and Mr. Penton, an ex-president of the Erie County Bee Keepers' Society, and others, have offered to do all they can to provide for the comfort of the delegates.

As stated in my previous convention notice in GLEANINGS, there will be no fixed program and no papers, and the time will be occupied in answering and discussing questions, except that on Thursday evening there will be a joint session of our association with the American Pomological Society, to discuss "the mutual relations of bee-keeping and fruit-growing;" and Prof. Beach, of the N. Y. Agricultural Experiment Station, and Prof. Fletcher, of the Central Experimental Farm of the Dominion of Canada, will help talk for the bees at that session, and it is hoped that much good will result to fruit-growers and beekeepers from this joint session.

If any bee-keeper who can not be at the convention has any questions, knotty or otherwise, he would like to have answered at the convention, will send them to me I will see that they are presented.

A. B. MASON, Sec., Sta. B, Toledo, O.

HONEY-PACKAGES OF TIN.

Owing to the strike of the members of the Amalgamated Association and those who sympathize with them, and the consequent stoppage of the larger number of mills making tinplate and sheet metals, there is a sheet metal famine, and prices are abnormally advanced for the time being, not only on the sheets but on articles made from them as well. The last price quoted us by the tin-can trust on one-gallon cans is \$1.50 to \$3.50 higher than the price we are selling them for. We do not propose to increase our price so long as our stock lasts; but we can not fill orders after stock on hand is used up until we can obtain more. Of tin honey-packages listed in our catalog we have the following in stock.

RAISED-COVER PAILS.

300 pint, 150 quarts, 200 2-quarts, boxed separately.
400 nests $\frac{1}{2}$, 1, and 2 quarts.
350 nests $\frac{1}{2}$, 1, 2, 3 and 4 quarts.

RECORD'S TIGHT SEAL-COVER PAILS.

150 No. 1; 400 No. 2; 575 No. 3; 1000 No. 5, and none of No. 10.

CANS WITH SCREW CAPS.

2000 5-gal. cans with $1\frac{3}{4}$ -inch screws, and a few with 2-inch lever seals, which will be boxed one or two in a box as required.

500 1-gal. square cans with $2\frac{1}{4}$ -inch screws.
1400 1-gal. square cans with $1\frac{3}{4}$ -inch screws.
300 1-gal. oblong cans with $1\frac{3}{4}$ -inch screws.
700 $\frac{1}{2}$ -gal. square cans with $2\frac{1}{4}$ -inch screws.
300 $\frac{1}{2}$ gal. square cans with $1\frac{3}{4}$ -inch screws.
1000 $\frac{1}{4}$ -gal. square cans with $1\frac{3}{4}$ -inch screws.

We have also some 600 $\frac{1}{4}$ -gal. oblong square cans with 2-inch lever seal, which we do not list, which we offer at \$6.00 per 100 or \$5.50 if the whole lot is taken. We have also 400 1-quart round cans with 2-inch lever seal, which we offer at \$4.50 per 100, or \$4.00 if the lot is taken.

HONEY PACKAGES, GLASS.

We still have a good supply of half-gallon Mason jars; only a few of quarts are left, and none of the pints. Prices remain the same for such stock as we have.

Of No. 25 jars holding a full pound of honey we have on hand and engaged, 100 gross, part packed one gross in a barrel and part 2 dozen in a partitioned case. We have also 25 or 30 gross of the same style of jar holding about 14 oz. of honey, No. 100, which we sell at 50 cents per gross less than No. 25.

We have 11 bbls. of 1-lb tumblers, No. 789; 2 bbls. 788 and 789, nested, and 2 bbls. of 788; 1 bbl. of 775 glass pails, and 2 each of 776, 777, and 778.

Prices on all the above will be found in our catalog, pages 26 and 27. If in need, order while we have the stock to furnish.

SECOND-HAND 60-LB. HONEY-CANS.

We still have on hand about 100 boxes of second-hand honey-cans in fair condition, which we offer, to close out, at 40 cts. per box in 10-box lots; 25 boxes or more at 35 cts. per box. These cans need scalding out before they are used. They would be a very cheap package for amber or low grade of honey, and most of them, when properly scalded out, will do nicely for good honey.

GLASS FOR SHIPPING-CASES.

The price of window glass is so high that at present market price we should have to ask \$5.00 a box for all strips up to 16 inches in length, and \$5.50 for those over 16 inches. It is only by getting strips cut from waste, as we are able to find them, that we maintain present catalog prices on cases including glass strips. We can not agree to furnish glass alone at catalog prices, only as we have a surplus. Any thing cut to order will have to be \$5.00 per box at least.

Special Notices by A. I. Root.

Travels, both in Florida and Northern Michigan, are crowded out of this issue for want of room.

WHAT TO PLANT THE LAST OF AUGUST; SEE P. 655, LAST ISSUE.

We are just in receipt of a letter from a friend in Kansas who says he has excellent success in sowing alfalfa during the last of August and first of September. The ground is to be made very fine by repeated workings, and very firm by repeated rollings, just as you fix it for wheat. Then sow 20 lbs to the acre. Full particulars will be given in our next issue.

ANOTHER LOW-PRICED EXCURSION TO NORTHERN MICHIGAN.

We have just received another notice from the Pere Marquette Railroad Co., Toledo, as follows:

"On September 3d, we will have a \$5.00 ten-day excursion to Ludington, Manistee, and all points north of Baldwin as far as Harbor Springs; \$6.00 to Mackinaw City and return for the same dates."

W. C. TOUSEY, D. P. A., Toledo, Ohio.

You will see the above takes in all of the places I have been recently writing about. This low rate to Harbor Springs, only \$5.00, is less than one-fourth the regular fare. The excursion starts from Toledo.

Readers of GLEANINGS who expect to buy a queen or two to test the merits of different stock, will do well to read H. G. Quirin's advt. on last cover page. Good stock at prices which are right, is his motto.

WANTED.—To sell my entire and complete apiary consisting of 75 colonies of bees, on Lang, and American frames, hives, winter-cases, extracting-supers with comb, extractor, and all other necessary equipments. Big bargain. Write for particulars. Also good 40 acre farm to rent or sell.

W. H. ALLSWED, Sanford, Mich.

WANTED.—A helper in the bee and honey business; one who has had success in this direction; an active young man; one with a conscience, good habits, and who can give references to cover the case; a steady job to the right person.

BYRON WALKER, Clyde, Cook Co., Ill.

GLEANINGS AS AN ADVERTISING MEDIUM.

We wish to say that our ad't in your journal paid us many times the cash expended for it. The inquiries and orders received were treble what we had from the others. We did a better business than we expected. The reason we stopped our ad't was that we had sold all we cared to sell, as we did not wish to lose trade by returning money; and, what was more satisfactory, we have not had a single complaint so far. All reports from patrons are satisfactory.

A Superior Red-clover Queen for 25 cts.

An Offer for New Subscribers:

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL list during August and September. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.25, and we will mail you the Bee Journal FOR A WHOLE YEAR, and also one of our SUPERIOR LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red-clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. All queens mailed promptly.

Headquarters in Chicago for Root's bee-supplies at Root's prices. A free catalog and sample of the American Bee Journal on request.

George W. York & Co., Chicago, Ill.
144, 146 Erie Street.

Standard-Bred Queens!

Acme of Perfection; Not a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$1.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover hustlers of America. 75 cts. each; six for \$1.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

FOR SALE.—One 2 frame Cowan extractor in good order at half price.

H. W. THOMPSON, LaPorte, Texas.

To Our Shippers.

We were obliged to notify you a few weeks ago that one Joseph M. McCaul had leased our old quarters at Nos. 120-122 West Broadway, New York City, and had there started up business under the name "Hildreth, McCaul Co.," and had distributed a multitude of circulars so worded as to create the impression that his business was a successor to or a branch of the business of Hildreth & Segelken.

For the protection of our shippers and ourselves, we at once instructed our attorney to commence action to enjoin the said McCaul from using the name HILDRETH in any manner whatsoever in connection with his business. On the 10th day of July, 1901, Hon. David McAdam, Justice of the Supreme Court of the State of New York, after a full argument upon the merits, issued a peremptory injunction, of which the following is an extract:

"And it appearing that the plaintiffs have for a long time been and now are carrying on business under the style of "Hildreth & Segelken," and that the defendant has recently opened a business at 120-122 West Broadway, in the Borough of Manhattan, City of New York, and is carrying on the same under the style of "Hildreth, McCaul Co.," and that such act is in violation of the plaintiffs' rights, and that the commission or continuance thereof, during the pendency of this action, will produce irreparable injury to the plaintiffs; . . . it is

ORDERED that the defendant (Joseph M. McCaul) and each of his agents, servants, and employees, and all other persons acting under his authority and direction be, and he and they are hereby restrained and enjoined from showing, displaying, or otherwise using during the pendency of this action in or upon any papers, devices, sign or signs, or otherwise, in the business conducted by the defendant at No. 120-122 West Broadway, in the Borough of Manhattan, City of New York, or elsewhere the name of "Hildreth" separately or conjunctively with any other name, designation, or description."

Outside of our desire in our own interests to protect the name which we have built by years of satisfactory dealings with our customers, we hastened to procure this injunction as soon as possible, to prevent our shippers from being misled into sending their goods to one who would make an attempt to gain their trade by such a trick and device.

With thanks for the many expressions of good will we have received from our shippers concerning this attempt to trade under our name, we are

Sincerely yours,

HILDRETH & SEGELKEN.

265-267 GREENWICH STREET, NEW YORK CITY.

CARNIOLANS.

To make room for queen-cells during the buckwheat flow we will sell, for 30 days, **fine** young laying Carniolan queens at 50 cents each. The Carniolans are **hustlers** to work, and the **gentlest** bees in the world. Descriptive price list free.

F. A. LOCKHART & CO., Caldwell, N. Y.

HONEY QUEENS!

Leather-colored Long-tongues.—I have a breeder for which \$25 has been *offered* and *refused*. You make no mistake in buying her daughters. They are dandies.

Goldens.—The Laws strain is as good as years of patient selection and breeding can establish.

Holy Lands.—These are a deserving race of bees. With two years' acquaintance I find them great workers, with no vindictive traits, easily handled, are becoming popular, especially in South.

The above races of bees are each bred in separate apiaries, and you can get them in their purity. Am filling all orders by return mail, and I sell at the following low prices, with the usual guarantees. Single queen, untested, 75c; six for \$4.00. Tested, \$1.00; six for \$5.00. Breeders, either race, \$2.50 each. Address

W. H. Laws, Beeville, Texas.

ALBINO QUEENS. If you want the most prolific queens, the best honey-gatherers, the best comb-builders, the hardiest and gentlest bees known, try my albinos. My untested queens, 75c. J. D. GIVENS, Lisbon, Texas.

W. H. Pridgen,

of Creek, Warren Co., N. C., whose money-order office is Warrenton, N. C., is now prepared to fill orders promptly with the Hutchinson "Superior stock," or golden untested queens, at 75 cts. each, or queen-cups at \$2.00 per pound, postpaid.

COMPRESSED CELLS can be used over and over; the oftener they are used the better they work. We compress cells in removable wooden shells at 2c each; or you can own a Grace cell-compressor for \$2.00, postpaid; blank shells, 1c each; started queen-cells, 5c each. Get a queen-rearing outfit and rear your own queens. All by mail. New circular ready.

The Swarthmore Apiaries, Swarthmore, Pa.

Bees that have a Record

Have longest tongues—handsome, gentle, and great hustlers for honey; all breeding queens, and sold at rate of \$8 per dozen. Now ready.

H. ALLEY, - WENHAM, - MASS,

CHEAP BEES!

I will sell 40 colonies of Italian bees, mostly in Root Company hives with Hoffman frames. Price here, \$50.

WM. GARRY, - SYLVAN, PENN.

FOR SALE.—A few hives of Italian bees in Root's eight-frame hives. Good strong colonies. No disease. L. I. SHRADER, New Albany, Ind.

STEEL WHEELS

for your **FARM WAGONS**

any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address **EMPIRE MFG. CO., Quincy, Ill.**

READ THE LABEL!

If it's "PAGE," it's safe to shake and take. Try it. **Page Woven Wire Fence Co., Adrian, Mich.**

PINEAPPLES!

Choice fruit and plants now ready for shipment. Suitable land for sale, sheds constructed, pineries set and cared for. Correspondence solicited.

Lewisiana Pinery Company, Orlando, Florida.
C. H. Lewis, Manager.

Long Tongues Valuable South as well as North.

How Moore's strain of Italians roll in the honey down in Texas:

Hutto, Texas, Nov. 19th, 1900.

J. P. Moore.—Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongue bees to secure the greatest quantity of nectar.

Daughters of my 25-100 breeder, the prize-winner: Untested, 75c; six, \$4.00; doz., \$7.50. Select untested, \$1.00; six, \$5.00, dozen, \$9.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, Lock box 1, Morgan, Pend. Co., Ky.

(Mr. J. P. Moore is entirely reliable.—A. I. R. Co.)

Your Order for Queens

—Tested and untested—will be promptly filled by return mail. Our strain of Italians is unsurpassed as honey-gatherers. Every queen guaranteed. Choice tested queens, \$1.00 each; \$12.00 per dozen; choice untested, 75c; \$8.00 per dozen. Send for price list. Address . . .

J. W. K. Shaw & Co., Loreauville, La.

Twice as Much Honey!

Dr. Mason's Experience with Superior Stock.

Dr. Mason, Secretary of the National Bee-keepers' Association, writes me, on date of June 28, as follows:

"I think that I am safe in saying that the colony of bees that has the \$1.50 queen that I got of you about a year ago, although not as populous as most of our colonies, is gathering nearly, if not quite, as much honey as any *two* of our most populous colonies. I never use any smoke in handling them and never get stung.

It's just fun to handle them. When I remove a comb, unless it rubs against another, they don't run and make a fuss about it, but keep quiet and attend to their business."

Price of a queen, \$1.50, or the Review one year and a queen for \$2 00.

W. Z. HUTCHINSON, Flint, Mich.

\$1-TESTED QUEENS=\$1.

A nice lot of young golden tested queens at \$1.00 each while they last; selected, \$1.50; warranted queens, 60c; —6 for \$3.50; select warranted, 80c—6 for \$4.50. My bees are a five-band strain, selected for size, energy, working qualities, long tongue-reach—and, lastly, beauty. I have never tested a strain that excels them. A pile of letters asserted the above claims are true, and also that they winter well north. Queens are sent promptly. **J. B. CASE, Port Orange, Fla.**

WANTED.—Customer for farm of 65 acres; good land; good buildings, and water; one mile from railroad station, and four villages and college; 125 colonies bees; \$1600. Ten head of cattle, team, farming tools, 5000 lbs. extracted and comb honey. Write for description and particulars. **N. A. BLAKE, Beebe Plain, Quebec, Canada.**

Wants and Exchange.

Notices will be inserted under this head at 10c per line. You must say you want your ad. in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We cannot be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange long-distance-record homing pigeons for bees, supplies, books, bee-papers, or offers. **GEO. A. FRANCIS, Bridgeport, Conn.**
1455 Sea View Ave.

WANTED.—To exchange worker combs, in either Hoffman or Simplicity frames, for Italian queens. **L. D. GALE, Stedman, N. Y.**

WANTED.—To exchange 25 Belgian hares—Fashodas and Yankans—for bees or supplies. **GEO. R. CRANDALL, 5707 N. 20th St., Omaha, Neb.**

WANTED.—300 to 500 colonies bees on shares in Cuba; or would work for salary; references given and required. **FRED E. MUNSON, W. Groton, N. Y.**

WANTED.—A strong, healthy young man of good habits to work in bees by September. Must have had some experience. Write at once, stating particulars and salary wanted. Permanent job for right party. **GLEN E. MOE, Candelaria, Cuba, W. I.**

WANTED.—Location for a custom saw and feed mill. **W. S. AMMON, Reading, Pa.**

WANTED.—Apples. I wish to correspond with some bee-keeper in the middle West, or elsewhere, in section where there is a good crop of apples. **F. W. DEAN, New Milford, Pa.**

WANTED.—One second-hand Barnes saw. Address **J. G. THAYER, Ivy Depot, Albemarle Co., Va.**

WANTED.—To exchange second-hand 60-lb. cans, practically as good as new, at 20c per can in lots of 20 or more. f. o. b. Chicago, for white-clover honey at market price. **B. WALKER, Clyde, Cook Co., Ill.**

WANTED.—To exchange for bees, brood-combs, or offers, black Belgian hares—a breeding doe and buck and eight young ones about four months of age, fine pedigrees; also my prize-winning rose-comb white leghorns at the Cortland show, in 1900, and my this season's breeders, and a few early-hatched cockerels; score-cards by Judge Zimmer. **LEON A. STAFFORD, Blodgett Mills, N. Y.**

NOW READY. LONG-TONGUED QUEENS!

YARD NO. 1.

By special arrangements with THE A. I. ROOT CO. to furnish them queens, I have secured their assistance in procuring the finest breeding queens that a thorough knowledge of the bees of the country and money can procure. Among them is a select daughter of their \$200 queen that they refuse to quote me prices on. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT SAYS: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

Send for descriptive price list.

Prices: Untested, 75c; 6, \$4.25; 12, \$8.00. Select untested, \$1.00; 6, \$5.00; 12, \$9.00. Tested, \$1.00; 6, \$6.00. Select tested, \$1.50.

Breeders, whose best bees show a reach of 21-100, with an average reach of 20-100, \$3.00. Breeders, whose best bees show 21-100, with an average of 20½-100, \$5.00. Breeders, whose best bees show 22-100, with an average of 21-100, \$7.00.

I have discovered 2 breeders whose best bees show 23-100; these are too good to sell; don't ask for prices.

Imported Italian stock. Apiary No. 2. Imported queens, daughters and grand-daughters. Have just received an importation direct from Italy which has been introduced into this apiary.

Golden, or 5-banded Italian. Apiary No. 3. Breeders, select tested, tested, untested queens.

W. O. VICTOR, WHARTON, TEXAS.
QUEEN SPECIALIST.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. **LEY'S POULTRY CONDITION POWDER** puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls—big and little get all the benefits in the food when fed in conjunction with it. Price 25c pkg.; 5 for \$1. **LEY'S Thoroughbred Minorena Eggs, \$1 for 13. Thoroughbred Belgian Hares. Geo. J. Ley, Florence, California.**

Queens! I have now some very fine queens for sale, either 3-banded or 5-banded goldens, at the following prices: Untested, 75c; 6, \$4.25; 12, \$8.00. Tested, \$1.25; 6, \$6.50; 12, \$12.00. Select tested, \$2.00. Golden breeders, \$5.00. We have Root's bee-supplies at Root's prices. We have a special low price on honey-cans. Give us your orders, and I will guarantee your satisfaction. **Robert W. Rogers, Hutto, Tex.**

QUEENS! Fine, large, gentle, and prolific; long-tongue reach; either 3 or 5 banded; 75 cents each; six for \$4.25. Try them and be pleased. **CHAS. H. THIES, Steepleville, Ill.**

30 COLONIES Italian bees for sale cheap; in good condition; no disease. Also S. C. B. Leghorns; no better; circular free. **H. M. Moyer, Shanesville, Pa.**

FOR SALE.—7500 lbs. clover and basswood honey, in 60-lb. cans, at 7 to 8 cts. Also fine tested Italian queens, \$1.00 each.

ELIAS FOX, Hillsboro, Wis.

LONE STAR APIARIES

Italian Queens.

Estab'd 1885 Prices of queens from imported mothers: Tested, \$1.50; 6, \$6.50; 12, \$12.00. Untested, 75c; 6, \$4.00; 12, \$7.00. Golden, same price. Select tested of either race, \$2.50 each. For a short time I will mail tested leather-colored queens at \$1.00.

Your money back if you are not satisfied. Address **G. F. DAVIDSON & SONS, FAIRVIEW, TEX.**

YOU CAN NOT afford to let the season pass without introducing some of Moore's 23-100 stock into your apiary. See advertisement on page 695.

GUS. DITTMER, AUGUSTA, WIS.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beville, Bee Co., Texas:
 Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, **J. C. WALLENMEYER.**

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good queen-bees and queens as money and labor produce. We breed three-band Italians, Golden, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get out paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.
 Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3 1/4-inch; \$1.10; 3-inch, \$1.00; 2 1/2-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm if attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 2.—Three-fourths of the total surface must be filled and sealed.
 No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

ALBANY.—Honey market not fairly opened yet, although have received some and sold at good price. White-clover comb fancy, 16 A No 1, 15; No. 2, 13@14. No buckwheat or dark comb appeared, yet we could get 12c for some buckwheat comb. We look for white extracted to sell at 7@7½; mixed, 6½@7. Received none as yet, but have some inquiries.
 Aug. 18. McDUGAL & Co., Albany, N. Y.

BOSTON.—Several lots of new Vermont honey in cartons have thus far been received, meeting a ready sale at 17, although, of course, in a small way. The trade generally seems disposed to hold off, looking for larger receipts and lower prices. This is somewhat due, of course, to the fact that the demand is still light owing to the warm weather. Cooler weather will make a better demand and naturally make a better feeling. Our market to-day is about 16@17 for fancy; 15@16 for A No. 1; 14@15 for No. 1. Extracted, full supply and light demand.
 BLAKE, SCOTT & LEE,
 Aug. 19. 31, 33 Commercial St., Boston, Mass.

BUFFALO.—Since last quotations new honey is coming more freely, and selling a little lower. Too early yet to move large quantities. Fancy white comb, 15@16; A No. 1, 14@15; No. 1, 13@14; No. 2, 12@13; No. 3, 11@12; dark, 10@12. Extracted white, 6@7 dark, 5@5½. Beeswax, 27@30.
 W. C. TOWNSEND,
 Aug. 26. 81, 86 W. Market St., Buffalo, N. Y.

TORONTO.—Honey turns out to be a very light crop, and in consequence prices are, for good white honey, about 8@9. Comb, 12½@16. M. MOYER & SON,
 Aug. 14. 408 Spadina Ave., Toronto, Canada.

CINCINNATI.—Extracted honey is coming in plentifully. Prices are still 5@6. Better grades, all-falla water white, from 6@7. White clover, 8@9; fancy white comb honey sells from 13½@15½.
 Aug. 22. C. H. W. WEBER, Cincinnati, O.

DETROIT.—Fancy white comb honey, 14@15; No. 1, 13@14; dark and amber, 11@12. Extracted white, 6½@7½; dark and amber, 5@6. Beeswax, 26@27. Honey is demanding a little more attention, as fruit is scarce.
 Aug. 22. M. H. HUNT & SON, Bell Branch, Mich.

MILWAUKEE.—The receipts of honey on this market are not large, offerings are quite numerous, and the demand only fair. Later we expect a larger want will exist when the cooler season approaches, and consider this market favorable for shippers of good honey. We quote fancy white 1-lb. sections, 16@17; A. No. 1, 15@16; amber, nominal, 12@14. Extracted in barrels, kegs, or pails, white, 7@8; amber, 5½. Beeswax, 25@30.
 A. V. BISHOP & Co.,
 Aug. 24. 119 Buffalo St., Milwaukee, Wis.

NEW YORK.—There seems to be some little demand for comb honey. The receipts so far are very light. We quote as follows: Fancy white, 14; No. 1 white, 13; No. 2 white, 12. There is hardly any demand for extracted, and sales are reported at 4½@6. Beeswax is in light demand at 27@28.
 FRANCIS H. LEGGETT & Co.,
 Franklin, West Broadway, and Varick Sts.,
 Aug. 24. New York City.

SAN FRANCISCO.—I have succeeded in advancing quotations on honey ½ to 1½c per lb. in two leading papers. The following are San Francisco prices on Aug. 10: Comb, 10@12. Extracted, water white, 5½@6½; light amber, 4@5½; dark amber, 4@5. Estimates of the season's crop for the State run all the way from 150 to 300 cars.
 Aug. 12. E. H. SCHAEFFLE, Murphys, Cal.

CHICAGO.—White comb brings 15 for the choice grades, with other lines not grading, No. 1 selling at 13@14; light amber, 12@13; dark, 10@11. Extracted, fair demand for white at 5½@6; amber, 5½@5½; dark grades, 5. Beeswax steady at 30 for choice yellow.
 R. A. BURNETT & Co.,
 Aug. 22. 199 South Water St., Chicago, Ill.

SCHENECTADY.—Receipts of new comb honey are small as yet, and prices not well established. We quote clover, 13@15; buckwheat, 10@12. No sale for extracted except in fancy glass packages.
 Aug. 22. C. McCULLOCH, Schenectady, N. Y.

WANTED.—Comb and extracted honey. State price, kind, and quantity.
 R. A. BURNETT & Co.,
 199 South Water St., Chicago, Ill.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co.,
 Front and Walnut Streets, Cincinnati, Ohio.

WANTED.—Extracted clover honey in cans; cans furnished if desired. Quote price.
 I. J. STRINGHAM, 105 Park Place, New York.

WANTED.—To buy your honey. State your lowest cash price, kind, and quantity.
 EDW. WILKINSON, Wilton, Wis.

WANTED.—To buy quantity lots of fancy and No. 1 white-clover comb honey in no-drip cases.
 BYRON WALKER, Clyde, Cook Co., Ill.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.
 THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Comb and extracted honey; will buy your honey, no matter what quantity. Mail sample of extracted; state quality of comb honey, and price expected delivered at Cincinnati. I pay promptly on receipt of goods. Refer you to Brighton German Bank, this city.
 C. H. W. WEBER,
 2146-2148 Central Ave., Cincinnati, O.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

GLEANINGS IN
BEE CULTURE

A JOURNAL DEVOTED
 TO BEES AND HONEY
 AND HOME INTERESTS.

ILLUSTRATED
 SEMI-MONTHLY

Published by THE A. F. ROOT CO.
 \$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

SEPT. 1, 1901.

No. 17

I UNDERSTAND bee-keepers are to have a pow-wow at Buffalo, Sept 10. Who goes from Medina? [A. I. R. and E. R. R. expect to go.]

I DON'T USE the scraper of the Muench hive-tool, but take it off. I prefer a garden hoe as a scraper, for a wholesale job on top of frames, and for the smaller jobs the circular end of the Muench tool is ahead of a putty-knife. But scraping is not the chief use of a hive-tool. For starting frames, supers, and covers, the Muench is 'way, 'way ahead.

"WE WILL HAZARD the prediction that the highest standard of excellence is to be secured through careful selection, rather than through intensification by in-and-in breeding," says the editor of *American Bee-Keeper*. I'm too much of a coward to say I agree entirely with that, but I'll risk saying that in-and-in breeding is a pretty safe thing for us common bee-keepers to let entirely alone.

ROBBER-BEES that take stores by force, bee-keepers are familiar with. W. W. McNeal, in *American Bee Keeper*, calls attention to another criminal class, thieves. They take stores by stealth, and there is no apparent remedy against them. The best-storing colonies are the most likely to be their victims, and Mr. McNeal thinks we should be on the lookout lest these thieves make us err in judgment when deciding upon the best stors to breed from. [There may be something in this; but how is any one to prove that a certain colony produces large averages by dishonesty rather than by hard honest toil?—ED.]

A. C. MILLER, in *American Bee-Keeper*, prefers the Alley plan for rearing queens, and says that by the cell-cup plan "in the hands of any person but those of an expert, there are many chances of producing inferior queens." I don't understand why. With the Alley plan a careless person may have queens reared from too old larvæ, a danger not met in the cell-cup plan. But the Alley plan is less troublesome, and takes less time.

With proper care the best of queens can be reared by either plan. [Our Mr. Wardell, after having tried all plans, prefers a modified Alley plan; that is to say, he uses the Alley method; but instead of worker he uses drone cells, and, all things considered, he says he prefers them.—ED.]

IF IT IS TRUE that bisulphide of carbon will kill moth eggs as well as larvæ, why is it not a long way ahead of sulphur for those who fumigate their sections? Bisulphide can be used once for all when sections are taken off, or within two weeks, and save the repetition of the fumigation that sulphur requires, also saving the danger of making the sections green with sulphur. [If the reports are true, the man who persists in using sulphur in place of bisulphide of carbon is far behind the times. The bisulphide is more thorough, and much less trouble to use. While it is subject to more or less danger from explosion, the burning of sulphur, even in an iron kettle, also has its danger.—ED.]

YOU DO NOT remember, Mr. Editor, to have seen the terms *preconstructed* and *postconstructed* used by others. Turn to p. 54, *American Bee Journal*, 1861, and you will find them used by as good authority as Samuel Wagner, who says that's what the Germans call them. *Emergency* is a better term than *postconstructed*. But it seems very inappropriate to call a cell a *swarming* cell which is not intended for swarming. [Page 54 of the *American Bee Journal* for 1861 is away back of my time, for I was born in 1862. Say, look here, doctor, can't you trot out a reference that is not quite so ancient? Well, now, emergency cell is all right. We are agreed on that. If a swarming cell and a supercedure cell are alike, why not use one term to designate both?—ED.]

WHEN CELL-CUPS are used for queen-rearing, no matter how much royal food is given at the time, says W. W. McNeal in *American Bee-Keeper*, the bees always remove it, and in a few hours the larva is left dry. He thinks this is against rearing the best queens, so in about 24 hours he removes the larva and substitutes another, which will never be limited in its food. Would it not be cheaper to use

the Pridgen plan, taking the cocoon-cup with the larva? In that case I think there is never any stinting. [Some one else, some little time ago, I do not remember who, stated that all the royal jelly will be removed. Possibly there is something in this; but our Mr. Wardell says that, whether it is removed or not, it has a tendency, and a decided one too, to induce the bees to accept cells so supplied. The Pridgen method would probably be an improvement on this.—ED.]

IN GERMANY, besides the malignant foul brood, they say they have a mild kind. Gravenhorst's *Bienenzeitung* says the mild kind extends only to the death of the unsealed larvæ. These become a clear gray purulent mass, finally drying into a crust. From the hive, proceeds a foul, sour smell, and brownish crumbs that the bees have dug out of the cells lie on the bottom-board, which, when rubbed in the fingers, give out the same smell. In this stage the disease is not yet contagious, and generally disappears by the efforts of the bees. It may be considered of the mild sort so long as the dead bees lie curled up on the bottom-board; but when they take a stretched-out, reversed position, then we have the malignant form. [From the description you give, I should be almost inclined to believe that what the Germans call a mild form of foul brood we call "pickled brood;" for, under some conditions, such brood has a sour smell, and hence the name.—ED.]

THE GREATEST PART of the cost of rearing a queen has been considered the time occupied in the nucleus to get her to laying; and, like others, I have made some effort toward seeing how few bees might be successfully used in a nucleus. But is not the cost of nuclei magnified? If I am not mistaken, a colony with a virgin queen will work just as vigorously as one with a laying queen, and a field bee will carry just as much nectar to a nucleus as to a full colony. If that is correct, and if a ripe cell is given at the time of removing a laying queen from a nucleus, then there will not be more than two days when the nucleus will not be in good storing condition, and when too much honey is in a nucleus a full frame can be exchanged for an empty one. Of course there will be some loss from the larger proportion of bees required to keep up the heat in a small nucleus. But I suspect that the gain from fewer bees in a nucleus is overrated.

YOU ASK, Mr. Editor, whether the fact that a preconstructed cell is never first occupied by a larva does not seem to argue that, if the bees were given their own way, they would prefer an egg? Hardly. The cell being prepared in advance, the egg is a sort of necessity. When given their choice on the removal of a queen, they prefer the larva to the egg. In rare cases I've seen them start with the egg, but I *think* there were no larvæ present. [There you go, using the word "preconstructed." Although I spent seven years of my school life on Latin, I had to go and look up our last issue to see whether it was swarming or supersedure cells. I now see that a preconstructed cell is a swarming cell. Of course,

I understand that *pre* means *before*, and *post* means *after*; but before and after what? That is what I could not remember. Well, it would seem, then, from your experience, that a swarming cell usually has an egg, while an emergency cell has a larva. Is this correct? Now, look here; if you come at me again with "preconstructed" and "postconstructed" I will throw my old shoes at you.—ED.]

BEEN WATCHING bees working on corn. Pollen lemon-colored. They stand in the air poised on wing, making their legs work lively packing the pollen. Now and then the tongue is thrust out, appearing to be wiped by the front feet. What's that for, unless to provide honey to pack the pollen? All the packing, however, is not done on the wing. A good bit of it is done while hanging to the flower, some of the time by one foot. [You are right. I also have watched this act on the part of bees while they were gathering pollen. It is very interesting and at times ludicrous. The tongue certainly has an important part to play; but, as nearly as I can make out, the moist edges of the tongue rub among the pollen grains in the flower, and then the bee draws the tongue between its two front claws. This will leave a wad of pollen grains, mixed, probably, with a little honey. It is then transferred from the fore feet to the middle legs, and from these, by a wonderful piece of dexterity bordering on sleight of hand, to the hind legs on which are located the wax-pockets.—ED.]

I'M GLAD that sugar question is getting a stirring up. I've an uneasy feeling that Mr. Cowan may be right, that beet sugar is not so good as cane sugar. [Personally I do not have any uneasy feeling about the sugar question. It is not proper for us to boast; but for the last ten or twelve years we have used beet sugar for feeding our bees; and if any one can show a higher wintering average than we—one who has used cane sugar—we should like to have him hold up his hand. Our wintering losses very often do not exceed 2 per cent, and the very highest is 15 per cent, I believe. This covers a period of about 20 years. I suppose a fair average would be between 3 and 4 per cent. If Mr. Morrison, in our last issue, is correct, the beet sugar is better than cane. But my honest impression is that, with either sugar, we shall get good results. The trouble from sugar-fed colonies is more because the syrup is fed too late or too thick, and the bees do not have opportunity to ripen it. If it is fed during warm weather, when they can fly, half and half, *other things being what they ought to be*, I would not give two cents to have the colonies insured.—ED.]

EDITOR HILL raises uneasy feelings by suggesting that, when a colony is storing while others have to be fed, the storing colony may be quietly stealing from those that are fed—a fact which might be ascertained by comparing a sample of the surplus with the goods being fed. [While this may be true, yet when red clover was in bloom the only colony that stored any honey during this time was the colony of our old red-clover queen-breeder,

and one other one in the same apiary. These red-clover bees showed their largest gains when red clover was in bloom; and as long as any of it was out they would more than hold their own. If there was absolutely nothing else that they could gather from the fields, then they showed no unusual activity at the entrance. But in support of what Mr. Hill says, I would state that the bees of our *old original red-clover queen* of 20 years ago—the one that distinguished herself so greatly—were the worst robbers we ever had. They could not only beat any thing else in the yard during a genuine honey flow, but if any sweets were to be obtained by pilfering they were the chief leaders. I have seen a regular bee-line from a robbed colony to the hive of this red-clover queen. This is a point well worth raising; and in estimating the value of a queen we need to consider whether the bees are honest at all times or not—[E.D.]

Welcome, first month with frost,
That breaks this torrid heat;
That brings again the needed rain
The harvest to complete.

Mr. Albert Gale, of Sydney, Australia, sends us the proof of an article written by him for the *Australian Agricultural Gazette*, wherein he contends that common corn does not yield honey, and that bees have nothing to do with it on account of its sweetness. As the concluding paragraph is a brief *resume* of the whole subject I give it. This is to be read in connection with what Dr. Miller says in *Straws* in this issue.

I have visited all parts of this State on matters connected with bee life. I have seen very many samples of so-called maize or corn honey, and these samples never agree the one with the other, either in aroma, flavor, or color. If those were *bona fide* samples of corn honey, there should have been uniformity in the points referred to, but such was not the case. Corn honey seems to be a thing of modern invention. I lived for years on the Lower Clarence, prior to the advent of sugar culture there, when it was perhaps second only to the Hawkesbury as a corn-producing district. I, with others, kept a number of bees, and in no case did the faintest suspicion enter my mind that I was harvesting corn honey, because I knew the grasses yield nothing of the kind. Neither did the bee-keepers around me hint at corn honey. There, in those days, I never heard the words used. We may as well expect to get honey from ferns or mosses as from the grasses, or expect a hen that is without ovaries to lay eggs as to expect honey from a plant that has no nectaries. Bees can not gather honey from maize, because the flowers have no glands wherewith to secrete it.

BEE-KEEPERS' REVIEW.

In the August issue Mr. Hutchinson gives three views which to me, at least, are very interesting, and I know they will be to all. The first is a view of his new residence where the *Review* is made, and two showing inside views of his office and type-room. It is prob-

ably the neatest and daintiest composing-room in the country. The pictures are accompanied by a brief sketch of Mr. Hutchinson's career as a bee-keeper from first to last. He has just been making a trip through Canada, and at the residence of Jacob Alpaugh he found a device for keeping out flies which I am sure will interest the women folks as well as the rest of us. He says:

At each upper corner of each window-screen the wire cloth was pried up $\frac{1}{4}$ of an inch by pushing in two little blocks of wood. Flies get into a house when the doors are opened. Sooner or later a fly goes to the window, runs up to the top, scurries along first to one corner or the other, and, if he finds an opening, out he pops, never to find his way in again by the same route. What would we think of a honey-house with crowds of bees hanging around the door that was opened dozens of times a day, and no opportunity for the bees to escape over the tops of the windows? We know that it would be full of bees all of the time. A dwelling with screens on the doors and windows is an exact parallel. Put escapes at the tops of the windows, and there is no necessity for sticky fly-paper.

ROCKY MOUNTAIN BEE-JOURNAL.

Under the title of "Honey without Bees," Mr. Morehouse has the following. He treats the matter without gloves, and in a manner that is refreshing. He says:

"HONEY WITHOUT BEES."

Such is the bombastic title of an advertisement of the Sanitas Nut Food Co., of Battle Creek, Michigan, that appeared in a recent number of the *American Mother*. Here is a sample of the wisdom of this bumptious ad. writer:

"Marvelous have been the discoveries in electricity and the uses of steam and the utilization of the various forces of nature; but a discovery which is really more far-reaching in its results, and perhaps capable of immediately benefiting a large number of persons, is a process worked out by an eminent physician by years of laboratory research whereby it is possible to make honey directly from wheat and other cereals, without the aid of chemicals of any sort, and by a process essentially identical with that by which honey is manufactured by plants ready to be collected and stored by the cunning little feet of the honey-bee."

Of course, such a pyrotechnic display of idiocy will only cause the bee-keeper to smile; but at the same time the assumption that genuine honey can be produced by artificial processes is capable of doing great harm by the suspicion it will create against the pure product. Won't some of our Michigan friends please hunt that fellow up and tell him that bees do not "collect and store honey with their feet"? We quote further:

"Malt honey, or meltose, is genuine honey—not an imitation or a substitute, but the real thing derived from the original source—the plant, but without the assistance of bees."

Bee-keepers will have no contention with these people if they will only be content to call their spurious concoction "meltose," and let it go at that. But to advertise it as "genuine honey—not an imitation or a substitute," is making for it a dishonest claim, and perpetrating a base fraud upon the public, that ought to render them liable to prosecution.

Be it remembered that no chemist's or physician's laboratory ever has, or ever will, produce a drop of "genuine honey."

It is to be hoped the Sanitas Food Co. will call that "bumptious ad. writer" to order.

J. W., Mo.—Your three acres of buckwheat will help to supply your six colonies with the necessary stores for fall and winter; but unless the flow is extra good it probably would not give enough honey, and sometimes buckwheat fails entirely.

GENERAL CORRESPONDENCE

RAMBLE 190.

Shall a Government Forestry Commission be Organized?

BY RAMBLER.

People in Los Angeles go to Santa Monica, mostly for a plunge in the ocean. It is only a trifle over 20 miles. The crowds go on the steam and electric lines; but there are quite a few who run down on their wheels. A very good bicycle-path is provided all of the way. I took the path one day in the same direction, but I went a little further and ran up into the Santa Monica Canyon; and it is a very good place for a bee-keeper and a seeker for information to go, for here is located the government forestry station. Here all kinds of shrubs and trees, both native and foreign, are planted, and their uses minutely investigated. An interest is taken in bee culture as far as to observe which trees, etc., are useful as honey-producers. Over 60 varieties of eucalyptus-trees and many other trees and shrubs are here under experimentation.

The superintendent, Mr. C. A. Colman, called my attention to a shrub in full bloom, known as *tegasaste*, or tree lucerne. A full-grown tree, with the superintendent, also full grown, is herewith presented. This little tree is adapted to growth upon arid land. The foliage is eagerly sought by cattle; and when

the tree is full grown it is not easily killed by close browsing. It is covered with a multitude of small white blossoms; and from the number of bees at work, and their enthusiasm,

VERONICA.

there must be quite an amount of nectar secreted. The tree was in bloom at the time of my visit, early in April.

Where a shrub can be of use aside from its secretion of nectar it is well to give it a trial; and I have no doubt the State University at Berkeley, Cal., could put applicants in the way of procuring seed.

My attention was called to a beautiful shrub bearing the beautiful ladylike name of Veronica, or *V. salicifolia*, which should be of some value to bee-keepers. At present it is found mostly in parks, both public and private; and until some combination of use is discovered it will remain an ornamental shrub. I believe some portion of it is used to a limited degree as an ingredient to a proprietary medicine.

The development of the leaves and blossoms is very interesting to those who love to study plant growth. The new growth that develops at the end of each twig looks like a matured pod, as will be noted in the full-sized photo of that part resting against the cup. But instead of being mature, this pod soon commences to split open, and it is transformed into two leaves; and, behold! as it opens, there peeping out are the twin baby-spikes of buds. They follow the example of the leaves, and soon part on either side of the stalk, and are

TREE LUCERNE.

soon in full bloom, while other leaves and buds are forming above. Each spike is covered with little white flowers, and the blooming continues for several months. Bees are always busy upon the blossoms from early morning until evening, proving the shrub to be a prolific source for nectar.

It appears to the Rambler that great opportunities are being neglected in this country, and especially in Central California, where trees and shrubs can be profitably grown for uses aside from honey.

There are large areas of alkali land. This land can be purchased for about \$2 50 per acre. The eucalyptus will grow upon it, and I am not sure but tree lucerne will also do well. The idea is to purchase a large acreage,

veronica, and kindred growth, upon the mountains and in the canyons of Southern California is of vital interest to bee-keepers and to all interested in irrigation. Conserve and extend the forests upon the uplands, and you add to the water supply for the valleys.

These are matters too large for individual effort; and I am looking for the time to arrive when the government will step in and do the planting. Many of these mountains are now set apart as government reservations, and they are in charge of rangers who spend their time, as the name signifies, ranging over miles of mountain and canyon. Set them to planting trees upon the waste places, and their value will be much enhanced.

Since writing the above there comes to hand,

FORESTRY STATION APIARY.

one or more sections, and plant to eucalyptus. And here we come to another feature that has received but little attention: Eucalyptus is usually grown in California for shade or for wood. The bee-keeper planting for honey secretion could easily select those varieties not only for use as fuel but for timber, and in building there are varieties that take a high polish, and can be used for the manufacture of furniture. In fact, there are many uses if the proper variety is planted, and this planting for industrial purposes is in its veriest infancy.

The excuse that the profits are not immediate will not hold good with this tree. It is of rapid growth, as I have demonstrated recently, and can be cut for wood and profit as soon after planting as a revenue can be secured from the planting of the orange, peach, or other fruit-trees.

The planting of eucalyptus, tree lucerne,

very opportunely, news of interest in this line. The Secretary of the Interior is taking steps to organize a government forestry bureau, and establish a system of reforestation of waste lands. It seems to me that bee-keepers should be wide awake enough to have a representative in this bureau. It is for tree-planting in the East as well as in the West.

We have a representative man in Washington, Mr. Frank Benton, and he is in position where he can exert a lasting benefit to bee-keepers. I am in hopes the editors of our bee-papers will think this of enough importance to cast their influence where it will do good.

Returning to the subject, Forestry Station, we find near it a neat apiary of about 100 colonies; and, though it belongs to private parties, I have termed it the Station apiary. By referring to the photo it will be noted that it is in a forest of sycamore-trees; and the su-

perintendent of the station neglected no opportunity to make observations as to where and how much the bees worked upon the station flora. The owner of the apiary, Mr. Smith, an honest Dane, gave intelligent study in the same line.

The hives were arranged in a semi-circle, in a little clearing against the side of the canyon. The hives were supported upon stakes driven into the ground; and when ants were troublesome these supports were smeared with axle-grease, and no ants need apply. The hive has its complement of double covers, quilts, and stones, though the latter are of trifling size compared to some of the heavy weights in California.

It is a matter of fact that bee-keepers never consider how much time is taken to unload the top of a hive. Rags, called quilts; cover, shade-board, stones, and all but the cover, are useless—more of a job to take off and put on the stuff than to examine the interior of the hive. In spite of all this extra work, Mr. Smith and many other bee-keepers worry along and get there with good crops of honey. The honey resources here are excellent; and, with the proviso of a good year, the yields are large.

Mr. Smith preferred the L. frame. This preference was so strong that he changed over a lot of Heddon hives in an apiary he purchased; and by nailing two divisible chambers together, and cutting down a little, he could use his beloved frame. It was a very short-sighted piece of business, according to my notion.

Mr. Smith kept his bees near his residence; and his bees, his poultry, his vrow, and his baby were all under his eye. It is a cosy and romantic location for an apiary and a forestry station, and so near the ocean that it is sometimes easy to hear the waves dash against the rock-ribbed shore.

[In my hurried trip through California my attention was called repeatedly to the eucalyptus. It is indeed a beautiful tree, growing so rapidly as to be useful for shade in a few years. The leaves are sometimes a deep green, and then they are a light blue. I was told that the blue was due to the younger growth, and the green to the older growth of the tree.

Everywhere I heard eucalyptus or gum tree highly spoken of as a yielder of honey; and in saying *tree* I mean to include quite a variety, as there appear to be several different species.

I was also told that those \$2.50 alkali lands would grow trees, and I do not know why Rambler's suggestion would not be practicable. Were it not that it takes a little time for it to materialize, tree-planting would be begun, and bee keepers would locate everywhere on those cheap lands. But even as it is, a splendid growth of trees can be secured in five or six years; and in ten years one would have quite a little forest.

I am glad to know that the government is looking into this matter of forest-trees. At the awful rate timber is being cut, it is highly

important that a government forestry commission be organized, so that some steps may be taken to supply future generations with timber that will be sorely needed. Hive lumber, we know, for example, has been advancing very rapidly; and the fearful fact is becoming more and more apparent that in a few years soft lumber will be either very expensive, or, what may be worse, we may have none to use at *any* price.

GLEANINGS will be glad to assist in any way in its power, and we take pleasure in seconding Rambler's suggestion that Frank Benton, in Washington, do what he can to steer the proposed forestry commission in the right direction. Certainly we ought to encourage the growth of those trees that will afford a threefold use—timber, shade, and last, but not least, honey.—ED.]

THE PRODUCTION OF WAX.

Can it be Made Profitable in Cuba?

BY HARRY HOWE.

The price of honey here at present is about 2½ cents per pound net, while the price of beeswax is about 27 cents. The prices are in American money. As a matter of fact we are paid in French and Spanish gold, but I have reduced all figures to U. S. gold. Now, dividing the price per pound of wax by the price per pound of honey gives a basis on which to figure. It is evident that we must get our pound of wax without expending a greater value in honey. This is very close to ten pounds of honey, which may be used to get the pound of wax. Authorities differ so much as to the amount required that no one of them can be regarded as reliable except under the exact conditions under which that particular test was made.

The only way I see of getting estimates for my location is to run one half of an entire apiary for wax and the other half for honey. This, I think, I can afford to do at present prices. Where honey can be sold for five cents, of course it would not pay, for it is pretty certain that it would take more than 5½ pounds to the pound of wax.

Our conditions here are more favorable to wax production than any other place I know of. Our honey-flow is eight months long; and during about half of this the night temperature is high enough to insure wax secretion without excessive waste to keep up heat.

During the four months in which the flow is generally less than daily needs, although there is some honey nearly every day, the temperature is the highest of the year. During the heaviest of the honey-flow the night temperature is too low for profitable wax production.

So far I have written of things about which I know something. Now come the things of which I want to know—how best to turn the honey into wax.

It is pretty evident that it can best be done during the warmest weather. This will in-

volve storing the honey some months, and then feeding. My plan is to cut out the combs instead of extracting them, and return the frames, but only half from each hive, extracting the other half so they will at all times have store room. Then when there is no longer a surplus to be had in the fields, contract the brood nest and set out honey at one side of the apiary. As fast as they carry in the honey, melt the wax which remains; then when they have built their combs nearly down, set them out to be emptied and melted.

I think the improved condition of my bees in the beginning of the next harvest will about pay for the extra labor; but until it has been tried, no one knows how it will work.

The native system in box hives is to cut out all combs that have no worker brood, about four times a year, or as often as the bees fill the hive with combs. By this means they get about 1 lb. of wax to every 15 lbs. of honey. That is, every time they get 15 lbs. of honey they also get 1 lb. of wax.

In the old times here there were many apiaries run entirely for wax. They simply threw away the honey.

In conclusion, it is safe to say that it is only in some special location like Cuba that it could be made to pay to run for wax alone; but in many places the wax production can be profitably increased.

Artemisa, Cuba.

[I see no reason why wax production could not be carried on profitably in Cuba; and I believe you will find that, under some conditions, it will not take more than 3 lbs. of honey to make one of wax. Indeed, some experiments were conducted—just where and when and by whom I can not now recall—showing that, when conditions were right, even as low as 2¾ lbs., or about that, of honey, could be converted into a pound of wax. Perhaps I am wrong in my figures; and if so, some of our many readers who can recall the experiments may be able to give us the exact data. Referring to your proposed method, I believe it is along the right line, and we shall be glad to know just how it turns out financially.]

Several correspondents in old Mexico have asked for particulars as to the best method for converting honey into wax; but so far we have been able to give no satisfactory information, for we have had absolutely no experience. If there are any of our subscribers in the West Indies, or any other hot country where honey is abundant and cheap, and wax high-priced, and who are in position to give us information, I should be glad to have them write and tell us all about it.—ED.]

CUBA FOR BEES AND HONEY.

Wrong Notions Corrected.

BY ROBT. L. LUACES

On page 136 I call the attention of brother bee-keepers in the United States to statements made by divers American bee-keepers in regard to conditions in Cuba, trying to show that Cuba is a much better country, both for

bees and production of honey, than such statements seem to impart; and now Mr. H. G. Osburn, page 432, says I have taken some of the old experienced chaps by the neck for not printing a truthful picture of the real state of the bee industry in Cuba. Mr. O. seems not to have read well what I wrote, for in his article he goes on to prove my object; first, Cuba gives better results to the bee-keeper than what is said. The first part of Mr. O.'s article proves this, for he gives us a synopsis of the production of his apiary at Punta Brava, that can't be beaten. The second part claims that bee-keepers have been printing things about Cuba as a bee country when they know only a very small portion of the island. Mr. O. commits the same fault by his own showing, for he says that there are good locations in the middle, and along the south coast of the island, "where nobody but colored people can live. I expect to penetrate some of them next year." Now, I live in the *middle*, and am *white*, as are 70,000 of my neighbors. Mr. O. *expects to penetrate*, so he has not done so; and the south coast of Cuba is some 700 miles long; I hope I shall see Mr. O. when he does his penetration act. Mr. O. seems to indicate that a 68-hive man can't know as much about locations as a 105-hive man; ergo, my neighbor, with his 1000 hollow log hives knows more about bees than Langstroth did. If Mr. O. would come up country and look around he could say he knew what Cuba is good for.

Mr. W. W. Somerford, on page 553, gives us something very good on hive-covers and bottom-boards. So far I have nothing to complain of in regard to the Dovetailed covers. I have had them in use two years out in the open, and they are as good as new. The 16×21 inch bricks are just the thing. I don't use them, but some much the same. I use pieces of hard-wood boards—mahogany, sabicu, jucaró, etc., with the same idea and results, after having found that my queen in two cases had moved to the space under the bottom-board, and the bees had filled it with comb. If Mr. S.'s friend of the railroad iron had used old street car rails he would have come out all right, for they offer no place for the bees to harbor in, and fulfill all other conditions. The staple in the bottom corner of frames just hits where I wanted.

I should like to call the attention of Messrs. Somerford, Howe, Osburn, and others, to the following: Bees here (Puerto Principe) die off a good deal during campanilla bloom. I am the only man who keeps hives on the ground. All others follow the custom of the country, and mount them on stilts. So far I have had no losses. All the others have. Is it location, season, or situation? Italians and their crosses suffer less than blacks.

Puerto Principe, Cuba.

[It is very easy for one to judge of a whole large territory by one or two little spots in it, and it would not be strange if some of our correspondents had unwittingly fallen into this error. If so, I know they will be glad to be corrected.—ED.]

A DESULTORY TALK REGARDING THE SEASON OF 1901.

"Good morning, Mr. Doolittle. I was coming over to see my son Charlie this morning, so I thought I would run in a minute and see if I could coax you to sell me a colony of bees next spring. That is, I want you to agree to let me have one at that time if you will."

"I have not advertised bees for sale for two or three years now, thinking that I would not sell more, as I have got about the number I wish, all on good straight worker combs, and had concluded that I had better keep them than to sell more at the prices quoted by others, for the honey I sell from them each year comes to more than double what bees are quoted at. But why do you wish one of my colonies? You have a good start with the ten colonies you now have."

"You know that red clover has blossomed this year for the first time in from 15 to 20 years. That is, this year is the first time the bloom has perfected in that time, and I have watched, when working on my 200-acre farm, and I have not seen a single one of my black bees at work on the red clover, but the clover is just swarming all the time with your yellow bees, and they stick to the head one goes on for a minute or two, as if they were getting half a load from a single head."

"But don't you know that it is said that bees go but a mile or so for forage, and here you are claiming my bees as working on your clover, which is fully three miles from here?"

"I can not help what is claimed; there are no yellow bees nearer me than yours are; in fact, I know of none others nearer than eight miles. Did you not get honey from red clover before basswood opened, and then after it was past? If you did not, then I am deceived in what I saw."

"Yes, I knew the bees were at work on red clover; for with the 17th of June all desire to rob stopped, and by the 20th honey was coming in at a rate nearly equal to that from a basswood yield. From that on till basswood bloomed, I could leave a frame of honey standing out in the yard all day and not a bee look at it, except to gather propolis off the ends of the top-bar to the frame, where the bees often put in more than is agreeable. To know that this was right I went to the fields, red with clover, and, as you say, found them swarming with Italian bees, while scarcely a bee but those of the German variety was to be found on the little white clover that bloomed along the roadside."

"But you have not told me whether you got any honey or not in the section boxes."

"Yes. I took off from some hives as many as 80 one pound sections of red-clover honey, while the average yield was not far from 65 sections. Then basswood gave a fairly good

yield, but I can not say just how much, as many fields of the mammoth red clover were still in bloom, not having been cut when basswood was over, and the bees worked on those fields from a week to ten days after basswood, till the clover was cut for hay. This helped very much, as it gave the bees a chance to finish up those only partly filled from basswood. From two colonies I have taken 176 completed sections, with an average yield of about 145 sections from such colonies as were not drawn on for queen-rearing. This is the highest average yield I have ever made, except in 1877, when the yield was 166 pounds of comb honey."

"That shows you why I wish a colony of bees from you. From my ten colonies I shall not get 300 sections, and that will be nearly all from basswood, as the new swarms did not get to work till about the time basswood blossomed, and the old colonies swarmed so much that they have done nothing."

"Well, now you have touched something not in your first idea, that it was the red clover which made the difference. Had you not allowed those old colonies to swarm themselves to death, so to speak, and kept your original three colonies at the same number, or not allowed them to increase more than to six, at most, you would have been enabled to make a much better showing, I am sure, with your black bees. My increase at the out-apiary has been only one, and here at home the count is only two greater than in the spring. If you wish a good yield of honey from each colony you will keep the bees together as much as possible, for 60,000 bees in one hive will produce very much more section honey than will the same number of bees in three hives; or, worse still, the most of them divided up in after-swarms, and in the parent colony."

"Do you pretend to say that you had any colony which contained 60,000 bees during the late honey-flow?"

"Yes. Those which gave the 176 sections contained more, I calculate, instead of less."

"Oh what do you base your opinion?"

"Bees live to be about 45 days old during the working season, while the eggs laid by the queen perfect into bees in 21 days, so that we can figure two and one-seventh generations coming on to where one generation dies off. Many of my hives contained 800 square inches of solid brood which would perfect in time to take advantage of the red-clover honey harvest, although, owing to wet cold weather later on, this brood was not kept up to produce the basswood workers I desired; and this had something to do with the larger yield of honey from red clover. But as brood-rearing sprung up as by magic as soon as the cold and wet ceased, we can safely count on about 700 square inches of brood, as the average, to give bees which were available during the harvest. And as each square inch gives at least 50 bees, we have an average of 35,000 bees every 21 days, and two and one-seventh times that is 75,000."

"Whew! it does figure up, doesn't it?"

"Yes. And if we remember that many

bees are killed by accident, and otherwise, so that they do not live out their allotted time, as some claim, we can cut off 15,000 for this, and still have 60,000 left, as was proposed at the start. And could the weather have been favorable for brood-rearing 37 days before basswood bloomed, several thousand more bees could have been on the stage of action, and thus 1901 might have gone on record as the best year in the history of my bee-keeping life, instead of second best."

"But how do you keep so many bees together? Mine will rot stay together after they get strong enough to swarm."

"Did you try to keep them together?"

"No, I did not know how. Tell me how."

"Well, I have several plans I am trying, but have only one which is as yet perfect enough to give out. Give lots of room, with as many bait sections as possible, so as to discourage early swarming as much as you can. When you think you can hold them from swarming no longer, cage the queen. Now wait from ten to eleven days, when you will shake the bees off their combs so you are sure to see every queen-cell started, and pull every cell off. Now make a hollow plug to fit one end of the cage the queen is in, and fill the hollow with candy, such as is used in shipping queens, having the plug about 1½ inches long, so the bees will be about two days in eating out the candy and liberating the queen. This does away with all desire for swarming from that colony."

"But don't the bees fill the cells where the brood emerges with honey?"

"Yes, quite largely; but as soon as the queen is out she soon asserts her rights, if she is a good one, and this honey is removed from the brood-combs and taken to the sections, and this, together with what is coming from the fields, and the new impetus given to the bees through having the queen laying again, makes a boom in the sections which is rarely attained under any other condition, so that they are filled as by magic, and completed in the finest shape to go on the market as 'gilt edged.' But I can not tarry longer this morning, as I have at least three days' work that ought to be done to day. Come again when I am not quite so busy."

not inclined to buy, only for present wants, while in the local market 3 to 4 cts. is all that is offered for extracted." Now the bee-keepers state that half of the bees starved to death last season, and, in consequence, are not on hand to gather the honey, and the weather has been too cold for the bees to work to the best advantage. In consequence, there will not be a large crop from the lower part of this State.

The statements of Western bee-keepers are frequently doubted because they differ from the experiences of Eastern bee-keepers. I am glad to note that Mr. E. R. Root finds that Western bees have ways of their own that are peculiar to themselves, and altogether unlike their Eastern sisters. I have always been told that "bees fill their combs with brood and stores; and when there is no longer any more spare room they swarm out and leave their stores and brood behind them." This season I bred my bees up strong, giving them two brood-chambers of 8 or 10 frames each, with supers in addition. The queen had all of the combs full of brood and bees, the supers well filled with honey, when the weather turned raw and cold. After about a week of this weather it changed to warm, and the bees swarmed all along the rows. An examination of the hives showed that the bees had consumed the stores, many of the combs being "as dry as a bone." The brood had nearly all hatched out of the combs, in the brood-nest, and the queen had not laid any eggs in the vacant cells. The hive was as bare—yes, more so—than at the close of a bad winter; yet with empty combs and vacant brood-cells they had swarmed as never before. I think I shall have to change the cause of swarming, in this locality, to "bees swarm when they want to, without regard to the condition of the combs; this season because they were populous."

The rules for grading comb honey are possibly as good as can be selected; but those governing extracted honey could not be worse. Every thing hinges on color. As well might we rate maple syrup, wine, or any other liquid by color alone, as honey. I should like to see the Morse butter scoring system, with a few changes applied to extracted honey. This system gives, in 100 points, flavor, 45; body, 25; color, 15; salt, 10; package, 5. Now, why not give extracted honey—flavor, 50; body, 25; color, 25; package, 10? The present method is a reflection on the intelligence of the fraternity.

E. H. SCHAEFFLE.

Murphys Cal., June 24.

PRICES ON HONEY; HOW THE BEES OF CALIFORNIA BREAK OVER ALL RULES; GRADING EXTRACTED HONEY.

"I arise to say" "Here too!" to several articles in a late issue of GLEANINGS. I quite agree with Mr. Wallenmeyer that, to overestimate the crop of honey, is a serious blunder. The leading commission house of San Francisco writes me: "The report has gone east that there is a big crop of honey coming from lower California. In consequence, they are

[I have already published my estimate of the crop conditions in California, and that was to the effect that there was not nearly the honey actually secured that the early rains indicated there would be, and that I thought the prices would rule about the same as the year before. From recent advices from reliable sources I am pleased to know that there is a slight upward tendency in the market, as the coast buyers have come to learn they must pay more if they get any honey to sell. This is also true of Colorado and Arizona.

The grading-rules proposed by you are excellent. Now how shall we carry them into effect? The bee-journals could probably do more than any other agency, and GLEANINGS would be glad to co-operate with any of its cotemporaries.—ED.]

ABOUT HIVE-COVERS; THE USE OF SAW-CUTS ON THE UNDER SIDE.

About eight years ago I wrote you from Orlando, Fla., that I had discovered how to keep the flat hive-covers from warping. The letter was published in GLEANINGS; and when the patented Danz. hive was offered, I found one of its features was in line with my suggestion.

I called your attention to this fact, and received a very cordial letter from Mr. Danzenbaker, explaining that this particular was not included in his patent, for the obvious reason that it was not original, but had been for a long time in common use among woodworkers.

Each time I hear or read complaints of the flat cover warping, I wonder that people are so slow to profit by a good thing when told of it; and what can be simpler than to cut saw-grooves $\frac{1}{2}$ inch or $\frac{5}{8}$ deep in the under side of the cover, in line with the grain of the wood, and $1\frac{1}{2}$ or 2 inches apart? Then nail on the cleats, and the board simply *can't* warp, whether in Cuba or Alaska. With such covers Rambler can lose his harrow-tooth, and Dr. Miller stuff his rags in his smoker. It is equivalent to a cover made of $\frac{3}{8} \times 1\frac{1}{2}$ -inch strips, and the cleats hold it securely flat under all conditions. Again, it is like a $\frac{1}{4}$ -inch cover, with all the strength and weight and smoothness of a solid $\frac{3}{8}$ -inch board.

Here in Pennsylvania the solid board cover does not warp much, a $\frac{1}{4}$ -inch crack being the maximum; but in Florida I used to pile 50 lbs. of brick on diagonally opposite corners to keep them anywhere near flat. One day when applying the method to the parts of a small box which I was gluing together, I fairly blundered on the idea that it would keep my cantankerous hive-covers flat. It did, does, and will.

Try a few, and see if it is not a very effectual and simple remedy for the only fault of the flat cleated cover.

E. J. BAIRD.
Lock Haven, Pa.

[The fact is, we did give the idea of saw-kerfs on the under side of the cover-boards a most thorough test. While they might give good results in Florida, with its great amount of humidity, they will not do at all in a western or dry climate. In fact, they give a great deal of trouble right here in Northern Ohio. Boards having saw-cuts will check and split right along the line of the cut; and then we find they are bad to ship. Our conclusion was that it was far better to have solid boards. The best of hive lumber, under conditions that prevail in various parts of the United States, will check and crack soon enough without making matters worse by inviting such checks by cutting boards half way through. We have, therefore, abandoned the use of these saw-kerfs, not only on our own covers,

but on the Danzenbaker; and I believe Mr. Danzenbaker himself is satisfied that that idea was not a success, for I have sent him some samples of covers that would almost invariably start to check at the saw-kerf; and we found that, as manufacturers, we could not afford to assume the loss in shipping on such covers.—ED.]

THE ROUGH HANDLING OF A VIRGIN QUEEN.

A young queen, after her wedding flight, returned to the wrong hive, one in which there was a laying queen. About two hours after her return I discovered, by an unusual commotion among the bees of the hive from which she took her flight, and by examination, that she had failed to return. I had seen her take her flight, and at once suspected that she had made a mistake and had gone into an adjacent hive. On opening it I found the bees "balling" her at the bottom of the hive. I at once removed this "ball," succeeded in liberating the queen, and putting her into the proper hive. The bees which balled her had torn away from her the appendage usually appearing after the wedding flight, leaving the parts gaping open as if she were injured. I watched her closely to see whether she would take another flight. She did not go out any more, but in two or three days she began to lay, has proved herself to be quite prolific, and her bees are all right. May not her accident affect the length of her egg-laying life?

H. W. WILLIAMS.

Elberton, Ga., July 12.

[The mere fact that the drone's appendages were pulled away by the bees would not, I think, necessarily imply that the queen would not lay so long on that account. Even if she had returned to the right hive in the first place, her own bees would have taken away the visible portions protruding from her body, and hence the result would have been just the same. In the arrangement of nuclei it is always desirable to have something by which young queens can discriminate between their own entrance and that of some other of the same general appearance.—ED.]

CELL-BUILDING ON DRY COMBS.

I removed the queen from one of my hives to cause them to rear queens, and I find they are building queen cells on cells where there are no larvæ. I took a frame of Carniolan larvæ from a colony, and put it into a colony of hybrids after making it queenless. My object is to raise some Carniolan queens, with the result that they are not building on *any* larvæ.

WM. J. MCCARTER.

Port Republic, N. J., Aug. 2.

[The circumstances you relate, of bees building cells on combs without any larvæ or eggs in them, is quite unusual; yet our Mr. Wardell says he has had two cases of it this season. But when they do build cells on such combs they will transfer the larvæ from the comb having them in the first place to the queen-cells that are empty.

But if your bees do not do this, there is nothing to prevent transferring bees or larvæ yourself, then taking away all brood of every sort, leaving nothing but the frame or frames with cells.—ED.]

GASOLINE IN LIEU OF BISULPHIDE OF CARBON FOR KILLING THE MOTH-WORMS IN COMBS.

I have just made an important discovery, to me at least; that is, that gasoline is as effective in killing moth-worms in bee-combs as bisulphide of carbon, and it does not cost a twelfth as much. My plan is to fill a tight box or barrel with combs, then pour in a pint or so of gasoline; close up tight for 24 or 36 hours, and the work is done. Gasoline beats sulphur far away, and is much easier used, and safer. I have used gasoline on hundreds of L. combs, and have no trouble with worms, as I think the gasoline kills the eggs as well as the worms. J. B. RAPP.

Owensville, O., Aug. 6.

[I know that gasoline can be used in place of the more expensive drug in destroying ant-nests; but it requires a larger quantity. If it will also kill moth-worms in combs it is a kink worth knowing.—ED.]

PECULIAR DISAPPEARANCE OF QUEEN.

I received the queen in good order. I had trouble during the latter part of June with my queens. Good strong colonies with plenty of brood would get queenless all of a sudden. I can't tell the cause, but I find I am not alone. It seems to be the case all over the State, and it is hard to get them to build cells, but they will accept other queens.

Newman, Cal., July 28. S. LONGMIRE.

[When I was through your vicinity I learned that queens were "turning up missing," in a way that could not be accounted for by the veterans in the business. If any one in the vicinity or elsewhere has a solution, let him be free to tell it. It may be that there is a disease that affects queens and not the rest of the bees; and it is a little strange that they should refuse to build cells.—ED.]

IDAHO AS A BEE LOCATION.

Mr. Root.—You are correct in regard to Idaho being one of the best locations for the bee industry in the United States. Our average winters here will compare favorably with those of eastern States far to the south of us. We have more days of sunshine than nine-tenths of the States have. Every few days in ordinary winters the bees can clean house and fly some. We leave them out on the summer stands unprotected all winter. Sometimes some protection would be better. Sweet clover grows wild after starting, wherever water can reach it. We have few wild flowers to make honey. Lucerne is the great crop and honey producer. We get three crops of this, yielding from four to seven tons, and selling at from \$3.00 to \$5.00. Clover yields two

crops, and is usually cut, one for hay and one for seed. The seed yields from four to six bushels to the acre; weighs 60 lbs. or more, and is superior in quality to any raised elsewhere I ever saw. Our water gives us absolute control of its ripening. Neighbors of mine realized as much as \$30 to \$35 an acre on crops of this kind last year. Wheat produces up to 50 bushels, and oats to 75 per acre. Of course, this is the best farming. Vegetables do as well, and fruit and berries equal the best raised in the United States. We have proved this in open competition. Idaho apples sold higher on the New York market last year than any other—\$1.00 a dozen. Living is nearly as cheap as in the central East. We have good society, and order; have a free-text-book system, and spend more on our schools per capita than half the States do. Our country schools have from six to nine months school annually. Teachers from Michigan and Vermont, with first-grade certificates, have trouble to secure second-grade here.

All together, any bee-keeper wanting a new location would do well to look up Southern Idaho. This is the second year for our association, and we have over 20 members. So far as I know, it is the first and only one in the State. Father gave me \$20 for his first colony of bees. They can be bought now from \$1.00 up. F. R. FOUCH,

Sec. Parma Bee-keepers' Asso'n.
Parma, Idaho, Aug. 13.

[Were it not that the writer of the above is secretary of a recognized bee-keepers' association, I should incline to the opinion that this was a free advertisement from some land speculator; but after having gone through Idaho, and studied its conditions, I am of the opinion that much of the above, if not all of it, is true. In Idaho, alfalfa, red clover, timothy—in fact, all the various kinds of hay and fodder plants—can be grown. Sometimes I could see an alfalfa field, and next to it a fine growth of red clover. If I am not mistaken, every thing that can be grown in the East can be grown in Idaho, and a good many other things besides. There are quite a number of fine locations for bees, and not a bee in the regions. But no one should think of going to Idaho, or anywhere else, *without first making a personal visit himself*; and if he desires to keep bees in one of these new fields, he should by all means hire out for one season to some bee-keeper so that he can accustom himself to the conditions, and thus learn whether it will pay him to move his bees and family to the new climate.—ED.]

HONEY CAKES.

Mix thoroughly 1 quart of honey, $\frac{1}{2}$ pound pulverized sugar, $\frac{1}{2}$ pound fresh butter, juice of 2 oranges; then stir in gradually enough sifted flour to make a dough stiff enough to roll out easily. Turn out on a molding-board; beat well for a few minutes with a rolling-pin; then roll out into sheets half an inch thick; cut into round cakes, and bake in shallow buttered pans.—*Delineator*.

Murphys, Cal.

E. H. SCHAEFFLE.

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chapinville, N. Y.; J. M. Hambaugh, Escondido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

OWING to a little delay in getting the pictures ready illustrating the bee-keepers' paradise, I am not able to continue my travels in this issue, but will have them in our next.

PERHAPS some of our readers may wonder why the description of my western trip does not progress more rapidly. I have gathered so much material and made so many pictures that it will take considerable time to cover the whole series. While some features of the journey have been taken out of their natural order, yet the major part of them will necessarily have to follow in chronological succession.

THERE seem to have been heavy rains in the eastern and central States. This will help to preserve the life of the young clovers, and at the same time may give us fall crops. By the by, of late years we do not seem to hear much about fall flows of honey in the central and eastern States. What I mean by "fall flows" is honey from goldenrod and other plants that come into bloom in the autumn months.

GENERAL MANAGER SECOR was nominated for Representative in the General Assembly of Iowa at the Republican district convention, composed of Winnebago and Worth Counties, Aug. 13. The nomination was unanimous, and means election. Mr. Secor is a popular and able man, and well deserves the honor. If he had made any effort, from what I learn he might have received the nomination for Representative in Congress for his district.

OUR friends will not forget the big National Convention to be held at the Pan-American, Sept. 10, 11, 12, Tuesday, Wednesday, Thursday. The place of meeting is the Buffalo Library Building, corner Washington and Clinton Sts. There will be a joint session of the American Pomological Society and the National Bee-keepers' Association, on Thursday evening, the 12th. As has been already stated, there will be no fixed program outside of the joint session, and the general discussions of the bee convention will be those furnished by the question-box. In other words, there will be no long essays of any kind. It is ex-

pected that there will be nothing but lively, crisp, interesting, offhand talks—the kind that keeps everybody awake, and alert, and awaiting a chance to get in a word. We expect to have a stereopticon on the evening of the 11th, when an entirely new set of views will be given, taking up bee-keeping in the great West, showing how it differs from the bee-keeping of the East.

The A. I. Root Co. expects to be represented by the three Roots—A. I., E. R., and H. H.

ACCOMMODATIONS FOR BEE-KEEPERS WHO EXPECT TO ATTEND THE NATIONAL CONVENTION.

UNDER date of Aug. 26, Sec. A. B. Mason writes:

Dear Ernest:—I can furnish places for about 60 delegates to the N. B. K. A., for 75 cts. for lodging and breakfast, in nice clean private families, if they will apply to me at the convention; and all others who may wish entertainment will be assigned to such places as they desire by the Dr. Pierce Free Bureau of Information at 652 Main St., if they call for Mr. Sidney S. Sleeper; and I am assured no one placed by the Bureau will be in any way dissatisfied, "provided they do not expect something entirely out of reason." The Bureau will furnish information free.

A. B. MASON,
Aug. 26. Station B, Toledo, O.

THE ANTI-SALOON LEAGUE AT THE BUFFALO EXPOSITION.

WE have just received the following from our good friend Bro. Brant:

Dear Bro. Root:—I hope that we may be able to help locate many of the delegates to the Buffalo convention Sept. 10-12. Can you not speak another good word for us in your excellent magazine?
J. F. BRANT,
Buffalo, N. Y., Aug. 23.

Inclosed with the above letter were circulars from which I make the following extracts:

Dear Sir:—We will either give you accommodations at the "Central Park Place," or equally good in our best Christian homes, for \$1 00 and upward, breakfast and late dinner extra. A tasty luncheon will be prepared for taking on the grounds if desired, and late supper will also be served at reasonable rates. The mayor has decided not to have runners at the depots allowed, so on your arrival take the Main Street car direct to 63 Huntington Ave., or to our office, D. S. Morgan Building, just off Main on Niagara Street. Persons willing to occupy neat and comfortable cots in our annex, can save from one-fourth to one-half. We are just 6 minutes' car-ride from the Exposition Grounds, and cars near at hand. Persons desiring to make definite arrangements for rooms in advance will please write promptly, enclosing postage for reply, to Rev. John F. Brant Supt. Buffalo District, 300 D. S. Morgan Building, Buffalo, N. Y.

We sincerely hope all who love temperance and godliness will avail themselves of Bro. Brant's kind offer, and at the same time get accommodations among people who love righteousness and hate iniquity.

A CALIFORNIA BEE JOURNAL.

THE new series of the *Pacific Bee Journal*, bearing the insignia of "Vol. IV., Aug. 1," is before me. The editor, B. S. K. Bennett, in heralding the re-appearance of his journal, says: "We have awakened out of a sound sleep of three years to find the bees again humming, honey a flowing, and the bee-men much a going." Friend Bennett has put a good deal of life and energy into this number. He is a man who is thoroughly acquainted with all the special climatic conditions of the State of the setting sun—at least that was my

conclusion after having made a forty-mile ride with him over the mountains in the vicinity of Los Angeles. This trip, or, rather, the stops we made on it, will be illustrated in GLEANINGS, and then I shall have the pleasure of formally introducing our brother editor. In the mean time I am glad to extend to him on behalf of GLEANINGS the right hand of fellowship. There is a broad field for a bee-journal in California, and there is no reason why the old-new journal should not be a success.

CARELESSNESS IN THE HANDLING OF DISEASE INFECTED TOOLS, ETC.

SOME have written us that, even after they had used the McEvoy treatment for handling foul brood, the disease broke out again. Many bee-keepers do not realize, in spite of all that has been said, the importance of having every thing that comes in contact with foul or black brood either burned up or shut up in a tight box or room where bees can not get at it. Metal tools such as screwdrivers, pries, etc., should be put on a bed of live coals for a few seconds—not long enough to draw the temper, but to destroy every thing in the way of microbes that may still be hanging about the articles. Smokers should be painted over with a strong solution of carbolic acid, and the fire-cup can be disinfected by making a good hot roaring fire in it. Division-boards and bee-feeders, and things like that, should either be immersed in boiling water and kept there for a time, or should be dipped in a strong solution of carbolic acid—one part of the acid to fifty of water. When I speak of the acid I refer to the crystals and not to the solution that is ordinarily obtained at the drugstores.

In burning old combs I would first make a good bonfire and get a lot of live coals; then lay the combs on top of the coals one by one. But do not put them on too fast; and as a further precaution (for the wax sometimes runs down into the ground without becoming sufficiently heated) I would bury the ashes and the ground under them. Put them so far below the surface that neither plow nor spade will ever dig them up.

FEEDING MEDICATED SYRUP; HOW TO PREPARE THE CHEMICAL.

It will soon be time to feed bees in the central and northern States; and if feeding has to be resorted to I would strongly urge medicating all the syrup with the naphthol-beta solution. Such a precaution becomes exceedingly necessary just now when foul and black brood have been extending their ravages in every direction. The medicated syrup will not kill the spores of either disease, but it will destroy the bacilli as soon as the spores develop into the active stage. We gave full particulars on this subject on page 776, Oct. 1, 1900; but for fear some may have forgotten, I will repeat it.

Into an eight-ounce bottle (half pint) empty a one-ounce package of naphthol beta in the form of a fine white powder. Pour in just enough wood or common alcohol to dissolve the powder, and fill the bottle full. This

quantity of chemical in solution is just right for 140 pounds of sugar dissolved in 140 pounds of water. To mix, put 140 pounds of water in a common honey-extractor; then add sugar gradually, dipperful by dipperful, until there are about 140 pounds of sugar. While the sugar is being added, keep turning the handle of the extractor so there will be a rapid agitation and thorough mixing. After the sugar is all in, keep on turning the handle until it is all dissolved, and, last of all, pour in the naphthol-beta solution already referred to. Stir this into the mixture thoroughly by running the extractor for several minutes longer.

In handling the naphthol-beta solution, be careful not to get it on the fingers; but after it is mixed with the syrup, it is perfectly harmless to man or bees. Naphthol beta can be obtained for 25 cts. an ounce; and at this low price no bee-keeper can afford not to take the precaution.

In making the syrup we recommend half sugar and half cold water. There is no need of heating, provided thorough stirring is used, either with a stick and tub, or, better still, in an extractor in the manner explained. We have fed a half-and-half mixture for several years; and since using it we have never had any trouble from its going back to sugar in the cells after the bees have put it into the comb. For very late feeding it may be advisable to use one part of water and two of sugar.

PRICE OF EXTRACTED HONEY DECLINING SLIGHTLY; MARKET FIRM ON COMB HONEY; HOW TO CIRCUMVENT THE SMALL PRODUCER WHO IS TRYING TO BREAK THE MARKET; IMPORTANCE OF BOTTLING EXTRACTED HONEY.

FROM the best information we can get hold of up to date it begins to appear that prices on extracted honey in the East will rule a trifle lower than last year at this time; but the market on comb will be fully as high. We base this estimate on the offerings that we have received, and from other information that we are able to gather at this point.

As we have before stated, too many bee-keepers are producing extracted. See GLEANINGS, May 1st, page 384, current volume. If more would turn to the production of comb honey, or, if some of those who produce and market the liquid article in bulk would sell it in the bottled form, the net cash received would be more.

We find that this year, the same as every year, the small producers are rushing their product to market at ruinous figures. The large producers should make it a point to hunt up these people, buy their honey at the low figures, and thus prevent it from going into the centers of distribution and breaking the market. A few hundred pounds at a low figure to some buyers may be the means of bringing down the prices on hundreds of thousands of pounds not yet offered.

Bee-keepers in California, Colorado, and Arizona, where large quantities of honey are produced, should not be in haste to take the first price offered. Already buyers are begin-

ning to see that they must advance on their prices or else they will not get much honey. Producers in these States should go around and visit *all* the small producers in their localities and get them to hold their honey at a certain figure. If they will not hold, buy the honey outright. You better have the low figure than the buyer who will use it as a club on you.

If more bee-keepers who produce the extracted article would turn their attention to bottling, it would have a tendency to stiffen the market for their kind of honey. A large number are doing so now; and it is an encouraging fact that consumers are beginning to learn that, when honey is bottled, bearing the name and address of the producer, it is pretty fair evidence that the goods are pure. There is not a particle of doubt that the careful, intelligent bee-keeper may get a better price for honey for bottling it, even including all expenses, providing, of course, that he puts up an article that will not candy for a year, is neat and attractive, and providing, too, that the honey is of first quality. All off and dark grades should be sold in bulk—never, never, put it in bottles.

Our bottling business is growing larger and larger; and from what we can see and learn, the field for such goods is very large, and every one can, in his own locality, build up a nice trade. Do not be discouraged by the sales of one year; and if the grocer tells you he can buy of a certain syrup and refining company at a good deal lower price per dozen, tell him that you do not sell that kind of goods. Ask him to sample your honey and that of the city chaps with the barrels of glucose in their warehouse.

THE OPINION OF SCIENTIFIC MEN ON THE PEAR-BLIGHT MATTER.

AFTER publishing the article on page 602 of GLEANINGS for July 15, regarding the question of pear-blight as it relates to the region round about Hanford, Cal., I sent marked copies to several scientific men; and among the number was one to Prof. Waite himself (one of the government officials who places part of the blame on the bee), stating that I believed the bee-keepers in that vicinity were preparing to move their bees out of that locality during the time the trees were in bloom. In reply I received the following, dated Aug. 14, which will explain itself:

U. S. DEPARTMENT OF AGRICULTURE,
Washington, D. C.

Mr. Root:—Your favor of August 7, with a copy of GLEANINGS, came duly to hand. I am interested in your views as expressed in the journal and trust that the attention called to the subject of bees and the spread of pear-blight may lead to valuable results. In case the bee-keepers of Hanford and vicinity remove their bees to a five-mile limit from the pear-orchards and retain them thus during the entire period of bloom, this department will try to undertake a thorough and comparative study of the results. It is hoped that this laboratory will be able to prepare a careful record of the number of spring infectious or blighted branches in several leading orchards about Hanford this season—plating the orchards and charging each tree with the number of cases of spring blight it sustained in the season of 1901. At the same time next year, provided the bees have been duly removed as here outlined, the same orchards will be

again studied, and the number of spring infectious which have been induced in the season of 1902 will be charged to each tree. A comparison of the records of 1901 and 1902 may then throw much light upon the influence of bees in spreading blight, and incidentally upon pollination, and, I hope, may lead to a broad and impartial adjustment of the interests now seeming to conflict.

NEWTON B. PIERCE,
Pathologist in Charge.

Santa Ana, Cal., Aug. 14.

This letter fully justifies the good opinion that I expressed concerning Prof. Pierce; namely, that he is a fair man, and will endeavor to give the bees full justice.

In a recent article in the *American Agri-culturist* Prof. Waite, another one who has incriminated the bees, has this to say:

I have thoroughly worked out the question relative to bees carrying blight. The conclusion reached is that bees carry pear-blight extensively, and, with other insects, are the principal or almost the only agency of distribution of the germs.

Bees were seen repeatedly visiting the infected flowers, and some were caught taking infected nectar, and by means of plate cultures the pear-blight germs were isolated from their mouth parts. By covering parts of the trees with sacks of various kinds of material, including mosquito-netting, and then artificially infecting certain flowers on the tree, the blight was observed to spread very freely over the uninfected and uncovered blossoms, but was entirely absent in the blossoms covered by mosquito-netting.

It may also be well to state that, as a result of this serious charge against bees, I was led to carry on an extensive series of experiments in the pollination of pomaceous fruits, and as a result of these I found that bees are indispensable to the pollination and setting of most of our pomaceous fruits, hence they should not be destroyed, as some California growers think. They simply carry the pear-blight incidentally while performing an important and necessary function.

From this it appears that Prof. Waite recognizes that "bees are indispensable to the pollination and setting of most of our pomaceous fruits." This opinion seems to be sustained by all of our agricultural colleges and all the best scientific authority throughout the United States; and it would appear that, even though the bees are declared guilty of spreading pear blight, yet the pear grower can not and would not be able to dispense with their services.

In addition to the letter from Prof. Pierce, I have letters from Prof. Cook and Prof. Gillette, both of whom, as bee-keepers well know, have been warm friends of our friends the bees. Prof. Cook writes:

DEPARTMENT BIOLOGY, POMONA COLLEGE,
Claremont, California.

The "pear-blight" is a very serious question. I shall do all I can to determine the truth. I have little doubt that bees do aid in scattering the virus; but I am far from convinced that their removal will abate the trouble, or is wise and necessary. Yet I fully approve your action, and for reasons you give. We must be fair, and shall lose nothing in the end by such concessions as made. I shall do all I can to aid in the matter. Surely bees are not at the very worst, the exclusive wrong doers. Ag-in. (her means than insects must aid in spreading the evil. A. J. Cook,
July 29.

The following is a letter from Prof. C. P. Gillette:

THE STATE AGRICULTURAL COLLEGE,
Dep't Zoology, Entomology, and Physiology,
Fort Collins, Colorado.

All science (properly so called) is a search after truth, and not a search after evidence to establish or defend a preconceived opinion. Whoever takes up the matter of bees and blight should s-e-e to it that so good a friend to man as the honey bee is not condemned until *proven* guilty. If the blight bacillus develops freely in the nectar of flowers it seems certain that any insect that sips nectar from flower to flower will scatter the disease. It seems to me that the first inoc-

ulations in the flowers can not be laid to the bees. After germs have in some way entered flowers, and multiplied there, bees and other insects going from flower to flower would spread the disease, and the number of cultures in flowers would rapidly increase, so that late-blooming varieties should be diseased immeasurably worse than the early-blooming varieties. So far as I can now recall late and early blooming varieties, and their tendency to twig blight, the late bloomers are not more diseased than the early-blooming varieties.

Much significant data might be collected in a single year, but I am inclined to think it will take a longer time to establish very clearly either the guilt or innocence of the honey-bee in spreading blight. I do not mean to question the results obtained by Prof. Waite, but wish to say that it seems to me it will be a considerable time before we can draw a very correct conclusion as to the extent to which the honey-bee is accountable for the spread of the disease known as blight.

C. P. GILLETTE.

July 25.

I would state that I asked of the two last-named whether they would be in position to render us any assistance in the matter of confirming or disproving the statement that bees do carry the virus of pear-blight from tree to tree.

Respecting the attitude of the Central California Bee-keepers' Association, we have received a letter from Sec. F. E. Brown, who writes under date of Aug. 14:

We met as a body in session July 1, and passed resolutions advising the bee-keepers to move their bees out from the pear-orchards during pear-blooming season, as a matter of test only, at the same time asking the fruit-men to co-operate with us in helping to furnish us suitable places to locate the bees during that period; handed a copy of the resolutions to the committee of fruit-men that had the bees and pear-blight in charge. As to the result of this, I am unable at this writing to say, as I have not had the opportunity to find out since returning home.

F. E. BROWN.

Hanford, Cal., Aug. 14.

From this it appears that the bee-keepers expect to carry out their part of the program in good faith; and from various newspaper clippings I judge that the pear-men are very much gratified at the attitude of the bee-keepers; and that, so far from being strife, there will be an honest effort on *both sides* to get at the truth, let it cut where it may. This is as it should be. There is no need of talking about poisoning bees or resorting to the courts. This whole question can, and should be, settled amicably between men of sense and fairness.

CONVENTION NOTICE.

All arrangements for the next convention of the National Bee-keepers' Association have been completed so far as possible, and the convention will be held in the audience room of the Buffalo Society of Natural Sciences, Sept. 10th, 11th and 12th; commencing on the evening of the 10th. The place of meeting is in the Buffalo Library building, corner of Washington and Clinton Streets, near the business center of the city. The president of the Natural Sciences Society, Mr. Smith, has also kindly offered our Association the use of their library and other committee rooms during the time of our convention, and to do all in the power of the society to help make our meeting a success.

Railroad rates will vary in the different passenger association territory, from one cent per mile each way to one and one-third fare for the round trip. Each person can readily learn the rate on inquiry at his railroad station.

The Buffalo bee-keepers will try to provide entertainment at reasonable rates for all attending the convention, who will notify Mr. Sidney S. Sleeper, of Holland, N. Y., by Sept. 2d, of their wish for entertainment.

In a letter just received from Mr. Sleeper he says, "We want all to come who can, for we wish to make the Buffalo meeting the most pleasant and instructive one that was ever held in America. We will have the co-operation of all the sciences as well as the school board," and names some professional men who are interested in our specialty and will be at the convention to help.

In a long letter from Mr. Hershiser, just received, he closes by saying, "Call upon me for whatever further assistance I am able to render;" and Mr. Penton, an ex-president of the Erie County Bee-keepers' Society, and others, have offered to do all they can to provide for the comfort of the delegates.

As stated in my previous convention notice in GLEANINGS, there will be no fixed program and no papers, and the time will be occupied in answering and discussing questions, except that on Thursday evening there will be a joint session of our association with the American Pomological Society, to discuss "the mutual relations of bee-keeping and fruit-growing;" and Prof. Beach, of the N. Y. Agricultural Experiment Station, and Prof. Fletcher, of the Central Experimental Farm of the Dominion of Canada, will help talk for the bees at that session, and it is hoped that much good will result to fruit-growers and bee-keepers from this joint session.

If any bee-keeper who can not be at the convention has any questions, knotty or otherwise, he would like to have answered at the convention, will send them to me I will see that they are presented.

A. B. MASON, Sec., Sta. B, Toledo, O.

The servant of the Lord must not strive, but be gentle unto all men, apt to teach, patient; in meekness instructing those that oppose themselves.—II. TIMOTHY 2:24, 25.

The test of a soldier is to see how he behaves under fire. If, when the trial of his courage comes, his behavior does not correspond with what he has formerly taught, especially with what he has at times boasted of—in other words, if he does not practice what he preaches, his preaching comes to naught. And so it is with the Christian. If he can not stand the fire of sarcasm, ridicule, and unjust accusation, his previous talk amounts to nothing. I am many times pained and astonished to see how few there are who can follow the admonition of our text, especially when they are severely tried. Of course, Satan tries to trip us up; and a great many really good Christian people seem to think it incumbent on them to defend themselves, and even strike back, when they are persecuted. Of course, I allude chiefly to a war of words. Somebody is abusive, overbearing; may be he has been drinking; or if not, perhaps Satan has got into his heart. In such cases, how quick—yes, I think I may say all of us, even the best of us, forget the injunction, "Love ye your enemies, do good to those that hate you!"

Yes, this is the old, old story that I have talked about so much, some of you may say; but, notwithstanding, I do feel that it needs to be talked about, and more than all, needs practicing. Once in a great while we find a man who will be meek and patient, and even pleasant, when he is roughly or rudely assailed. I have said several times that this matter of returning good for evil, and gentleness for rudeness, is an almost unexplored region, and

I think so even yet. A great many of us can not even bear to be told of our faults—faults that sadly need correcting; and, oh dear me! I am afraid I too am one of that kind. I have a few friends, and God knows I wish I had more, who are not afraid to tell me kindly and pleasantly of my faults and shortcomings. I have had some tests lately along that line. Some good friend who really shows his love and regard for me reminds me of duties I owe to society and to my fellow-men. I recognize it, and thank him, and start about a reformation; but after a while I get to defending myself, and before I know it I am feeling a little spiteful toward the one who cared enough for me to tell the plain frank truth.

I am going to give you a letter right here that I have just received. The writer did not intend it for print, but I am inclined to think he will not object, especially as he is a man who is not afraid to speak out his mind. I know from past experience that many of the readers of GLEANINGS will be inclined to bristle up and feel like talking back to him for me. Please do not do it, friends. This brother is a friend of mine, even if he has not said what he felt, in as kindly a spirit as he might have done.

The A. J. Root Co.

Your paper is not quite common and practical enough to suit me—travel notes and preaching. When I pay for a bee-paper I'd like all bee. I must preach to A. I. R. a little. He seems to be stuck on his nice confessions, as though that would atone for his lapses. His Sunday excursion was just inexcusable. I think it would be better if he were not so quick to see all the handsome women, and talk to all the pretty girls. His Florida meandering was just like him—no definite aim and no settled convictions. He will excuse us if we don't take his political preachings at all seriously. He was never cut out for a leader in thought or deed; he slops over too easily. For more possession and less profession (confession). From a reader of over a quarter of a century.

Dakota, Ill., Aug. 20, 1888. WM. S. FEHR.

Dear brother, I suppose you mean by your opening sentence that I am getting to be a little too worldly, and mixing in too much with the aristocracy to suit you. Very likely you are right, and I have been feeling something of this myself. Perhaps you do not know that I go to many fashionable and "high-toned" places, so called, not because my inclinations lie that way, but because I feel that, in my position, I ought to know a good deal about this world of ours, especially the great *busy* world. Just now I feel it a duty to visit the Pan-American at Buffalo; but, to tell the truth, I should very much prefer to go off in the woods on my ranch, and grow potatoes, and play with spring water. My trip up through the summer resorts of Northern Michigan was a good deal because I thought many people who have been, like myself, out of health, ought to know about these things and the facilities that are being offered to those who are seeking health by traveling. I realized, at the time I made that confession you allude to (about going on Sunday excursions), that I should be taken to task; but so far only one other reader of GLEANINGS has mentioned the matter.

Now, dear brother, if, when I started out on that excursion on Saturday morning, I had planned a Sunday trip without going to any

place of religious worship at all, and had also figured out that I would make it all right by putting it in print in the way of a "*confession*," then I should justly deserve your criticism. Perhaps you may not believe me when I tell you that I had no thought, when I started out, of omitting attendance on Sunday services. It is true I might have guessed how it was likely to come out, but I didn't. If you think I am untruthful in this, then I would recommend that you do as you say you will, drop GLEANINGS entirely, and not waste any more time in reading my writings. I made a mistake, which I exceedingly regret; but after all I have said about remembering the Sabbath day to keep it holy, my conscience troubled me until I had confessed my mistake and owned up. How could I come before you and write these Home Papers, and leave you to suppose that I at all times and under all circumstances practiced a strict observance of the Sabbath? You say, when you pay for a bee-paper you would like it *all* bees. There are several good journals that are devoted entirely to bee culture, or almost entirely; but for almost 25 years, the time you have taken GLEANINGS, there has been a statement on the cover to the effect that our publication is "devoted to bees, honey, and home interests."

Very likely you are right in finding fault or complaining because of the way in which I spoke of the handsome women out Sunday afternoons on Mackinac Island. It is unusual for me to speak of such things as I did then, and my conscience troubled me about it afterward. While I like to see both men and women well and neatly dressed, I would not for the world do any thing or say any thing to encourage the extravagance in dress that is so common, especially in summer resorts.

When I finished my Florida trip I felt something as you do—that I had been traveling without any definite aim or settled convictions. One reason of this was poor health during almost the entire trip. I think, however, I had one pretty definite aim in starting out—that I might find the warm weather in Florida more favorable than the changeable weather here at home; but I did not find it so.

I most heartily agree with you, dear brother, that I was never "cut out for a leader in thought or deed." But the last of your sentence, about slopping over, is pretty tough. May be, however, I do sometimes; but if it is really true, you are the first person who has so far ever accused me of it, so far as I remember. I heartily agree with you, too, in wishing for *more* possession of the Holy Spirit to go with my profession. I notice you put in parenthesis the word "confession" with possession. Now, I am with you exactly in thinking that confessions are in the main bad things. A good many times in life, especially during my Christian life, when seeing the after-consequences of confession, I have questioned the wisdom of it. If there was no *transgression* there would certainly be no need of *confession*; and it behooves every one of us who are professing Christians, and everybody else, to live in such a way that there will be *nothing* to confess.

For almost 25 years, dear brother, I have been able to hold up my head and look everybody in the face, and say I had nothing to conceal in any part of my life—nothing that I would hesitate to have fully exposed or unfolded to the full light of day. The thing that troubled me, and which brought out the confession you object to, is that there was at least some sort of deliberate transgression. May God help me so to live that there may be no need of having at any time any *thing* to confess.

The last words of your letter are a little the hardest of all, "from one who has read GLEANINGS for 25 years," and *then* decided to drop it and turn his back on his old friend A. I. Root. Very likely this would have never occurred had I not listened to the voice of the tempter, and decided to do that which I *knew* had at least the "appearance of evil."

Perhaps the other readers of GLEANINGS may care to know that some others felt helped and *encouraged* in their spiritual life by my frank confession. Here is an extract from a letter that was put into my hand at just about the very time I read the severe censure from friend Fehr. Of course, this letter, too, was not intended for print, or I should not have thought of using it; but it illustrates how differently constituted we are, and how things strike one person in one way and another person in another way.

Mr. Root:—Under God I thank you—yes, I thank you. Do you say to me, "What have you to thank me for?" Because I see your candor in publicly condemning wrong-doing as an example. That is enough to call forth the grateful thanks of any one desiring to do right. To one who is conscious of his own weakness in many ways, being so much greater than yours (for which you have so publicly and earnestly condemned yourself), it comes home, I tell you. Then in the second of your texts you quote from David, showing how he struggled, or, rather, how the good in him struggled to overcome the evil that was also there. The outcome of living the good, and overcoming the evil by the good, is joy, pleasure, gladness, happiness—a boldness, a courage, a nobleness, all to that degree that comes *not* without such living and such *overcoming*.

I have thought of you often this year. Had I known when you were at your "little ranch" I should have tried to get there, and I think I should. To-day I got the August 1st issue. It seems providential that I should have opened and read your article.

Traverse City, Mich., Aug. 5. Z. C. FAIRBANKS.

In the fore part of my talk I suggested there was one other letter referring to this matter of confession. I give it here:

Mr. A. I. Root:—

In GLEANINGS for Aug. 1st you take as a part of the subject of your discourse some verses from the 51st Psalm. It should be borne in mind that this Psalm is mostly a sobbing-out to God his penitence for the deadly sins of murder and adultery. By their commission he had placed himself with the outcasts, the pariahs of his people. Did he go about proclaiming his sin and his penitence, and exhorting to righteousness? I think not. What influence for good could his exhortations have on those who knew of his transgressions? If I mistake not, the consequences of his sin followed him to the end of life, and he found the rest and peace for which he so earnestly prayed only beyond the grave. In a life of threescore and ten, in which I have not been unobservant, I have noticed that the converted murderers, adulterers, thieves, gamblers, drunkards, and whoremongers have not been kindly listened to by persons who have led clean and upright lives. It takes long, sometimes, to expel the devil from one of these; and until he is expelled, the man knows it, he had better be modest before his fellow-men. I would not venture to write this,

only that I am older than you, and that my experiences have not been dissimilar to your own.

Leon, Ia., Aug. 8.

EDWIN BEVINS.

Dear friend B., permit me to thank you for the very kind and Christianlike way in which you make your suggestions. You are right, and I thank you for your thought in regard to that wonderful prayer that seems wrung from the very heart of one guilty of deadly sins and even crimes. I did and do recognize that the circumstances are far different; yet somehow, when I was thrown in daily and hourly contact with people who cared little or nothing for Christianity or Sabbath observance, it brought vividly to my mind David's touching and beseeching prayer—"Create in me a clean heart, O God, and renew a right spirit within me."* No, David did not go about proclaiming his sin; and I think you are a little hard on me, dear brother, if you think I was a little too ready to confess and (as you put it) "proclaim" my sins. I know from one standpoint it might look that way, and I hesitated about it for the very reason you mention; and yet my conscience was easier after I had decided to own up before the readers of GLEANINGS as I did.

There is still another point: One who criticises Sabbath-breaking and Sabbath-breakers should know exactly what he is talking about; and after my experience I felt less like censuring *severely* those who venture to go on a trip that takes in and includes the Sabbath day with other days. They were, on the whole, a nice, orderly set of people. I saw no drinking whatever, and there was little or no objectionable talk of any sort. I did not commit a crime; in fact, it was more because I did not "shun even the appearance of evil" than any thing else. Your point is a good one—that the consequences of sin usually follow us to the end of life, even if we do repent in sackcloth and ashes. I too have many times felt as if I did not care to hear some converted criminals speak from the pulpit. It is certainly praiseworthy to reform and repent; but it is better, far better, to lead clean and upright lives, as you express it, from youth to old age. May God help me to be modest and careful, even as the language of our text exhorts. Permit me to thank you again, friend B., for I feel sure I shall profit from your kind words and exhortations.

Here is another letter that comes to me like oil on the troubled waters, after having read the letter from friend Fehr:

Friend Root:—I wish I could tell you how much good your writings have done me. Your little book, "What to Do," aroused my enthusiasm some years ago, and now I am the proud possessor of the dear old homestead of 100 acres worth \$8000. Had it not been for the writings of such men as Root, Henderson, Terry, and others, strangers would have stepped in and turned me out with a broken heart.

Pymont, O., Aug. 19.

C. RHODES.

*Perhaps the beautiful lines of the old hymn by Cowper will express better what I felt after the experience of that Sabbath day than the words of David:

Return, O heavenly Dove, return,
Sweet messenger of rest;
I hate the sins that made thee mourn
And drove thee from my breast.

FLORIDA TRAVELS, CONTINUED.

On page 608, July 1, I spoke of visiting Mr. R. M. McColley, at Sorrento; but I omitted then to mention that I found there a successful house-apiary. This house-apiary is not made tight, as we make them here in the North, so as to exclude frost and cold. The upright boards are far enough apart so the bees can get through the cracks. We might call it a sort of corncrib house-apiary, inasmuch as it has openings all around, somewhat like a corncrib, but, of course, not with so many or so large openings. Well, this house-apiary is all right. The bees can be handled just as well as outdoors; in fact, Mr. McColley thinks he prefers handling them in the house. Quite a few who have house-apiaries say the bees sting worse in a house than around a hive located outdoors. Mr. M. thinks it is the other way. I suggested that, as the hives did not receive the benefit of the direct rays of the sun on cool mornings, the bees would not start out as early as the bees outside; but after watching carefully during a cool morning when it was almost frosty, I was obliged to admit that the bees began flying, and bringing in pollen, first from the hives in the house-apiary. I suppose this whole thing will be a matter of taste. Some who get acquainted with the house-apiary will like it; but as a rule most bee-keepers seem to prefer the hives located outdoors. In tropical climates, as in Florida and Cuba, for instance, no doubt some kind of shade, either of trees or movable boards, is quite an advantage.

Mr. McColley is quite deaf, and one must raise his voice pretty well to talk with him; but aside from this he is a most interesting talker, and has a great fund of useful information to impart to his visitors. Like others who are afflicted in like manner, he has spent quite a little money in remedies for deafness. Not long ago he answered an advertisement for artificial ear-drums. He told the proprietors that he had deposited \$10 with his postmaster. If the ear-drums gave him any relief whatever the postmaster was to forward the \$10; otherwise the drums would be returned. Of course, they would not "trade" on such terms; but they made such emphatic promises of sending the money right back if the apparatus did not do all they claimed, he finally sent the \$10. The ear-drums gave him no help whatever; but the Wilson people had some very good excuse for not returning the money. A lady who is afflicted in a like manner, near him, was anxious to try them, but her experience was just the same.

One day while friend McColley was going along the street he saw a swarm of bees hanging on a limb in a neighbor's dooryard. This neighbor also was deaf, and he had faith in the much-advertised ear-drum. Friend M. laughingly told him he would give him \$10

for the swarm on the limb, and "take his chances," provided the owner of the bees would take the \$10 in ear-drums and take *his* chances. They made the swap, and my host showed me his "\$10 swarm of bees." But the man who got the ear-drums, like the rest, could perceive no benefit from their use.

I can not remember exactly just now whether I have ever told our readers that I too have had a like experience. After having the grip one winter I found I could not hear as well as usual. I tried a pair of \$10 artificial ear-drums. They were not only no help whatever, but my opinion is, it required several months for me to get fully recovered from the damage they did these delicate organs. I followed the directions very carefully, and succeeded in getting the things in my ears according to directions. From a careful examination of the way in which the things were made, my impression is that 10 cents in place of \$10 would be a pretty fair price for them.

I had an exceedingly pleasant visit at Braidentown, Manatee Co. This locality is so far south that frost has never done any great damage to the orange-trees. Our readers of six years ago may remember my mention of our friend Bannehr, and that his family came from England and stayed in Florida two or three years, but became so homesick they pulled up stakes and went back to England; but after staying in the fatherland, I think it was less than a year, they became still *more* homesick, and pulled up stakes *again* and went back to Florida. They have a very beautiful place, with enough tropical plants growing right in the open ground to delight the heart of almost any florist here in the North. Friend Bannehr has sent me quite an assortment of rare and beautiful plants which are flourishing finely in our own greenhouse.

In the town of Manatee, right near his home, I noticed, six years ago, a beautiful spring, of such volume as to make a swamp or quagmire of perhaps $\frac{1}{4}$ acre in extent. This was an unsightly place almost in the heart of the town; and I suppose everybody thought the nasty boggy place was of no value at all to anybody, and never would be. The owner, however, has lately caught on to the new celery culture in Florida. He cut channels to let off the water of the spring, threw the ground up into beds, and planted celery. Just at the time of my visit he was harvesting a crop that I think promised to net him over \$500 from that worthless $\frac{1}{4}$ acre. A neighbor over the fence had evidently caught on, for he too was growing some very fine celery. If there was any lack of rain, all they had to do was to dam up the outlet of the spring until the water came up to the roots of the celery to the desired height. The whole thing seemed very simple when you saw the men at work at it. But I am sure there are thousands of places, north, south, east, and west, where this same plan can be managed without any trouble at all. Of course, these people secured large prices by shipping celery to New York in the dead of winter.

By the way, let me mention right here something to the credit of our commission men.

Again and again I found cases where Florida growers were almost startled at the prices the New York commission men paid them for the stuff they shipped. Sometimes stuff that the grower himself did not consider any thing like first class was sold at a figure that was away above any thing they had thought of getting. This may, of course, be the result of the present general activity in all kinds of business.

Friend Bannehr's neighbor, Mr. Trueblood (rightly named I think), is also an enthusiastic bee-keeper. He is a lawyer by profession, but at the same time he is a most earnest and devoted Christian. He loved the honey-bees, and loved to care for them, and loved to grow crops better, perhaps, than he loves his profession; but I want to say to him, and perhaps to a thousand others who read GLEANINGS, that there was perhaps never, in the history of the world, a time when God-fearing lawyers were needed more than they are just now. Yes, we want lawyers, no end of them, who are not afraid to do right, especially when doing right costs something.

Mr. E. B. Rood, of Braidentown, is also one of the old-time bee keepers; but in consequence of some bad luck in the honey business they are now keeping a very pleasant little restaurant in Braidentown.

SOME INTERVIEWS WITH SUCCESSFUL POTATO GROWERS JUST BEFORE OUR POTATO-BOOK WENT TO PRESS.

After the potato-book was all finished it occurred to me I had better visit a neighbor, Mr. George Ballasch, of Whittlesey, O., who makes a business of growing potatoes to the extent of forty or fifty acres every year; but before telling you what I saw and learned, permit me to explain that the month of July, 1901, has been the hottest of any July since the U. S. Weather Bureau has made any record—a period of about twenty years. The result of the severe drouth has been especially disastrous to potato-growers. Varieties that were disposed to blight were gone before the potatoes were half grown; and all varieties, in fact, were affected more or less, unless advantage was taken according to the best knowledge up to the present day to secure or insure, if you choose, a crop. Mr. B. makes potato-growing his entire business. He has a piece of low black ground especially adapted to this industry. It has been most thoroughly underdrained, so that it rarely suffers from excessive rains, such as we had during the month of June past.

Well, just when early potatoes were a failure everywhere, north, south, east, and west, Mr. B. has secured almost an average crop, and this, too, when the conditions are such that

one of our Cleveland daily papers quotes for to-day, Aug. 26:

Potatoes.—Per barrel, fancy Eastern stock, \$1.25@1.50; per bushel, \$1.25@1.50; Louisville and Ohio stock, per barrel \$3.75@4.00.*

Mr. Ballasch has dug and shipped three carloads already. The yield is from 175 to 200 bushels per acre, and the potatoes have sold from \$1.25 to \$1.50 per bushel, as nearly as I can make out. This remarkable yield during such a year has been made in spite of the fact that potatoes have been grown on this same land for ten years in succession. With his large acreage it is out the question to think of getting enough stable manure to go over it all. He uses chemical fertilizers to some extent. But his main reliance is on a crop of rye that is put in the ground just as soon as the potatoes are taken off. He believes emphatically in what Mr. T. B. Terry teaches, that the soil should always be green with some crop or other, every month in the year, winter and summer. The rye is sown at the rate of fully two bushels per acre. It is plowed under whenever he is ready to plant. One of the largest crops he ever grew, he said, was where the rye was fully six feet high, and was turned under just when it was coming into bloom. In fact, he had hard work to get it all under the fine black soil. The yield was very close to 400 bushels per acre.

Mr. Ballasch has, of course, experimented a good deal with varieties. I was pleased to know that his choice, not only of varieties but of methods, accords very closely with the teachings of the potato-book. At present he considers for a medium late variety the State of Maine as about the best potato he has on his farm, all things considered. I was pleasantly surprised to learn that the three carloads of potatoes he dug first and sent to market were the Early Thoroughbred that I helped to introduce five or six years ago. Friend Terry succeeded so well with this new variety, which was brought out by Wm. Henry Maule, that I bought several barrels, paying the extravagant price of \$20 a barrel, and offered these as premiums to our subscribers. For the first year or two we did very well with them, and many of our subscribers succeeded equally well; but after a while, when they were obliged to take their chances with ordinary culture, together with other extra-early potatoes, they gradually went out of sight unless it is in a few localities; and during this past season we decided not to include them in our list of perhaps a dozen or more of the best up-to-date potatoes. But Mr. Ballasch rather prefers them to any thing else for extra early.

Now, this illustrates what I have already told you. A certain variety may be the very best for one particular locality, but not for other places. There was also a splendid showing for another variety just brought out, called

*To illustrate the present state of affairs, I copy the following from the Akron *Beacon* of Aug. 15, 1901:

If the price of potatoes continues to increase for another month as it has during the past few weeks the farmers will soon be riding in automobiles and wearing diamonds. Potatoes Thursday were selling at \$2.00 a bushel.

Permit me to suggest that, before the farmers can have the automobiles and diamonds, they will have to have some potatoes to sell at the above prices.

King of the Earlies;* and our old friend the Early Rose, the one I found doing so well in the Traverse region, is also giving about as large a yield during this unfavorable season as any, although it is not as early as some others.

Mr. Ballasch has trouble with the scab as well as the rest of us; but he has very much less trouble where the seed is treated with corrosive sublimate. Ashes tend to produce scab in the soil, without doubt. We dug a number of tremendously luxuriant hills, where he had recently burned out some large stumps. There was a big yield of great handsome potatoes, but they were badly scabbed. He thinks it is not altogether the potash that produces scab; for a commercial fertilizer running high in potash does not act like ashes. The large percentage of lime contained in most wood ashes probably has as much or more to do with the production of scab than does potash.†

Carman No. 3 has been one of his best potatoes until this year; but during the past peculiar season, excessively wet in June and very hot in July, the State of Maine rather excelled the Carman.

The matter of variety is one of tremendous importance to one who grows forty or fifty acres of potatoes. He pointed out to me where hundreds of dollars would have been saved had he planted something else. On one occasion a neighbor offered him a lot of seed potatoes at 30 cts. a bushel. It was a variety, too, that has been praised largely through the press—yes, even by our experiment stations; but his loss was away up into the hundred because he chose this variety for seed where he might have taken some other.‡ He uses the Hoover digger. One reason he gave for preferring the Hoover was that it is manufactured in Ohio, close to his home. If he has a breakdown at a critical time he can get the missing part by express without delay. This is certainly something to be considered when one works on a large scale as does Mr. Ballasch. He uses the Aspinwall potato-planter. Of course, there is here and there a missing hill ;

* Since the above was written the King of the Earlies have been dug, and the yield was 218 bushels per acre of nice potatoes.

† An excess of acidity in the soil prevents scab; and any alkali, especially lime that neutralizes this acidity, encourages scab. Corrosive sublimate, and possibly leaving potatoes exposed to the light, kills the scab fungus. But to get rid of the scab fungus that is already in the soil, there is no remedy known, if I am correct, except plowed-under rye. This seems to sour or in some way produce the excess of acid we need in the soil. Just now I am unable to say whether plowing under a crop of wheat will produce the same result as rye or not. I can only say this: Where my wheat that was lodged badly was plowed under in June we have a nice crop of potatoes; and although I have dug into hills all over the patch I have not found any scab at all.

‡ Mr. Ballasch has an acre or more each of Maule's Commercial and Manum's Enormous. The Commercial is all right were it not for its exceedingly irregular and scraggly form. Our friend says he would not plant any more of them, even if they had every other good quality. We pulled up one tremendous stalk, or vine, and found just one scraggly mammoth potato, too large for table use. Manum's Enormous did better, but it was blighting badly when the State of Maine and Carman No. 3 seemed to be all right.

but he thinks this does not occur often enough to offset the expense of an additional hand required with the Robbins planter.

The man has a beautiful home. He uses gas for lighting and fuel, that was found on his own premises. His potato cellar or cave, constructed especially for his crop, is to be lighted by gas, just the same as his house; then there will be no need of letting in air or light during unsuitable weather. This man makes the growing of potatoes his sole business in life. He reads up all the literature connected with his business. He tests different varieties, and he keeps in touch with the markets, and knows where to sell to get the best prices.

May I venture to speculate a little as to what his crop is going to be worth this year? Fifty acres at 200 bushels per acre would be 10,000 bushels; and at present prices the crop may bring him from \$10,000 to \$12,000 just because he is an expert in his line, and has succeeded in growing a crop when almost everybody else has failed. He told me that just now he was getting just about \$150 per acre, over and above all expenses.

Perhaps I might mention right here that, where I turned under a heavy crop of wheat that was lodged badly, and planted potatoes, we have the best showing now of potatoes of any on our grounds. I asked Mr. Ballasch if he thought a heavy crop of wheat or rye could be worth anywhere near as much as a heavy growth of clover. He said he was sure it would not. Like myself he prefers the mammoth clover when he is growing clover to be turned under to bring up his land and for no other purpose.

I said to him, "Friend Ballasch, I know from my own experience during this past unfavorable season that you must have fought obstacles and enemies inch by inch, without any letting up." He replied:

"Mr. Root, at one time the bugs seemed just *determined* to destroy my crop; but I was equally determined to win in the fight. Why, we have actually used *200 lbs. of Paris green* this season, to say nothing about the labor required to make a good job of applying it so as to kill the bugs and not injure the vines." He used a sprayer worked by horse power.

Twenty-four hours later, in visiting a relative in the adjoining county of Summit, I mentioned Mr. Ballasch's success. My relative replied, "Now, look here. I have a potato story to tell too. Mr. ———, over here near the lake, started last spring to grow early potatoes. He paid over \$100 for a lot of the best varieties of seed. He prepared his ground all right, and every thing seemed to be promising. But the bugs and wet weather and weeds came on all at once. He fought them for a while, but began to get discouraged, hesitated about using more money to employ hired help, and finally—what do you suppose? His whole plantation now is covered with weeds, and I do not suppose there will be a potato worth digging, even at the present high prices."

During the afternoon of the same day I visited my cousin, Wilbur Fenn. I found his farm in apple-pie order from one end to the

other. The outside fences around the road had been removed, and there were no unsightly bushes or weeds anywhere. In the back yard, and out around the barn, every thing is just as clean and slick as in the front yard. In fact, I do not know but the kitchen garden is a little handsomer than the front yard.

But the one grand sight of his whole place is a six-acre field of Russet potatoes. They were planted the 10th of July, right in the midst of our severe drouth; but they came up evenly, bright and clean; and Aug. 17th, just about five weeks from the day they were planted, they were knee-high, and covered the ground, if you looked across it at a little angle. The foliage was of that light green so characteristic of the Russet. Well, these had grown so fast that they were clean, and for some unknown reason there did not seem to be any perforations by the flea-beetle, or scarcely any evidence that bugs or insects of any kind had ever touched their beautiful tops. He said he had fought bugs, however, and had had a harder fight than ever before. He fought them with both Paris green and with the tin pan and paddle. The latter implements are quite an improvement over any thing I have ever seen used for the purpose. For the pan, imagine a large-sized dish-pan fastened securely to a pole long enough to come up under the left arm. On this pole is an adjustable handle like that on a scythe-snath. This enables one to carry the pan down close to the ground without much fatigue, even when standing erect. One side of the pan is cut away just enough to let it slip under and almost clear around a hill of potatoes. The rough edge around the cut is smoothed by turning up the tin; and this lip that is turned up keeps the bugs back in the pan. The paddle is made of a small-sized shingle or an oblong piece of light pine board. This is tacked to an ordinary broom-handle. This broom-handle is laid across the board diagonally from one corner to the other. This brings the shingle square with the surface of the ground. With the left hand you place the pan right up around the hill. With the right hand strike the potato-tops with the paddle, and every beetle or slug will drop down into the pan. This makes almost a clean job, and the vines are not damaged by poison. Every little while the bugs are dumped from the pan into a tall crock of water with a little coal oil on the surface.

I must here state that the wonderfully even stand, with no missing hills, was the result of the management of Miss Ellen Fenn, now 15 or 16 years old. When she first commenced managing the planter for her father she was only 10 or 12. Mr. Fenn does not have to employ very much hired help just now, for he has a good-sized family of bright interesting children who are all interested in the potato crop of 16 or 17 acres. Very likely he will not get the prices that Mr. Ballasch does, but I think he will get a fair reward.

Special Notices by A. I. Root.

GROWING LETTUCE-PLANTS TO BE PUT UNDER GLASS LATER ON.

Now is the time, and during this month and next, to start your lettuce-plants for next winter's crop. Grow them outdoors just as long as you can, and they will stand quite a little frost. Good strong well rooted plants ready to move into the house as soon as the weather is too cold for them outdoors is half the battle in making the crop. The art and skill of man have never yet, in my opinion, invented any system of watering equal to a summer shower; and we sometimes have showers right along into November. Neither has any plan ever been discovered for keeping the plants healthy, and free from disease, like growing them in the open ground, and letting them get a few November showers. Even a soft snow will not hurt the plants a bit; but it is death to the green fly and all other enemies of healthy lettuce. I like to have them transplanted in beds where we can put on the sashes if the weather is severe, and pull them off at other times for the last transplanting, say toward Christmas, moving them into the greenhouse; and with good strong well-transplanted cold-frame plants to take into the greenhouse, you can get a crop ready to sell in three or four weeks. Now is the time to sow the seed, and we have an extra-fine lot true to name, grown specially for us. Ounce, 5 cts.; 1 lb., 50; 5 lbs., \$2. By mail, 10c per lb. extra.

There is no other forcing lettuce, if I am correct, that will take the place of Grand Rapids, or come anywhere near it.

OUR NEW POTATO-BOOK.

I have been hard at work revising the old book (by T. B. Terry) for much of the last six months. The first edition was put out in 1893—eight years ago. In order to have the new book fully up to date I have gone over every point of value found in GLEANINGS during the past eight years. I have visited potato-growers, and studied up potato-growing from Florida to Northern Michigan—yes, and I might almost say from California to the Bermuda Islands. The book also contains quite a treatise on potato-growing for the London market, on Jersey Island. Instead of about 250 pages, the size of the old edition, it now contains almost 300; and if it does not touch on every difficulty the skillful potato grower meets, I have certainly tried hard to make it do so. The book certainly should be worth several dollars to every man who grows an acre of potatoes or more—that is, if he studies its teachings. As an illustration, last spring after I had planted two or three acres of potatoes I all at once decided to put in about a dozen acres more; and I actually started to the office to send a telegram for one of the latest styles of potato-planters. On the way I began figuring how much the planter would save me in time of team and men, if I planted a dozen acres each year. At first thought it looked as if I should pay for the machine in three or four years. Then I began to calculate that the potatoes would have to be cut just the same, even if we did have a machine. And then I wanted to know how much a bushel or how much an acre it cost to cut potatoes, say to two eyes. I got the potato-book, and I tell you I turned the pages over lively for about an hour. First I decided I would send my telegram for a digger; then in some other part of the book I found something that decided me the other way, and I changed my mind several times during the hour. This incident illustrates the importance of having a comprehensive index, and I have just got through making that index. It contains three pages or about 300 topics, and I have "proved it" so as to be sure it "strikes the spot" every time. I believe the book will tell you almost every thing you wish to know about growing potatoes—not only how to become an expert, but it gives careful estimates of the cost of each operation all the way through. It tells you how successful men are fighting insect enemies, fungus blight, etc. It is not *exactly* the book for one who wishes to "support his family on a quarter of an acre"; but I think it exactly meets the wants of thousands who love to till the soil, say from two or three acres up to thirty or forty.

There are 41 illustrations in the book. On account of its greatly increased size, the price will be 45 cents instead of 35, the old price. Postpaid by mail, 50 cts.; cloth-bound, 68 cts.; by mail, 75. Nearly 200 pages of the book are by T. B. Terry. The remaining 100 pages were by A. I. Root and Rev. C. D. Merrill, Beloit, Wis.

HONEY QUEENS!

Leather-colored Long-tongues.—I have a breeder for which \$25 has been offered and refused. You make no mistake in buying her daughters. They are dandies.

Goldens.—The Laws strain is as good as years of patient selection and breeding can establish.

Holy Lands.—These are a deserving race of bees. With two years' acquaintance I find them great work-ers, with no vindictive traits, easily handled, are becoming popular, especially in South.

The above races of bees are each bred in separate apiaries, and you can get them in their purity. Am filling all orders by return mail, and I sell at the following low prices, with the usual guarantees. Single queen, untested, 75c; six for \$4.00. Tested, \$1.00; six for \$5.00. Breeders, either race, \$2.50 each. Address

W. H. Laws, Beeville, Texas.

3 Good Points

Good Stock ;
Low Prices ;
Prompt Service.

My stock is from J. P. Moore's long-tongue strain, A. I. Root's famous \$200 queen, and from the stock of J. F. McIntyre that filled supers when other colonies were starving. I have been selling warranted queens at 50 cts. each in any quantity, but the demand has become so great that I am compelled to raise the price to 65 cts. each. If a queen proves impurely mated, another is sent free of charge. All queens go by return mail unless otherwise ordered. I guarantee safe arrival and entire satisfaction. Otherwise, the money is refunded.

L. H. Robey, Worthington, W. Va.

Fertilizing Boxes attached to standard hives simplify queen-rearing. We have letters of recommendation from many who have used the Swarthmore devices with gratifying success. Write us if you are interested. Golden-all-over queens, \$1.00 each.
The Swarthmore Apiaries, Swarthmore, Pa.

100 Full Swarms With good laying queen in shipping-box, no hive or comb; hive extra \$1.00. These bees are for feeding up for winter to make colonies, or to strengthen weak colonies, or may be used for re-queening. Full directions given. Orders filled as received. Write for further information regarding these bees. Address
F. H. McFarland, Hyde Park, Vermont.

ALBINO QUEENS. If you want the most prolific queens, the best honey-gatherers, the best comb-builders, the hardest and gentlest bees known, try my albinos. My untested queens, 75c.
J. D. GIVENS, Lisbon, Texas

Bees that have a Record

Have long-tongues—handsome, gentle, and great builders for honey; all breeding queens, and sold at rate of \$8 per dozen. Now ready.

H. ALLEY, - WENHAM, - MASS.

\$1-TESTED QUEENS=\$1.

A nice lot of young golden tested queens at \$1.00 each while they last; selected, \$1.50; warranted queens, 60c; —6 for \$3.50; select warranted, 80—6 for \$4.50. My bees are a five-band strain, selected for size, energy, working qualities, long tongue-reach—and, lastly, beauty. I have never tested a strain that excels them. A pile of letters assert the above claims are true, and also that they winter well north. Queens are sent promptly.
J. B. CASE, Port Orange, Fla.

Now is Your Time

to stock your bees with my large yellow red-clover queens, while they are low in price. If you are looking for tons of honey, don't fail at least to try a few. Read my ad. in June 15th number. Prices: Untested, 65c; 2, \$1.00; dozen, \$5.25. Tested, \$1.00, dozen, \$10. Try them.

G. Routzahn, Menallen, Adams Co., Penn.

Special Offer !!

For the next 60 days we will sell select tested superior red-clover queens from our best red-clover stock at \$1.00 each; half dozen, \$5.50; untested, 75 cts.; half dozen, \$4.25. We guarantee our bees to work on red clover. Address

LEININGER BROS., FT. JENNINGS, O.

QUEENS! Fine, large, gentle, and prolific; long-tongue reach; either 3 or 5 banded; 75 cents each; six for \$4.25. Try them and be pleased.
CHAS. H. THIES, Steepleville, Ill.

Angora Goats. Delaine bucks; good stock; low prices; large circular for stamp.
ED. W. COLE & Co., Kenton, O.

QUEENS the balance of season, 50c; full colonies, \$3. MRS. A. A. SIMPSON, Swarts, Pa.

SCOTCH COLLIE DOGS, and poultry, interesting prices. PORTS BROS., Bx 111, Parkersburg, Pa.

Write Us if you have any large or small lots of extracted honey to sell. State quantity, kind, and price expected and if possible mail sample. We pay spot cash. Reference, Wisconsin Nat'l Bank. E. K. PAHL & CO., Detroit & Bdwy, Milwaukee, Wis.

For Sale! 150 swarms of Italian bees in 10-frame hives, with ample stores for winter. Combs from foundation; thick-top frames wired; no foul brood or disease of any kind. Price \$450. Also a lot of bee-supplies. Will also sell a 40-acre farm with house and barn, situated in basswood region of Wisconsin; good schools and churches; best of neighborhoods; never have to lock a door. Price \$1500. Reason for selling, my health requires a warmer climate. Address as below
W. H. Young, Ono, Wisconsin.

Young mismated Italian queens for 30 cts. each.
C. G. FENN, Washington, Conn.

A reader of GLEANINGS who has tried Quirin's strain of bees says they are very energetic. They are out first in the morning and last at night; in fact they work so late evenings that he has baptized them "Quirin's Night Hawks." H. G. Quirin's ad. appears on the last page of cover.

WANTED.—To sell my apiary consisting of 30 colonies of bees on deep frame hives, 10 Jumbo, 7 chaff, 20 8 frame, and 12 chaff hives, 17 telescope covers, extractor, and other equipments. Write for particulars to
THYD. GINGO, Hugo, Jackson Co., Ia.

FOR SALE.—105 colonies of bees at \$1.50 each.
H. VOGELER, New Castle, Cal.

IF IT'S GOT TO

stand USE and ABUSE, you'd better buy "PAGE,"
Page Woven Wire Fence Co., Adrian, Mich.

PINEAPPLES!

Choice fruit and plants now ready for shipment. Suitable land for sale, sheds constructed, pineries set and cared for. Correspondence solicited.

Lewisiana Pinery Company, Orlando, Florida.

C. H. Lewis, Manager.

STEEL WHEELS

for your **FARM WAGONS**
 any size wanted, any width of tire. Fits to fit any axle. **No blacksmith's bills to pay.** No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address **EMPIRE MFG. CO., Quincy, Ill.**

The Storm Proof KING WIND MILL

produces 25 to 50% more net power from any kind of wind than any other mill made. Wheel being only 1 in. thick, cuts the wind like a knife and is 100% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both pump and power, back geared or direct stroke. Send for circulars and prices before you buy. **Medina Mfg. Co., Box 11, Medina, O.**

YOU NEVER CAN TELL

how soon you will need medicine. Get our **Large Drug Book**, keep it handy. Contains over 35,000 listed drugs, medicines, family remedies, toilet articles, etc. Mailed for 10c. A Superior Red-clover Queen for 25 cts.

An Offer for New Subscribers:

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL list during August and September. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.25, and we will mail you the Bee Journal for a WHOLE YEAR, and also one of our SUPERIOR LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. All queens mailed promptly.

Headquarters in Chicago for Root's bee-supplies at Root's prices. A free catalog and sample of the American Bee Journal on request.

George W. York & Co., Chicago, Ill.
 144, 146 Erie Street.

Standard-Bred Queens!

Acme of Perfection; Not a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$4.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover hustlers of America. 75 cts. each; six for \$4.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

Fred W. Muth & Co., Cincinnati, Ohio.
 South-west Corner Front and Walnut Streets.

Belgian Hares

Fully pedigreed of the highest breeding, at prices that will suit. With every hare sold goes a full pedigree, register number, and score-card, scored by an official judge; and, when desired, does will be bred to one of our famous high-scoring bucks before shipment. Address **J. B. MASON,** Mangr. of The A. I. Root Co., Mechanic Falls, Me.

Belgian Hares

I have some fine hares for sale at reasonable prices.

J. F. Moore, : Tiffin, Ohio.

Marshfield Manufacturing Company.

Our specialty is making SECTIONS, and they are the best in the market. Wisconsin basswood is the right kind for them. We have a full line of BEE-SUPPLIES. Write for FREE illustrated catalog and price list.

Marshfield Manufacturing Company, Marshfield, Wisconsin.

Florida! Twenty good strong colonies of bees, all supplies needed for 40, a house built in 1900, 1½ acres for cultivation (wet or dry, as desired), within 10 acres securely enclosed by a barbed 8-wire fence, on Halifax River, at Oak Hill, where in good years the heaviest returns of honey are taken; half mile from railroad station—going past church, schoolhouse, and postoffice on way. A Baltimore Company with capital of \$1,000,000 has just purchased 5000 acres—Oak Hill station is their shipping depot. To let for one or two years at \$10.00 per month. The house will be vacant any time from October until January 1st. For further information apply to H TURNOR, Matthews P. O., Duval Co., Florida.

BREEDING CARNIOLAN QUEENS BELOW HALF PRICE.

To dispose of these queens at once we offer 100 fine young select tested Carniolan queens at \$1.00 each. Their bees are finely marked and gentle, and hustlers to work. Don't fail to order one of these queens. Our regular price is \$2.25 each. Now is your chance to purchase fine breeding queens cheap. Address F. A. LOCKHART & CO., Caldwell, N. Y.

Over in Canada

are some of the best bee keepers on this continent. If you should go visiting among them you would be able to come home and give your brother bee-keepers a good many valuable pointers as to how they do "over in Canada." The editor of the *Bee-keepers' Review* recently spent two weeks, with note-book and camera, among Canadian bee-keepers, and his paper for the next two months will be telling about and showing pictures of the good things he saw and heard "over in Canada." The September *Review* will give a

picture of Mr. McEvoy, Canada's efficient Inspector of Apiaries; a view of his apiary, together with a description of how he winters his bees on their summer stands—one or two points in which are decidedly unique.

The *Review* is \$1.00 a year, but new subscribers will receive the rest of this year free; or, for \$2.00 I will send the *Review* from now to the end of 1902, and a queen of the Superior Stock.

Red-clover Queens!

We have been telling you through our advertisements of the superior stock of queens we are furnishing this year, and we have abundant testimony from others corroborating our opinion. Look at the following, which is one of the numerous endorsements received regarding a colony from our place on the Exposition Grounds, with a tested Red-clover Queen.

Notice the date of this letter.

The bees are working as I never saw them work before, and already there is over 100 pounds of honey in the hive, and all from clover. I am led to believe that long tongues and good working qualities go together.

Buffalo, N. Y., July 5, 1901.

OREL L. HERSHISER,

Supt. N. Y. State Apiarian Exhibit, Agricultural Building,
Pan-American Exhibition, Buffalo, N. Y.

Now see this letter from one of the leading queen-breeders of the United States, regarding Root's Red-clover Bees.

Coronaca, S. C., August 8, 1901.

A. I. Root Co., Medina, Ohio.—Your letter in answer to my report on the queens you mailed me last fall was received a few days ago, and you ask for a still further report. I am so well pleased with them that I am still of the opinion that I want my whole apiary stocked with this strain of bees. All of these queens were introduced to nuclei last fall, and this spring while they were quite weak two of them have built up to be as strong as any colony I have; and one, my special breeder, I have drawn from in order to keep her from building up so strong, as it is troublesome to open up a strong colony to get larvæ for queen-raising. I consider the one I am breeding from one of the finest queens I have ever had in my apiary, and I am introducing her daughters to my colonies every opportunity.

J. D. FOOSHE.

GLEANINGS 1 year and Sel. T'td Queen, 6.00

If you want something good you can not do better than to order one of these queens. All orders are filled promptly. No extra postage on these to foreign countries.

The A. I. Root Co., Medina, O., U.S.A.

The Best Queens of the Best Kinds.

By special arrangement with The A. I. Root Co. to furnish them QUEENS, I have secured their assistance in procuring the FINEST BREEDING QUEENS that a thorough knowledge of the bees of the country and money can procure. Among them is a SELECT DAUGHTER OF THEIR \$200 00 QUEEN THAT THEY RE-

FUSE TO QUOTE ME PRICES ON. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT says: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

MR. R. A. JANSEN, of Iago, Wharton Co., Texas, bought of me last fall 80 queens. He says of them: "I consider myself the queen and 50 cents per colony BETTER OFF, for the purchase of these queens, on the SPRING HONEY FLOW ALONE. They SURPASSED ALL OTHER COLONIES in my yard during the spring honey flow and KEPT UP THE LICK. Please book my order for 100 MORE queens to be delivered in the fall. I shall, in all probability, increase this order later."

Under date of July 28th, 1901, from Mr. W. E. Burch, of Los Banos, Cal., comes the following in regard to queens from my apiary: "The three that I have are the FINEST queens I ever saw, and the GENTLEST BEES TO WORK WITH. When I am working with these three colonies I do not use the smoker, and they ALWAYS SEEM TOO BUSY ATTENDING TO THEIR OWN BUSINESS to interfere with me; AND THEY ARE THE BEES THAT BRING IN THE HONEY."

From Ramey, Minn., under date of Aug. 8th, 1901, Mr. A. T. McKibber writes: "The cage of bees arrived o. k., and were measured. They ran 24-100 and 25-100, which is just a little longer than any I have, or have measured, and I think by their looks that they're good bees. The bees you sent could probably take honey $\frac{1}{4}$ inch."

Louis Werner writes under date of June 19, 1901, from Edwardsville, Ill.: "The queen I got from you is a good one, and proved to be as good as I EVER GOT FROM ANY BREEDER. When I am in need of queens I know where to get good ones."

Frank Coverdale, of Maquoketa, Iowa, says, under date of July 6, 1901:

"We like those that have hatched. They are exceedingly gentle, and queens prolific. Among the first fifty the tongue-reach is very good, generally 20; one measures 23, and another, which is best of all, measures 24. THIS QUEEN I VALUE VERY HIGH. Her bees are uniform in color. I'd like you to send me a cage from your longest-reach queen, as I'm well equipped for measuring."

This is from far off Jamaica:

"Kingston, Jamaica, B. W. I., May 14, 1901.

"Queen received on the 8th in the pink of condition. Attendants and queen appeared as if just placed in cage THE DAY BEFORE.

S. E. SURKIDGE."

If I have real good success, by next year I expect to be able to furnish a QUEEN for the Chinese that will be acceptable to the POWERS.

The A. I. Root Co. also knows a GOOD THING when it sees it. LISTEN!

"Medina, Ohio, May 1st, 1901.

"W. O. Victor.—Instead of sending us 12 untested queens per week, send us 18 in two installments, a day or so apart."

I have on hand at the Pan-American Exposition a nucleus, with queen. Mr. Orel L. Hershiser, Superintendent Apiarian Exhibit, will take pleasure in showing them, as he always "Seeks after the Good, the Beautiful, and the True."

Prices for September, October, and November Only.

Untested queens, 65c; 6, \$3.50; 12, \$6.50; 50 or more, 50c each. Select untested, 85c; 6, \$4.50; 12, \$8.50. Tested, \$1.00; 6, \$5.50; 12, \$10.00. Select tested, \$1.50; 6, \$9.00. Breeders whose best bees show a reach of 21-100, with an average of 20-100, \$3.00. Breeders whose best bees show a reach of 21-100, with an average reach of 20 $\frac{1}{2}$ -100, \$5.00. Breeders whose best reach show 22-100, with an average reach of 21-100, \$7.00. I have discovered two breeders whose best bees show 24-100, with an average reach of 22-100. These are too good to sell. Don't ask for prices. Yard No. 1.—Long-tongue Root Clover. Yard No. 2.—Imported Stock. Yard No. 3.—Golden, or Five-banded Stock. Yards No. 1 and 2 contain, without question, bees as gentle as was ever handled, and I think equal of any in the world as honey-gatherers from any flower that grows. Don't forget that my FAMOUS BEAR PICTURE goes as a premium with each order for six or more queens at prices quoted. Send for list showing description of stock and arrangement of each apiary.

W. O. VICTOR, Queen Specialist, Wharton, Texas.

To Our Shippers.

We were obliged to notify you a few weeks ago that one Joseph M. McCaul had leased our old quarters at Nos. 120-122 West Broadway, New York City, and had there started up business under the name "Hildreth, McCaul Co.," and had distributed a multitude of circulars so worded as to create the impression that his business was a successor to or a branch of the business of Hildreth & Segelken.

For the protection of our shippers and ourselves, we at once instructed our attorney to commence action to enjoin the said McCaul from using the name HILDRETH in any manner whatsoever in connection with his business. On the 10th day of July, 1901, Hon. David McAdam, Justice of the Supreme Court of the State of New York, after a full argument upon the merits, issued a peremptory injunction, of which the following is an extract:

"And it appearing that the plaintiffs have for a long time been and now are carrying on business under the style of "Hildreth & Segelken," and that the defendant has recently opened a business at 120-122 West Broadway, in the Borough of Manhattan, City of New York, and is carrying on the same under the style of "Hildreth, McCaul Co.," and that such act is in violation of the plaintiffs' rights, and that the commission or continuance thereof, during the pendency of this action, will produce irreparable injury to the plaintiffs; . . . it is

ORDERED that the defendant (Joseph M. McCaul) and each of his agents, servants, and employees, and all other persons acting under his authority and direction be, and he and they are hereby restrained and enjoined from showing, displaying, or otherwise using during the pendency of this action in or upon any papers, devices, sign or signs, or otherwise, in the business conducted by the defendant at No. 120-122 West Broadway, in the Borough of Manhattan, City of New York, or elsewhere the name of "Hildreth" separately or conjunctively with any other name, designation, or description."

Outside of our desire in our own interests to protect the name which we have built by years of satisfactory dealings with our customers, we hastened to procure this injunction as soon as possible, to prevent our shippers from being misled into sending their goods to one who would make an attempt to gain their trade by such a trick and device.

With thanks for the many expressions of good will we have received from our shippers concerning this attempt to trade under our name, we are

Sincerely yours,

HILDRETH & SEGELKEN.

265-267 GREENWICH STREET, NEW YORK CITY.

LONE STAR APIARIES

Italian Queens.

Estab'd 1885 Prices of queens from imported mothers: Tested, \$1.50; 6, \$6.50; 12, \$12.00. Untested, 75c; 6, \$4.00; 12, \$7.00. Golden, same price. Select tested of either race, \$2.50 each. For a short time I will mail tested leather-colored queens at \$1.00.

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beville, Bee Co., Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, **J. C. WALLENMEYER.**

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$3.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper. \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop ink drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3 1/2-inch; \$1.10; 3-inch, \$1.00; 2 1/2-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm ly attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell. The outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.
 No. 2.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 3.—Three-fourths of the total surface must be filled and sealed.
 No. 4.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

NEW YORK.—For this time of the year, there is a fair demand for comb honey. Prices in this market rule about as follows: Fancy white, 14@15; No. 1 white, 13@14; No. 2 white, 12@13. We are not receiving very much from this section at present, but arrivals from the South have been fairly good. Hardly any demand for extracted. Prices are about 4½@6 cents per lb. according to quality.

FRANCIS H. LEGGETT & Co.,

Franklin, West Broadway, and Varick Sts.,
 Sept. 6. New York City.

ALBANY.—Increasing demand for honey now, and very little come as yet. Fancy white comb, 16 medium, 14@15; mixed, 13; buckwheat would sell at 12@13. Extracted white, 6@6½; dark, 5½@6. We look for good demand for honey on this market, as the local crop is very light—bees having been destroyed to prevent full brood.

Sept. 11. McDOUGAL & Co., Albany, N. Y.

MILWAUKEE.—This market offers inducements to shippers of honey, as the supply is not large, and values good and prospects of good demand, as the season for consuming honey arrives and fresh fruits get out of the way. We quote fancy white 1-lb. sections, 15@17; A No. 1, 15@16; amber, nominal, 12@13. Extracted white in barrels, kegs, or cans, 7@8; amber, 5@6½. Beeswax, 25@30.

Sept. 7. A. V. BISHOP & Co.,
 119 Buffalo St., Milwaukee, Wis.

CHICAGO.—The receipts of comb honey are heavier, and the demand is hardly sufficient to take all that is being offered. Choice white, in the so-called pound sections, continues to bring 15 cts., while other lines that can scarcely be called choice nor even grading as No. 1, sell at 14 cts.; the light-amber grades bring 12@13; at present there is no dark comb on the market. Some sales have been made of white-clover extracted at 7; basswood, in some instances, has brought nearly as much, but some other grades of white are dull at 5½@6; amber ranges from 5¼@5½, depending upon the body and flavor; buckwheat and other dark grades selling slowly at 5. There is an easier feeling in bees-wax with 28 cts. about as much as it will bring.

R. A. BURNETT & Co.,

Sept. 7. 199 South Water St., Chicago, Ill.

NEW YORK.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good. We quote as follows: Fancy white, 14@15; No. 1, 13; No. 2, 12. Amber, 11. No buckwheat on the market as yet, but are expecting some within a week or so. Extracted is selling slowly, with plenty of supply, at unchanged prices. Bees-wax dull at 27.

HILDRETH & SEGELKEN.

Sept. 10. 265 Greenwich St., New York City.

DENVER.—No. 1 comb, \$3.00 per case; No. 2, \$2.75. Extracted white, 7½@8. Beeswax, 22@24. Local demand for comb honey is still light, owing to continued warm weather and an abundance of fruit. A considerable portion of the crop of this State has been contracted for by eastern buyers.

THE COLORADO HONEY PRODUCERS' ASS'N.,

Sept. 9. 1410 Market St., Denver, Col.

SCHENECTADY.—From present indications the crop of buckwheat honey will be far short of what it promised to be earlier in the season, and this will cause a firmer market for white. We quote white, 14@16; buckwheat, 11@12. Light extracted, 6@7; dark, 5@5½.

Sept. 9. C. MCCULLOCH, Schenectady, N. Y.

CINCINNATI.—Comb honey is coming in fairly. Fancy white clover brings 15c.; other grades in proportion less. Extracted honey is offered much more than a year ago. There seems to be very little demand so far. 1-lb honey will sell from 5@5½, and lighter grades from 6@7; white clover, extra fancy, 8@9.

Sept. 7. C. H. W. WEBER, Cincinnati, O.

SAN FRANCISCO.—Comb honey, 10@12. Extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Lees-wax, 26@28.

Aug. 30. E. H. SCHAEFFLE, Murphys, Cal.

PHILADELPHIA.—Honey not arriving very freely, market price not established. Extracted fancy white, 8@9; No. 1, 7@8; amber, 6. Fancy comb, 16@17; No. 1, 14@15. Beeswax, 26. We are producers of honey—do not handle on commission. WM. A. SELSER,

Sept. 20. 10 Vine St., Philadelphia, Pa.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co.,
 Front and Walnut Streets, Cincinnati, Ohio.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.

THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Write us if you have any large or small lots of extracted honey to sell. State quantity, kind, and price expected and if possible mail sample. We pay spot cash. Reference, Wisconsin National Bank. E. R. PAHL & CO., Detroit & Bdwy, Milwaukee, Wis.

WANTED.—Comb and extracted honey; will buy your honey, no matter what quantity. Mail sample of extracted; state quality of comb honey, and price expected delivered at Cincinnati. I pay promptly on receipt of goods. Refer you to Brighton German Bank, this city. C. H. W. WEBER,
 2146-2148 Central Ave., Cincinnati, O.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

Vol. XXIX.

SEPT. 15, 1901.

No. 18

EDITOR HUTCHINSON, wax from cappings is the hardest kind of wax, and the best kind for brood foundation if you don't wire frames.

"FLY-ESCAPES are needed on the windows of a dwelling as much as bee escapes are needed on the windows of a honey-house," says Editor Hutchinson. Bright idea; and he got it from that Kanuck, Jacob Alpaugh.

I'M VERY GLAD to know that the tables are turning with Bro. Doolittle, and that, instead of red clover being worthless as in past years, he has been getting the grand red-clover crop reported on page 712. What a testimonial that is for those yellow bees!

A RULE that I supposed without exception was that, if you found more than one egg in a queen-cell, you might be sure of laying workers. The other day I found two eggs in a queen-cell and a good laying queen present. "Bees do nothing invariably."

"DARK OLD COMBS give to honey a darker color. This is the experience of some—others say no. Why this difference of experience?"—*Bee-keepers' Review*. May there not be a difference as to careful observation? Will not the length of time the honey is in the comb also make a difference in color? Fill a black comb with water, and immediately throw it out, and the water will be clear. Let it soak for a number of days and it will be like ink.

CARBOLINEUM seems to be getting more popular in Germany as a substitute for oil-paint on hives. Editor Weippl, of *Illustrirte Monatsblätter*, says he has used it exclusively for years; prefers it to paint because cheaper, and because it does not close the pores of the wood so as to prevent ventilation; and in spite of its strong smell he has hived swarms in hives painted with it two hours previously, although it is better to let them dry two or three days. I wish I could get some of it to try. [Carbolineum—I can not find it in the dictionary, and do not remember to have

heard of it before. Does it go by some other name in this country? In any case, what are its main ingredients?—ED.]

F. B. SIMPSON, in *Review* and elsewhere, is looming up as a real light upon the subject of queen-rearing. Upon one point, however, it is hard to agree with him. If I understand him correctly, he says that length of tongue is of no value *per se*, only as it indicates the presence of other good qualities. Take two colonies exactly alike in industry, etc., differing only in tongue-length. Would not the greater length of tongue have a cash value *per se* on a crop of red clover? Possibly, however, I do not rightly understand him.

BEES transfer larvae—p. 714. I don't know whether that's true or not, but I'd like some proof if the assertion is to stand. We do know that it is a very common thing for bees to start queen-cells that are never used; now, why might not queenless bees do that? [Bees transfer larvae? I could not believe I had said any thing of the kind; but, sure enough, the type stands out clear and cold. What I had in mind, and should have said, was that bees transfer eggs, for I have seen them do this. Under stress of conditions they may do the other.—ED.]

IT IS REPORTED in *Elsasz Bienenzuechter* that bees were fed honey that came from cappings that had stood in a zinc enameled dish, and half the bees died. [This might be true; but in that event the quantity of honey was probably small compared with the amount of zinc exposed; but the Californians universally store their honey in galvanized (zinc covered) cans; but the cans hold anywhere from ten to twenty tons; and the amount of surface of zinc exposed to the honey is so small that, for all practical purposes, we might say that the amount of poison is infinitesimal, and not worth considering.—ED.]

"IN THE ARRANGEMENT of nuclei it is always desirable to have something by which young queens can discriminate between their own entrance and that of some other of the same general appearance." That's what the editor says, p. 714, and it's worth saying over again. It applies to hives as well as nuclei.

It is a great mistake to suppose that distance is the main thing. If there is some object by which the entrances can be located, there is less danger of mistake with the entrances two inches apart than with them at two yards apart if the hives are in a long straight row on a dead level, with no other object than the hives to locate the entrances.

WITH SAW KERFS on the under side of hive-covers, end-cleats will prevent warping, but will they prevent twisting? No matter how firmly a cleat holds at each end of the cover, it seems to me that would not prevent the cover twisting so that the end-cleats would not lie in the same plane. [Saw-kerfs would aggravate the difficulty rather than help it. I believe the best solution of the hive-cover problem will be two boards $\frac{3}{8}$ inch thick separated by a $\frac{3}{8}$ air-space. The twisting tendency of one board would be counteracted to a great extent by the other if the two sets of boards are properly nailed and cleated.—ED.]

FORMERLY I supposed that the presence of queen-cells where there was no intention of swarming was a reliable sign that no queen was present. When I take a laying queen from a nucleus and give a ripe queen cell, the rule is that, a day or so later, I'll find the young queen present and a number of queen-cells, which latter may not be destroyed till they have young queens nearly ready to emerge. When I give a caged laying queen to a colony, the rule is that, a week later, the queen will be laying, and queen-cells will be present, although not allowed to proceed to maturity. Even the presence of cells and the absence of eggs is not proof positive that the queen is not there. Sometimes it will be more than a week before she begins laying. [This is true according to my experience. The presence of queen-cells, I think we may safely say, outside of the swarming impulse and supersedeure impulse, indicates the absence of a laying queen, especially if they are in all ages of growth. A ripe queen-cell might, however, be in a hive with a laying queen for a day or two after the queen has been introduced, and this would be the only other exception to the rule, I believe.—ED.]

MR. EDITOR, I had it laid up for you on the question of size of colonies and of bees in normal colonies destroying eggs. I intended to weigh a strong colony, and then crow over you. As a punishment for my wicked designs, when the time came for strong colonies they were not on hand, because the weather was so dry that the bees had stopped breeding. I'm not subdued enough, however, to refrain from asking you why it is that we have such beautifully even combs full of brood all uniform in age if the workers have the ugly habit of lurching upon the eggs at irregular times. Why don't we always see some cells among the sealed brood still open? You will see that Bro. Doolittle makes no allowance for that sort of lurching in his figures on page 712. [When the honey-flow is on full blast, and conditions are normal, I do not suppose there is any "lurching" business going on. Over and over again have I observed that a frame

that had been full of eggs on one day would the next day have them half or two-thirds gone. This was after the honey-flow, and it may have been that supplies were very short in the hive. Just now my memory is not very clear on this point. I still believe as I have before said, that we can figure that not *all* the eggs that a queen will lay will produce workers, by a long way.—ED.]

In speaking about movable apiaries, it seems that Russia is taking the lead in a striking way. The August *Century* gives a view of an immense floating barge anchored at a village, also birdseye view of the deck. The following, taken from *Public Opinion*, will further explain the matter besides prove interesting in other ways:

The Russian educators, in casting about for the best means of economically fulfilling their mission, decided to experiment with immense floating gardens hundreds of feet in length. These great barges, built wide enough to give a comfortable area for the laying-out of a garden, are launched with the breaking-up of the ice. As these floating agricultural-experiment stations drift slowly downstream to warmer climes, the seeds sprout, and grain grows and eventually ripens. On the deck of the great barge is an extensive building, the residence of the professors of agriculture who have the station in charge, and a smaller house for the crew. The size of these buildings, however, is dwarfed by the immensity of the barge. On its great broad deck, besides the vegetable and grain beds, are various working models of bee-hives; for the government is bending every energy to revive this industry, once famous in Russia, when honey mead was the national drink.

As the barge journeys with the current, it stops at every village. The church bell is rung, and the people gather from the fields to be led by the *starosta*, or mayor, to the floating farm. They are invited aboard, where the various plants are explained to them, while illustrated lectures are sometimes given on the advantages of diversified farming. The questions of the peasants are intelligently answered, and seed is often left with the most enterprising for planting. So far the barge experimental farms have proved the most efficient method of spreading the new knowledge of farming in Russia, for the country is one vast plain. The great rivers flowing southward through the rich agricultural prairies take their rise in the dense forests of central and northern Russia. Here the great barges are built late in the fall, the spring freshets are made to save the expense of launching, and when fall comes again the wood of the barges can be sold in the treeless southern country, where wood is dear, and thus made to pay the expenses of the trip downstream. In America we little realize the extensive use Russia makes of her waterways. In European Russia alone there are over sixty thousand miles of navigable waterways, or almost three times the mileage of navigable rivers in the United States.

AMERICAN BEE-KEEPER.

Mr. Hill kindly says:

The editor of GLEANINGS has taken a Western trip, and in consequence thereof has become enthusiastic in regard to the great extent and diversity of all things apicultural in that quarter. His mental expansion is already evinced in his journal to a marked degree. The fact that he quotes Horace Greeley, in his admonition to young men, however, strongly suggests that he has not yet "done" the South.

GENERAL CORRESPONDENCE

THE SWARTHMORE SYSTEM OF QUEEN-REARING.

Arrangement of the Fertilizing boxes for Mating Numerous Queens in Full Colony on a Single Stand; a Plan Particularly Adapted to Honey-producers, and Those who wish to Rear Queens for Their own Use.

BY SWARTHMORE.

Through the side boards and back end of an ordinary Dovetailed hive-body cut several pairs of holes to match the zinc cut covered holes in the fertilizing-boxes—six on each side and four in the back, or three on each side and two in the back, according to the size of your hive and the number of boxes you wish to attach. If you object to cutting your regular hives use any old half-depth super or extemporized hive-body. To bring the flight-holes as far apart as possible, have the upper ones up and the lower ones down. Queens take no notice of colors or odd forms. It is the little cluster of anxiously waiting young bees that attracts them. Thus an entrance arrangement that separates the clusters is desirable. Young queens will fly from three to four times in a day, returning each time with the evidence of having met a drone, often repeating the performance for two and sometimes three days. These are false contacts, and are easily removed by the bees. The true connection will show a fibrous substance much resembling strands of fine flax when dry. This the bees do not seem to remove, but it comes away with the first eggs discharged, which, by the way, are not deposited. A young queen will begin laying on the second day after becoming pregnant. Many of the first eggs are drone, and are rarely allowed to develop by the bees. But I digress.

FIG. 1.

$\frac{3}{8}$ -inch holes bored through Dovetailed body, ready for attaching fertilizing-boxes outside.
X, front board, no holes.

Now adjust over each pair of holes a fertilizing-box. Hang the boxes on little wire hooks so they may be easily removed at any

time, or the back lids may be simply tacked to the hive. Have, a little to the sides of each box, small staples or screw-eyes to hold pieces of stout cord for tying the boxes firmly to the sides of the hive.

Those living in a climate where the nights are quite cool are advised to attach the boxes to the inside walls of the hive, and to bore single $\frac{3}{8}$ -inch flight holes through the hive-body to correspond with the $\frac{1}{2}$ -inch flight-holes in the boxes. This practice is especially desirable in early spring or late autumn; also during long rainy spells. To separate the clusters, tack a plain $4\frac{1}{4} \times 4\frac{1}{4}$ section box about each flight-hole, on the outside walls of the hive.

FIG. 2.

FERTILIZING-BOXES IN PLACE ON DOVETAILED HIVE BODY.

F, flight-hole; S, shell-cup queen-cell; H H, hooks to support box.

After you have supplied each fertilizing-box with one comb containing brood, mainly capped, as explained previously, attach one hatching cell to each comb (on the inside lid). A shell cup may be slipped in through a hole in the top-bar, as shown at S, Fig 2, at any time, without the necessity of opening the boxes. Put the boxes all in place on the outside of the hive-body, and tie each one firmly. Fill the hive-body with combs containing honey, capped brood, etc. Bring the brood to the outside walls to attract young bees into the boxes. Unless the queen-cells are ripe, many may fail to hatch, on account of cool nights, dampness, or insufficient bees to cover them; therefore it is far better to run just-hatched virgin queens into each box. Cells hatched in cages, inside the main hive, obviate the necessity of any special or intricate introduction proceedings; for, having hatched in the midst of the bees, each queen is as much a part of the colony as the bees themselves. Bees will not deliberately destroy virgin or laying queens if they are held apart from one another in cages or fertilizing boxes; but if a young laying queen is at large on the combs, every virgin will be balled by the bees at 24 to 48 hours of age. When the laying queen below is an old one, however, virgins will be allowed to live and mate, on the principle of supersedure.

The Swarthmore nursery cage is especially adapted to this system, as the bees can freely enter the cages through the zinc side, and can

become acquainted with each queen as she hatches. Place in cages, in the midst of the mating colony, as many fine cells as you have boxes attached; and as soon as the queens hatch, simply remove them from the cages and run one into each box. Either place the box attachments upon some queenless colony (above an excluder) that has just been used in forcing a batch of cells, or one that has been deprived of its queen three days prior. Place a guard at the grand entrance, to prevent stray queens from entering there.

After all the young queens are laying, run one into the lower chamber, and leave the others in the boxes until needed. They will do no harm if left in the fertilizing boxes for months. We keep them thus from May to November without guards of any kind.

To keep up the strength of the mating colony where no queen is run into the lower chamber, add full combs of brood inside the hive-body; but be sure that no brood given is young enough for royal appointment. When the time comes for removing the young queens for shipment, or use in the home yard, they may be taken *one* or *all* at a time; but no attempt to introduce other virgins should be made until all the laying queens have been removed from all the boxes three days.

To take away the queens, loosen the knot and remove one lid at a time, as previously directed. Northern breeders can keep extra queens for late autumn delivery way up to frost, by placing the boxes, queens, bees, and all inside an empty hive-body, directly on to the tops of the frames below. Leave ranges between the boxes so that the bees can cluster about and enter all of them. Fill the remainder of the hive-body with quilts tucked in nice and warm, then cover all with a good rain-proof lid.

By tiering hive-bodies and utilizing the top of the hives, as well as the sides and ends, provision can be made for mating forty queens at one time from one full colony.

By having cells of different ages, one to three days apart at hatching, a large number of boxes may be attached to a single hive; for by alternating the queens of different ages about in the boxes, no two coming close together are in flight on the same day; therefore the loss from possible mixing is slight. It is only a question of skill and a thorough knowledge of the habits of young queens, with a cunning planning of remote flight-holes, when any bee-keeper may successfully mate innumerable queens, all from one powerful colony, on a single stand.

[This scheme of fertilizing-boxes looks as it might work. I say *might*, because several have already written, stating that they do not believe that the Swarthmore one-comb fertilizing-boxes, as described on page 436, May 15, would work in the hands of the average person, particularly during the robbing season. The objection made is that, in small one-comb nuclei, four or five inches square, there are too few bees to secure good results. In the arrangement above, Mr. Swarthmore

seems to overcome this objection, and now it remains to be seen whether others can secure the same result Mr. S. does. A little later on, I hope we ourselves may be able to speak from experience on both methods of having queens fertilized.—ED]

RAMBLE 101.

Some Inventions.

BY RAMBLER.

After your good sense has induced you to get a good hive, it is then necessary to have a good cover; and that is a rock upon which bee-men split. We have discussed the cover matter in GLEANINGS quite a little, and the subject is not exhausted. My pet cover is made of redwood sawed shakes, and double, as shown in the drawing. This cover will hold its shape in hot climates, and gives an air-space, which is necessary in hot locations. Paper can be used on this cover, and in the air-space, where it will be protected. I use cleats, making the air-space a full inch, and nail the middle cleat an inch from the center.

The reader of bee-lore has learned that in California, and especially in the southern part, several wagonloads of stones are distributed around on the hives in an apiary. A little improvement in my cover will enable the bee-keeper to dispense with the bothersome stones.

A stiff wire, $\frac{3}{8}$ in diameter, is bent as shown in dotted lines, and fastened inside the air-space. The hooked ends project only when in use, and then they grip strongly into the edge of the hive where a small hole is made to receive the points. The spring, or tension, of the wire causes it to grip. These grip so tightly that the whole hive can be lifted by the cover. When released from their grip on the hive the hooks retire into the air-space, entirely out of the way.

The editor saw one of these covers and fastener, and indorsed it. He might have been influenced that way by some of my flapjacks, for he had just eaten his fill of them under our fig-tree.

And now that we have exhausted the hive-and-cover matter, I will show you another device the editor indorsed. The half-tone will show you the nature of the device, without much description. It is for loading a queen-cage with queen and bees, and not touching a bee. The broad end of the cage has a sliding cover; the narrow end, a little tin gate or

slide. To operate, take the slide off the large end; and when you have found the queen, set that end down over her. As soon as she runs up into the cage, place the finger over the end, then slip on the tin slide, and you have her. Now place the beveled small end under the wire cloth on the shipping-cage; pull out the little gate, and the queen will immediately run into the cage. Now withdraw the catcher, and with the big end and your finger scoop up a lot of bees, and run them in, or as many as you need, and the work is done. It

QUEEN-CATCHER.

may be done as quickly by the plan of picking up one at a time; but this way is certainly safer for the queen.

As I walked by myself I said to myself, "John Rambler, you are a back number."

An echo from the editor under the fig-tree whispers, "Not in the line of flapjacks."

I found myself asking myself a queer question a few mornings ago. Said I to myself,

and myself said unto me, "Say, John Rambler, did you know you are getting to be a back number?"

"So ho, John Rambler, that may be; but there's lots of company on the same road."

"There is Doolittle. His queen-rearing was away up to date; but now Swarthmore leaves Doolittle away down cellar under the back kitchen. Yes, sir; Doolittle feels it, and is trying to catch up by whacking at long tongues. Can't do it; out of breath; knees stiff; under the fence."

"There's Dr. Miller, a back number, holding on to the T super like a tick to a sheep's back, out of date fourteen years ago, don't you know? Then the doctor keeps grinding away with that same old Straw-cutter; cogs slip; the feed-gear all out of whack; needs oiling. If you must run the old machine, do grease it up, doctor."

"Now I am getting right down to business, there is A. I. Root. You wouldn't think it, but he is a back number. He used to tell us how to make good serviceable hives out of good well-seasoned $\frac{7}{8}$ -inch lumber. Somebody shows him a hive made of $\frac{1}{2}$ -inch lumber; claps his hand on the fellow's back, and says, 'Yes, sir; that is a good thing.' Dear me! It worries me to think of it."

WEE-WAW HIVES.

Look on the accompanying picture. The first hive on the ground is a good $\frac{7}{8}$ -inch one—has seen much service, but it is still strong. The super upon it is made from a kerosene-case, $\frac{1}{2}$ -inch sides, and improperly labeled; for if the super itself does not explode, the fellow who handles it will use explosive language. After a few months' use it becomes what I term a wee-waw super, remarkably loose jointed, and, when plac'd upon the top of the good square hive, see how much out of square it is—just the thing for a careless helper to use. He would leave half of the colonies in the apiary with center ventilation.

Anybody can readily see the reason why it becomes "wee-waw." There is not enough thickness of lumber to hold the nails firmly. To be sure, it might be nailed often; but many nails weaken the holding parts, and it spreads at the corners as shown in the next hive. The only way to hold it in at the corners is with those corner-clamps used on fruit-boxes, and shown on the next two hives; but even these clamps do not prevent the wee-waw appearing in due time.

Well, let's see. Suppose we put them on with a lock corner or dovetail. That would certainly help matters; but still, there is that thinness of lumber; and unless the grain is straight there are little corners breaking out, splitting half way along the lower edge. Any way you can fix it, there is an everlasting bother in the use of a hive made with $\frac{1}{2}$ -inch sides.

Did you ever turn a wee-waw super up side-wise and sit down on it? I saw a fellow do it the other day. The super collapsed, and the fellow went to the ground with his heels in the air. A good $\frac{7}{8}$ inch hive can be used for a seat or to stand on or to dance on. It is the only hive fit to use.

[Rambler's flapjacks are all right, and so are the other things he shows, except—except—well, the half-inch hives. I saw him at Rambler's, and if they wouldn't make a fellow "explode," I don't know what would.]

Some of these old "back numbers" are all right, even if they do let a "cog slip" once in a while. The fact that some of their machinery has gotten out of gear a few times helps us young fellows in that we are careful not to use the same kind of gear. The mistakes of the veterans are often more helpful than their successes.—ED.]

THICK TOP-BARS, AGAIN.

A Thorough Examination of the Subject by Two of Our Best Authorities.

BY S. T. PETTIT.

Dr. Miller and the editor seem much excited over my article on top-bars, p. 227; also p. 380. In the footnote the editor says, "We first tried top bars that were wide and only $\frac{1}{4}$ in. thick. We had trouble from such bars sagging, and the building of burr and brace combs." I want to say, had those $\frac{1}{4}$ inch-thick and $1\frac{1}{8}$ -wide top-bars by some means been kept straight, they would have remained as clean as the cleanest the editor ever looked upon—yes, they would. I can not for the life of me understand how it can possibly be that the editor's experience shows him that brace-combs are more plentiful by the use of $\frac{5}{8}$ -thick than $\frac{7}{8}$ -thick top-bars. Is it possible that the length of the L. top-bar allows it to sag when only $\frac{5}{8}$ thick? But after all, respectfully, I wish to say I firmly believe the editor is all mistaken in that. My experience with $\frac{5}{8}$ -thick top-bars covering about 15 or 16 years is altogether different from his statement.

Dr. Miller (p. 380) says, "His strong point is that, by having $\frac{1}{4}$ inch more depth, the space of 1600 to 2000 cells is lost." Yes, that is my strong point; but there are other strong points. I will notice them further on.

No, I did not make the mistake of "counting that the same number of bees were occupied brooding those sticks as would be occupied in brooding $\frac{1}{4}$ -inch depth of comb." I neither thought it nor said it. This is what I did say: "The saving of that space in each

hive is a matter worthy our best consideration." Most certainly 1600 to 2000 cells in an average hive are of far more value than useless lumber, adding weight and unnecessary expense. I trust, with due consideration, the doctor will agree with me; but I must not forget that prejudice is an exacting, unrelenting tyrant. Then he proceeds to use up about half a column, and proves nothing, only that he "*don't know*" what he is talking about. His ferocious clip at an imaginary object hit nothing—it's all wasted energy.

Further on he says: "So if the prevention of burr-combs by deep top-bars be all a delusion—which I do not believe." Well, I presume I can show the reason why he does not believe it. He did not make thorough experiments to know for himself; but he came to his belief by—well, I guess I can not do better than to give the words of E. R. Root as follows: "Dr. Miller was greatly struck with the idea; and after some extended correspondence with the doctor we decided that we would launch forth for the ensuing year the new top-bars." Then later they imagined that they evolved the new top-bar by revolving around each other by the coat-tail—a clear case of conviction not founded upon personal practical experience.

Below I quote from a letter sent me from the United States dated April 4, 1901: "I have read with much interest your article in GLEANINGS for March 15, and want to say that I indorse all you say in regard to *wide* and *thin* top-bars, and bottom-bars $\frac{3}{4}$ inch wide. For a number of years I have been using a top-bar $\frac{1}{4}$ inch thick and $1\frac{1}{8}$ wide, and *not* a burr-comb on a single frame in 8 years' use. A few days ago Mr. Cruikshank, near this town, called upon me, and, in alluding to this discussion, said he uses $\frac{5}{8}$ -inch thick top-bars, and has no bother with burr or brace combs." But the doctor says: "I still want the $\frac{7}{8}$ top-bars for the sake of having the sections so far from the brood-combs that the bees will not find it convenient to carry up a lot of black wax to spoil the snow-white sections." This statement reveals the fact that he has not yet learned all the valuable uses to which the queen-bar, or perforated metal queen-excluder, may be put. My practice is to get the sections just as close to the brood as I can, preserving all the necessary bee-spaces. To this end I want thin top-bars. Then to prevent the bees moving up dark wax, and to bar the drones with their filthy habits from the sections, to keep the queen in the brood-chamber, and to restrain pollen, I use a queen-bar, or an all-metal perforated zinc queen-excluder, which has a $\frac{1}{4}$ -inch-thick rim and two cross-pieces to keep it rigid.

This arrangement gives the same space between the top-bars and sections as the deep top-bars with all the extra advantages enumerated; but I would bring the sections closer to the brood if I could, and not dispense with the queen-bar.

On page 380 the editor says: "It seems to me that our friend Pettit assumes, or indirectly assumes, that those 1600 to 2000 cells are lost because of the brood that might have

been reared in them." Exactly so; and that is what hurts. Continuing he says: "But it is very seldom that brood is reared any closer than within an inch of the top-bar, with ordinary L. frames." Well, if that be so, then verily the management is faulty—yes, very bad indeed. Let me explain by giving my practice. I want practically all the brood-chamber for the queen. All stocks, weak and strong, are kept warm by keeping a warm cushion upon each; then, when the early flow sets in, to all strong stocks a super filled with comb is given, with that warm cushion on top, and a queen-bar to keep the queen down. Then the surplus honey will go into the super, and the brood and pollen will generally fill every last cell to the top-bars. Of course, there will be honey in the corners; and the thinner the top-bar the less the burr-combs and the more the brood. While the weather is cool a few cells along the top-bar, especially when the bees are not up to best condition, will contain unsealed honey and pollen; but as the heat increases, brood will come to the top-bars.

Twenty-five or twenty-six years ago I commenced to use a cushion on my hives; and when the comb or extracting-super goes on it goes up. It stays right on, or its equivalent, summer and winter. Mr. E. R. Root is just now finding out the benefits of a warm cushion, and so it will be with the thin top bars; but I hope it won't take him a quarter of a century.

Aylmer W., Ont.

[In order to enable the reader to make a better comparison of the points at issue, we deemed it best to have Dr. Miller's answer follow here instead of waiting till a later issue.—ED]

In the matter of thick or thin top-bars, there are several different points to be considered, and it is of some consequence that we keep them separate. One question is: Does thickness of the top-bar *per se* have a direct bearing upon the matter of burr-combs between top-bars and sections? Quite another question is this: If thickness of top bar has of itself no bearing upon the matter of burr-combs, is it practicable to use thin top-bars without getting into trouble otherwise? Still separate from these is the question: Is there any sufficient reason for thick top bars aside from the matter of burr combs? And again: If the same end can be reached by other means than thick top-bars, which plan on the whole is best?

As to the first question, I have said I don't believe that the prevention of burr combs by deep top-bars is all a delusion. I have not said it is certain that deep top-bars are absolutely necessary to prevent burr-combs. I don't know. And knowing and believing are two quite different things. I'm afraid we don't know any thing on this subject as positively as we might. An experience of 16 years with top-bars $\frac{5}{8}$ thick makes friend Pettit think a greater thickness would be no better. Mr. Cruikshank says he has no trouble with burr or brace combs while using top-bars

$\frac{5}{8}$ thick. Editor Root says that actual trial gave more trouble with $\frac{5}{8}$ than $\frac{7}{8}$ of thickness. Mr. Pettit gives the remarkable testimony of a man who had "not a burr-comb on a single frame in eight years' use," and his top-bars were only $\frac{1}{4}$ inch thick! Amid this conflict of testimony, what is one to believe? One says a thickness of $\frac{7}{8}$ is necessary, and Mr. Pettit brings testimony that makes no greater thickness than $\frac{1}{4}$ inch necessary, while he finds reasons in his own experience to make $\frac{5}{8}$ necessary. Possibly a difference in hives, localities, or conditions may have something to do in the case.

Without pretending to have settled the first question, what about the second? Sufficient rigidity, in Mr. Pettit's case, required a $\frac{5}{8}$ -in. top-bar, while $\frac{1}{4}$ gave sufficient rigidity in another case. The question arises in passing: If $\frac{1}{4}$ gives sufficient rigidity, why should Mr. Pettit need two and one half times that thickness? It is probable that there would be general agreement that no more than $\frac{5}{8}$ is needed to prevent sagging.

To the third question it has been answered that the thickness of top-bars tends toward whiteness of sections by increasing their distance from the black brood-combs; and to the closely connected fourth question it is answered that a queen-excluder will answer the same purpose. This, however, does not answer the question fully, for it still leaves unsettled whether the excluder or the thick top-bar is better. Right here is a good place to allow the manufacturer a word, and I may be allowed to quote from one, who says: "This is an exceedingly important matter; for if top-bars of brood-frames under proper conditions are just as good $\frac{3}{8}$ thick as $\frac{7}{8}$ we could make twice as many out of the same material which we now use in making such a large quantity each year. It would save a good deal of freight charges to customers, and the first cost and selling price could become lower. I presume it is a question on which there will always be a difference of opinion, but there ought to be strong grounds for continuing the $\frac{7}{8}$ top-bar if it is to be continued."

Most surely this should have due consideration. It is not, however, a question, in Mr. Pettit's mind, between $\frac{3}{8}$ and $\frac{7}{8}$, but between $\frac{5}{8}$ and $\frac{7}{8}$, with our present knowledge of top-bars. If the use of an excluder makes no greater thickness than $\frac{5}{8}$ necessary, is it right to oblige one to have a greater thickness if he would in any event use an excluder? The argument for whiteness of sections loses all its force with those who produce extracted honey. It also loses its force with such as Mr. Pettit, who would probably use an excluder anyhow. But there is a large number of comb-honey producers who feel no need of an excluder for other purposes, and the question is whether it will be cheaper for them to secure whiteness of sections by means of excluders or thicker top-bars. Mr. Pettit seems to think that, if I understood the full value of excluders, I would want to use them under sections. I value excluders, and have something more than a hundred on hand; but I would rather have them lie idle, as many of them do, than

to put them under sections. His reasons do not appeal to me, for the amount of pollen in my sections would not pay for the extra trouble of handling excluders if they cost nothing, and along with this goes the trouble of the queen going up, and my drones are not addicted to filthy habits in the super. So in my case, at least, if excluders could be had free I would decidedly prefer to secure whiteness of sections by means of thicker top bars. The extra thickness costs a trifle compared with the expense of excluders, and the time taken to handle the excluders costs something.

Mr. Pettit is in error in supposing that Mr. Root and I imagined that by any process we had evolved thick top-bars. I don't know where the first evolving was done, but I suspect it was in the brain of that very practical countryman of Mr. Pettit's, J. B. Hall. Mr. Root speaks of getting the idea from him ten or twelve years ago; but my interest in thick top-bars antedates that by several years. In 1883, at the exposition at Toronto, J. B. Hall, in a neighborly way that I have never forgotten, showed me a hive containing thick top-bars, and told me why he used them of such thickness.

Mr. Pettit thinks prejudice has a strong hold upon me—a fact of which I am only too painfully conscious; but I try to be free from prejudice where my pocket is concerned, and as yet I do not see what I could gain by changing to thinner top-bars with the addition of excluders. It is only fair to say that in either case, and I have tried excluders on a somewhat large scale, and, indeed, in any case that I have tried, I am not as free from brace and burr combs as I should like. If Mr. Pettit finds it necessary for other reasons to use excluders, and if with $\frac{5}{8}$ top bars he is entirely free from trouble, then I have no quarrel with him for using no greater thickness than $\frac{5}{8}$. But I should advise those who are just beginning, before investing in a full outfit of excluders to determine whether Mr. Pettit's experience or mine would best fit them.

Marengo, Ill.

C. C. MILLER.

[I was not aware that either Dr. Miller or myself was "excited" over this thick-top-bar matter. Is it not possible that friend Pettit himself is a little bit on that order? When he talks about "ferocious flings," and intimates that both the doctor and myself are under the spell of prejudice, "an exacting and unrelenting tyrant," and our "revolving around each other by the coat-tail," one would think *his* equilibrium was a little bit disturbed. There is no occasion for excitement, for truth is what we want; but in the discussion of this question I fear we all lose sight of locality. After having gone through the great West, I am frank to acknowledge I have changed my views materially on some things; and I believe that, if our friend Pettit were to make a similar trip, he would be less positive than he now is. When one makes a strong statement he ought to limit it to his own locality.

Pine lumber behaves very differently in different parts of the United States. A top-bar that would not sag in one place might warp,

twice, and check very badly in another. Still again, we do not all use the same kind of lumber. In the South the yellow pine is used; in some parts of the middle West, whitewood; along the Pacific coast, Oregon pine, Oregon spruce, California redwood, and sugar pine are much used for top-bars, and all these timbers have peculiarities.

After all, as I understand it, Mr. Pettit, Dr. Miller, and myself are not very far apart in our views; and while I rather favor a top-bar $\frac{7}{8}$ thick, Mr. Pettit argues for $\frac{5}{8}$. As to the matter of width, I think there is no difference in opinion; therefore the only difference between us is in the thickness of the top-bar, and *that only* $\frac{1}{4}$ inch. I am willing to admit the $\frac{5}{8}$ bar gives very good results in some localities when some kinds of lumber are used; but the kind of bees, the kind of honey-flows, the depth of bee-space over the top-bars, are other factors that help to make a great variety of opinion. In discussions of this kind we should be broad enough and fair enough to believe that every man is telling the exact facts according to his locality, until we know what are the conditions of that locality.

As to the other points raised by Mr. Pettit, I can only refer to what I have already said on pages 227 and 380.

I do not wish to convey the impression that we of the Root Co. are wedded to $\frac{7}{8}$ inch, and can not change to $\frac{5}{8}$. Some conditions in the West, as I have observed them, may render it necessary to make a $\frac{5}{8}$ bar for those parts of the country. Rather than have two thicknesses and the resulting confusion, we may make for our Eastern trade a $\frac{5}{8}$ bar, even though we may have the feeling that there will be a slight increase in brace-combs.

There is one point to which Mr. Pettit refers, and that is that he succeeds in getting his brood built clear up to the top-bar in L. frames. If he can do that with pure Italians, without reversing, then he can do more than we can do with ours, even with cushions, and more than any one else I have ever met. We can accomplish the result with Syrian or Holy Land blood; but we prefer to have a little honey in the brood-nest rather than to have such bees in the yard.

There are very few producers of *comb honey* who use queen-bars or perforated zinc between the upper and lower stories. If a $\frac{5}{8}$ top-bar necessitates excluders and another bee-space, then it would be cheaper for bee-keepers to use the $\frac{7}{8}$ bar without the excluder. As a rule, excluders between the upper and lower stories are used in the production of *extracted* honey, and to only a limited extent have I noticed them being used in the production of comb.

To illustrate the difference in locality, I produce here a sample of some of the letters we have received. Here is a man, for example, who says a $\frac{5}{8}$ -thick top bar is all right, but a $1\frac{1}{2}$ top-bar, advocated by friend Pettit, is "an abomination." Well, we will let Mr. Atwater, whom I met in Idaho recently, speak for himself.

Mr. Editor:— "The *frames* the thing with which I'll catch the conscience of the

kings" (Root, Doolittle, Dr. Miller, and others). Here comes Pettit, in *American Bee Journal*, crying for a thin-top-bar frame, but advocating width as essential for the prevention of burr-combs. Mr. Pettit, I believe, speaks from the view-point of the comb-honey producer—at least I can scarcely tolerate the 1½-inch-wide top-bar in extracting-supers. A few firms are pushing a thin-top-bar Hoffman frame, "better and cheaper;" believe it not; they sag, not a little, but too much. I have had wired frames of this class sag fully ½ inch when heavy with honey. The old-style molded top-bar frame about ⅝ inch thick has never sagged, even when used as extracting-frames, answering perfectly for combs weighing as much as 7 to 10 lbs. In our yard we have in use hundreds of old-fashioned triangular top-bar L. frames, ⅞ inch wide; and for extracting, and ease and rapidity of uncapping, they are away ahead of the modern (?) 1½-inch-wide top-bar abominations, and my combs are built out thick, as I use only 8 combs in most of the 10 frame extracting-supers.

Now Doolittle, in *Amer. Bee Journal*, tells us that he uses top-bars $\frac{7}{8} \times 1\frac{1}{16}$. If a top-bar of this thickness will not sag, it would be a little better than a thickness of $\frac{3}{8}$ inch or $\frac{7}{8}$ inch; but the width would make it any thing but a good frame for extracting. What, then, shall we have? My answer, dictated by somewhat limited experience, is that, for the producer of extracted-honey, a top-bar $\frac{7}{8}$ inch wide is the very best. The thickness must be sufficient to prevent sagging, perhaps $\frac{3}{8}$ inch. Let us hear from the veterans in the production of extracted honey, for dissatisfaction with the 1½ inch top-bar is abroad in the land.

E. F. ATWATER.

Meridian, Idaho, Aug. 12.

[I would state for the benefit of Mr. Atwater, as well as for Mr. Pettit, there is a large number, in the West especially, of extracted-honey men who will not have a wide top-bar. They insist that their extracting-combs shall have narrow bars so they can uncapp easily. If the combs bulge much, they not only uncapp but cut off the bulges; and these bulges of wax, they contend, help to increase their profits, as they consider wax production an important part of the bee business.

Another, who owns 500 colonies, Mr. W. L. Chambers, of Phoenix, Ariz., wants his top-bars *one inch thick*. Yes, it is perfectly true that we can not bring every one to our standard of measure. The fact of the matter is, the Root Co. makes several different styles of frames, and we supply for the Western trade narrow top-bar frames almost by the carload. —ED.]

A RELAPSE OF BEE FEVER TO AN OLD VETERAN IN THE BUSINESS.

BY MRS. L. HARRISON.

Mr. Editor:—I've had a relapse of bee fever. It appears strange, since it has been so many years since I had such a severe attack, and it came on so suddenly too.

Last season I filled the second story of an L. hive with empty combs to protect them; and in the fall, when I prepared the bees for winter, I let this colony alone, excusing myself by saying we have such near neighbors if I stir them up by taking out those combs to extract them, some one may get stung, and run after the police. So I told the bees I didn't believe they had much honey any way, and that they were welcome to all they had.

This colony verified the truth of this saying, that bees build up stronger in spring when they have a full pantry. They knew that there was no danger of their children starving, and reared a large family. They soon became so strong as to hang out, and Mr. Harrison divided them, putting empty combs into the upper story.

One morning, while enjoying my rocking-chair in the shade of a catalpa-tree, I said to myself (I'm deaf, but she can always hear), "I'll not let that colony have all the honey they gather this year—so I'll not." I left my rocking-chair, and went into the honey-house. I tackled the extractor that had long remained idle, took out the gearing, washed and oiled it, and felt so good that I oiled the pump and clothes-wringer. Spiders had taken possession of the inside of the extractor, and I enjoyed slashing the water around; washed the tin bucket for carrying combs; sharpened the uncapping-knife, and scraped out the smoker, all the time my enthusiasm growing, and tingling in my finger tips. I felt youthful, and full of love to God and man.

I lighted my smoker, and paid my respects to the bees. They were civil, and treated me like a lady. I gave them a little smoke at the entrance, and then on top of their combs, and removed them to the honey-house. How delightful to uncapp and put into the extractor, and see the honey running out into a jar covered with cheese-cloth! And now we have a nice jar of honey for our cakes another winter.

A friend told me lately that, during the blooming of his tulip-trees, there was a sound as if a swarm were among the branches. These trees are large forest-trees, and were transplanted many years ago from the Wabash Valley, of Indiana. It appears that they bear honey in this locality.

During the great heat and drouth, bees carried much water, and appeared to gather some honey. It may have been from the button-bush, as the Illinois River lowered. White clover is yet blooming in yards that are watered from city hydrants, and sweet clover has taken possession of all uncultivated land. Residents call it weeds, and call on the police to cut it down; but, like the children of Israel, the more it is persecuted the more it multiplies and grows. Bees work upon it much of the time.

I doubt if this locality will ever yield honey in the future as in the past. Paved streets and shingles yield no nectar. Lands that were overflowed and left uncultivated are becoming valuable and drained; where the plow and reaper go, there is small chance for bees. It appears to me that it would be for the good

of the country if bees were evenly distributed, many persons keeping a few colonies to fertilize fruits and clovers.

Peoria, Ill.

NOTES OF TRAVEL.

That Bee-keepers' Paradise in Texas.

BY E. R. ROOT.

When I left San Antonio, Texas, I took the train for Uvalde, about 80 miles west, on the Southern Pacific R. R. There seemed to be nothing particularly inviting in the country I went through, for the land seemed to be covered with desert-like shrubbery; when, therefore, Uvalde was called out by the train-man, I could not think what there could be in that apparently God-forsaken country to support bee-life to such an extent that carloads of bee-keepers' supplies should be poured into it and train-loads of honey go out.

Uvalde proper—that is, the town—is about $1\frac{1}{2}$ miles from the station; and as we got up into the suburbs of the village I began to see evidences of thrift and good homes. I went first to the hotel, and prepared to put up for the night. At the supper-table that evening I was surprised to hear talk about bees, hives, and honey prospects, just as one does here hear talk about grain crops in a farming community. As no one knew of my coming unless he consulted the register (and probably would not know me any way), I was an interested and a silent listener. Sometimes the talk changed to cattle-raising; then it would veer over to bees, honey, and hives. Said the owner of a weather-beaten face, with scraggly beard all over it, hair somewhat disheveled, a typical Westerner, with brawny hands, and big cowhide boots, "Wall, I reckon I can make my own hives—don't cost so much. Then you know I am a juck at all trades. Yes, I am quite handy in the use of tools."

Some one across the table ventured to remark that he preferred "factory goods," as they are made better.

"Mine are good enough for me, and I will put them aside of any of your Rute goods or Lewis goods, or any of your highfalutin' stuff."

And then, as if to qualify what he had said, he continued:

"Rute goods are all right, only I just won't pay his prices—freight is high, you know; and then I guess Rute likes to make a little too much off'm us fellows. No, I can make my own goods, and save Rute's big profits; but I'll allow Rute goods are good goods."

At this juncture I could not restrain myself any longer, and, turning to him, I said:

"I am very glad to hear you make that last remark, for my name is Root."

His eyes swelled under those shaggy overhanging eyebrows, and finally, recovering himself, said:

"What! you Rute? Wall, now! Say, stranger, I did not mean to run down your goods, for they are all right; but you know a

fellow can't afford to pay freight. You a'n't to blame for that. The S. P. road robs us."

"Certainly, my friend; you spoke highly of our stuff, and that is why I spoke."

But he seemed to feel that he had given me offense; and if he apologized once he did it half a dozen times while the rest of the men at the table were having a good laugh at his expense. I assured him his logic was all right, and that I had no doubt he could make just as good goods, and save money; and that if I were situated as he was, and could do accurate work, I would do just as he was doing.

After supper I sat out on the veranda, and heard bee and cattle talk intermingled. I was still an interested listener—the more so, as I knew that only a small number had heard the conversation at the table. I finally went to my room, which was just adjoining the veranda, and when the men thought I was out of hearing I could hear them laughing at the expense of our old friend—I can not remember his name—and the "slick way" he had "punched the ribs" of one of the Roots.

Knowing that D. M. Edwards was the "great bee-king" of the whole county, and of this fact I obtained evidence afterward, I sought out that gentleman the following morning. Everybody knew him, and I was told to go down to such a street, turn to the left, go so many squares, then go down another street—well, in trying to carry out my instructions I got all mixed up; so I turned to a man who was working in a back yard of one of the homes. I asked him if he could tell me where Mr. Edwards lived.

"No sabe."

Not catching the reply, I looked into his swarthy face, surmounted by a great peaked hat. I repeated my question, thinking I had been misunderstood. Back came the same lingo. I kept saying it over to myself, not knowing what it meant. After a little more wandering I found Mr. Edwards within a stone's throw of the "greaser" with whom I had been talking, and who persisted in hurling at me his "no sabe." Mr. Edwards was busily occupied in the rear of his pretty home when I called. I found him to be a man of pleasing address, and, after I had introduced myself, I related to him my experience with the aforesaid greaser.

"What! that man over there?" pointing.

"Yes," I said.

"Why, he knew perfectly well what you asked, but, like half the Mexicans, rather than give you a civil answer he fired at you the usual 'no sabe,' meaning 'don't understand,' when he did. But if you owed him some money, you would find he could 'sabe' with the rest of us."

All through my western trip, even extending into California, I found it was almost impossible to get a direct answer from many of the Mexicans or greasers. I had the words *no sabe* (no sobby) fired at me so many times that my impression of the average half-breed is that of a man who is suspicious of the Anglo-Saxon, and who prefers to hide under the cover of "no sabe" rather than to extend an accommodation.

Lest I may give offense to some very worthy and excellent Spaniards and Mexicans I met, I would say I do not mean to include them in the term "greaser" and "no sabe" people. Well, to return:

I pulled out my largest camera and took a picture of Mr. Edwards, and here reproduce it the size I took it. He is indeed the bee-

assistance or start; for when one expects to go into the bee business, about the first thing he is told to do is to go and see Edwards; and Mr. Edwards is one of those broad-hearted, kindly faced men who will give his neighbor intelligent and satisfactory answers to his questions even though that information may be the means of bringing on to his territory a

D. M. EDWARDS, ONE OF THE PIONEERS OF UVALDE BEE PARADISE.

king of the whole county—one of the pioneers. He handles bee-keepers' supplies, and is one of that kind of men who can stand up and answer questions by the hour. As nearly as I can learn of some of his friends, nearly every bee-man in the county has either come in contact with him or received some sort of

bee keeper who will come in and divide the profits of his bee-range; and right in this connection I would say that one of the bee-paradises—this one in Uvalde Co., is pretty well overstocked with bees now. I do not think there is a single spot in the whole county that does not have all the bees it can possibly sup-

port, and more too. When I referred to a bee-paradise in an editorial, recently, I not only included Uvalde Co. but some of the adjoining ones, and some in New Mexico; and hence when I wrote on the train, riding as I was through New Mexico, that there were not enough bees to gather all the honey, I did not have in mind Uvalde Co., which I knew perfectly well was fearfully overstocked. But Mr. Geo. F. Robbins, who has been in the vicinity, got the impression that I referred to that alone, and enters, and justly so, a vigorous protest against the sentence as it stands. As he has some other things in this connection, I publish this letter just as he gives it.

I am prompted to write these lines much from personal desire, but partly by Huber Root, with whom I had some talks at Buffalo. The cause is some statements made by Ernest in June 15th GLEANINGS, pp. 520 and 523. I assume that the notes pertaining to the bee-keepers' paradise and to Uvalde County both refer to the latter region. I agree with him that this is a wonderful honey country. I don't think any other tract in the world, 40 miles square, will support so many bees and bee-keepers, and send out so much honey. In June, 1900, I was told at the station that they were then shipping nearly 5000 lbs. of honey per day. That was no small thing, even for a station that is the shipping point for a radius of 25 miles in every direction except east. I can go with Ernest nearly all the way; but when he says "there are not bees enough to gather the honey," I halt. Against such teaching I, as one who lives in one of the best tracts of this land of bees and honey, must enter an earnest protest. I say it is overstocked; and I think I can safely challenge you to consult the bee-keepers of Uvalde Co. and see if the majority of them do not sustain me.

Last fall a bee-keeper near Uvalde asked me what I would take for a location we have in Nueces Co., some 20 miles northwest, saying he wanted to put an apiary there, but didn't want to intrude on others' territory. I told him I would rather he would keep out. He did, and distributed some bees he had bought among his three apiaries, I suppose because he couldn't do any better. I firmly believe the small crop of himself and his neighbors this year is largely due to the crowded condition of his range.

Last spring I tried to rent a certain location of a cattle-man. I could not get it, but he offered me a less desirable one for \$50.00 per year. He thought he could get that, for six or eight men had tried to rent bee locations of him that winter (I don't think he rented it). I could give several other instances to show that there is a perpetual scramble for bee territory.

Some five years ago Mr. Edwards told Mr. Flanagan that all the good available locations were even then taken up. I know of quite a number of apiaries that have been crowded in since then.

I want to refer to two other statements in the notes before referred to. You say, "The average is high, and there is a crop every season." There was a period some years ago when that seemed to be the case. That is what started so many in the business. But, taking the last five years as a basis, not many bee-keepers here would say that. A case of 120 lbs. I believe, generally considered a good crop. This means "chuck" or comb honey in cans about 25 to 33 per cent of which, in fact, is extracted. There is often considerable variation in tracts a few miles apart. This year, for example, on the upper Nueces, from a point about 12 miles from Uvalde, the crop has been much better than in any other part of the county so far as I have heard. Taking the county at large there has been little if any over half a crop gathered in the last five years, while in 1899 failure was almost general and complete.

The third statement I question is that to the effect that a honey-flow will stop swarming. I do not directly dispute it, but I do say the broad assertion that bees will, at the advent of the surplus season, destroy cells, kill off drones, and settle down to ho-ex-ting, needs qualification. It doesn't always prove true. As Hutchinson says in a late number of the *Review*, the idea that a copious honey-flow has a tendency to check swarming is not particularly new. Do little said something to that effect some years ago. These conditions for some weeks preceding the surplus season are just such as to promote swarming, and I can

readily believe that a very rapid ingathering of honey may have the effect claimed for it. I know it has not happened since I have been here, but I think, from what old bee-men here say, I have not seen one of their old time overflows from guajilla. The season of 1900 was noted here for excessive swarming and I greatly hoped that the surplus flow would stop it as I had been told it would. You can see I was much disappointed when my bees, working in sections, some of which I had divided some time before started on a round of swarming. This year there was but little swarming but I had almost as much of it during the early half of the season as I had before that time. One bee-keeper I know had swarming all through the season. I say, then, that, while I am not prepared to dispute the doctrine, I question, and am predisposed to accept it. I have never seen such a thing happen, and am certain such teaching can not always be relied upon.

Uvalde, Tex.

GEO. F. ROBBINS.

I have already answered that point in regard to overstocking Uvalde Co. While I see that the sentence in question on page 520 might be construed, and naturally, as applying to Uvalde Co., yet, riding as I was through New Mexico, and seeing just the kind of honey-plants and honey-trees that made Uvalde Co. a veritable paradise, in the other counties where there were no bees, I wrote the sentence having in mind the counties through which I was going. With this explanation I hope our friends in Uvalde will not feel that I was trying to flood their bee-ranges with more bees when they already have more than they can use to advantage.

With regard to the swarming before the honey flow, and its stopping afterward, I can only say that Mr. Edwards has been one of the pioneer bee-keepers of the county, and I believe he is more familiar with average conditions as they prevail than any other man in it. Mr. Udo Toepferwein, of Leon Springs, Tex., and Mr. G. F. Davidson, of Fairview, Texas, who I have just seen at Buffalo, both support the statement of Mr. Edwards; and they seemed surprised that any one should question it. Of course, they may not do this every season; but they said I might state positively that, in the beginning of a heavy honey-flow, swarming not only ceased, but that there would be a killing-off of the drones and a destruction of the cells; at least this was true of their respective localities.

My remark, however, to the effect that bees stop swarming, and destroy cells, etc., on the approach of the main honey-flow, was, perhaps, too general; but I intended to speak of the average conditions as I understood them from Mr. Edwards. At all events, I found that it is a peculiarity of the bees of the West that, on the approach of the main honey-flow, swarming either diminishes to a very appreciable extent or stops altogether. This is particularly so in Maricopa Co., Arizona, which I visited, and to a very great extent it is true of the southern counties of California, as well as of a few of the north-central. I also ran across the same peculiarity in the western part of Colorado. I have known, of course, that a heavy honey-flow has a tendency to check swarming even in the East but not to such a marked degree as in the West.

In our next issue I will tell something about the honey-plants and some of the peculiarities

of soil and climate of Uvalde Co. At that time I will give pictures of some of the celebrated honey-plants which, without irrigation, and on lands that are too dry to grow any thing else, yield such immense quantities of fine beautiful honey. These will show why some of the western counties of Texas are veritable bee paradises.

IS IT A CASE OF LOCALITY?

"Here I am from 'over the border' to have a little talk with you in regard to a part of what you told Mr. Brown in July 15th GLEANINGS, page 596, near the bottom of the second column. There you tell how you take combs of brood, together with the queen and one frame of bees from a nucleus, and, by setting the same on the stand of a populous colony which has not swarmed, make a colony ready to go into the sections in a few days, from this brood, frame of bees, and the queen, together with the returning field bees from the moved colony. Is this right?"

"That is the way I intended."

"How many colonies did you ever make that way?"

"I do not think I can tell the exact number, but probably 150 to 200, as I used the plan quite largely each year (during the week before the blooming of basswood) before I went into queen-rearing, and have used it several times since then."

"But are not the bees disconcerted by this mode of treatment?"

"Yes, to a considerable extent for an hour or so, but soon become accustomed to the changed state of affairs, very much as they do when a weaker colony is exchanged with a stronger, so that both may be benefited by the exchange. Those who have practiced strengthening weak colonies in this way know that there is considerable commotion in front of the hive for an hour or so, caused by the bees coming out of the hive and returning several times to see if they have not made a mistake as to entering the wrong hive. But after a little they make up their minds, apparently, that it is all right, and soon go to work the same as if no exchange of hives had been made."

"But don't you find that the returning bees from the moved colony kill all or nearly all of the bees you took from the nucleus?"

"No, I have never been troubled in that way, nor did I suppose others had been. Do you have bees killed when working that way?"

"Yes, they always kill the majority of the bees I put in the hive in this way."

"Well, this is news to me. We have been told for nearly half a century that laden bees, returning from the fields, will not quarrel with any thing, and I have always so found it. I

am well aware that where you undertake to run a swarm into a colony, either large or small, where no precautions are taken, that there will be a terrible slaughter of bees; but I never had such an experience where the bees returned singly, or individually, as it were, and especially where each bee is laden with provisions which it has collected from the fields. Which party is it that does the killing, in your opinion?"

"I calculate, as I hinted at in my last reply, that the bees from the removed colony kill the majority of those set in the hive from the nucleus."

"If you have bees killed in this way, and I do not dispute your word, it is something entirely new to me; for in all cases of quarrelling which have come under my observation (and I have had scores of such cases), it has always been the bees inside of the hive, or those composing the colony, which have caught, stung, and killed those trying to enter—not those entering killing those inside. In one instance a little colony of less than a quart of bees killed a large swarm which I tried to run into it, and I knew which did the killing from the little colony being composed of Italian bees, while the swarm was composed of black bees. After the struggle was over, the ground in front of the hive was two or three inches deep with dead black bees, with scarcely a dead Italian bee to be found."

"But they not only kill the bees, but (with me) the queen as well; or, if she is not killed, she 'takes to her heels and is gone.'"

"This is fully as strange as the bees being killed. When I first tried the plan I was afraid they would kill the queen; and so I caged her for a few days, when she was released; but I finally became more bold, working on the plan 'that with a general mixing of bees the queen is safe,' and never lost a queen except in one or two instances, which I could account for in some other way. I really do not know how to account for our different experiences unless 'locality' will so account. It is possible that, if the plan was tried at a time when robbers were plentiful there would be a general fight, and then the queen would probably be killed; but no one should attempt the multiplication of colonies at a time when nothing was coming in from the fields, for at such times the bees do not undertake such a thing themselves."

"I had not thought of locality making a difference. Perhaps it would, but I doubt it. Then you say colonies made as you advise are 'ready to go into the sections in a very few days.' I never, in one instance, have succeeded in getting one pound of section honey that way; for without a laying queen bees will not make section honey, or at most but very little."

"Of course, if in your locality the bees and queen are killed, the plan is not one which you should adopt, nor do I advise any to adopt any new plan, only on the most limited scale, till they have proven it will work with them; and I here and now caution you to go slow on all plans which you have never tried, especially so on a plan which is under dispute. And the caution which I would give you, I would

give to all had I their ears at this time so I could tell them. But it would not be in accord with the knowledge of such men as P. H. Elwood, Capt. Hetherington, and other practical bee-keepers of Eastern New York, to say that no section honey, or very little at most, could be secured by colonies not having laying queens, for these parties have secured tons and carloads of comb honey in just that way—that is, by having the honey stored in sections while the colonies have no laying queen. I do not recommend such a plan, for with me better success is obtained where the colonies have laying queens; but I know these gentlemen have eminent success in their locality in this way. But I have a batch of queen-cells from which the queens are just ready to emerge, and I must attend to them. But before going allow me to suggest that you try making *just one colony* by the plan given, an hour or so before sundown, next year, and see if it will not work, even in your locality. By so doing not nearly so great a force of the field bees from the old or removed colony would be thrown with the combs of brood and queen on the first day.

TOO MUCH BROOD IN AUGUST; WHAT TO DO.

I wish you would tell me what to do with my bees. They are getting just enough to make them rear brood. The frames are crowded full, and no place for the honey, if there were a surplus. I am afraid they won't get enough for winter; if I could take the queens away for a week they would fill the hives; but it is a lot of work. I never saw so many bees raised before at this time of year. If you can suggest a remedy I wish you would, for I am "stumped."

JAS. HILBERT.

Bingham, Mich., Aug. 28.

[I would not stop the queens' laying if I could as well as not. Let them fill up the brood and get a good ready for winter. If you have plenty of bees I think you will get fall pasture. If you do not, then I would feed them sugar to winter over. When you get more bees than you want, they ought to sell at a good profit. If nobody around you wants bees, advertise them next spring. With your bee cellar I think you can winter them with little chance of loss, especially if they are rearing lots of brood from now on. Make your colonies all very strong when they go into winter, and you need not lose more than one or two in a hundred. If the bees get the brood-nest so full that there is really no room for storing honey, I would let them into the upper story or take out some combs of brood and swap them with some other hive for an empty comb. You can probably do this for quite a while without opening up the upper stories for room at this season of the year.—Ed.]

THE DIFFERENCE BETWEEN COLONIES.

Mr. Root:—I have just been out among the bees and I find some stands that were given sections filled with foundation and baits early in the season, that have not put up one pound of honey. Adjoining them are other stands that have been worked for extracted honey, that have given me over 200 pounds this season. Now, I do not claim that these are average colonies; on the contrary they are the exception, but show that, while some bees will put up a large amount of surplus, others will produce nothing. My comb honey has come from the strongest swarms. The quantity produced is so small in comparison with what other swarms have given of extracted honey that there is no comparison in profits, hence I claim that with me 5 cts. for extracted honey is more profitable than 25 for comb, and there is all the difference between nothing with a colony of sluggards to 200 pounds and over with a strong colony of rustlers.

E. H. SCHAEFFLE.

Murphys, Cal., Aug. 20.

[This is in reply to the statement that Mr. Schaeffle had exaggerated the possible differences between two colonies.—Ed.]

"THE EX LIGHTNING OPERATOR."

I am surprised to see such a statement in your columns, and am sure that you owe the "lightning operator" an apology at once, and especially so to show to your readers what doctors are, even if they do have government handles in front of the "Dr." Mr. Howe's health is now as good as ever, and has been since last October. He is now caring for about 1000 colonies of bees. In fact, he is still the same old lightning operator that he used to be, and I can tell you that he is a hummer for a little man just in his thirties. If you don't think so, come down and run with him some; and if you are not "lightning" you will wish you were somewhere else.

W. W. SOMERFORD.

Caimito, Cuba, Aug. 11.

[Mr. Somerford refers to a statement over the signature of Harry Howe, published a few weeks ago, to the effect that he was suffering from heart trouble, and was under the care of a U. S. Army Surgeon in the General Hospital. This item came to me through the general avenues of our office, and, not noticing the date, I supposed it was fresh news, and published it. But the fact was, the letter, evidently a "stray," was a year old, and now Mr. Howe writes that he is fully recovered, and says the "joke is on me." I have no apology to make beyond the foregoing statement, and, on the other hand, I wish to congratulate Mr. Howe on his speedy recovery and return to good health.—Ed.]

GETTING COMBS BUILT DOWN TO BOTTOM-BAR ON HORIZONTAL WIRING.

Referring to Dr. Miller's Straw, page 625, and your comment, I wire horizontally, and have no difficulty in getting Hoffman frames,

either wired or unwired, built down to the bottom bar, by using them in eight-frame hives as second stories. Although I have several queens more than three years old, and the hives imperfectly shaded, I have had no swarms for several years by tiering them 3½ stories high. When using 1½-story hives, bees would frequently swarm before occupying a super, although the hives were properly shaded.

J. C. DETWILER.

W. Washington, Pa., Aug. 6.

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. I. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Champaign, N. Y.; J. M. Hambruch, Escondido, Cal.; C. P. Dadant, Hamilton, Ill.; G. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

QUITE a string of letters are coming in, inquiring about some of the localities I have visited; and it is evident that some, for financial reasons, and others for health, expect to move into localities which they hope will favor the pocketbook as well as the ailing body. It is almost impossible to give full or satisfactory information by letter; and if our friends will only wait I will try to cover the ground thoroughly, and at the same time give many illustrations. But no one should think of removing to some of these good localities without first finding whether they are already occupied. I think I can give that information along the line of my travels.

A MODIFIED PLAN OF RETURNING SWARMS TO THE PARENT STANDS.

OUR neighbor, Vernon Burt, has succeeded as usual in getting a good crop of honey. He returns all the swarms to the parent stand, giving the swarm a hive of empty combs, then putting the super from the old hive on top of the new one. If the weather is warm, he shakes or brushes *all* the bees off the combs of the parent hive, and then moves it to another location. Hatching brood will usually come out in time to take care of the young brood. In this way he gives the swarm all the strength it originally possessed; and by so doing he finds he gets the best working force possible. This plan is a combination of the return-swarm plan and of the Stachelhausen brush-swarm idea. But he says he is always careful to see there is hatching brood to make sure that the unsealed brood will not starve. He takes the further precaution of brushing only during hot weather. Of course, during the swarming season

there will be no robbing, and no fear need be entertained from that source.

The Root Co. bought Mr. Burt's entire crop of honey. It was in plain sections, 4×5.

SHALLOW FRAMES FOR COMB HONEY.

THE tendency among expert bee-keepers is toward a shallower frame than the standard Langstroth. Some others prefer the Langstroth because it has always given good results. But the other class consider that the frame given us by the father of American bee-keeping is a little too deep. They desire a frame just shallow enough so that there will be no honey, or very little at least, stored in the brood-nest. Said Mr. Vernon Burt, "With my shallow frames I often have no more honey in them than the size of a silver dollar; and I estimate that, if my colonies had all been in the shallow hive, I should have secured 30 lbs. more per colony." This is a strong statement, but Mr. Burt says he is ready to verify it by showing the piles of honey that have come off the shallow frames and the amounts that have come off the deeper ones. While he does not claim the bees would store any more honey in one hive than in another, if we *include both the super and the brood nest*, yet he says that, instead of there being from 25 to 30 lbs. of honey left in the brood-nest, which he does not want there, that amount all goes into the supers where he does want it, and where he can command the very best market price obtainable. When I asked Mr. Burt if it was not desirable to have honey in the brood-nest, he said it was not, according to his practice. "I prefer," he said, "to sell my honey, what I do get, at 12 and 15 cts., and then buy syrup at 3 or 4 cts.; and I not only make a good trade, but I give the bees a much better feed. While good honey does very well most winters, yet there are occasional ones when the syrup-fed colonies come out much better. No, sir," said he, very emphatically, "I do not want any honey in the brood-nest in late summer. I prefer to feed sugar syrup, for then I *know* my bees have the very best food for winter."

PRICES ON CALIFORNIA HONEY.

THERE seems to be a combination of forces at work in Southern California, probably inspired by the buyers, to create the impression that there have been 500 or 600 carloads of honey produced in the southern counties. First it was 400, next 500 cars; and if this rate of exaggeration continues, it will be up to 1000. If there are 200 or 300 in sight the Root Co. would like to know where. When I went through the territory I visited some of the largest producers; and I also secured reports from them of other producers. A large portion of the crop had already been secured, and it was then known about how much each man would have. We have taken some little pains to make an investigation. Ventura County, one of the best if not *the* best, shows up so far, counting up the big producers, only about 245 tons. If we estimate 12 tons to the car, that would make only about 20 carloads

for Ventura; and at this rate we could scarcely scare up 140 carloads for *all* the southern counties. We already have men in the field who are looking this matter up, and we expect to get further reports.

As to Northern California, the best advices seem to indicate that the crop is going to be somewhat light; so, taking it all in all, prices for the whole State should advance rather than go down. I would advise the large producers, at least, to hold over unless they can sell at a figure that is somewhere within reason.

The bee-keepers of California have had three or four poor seasons in succession; and now when they do get a little honey it would be too bad for them to sell that little at a low figure, because, forsooth, there has, according to the buyers, been a "big crop." If there had been the *bees* in Southern California that there have been in times past, when the years were good, possibly the figures would reach 300 to 400 carloads; but the fact is, as I have stated in previous issues of this journal, the small producers became discouraged during the poor years, and either sold their bees or allowed them to die.

Perhaps the question may be raised right here, "What do you consider a reasonable figure for California white sage?" We of the Root Co. do not think it is wise for us to name any definite amount; for the large producers know what honey they have in sight, and know best about what they can afford to let it go for. All we can say to them is, "Do not let the buyers hoodwink you by big tales of 500 cars."

PRIORITY RIGHTS OF BEE-RANGES.

SOME years ago we used to hear a good deal about "priority rights" in bee ranges. For many years bee-keepers have been encroaching on each other's boundary; and as they continue to encroach, the individual yields per colony are cut down proportionately. The problem is being solved in many localities by the bee-keeper buying or leasing the bee-range. This is more feasible in the West, where one person or one stock company may own a square mile or several of them. The man who will pay the highest for the bee-range for a period of years is the man who will get the exclusive right for that range for his bees. I could name over a number of men who actually control by lease the bee-range for several square miles. Some pay as much as \$50 a mile per season; some get it for much less, depending on the value of the honey flora under consideration.

It is coming to pass, then, that the ranchers of the West are learning that in their vast acres, besides the growth they get from the soil direct, there is an indirect and new property right which they can sell at so much per square mile.

A few of the pioneer bee-keepers have been quick to appreciate the fact that they can lease the range and keep out others from dividing the profits; and I am glad to give a hint to many of our friends. Sometimes the rancher does not know there is much value in the way

of honey, and so he will sell a bee-range of a square mile for an insignificant sum. To have a man come and offer him \$25 for something he never considered of any value to him is somewhat of a surprise, and so much clean cash, and he will sign a contract instantler, offering to sell the range, or lease it for a period of ten years at \$25 a year. Sometimes he will sell for much less than that. But the bee-keeper is fortunate if he can be the *first* man to make the application. If half a dozen fellows get to bidding on a range, there is no telling where the price will go. So take my advice, and bid first.

I have assumed all along that a rancher has a right to lease his range to a bee-man, just as he can lease or rent cow pasturage; and where such property right is acknowledged, and a purchase is made, the laws in our several States are bound to respect them.

But to buy a bee-range in the East would be quite another matter, as one might have to buy out fifty or a hundred farmers. One would have to buy the whole of them; for if *one* of them stood out this one might put just enough bees in his little spot that he would not sell, to cut the profits right in two. In the great West the conditions are quite different. If one man does not own half a square mile, there may be several that own that amount; and even if one paid each of them \$5 apiece, he would get just the range he desires.

A SUCCESSFUL PLAN OF HAVING QUEENS FERTILIZED IN AN UPPER STORY.

OUR Mr. Wardell, the man who has charge of our 700 colonies, has evolved a system of having queens fertilized in upper stories, that is a perfect success. I do not speak of it because it may be new, but because it gives excellent results. He tried it to some extent last year, and now, after having tested it most thoroughly the *whole season* with scarcely a failure, we are pleased to recommend it. By his plan he succeeds in getting three queens fertilized in one upper story at a time; that is to say, there may be three virgins, all of which will be fertilized within the usual time. The method is this:

He takes an ordinary Langstroth upper story, and divides it off lengthwise into three bee-tight compartments of equal size. On the under side of this story and a bee space below the frames he tacks a sheet of wire cloth. The partitions comes in contact with wire cloth at the bottom, and the cover at the top thus making each little room separate and bee-tight. On two sides and one end are entrances, one entrance communicating with each compartment.

This super, as constructed, is now put on over a strong colony, wire cloth down next to the bees. Into each of the compartments he puts two frames of bees, brood, and honey. He then inserts a queen-cell or lets run into each a virgin queen. The cover is put on, and the bees are left to their own devices. He now has practically three two frame nuclei, each one with a cell or virgin queen right over a strong colony, the only separation being the

wire cloth. And right here is the feature that makes it a success: The old methods have used perforated zinc, while Mr. Wardell uses wire cloth. Now for results:

These young queens fly out from the entrances from the upper story, come back and are fertilized. If cool weather comes on it does not make any difference, because there is a large amount of heat from the cluster of bees below that rises up through the wire cloth.

The great feature in favor of this method is that, in the fall, or at the close of the season, when it is desired to unite the bees, and the young queens have all been sold from the upper story, all one has to do is to remove the wire cloth from the two stories, and let the bees run together. They all have the same scent, and there is no fighting.

This scheme has also another advantage. It economizes room in the yard, and brings the nuclei up to a nice height for the apiarist to work. We also make one colony do the work of three nuclei; and if honey is coming in, the colony can store just the same; but, of course, the frames of honey would have to be removed as fast as filled with honey. If one of the nuclei runs short of brood, all that is necessary is to remove the upper story for a minute or two, take out the empty comb from the nucleus, and substitute it for a frame of brood from the colony below. Set this, bees and all, into the nucleus, replace the upper story, and all will go on as before. There will be no fighting, because, understand, the bees are all of the same scent.

THE TRUTH ABOUT BEET AND CANE SUGAR,

SINCE printing the article by W. K. Morrison, page 672, I have received two communications—one from the youngest member of the firm, Huber H. Root, who is looking after our exhibit at the Pan-American. Under date of Sept. 2 he writes:

In reading over the article on beet sugar in Aug. 15th GLEANINGS I noticed some things I didn't believe; but thinking that perhaps I didn't know much about it I asked the beet-sugar man to give his opinion of it, and, if he wanted to, to write an article in reply, which he did. You may think that he, being interested in the beet sugar industry, would not be able to give impartial statements; but Mr. Hershiser and I both know him to be a man who would state the exact truth, and, at any rate, there would be no ax for him to grind, because bee-keepers as a rule do not know what the source of the sugar is which they buy. Ernest, in his footnote, says he was told that the canneries prefer cane sugar to beet, because the cane has a higher sweetening power. Now, I have taken the trouble to question some men, grocers, etc. who have used both; and when they say that beet sugar is not as sweet, they also generally say that it also has an unpleasant odor. This lets out the fact that they have, because cheaper, bought that which was not as highly refined as it is when bought as granulated sugar. Unrefined beet sugar has a bad odor, because I smelled it myself. Refined has none. In places where the refined has been used, no one can tell the difference.

Mr. Gilmore is a chemist, as you see by his article, and he knows what he is talking about.

We may find two things that have the same chemical formula are different such as the diamond and charcoal, but do we ever see two substances which have the same chemical formula and also the same physical characteristics which were not the same?

HUBER.

The letter referred to by Huber is one by Melvin R. Gilmore, who, it appears, is in position to know something about this whole question of sugar. He writes:

A STATEMENT FROM COMPETENT AUTHORITY.

Mr. Huber Root called my attention to an article published in GLEANINGS, AUGUST 15, and asked me to read it and give my opinion of some of its statements. The writer, W. K. Morrison, seems to think that sugar made from cane is better than that made from beets. I do not know how he or any one can know when he gets granulated sugar whether it's made from cane or beet. Of course, if he sees the name of a sugar-factory of Nebraska, Colorado, or Michigan, on the sack in which it comes, he knows that he has beet sugar, but otherwise there is no way of knowing, for, even though it be from the refineries of Havemeyer or Arbuckle, it may be from either source, for these refineries handle raw beet sugar from Germany, Belgium, Holland, France, Austria, and Russia, as well as raw cane sugar from Java and the Indies.

One of the statements of the writer is that cane sugar is sweeter than beet sugar, "just as Jersey milk is richer than Holstein milk, and for this reason alone it commands a higher price." In the first place, I will say that cane sugar does not command a higher price than beet sugar; for in determining the price of sugar there is no question of its source but of its quality. In the next place, I will say that the sweetness of sugar, from whatever source, depends on its polarization of purity of sugar. As the chemical formula of sugar from both sources is the same ($C_{12}H_{22}O_{11}$), and their physical characteristics are both the same, it results that neither one nor the other can be said to be sweeter. The simile can not hold for the reason that, while sugar is a fixed chemical compound of so many atoms of carbon, hydrogen, and oxygen, with certain physical characteristics resulting from the atoms of the molecule uniting in a certain way, milk, on the other hand, is a variable physical combination of many chemical compounds; and while the slightest variation in the component parts of the molecule of sugar would make it other than sugar, there can be a great variation in the composition of milk and it would still be milk. It might contain more or less water, more or less casein, more or less fat, etc., and yet it is milk.

The writer of the article claims that Dr. Wiley says that beet sugar is cane sugar and cane sugar is beet sugar. I do not think that Dr. Wiley could say that. He might say that they are identical, or that beet sugar is cane sugar, but not that cane sugar is beet sugar, for the reason that "cane sugar" is the common name of the article which is chemically known as "sucrose," just as "grape sugar" is the common name of the article chemically known as "glucose." The name "cane sugar" was given at a time when the only known source was cane; but since then it has been found in other grasses besides the cane, and in a number of roots, as the carrot, parsnip, turnip, and notably in the beet. The writer of the article further states that, by the "same process of reasoning, saccharin, which is 500 times sweeter than ordinary sugar, ought to be cane sugar also, but it is not." I should say it is not! Saccharin is not a sugar at all having none of the characteristics of sugar except that in a dilute form it gives a sensation of sweetness to the tongue, while in concentrated form it would be very bitter, and it is in no sense a food, as is sugar. I do not know what he means by "the same process of reasoning," but certainly no process of reasoning could class saccharin as sugar.

MELVIN R. GILMORE.

Supt. of Exhibit of the American Beet Sugar Association at the Pan-American Exposition, Buffalo, N. Y., Aug. 31.

I will reiterate what I have repeatedly said in these columns, that beet sugar, such as we have used for the last 20 years for feeding our bees, has been eminently satisfactory.

I will write to the parties who told me that the canners on the Pacific coast will use nothing but cane sugar, which they allege is sweeter, and ask for further information. Possibly these same canners are using beet sugar of a fine quality when they supposed they were using cane.

A few days ago a particular friend of mine handed me a tract, and said he wished I would read it and hand it back to him. I read it with much interest and attention. In fact, after reading it once I went back and read it all over again. Then I got to talking with my friends and acquaintances about it, and happened to mention it to Mr. Calvert, my son-in-law, and he exclaimed, laughing at the same time, "Why, Mr. Root, you do not even seem to know that you are contributing to the support of that very institution; that the man has been here, and that you have had a talk with him; and that you two got to be fast friends in just a little while; and now you don't seem to know any thing about it at all." Our stenographer suggests right here that this is a remarkable instance of doing good with the "left hand" and not letting the "right hand" know it. But there is no great credit due me; for in this busy life of mine, so full of first one thing and then another, I often find myself, when night comes, utterly forgetful of something I was greatly taken up with and full of enthusiasm in the morning. Now, here is the little tract that took such a hold on me. The letter from the young infidel is strikingly like quite a number that have come to me. In fact, I have given some of them in the pages of GLEANINGS. You will notice they seem to have a set of phrases that are passed around from one to the other. The infidel letter was written, as you will notice, over six years ago. We trust and hope the brother has accepted friend Johnson's offer, and come out of darkness into light. Let us now consider the tract:

A REPLY TO A YOUNG INFIDEL, OR HOW I BUILT AND HOW I RUN THE SCHOOL OF THE EVANGELISTS

Eskridge, Kan. Jan. 2, 1895

Ashley S. Johnson:—I take pleasure to answer your letter that came to hand a few days ago. Can say this, that the books are all sold and the parties that have the books have never paid me, and, further, I went away directly after I let them have them and just got back on a few days' visit. Will return again in a few days. Now as to the payment of them, I will do so as soon as I can get the money to spare. When away I was sick for seven months, and that is the reason I have never written. I never received your letter until I came home. You seem to be of a different motive from some Christians. I have examined into all the phenomina of nature, and can clearly see by the things of nature by which I am surrounded and have found, that there is not the slightest evidence to prove the existence of God. Religion is a perfect fraud except to the extent of the morality that it teaches. It debas and has hindered all progress of thought and science. We can't go to religion and find any such thing as science. Religion never has produced one fact. I defy you to prove the things by which it is said God has done to be done in the length of time it was said to be done. Now write me, and I challenge you to take up my argument by letter or any other means. I should like to know by what method you were called, and where was that all-wise Being, as you claimed, when he called for you? What is he putting in his time at now? Why doesn't God call the science men as well as the little bull-headed nigger and the dull and ignorant men? It seems that he calls them instead. So I close for this time. Hoping to receive a reply,

D. A. RAMSOUR.

In reply to the above, Mr. Johnson sent the following to his friend. We hope it will receive careful consideration.

Kimberlin Heights, Tenn., Jan 7, 1895.

My dear Young Friend:—It grieves me beyond expression to read your letter; but as you so earnestly request it, I shall suggest some things in rebuttal of your ideas. In the first place, I think your claims just a little extravagant. You say: "I have examined into all the phenomina [no such word in the language] of nature." My son, "all" is a stupendous thing. Have you not overestimated your attainments somewhat? Sir Isaac Newton, who must have given fully as much thought to the physical worlds as you have, compared himself to a little child picking up here and there a pebble or a shell on the shore, while the great ocean of natural wonders stretched away before him! This must be my first answer to your letter. I now lay down a proposition which I have demonstrated in my own heart and before the world to be true: *God is; he is a living God; Jesus Christ is his Son and my Savior; the Bible is true, and our God hears and answers prayer.* Now to the proof. Did you ever read the Bible through? Did you ever count its promises? If not, let me assure you that it is claimed, and I doubt it not, that it contains twenty thousand promises to the man who leads a pure life and obeys his Maker in all things. How many of these promises have you personally put to the test? Half of them, one thousand of them, one hundred of them, ten of them, any of them? If not, you have no right to say that they are not true. I quote twenty-four of them. I insist that you can determine their truthfulness beyond doubt:

1. O taste and see that the Lord is good; blessed is the man that trusteth in him (Ps. 34:8).

2. Mark the perfect man, and behold the upright; for the end of man is peace (Ps. 37:37).

3. He healeth the broken in heart, and bindeth up their wounds (Ps. 147:3).

4. Trust in the Lord with all thine heart; and lean not unto thine own understanding. In all thy ways acknowledge him, and he shall direct thy paths (Prov. 3:5, 6).

5. There is that scattereth, and yet increaseth; and there is that withholdeth more than he meet, but it tendeth to poverty. The liberal soul shall be made fat; and he that watereth shall be watered also himself. He that withholdeth corn, the people shall curse him; but blessing shall be upon the head of him that selleth it. He that diligently seeketh good procureth favor; but he that seeketh mischief, it shall come unto him. He that trusteth in riches shall fall; but the righteous shall flourish as a branch. He that troubleth his own house shall inherit the wind; and the fool shall be servant to the wise of heart. The fruit of the righteous is a tree of life; and he that winneth souls is wise. Behold, the righteous shall be recompensed in the earth: much more the wicked and the sinner (Prov. 11:24-31).

6. If ye be willing and obedient, ye shall eat the good of the land; but if ye refuse, and rebel, ye shall be devoured with the sword; for the mouth of the Lord hath spoken it (Isa. 1:19, 20).

7. Bring ye all the tithes unto the storehouse, that there may be meat in mine house, and prove me now herewith, saith the Lord of hosts, if I will not open you the windows of heaven, and pour you out a blessing, that there shall not be room enough to receive it (Mal. 3:10).

8. Blessed are they which do hunger and thirst after righteousness: for they shall be filled (Matt. 5:6).

9. But thou, when thou prayest, enter into thy closet; and when thou hast shut thy door, pray to thy Father which is in secret; and thy Father which seeth in secret shall reward thee openly (Matt. 6:6).

10. But seek ye first the kingdom of God and his righteousness; and all these things shall be added unto you (Matt. 6:33).

11. Ask, and it shall be given you; seek, and ye shall find; knock, and it shall be opened unto you; for every one that asketh receiveth; and he that knocketh shall be opened. Or what man is there of you, whom if his son ask bread, will he give him a stone? Or if he ask a fish, will he give him a serpent? If ye then, being evil, know how to give good gifts unto your children, how much more shall your Father which is in heaven give good things to them that ask him (Matt. 7:7-11)?

12. And all things whatsoever ye shall ask in prayer, believing, ye shall receive (Matt. 21:22).

13. Therefore I say unto you, What things soever ye

desire, when ye pray, believe that ye receive them, and ye shall receive them (Mark 11:24).

14. Jesus answered them, and said My doctrine is not mine, but his that sent me. If any man will do his will, he shall know of the doctrine whether it be of God, or whether I speak of myself (John 7:16-17).

15. He that hath my commandments, and keepeth them, he it is that loveth me; and he that loveth me shall be loved of my Father, and I will love him, and will manifest myself to him (John 14:21).

16. He that spared not his own Son, but delivered him up for us all, how shall he not with him also freely give us all things (Rom. 8:32)?

17. For ye know the grace of our Lord Jesus Christ, that, though he was rich, yet for your sakes he became poor, that ye through his poverty might be rich (II. Cor. 8:9).

18. He which sows sparingly shall reap also sparingly; and he which sows bountifully shall reap also bountifully. Every man according as he purposeth in his heart, so let him give; not grudgingly, or of necessity; for God loveth a cheerful giver. And God is able to make all grace abound toward you; that ye, always having all sufficiency in all things, may abound to every good work. * * * being enriched in every thing to all bountifulness, which causeth through us thanksgiving to God (II. Cor. 9:6-11).

19. Hereby we do know that we know him, if we keep his commandments (I. John 2:3).

20. Beloved, if our hearts condemn us not, then have we confidence toward God; and whatsoever we ask, we receive of him, because we keep his commandments, and do those things that are pleasing in his sight (I. John 3:21, 22).

21. if any man serve me, let him follow me; and where I am, there shall also my servant be; if any man serve me, him will my Father honor (John 12:26).

22. Give, and it shall be given unto you; good measure, pressed down, and shaken together, and running over, shall men give into your bosom. For with the same measure that ye mete withal it shall be measured to you again (Luke 6:38).

23. But my God shall supply all your need according to his riches in glory by Jesus Christ (Phil. 4:19).

24. For God is not unrighteous to forget your work and labor of love, which ye have showed toward his name, in that ye have ministered to the saints and do minister (Heb. 6:10).

I have given you twenty four promises, about one out of each thousand. I have tried them, and in the love of truth and the fear of God I solemnly declare that they are true, true in every particular. The way is open. You can put these things to the test. You challenge me, but the promises of God challenge you! But probably the fact that I say they are true is no evidence to you; but wait and see what I have to offer. You ask how I was called. It is hard to explain, but my life speaks for itself. About five years ago the conviction fastened itself upon me that I should do something to help the thousands of poor and struggling young men throughout the world who want to prepare themselves to preach the gospel. I had a comfortable home, but I had neither wealthy friends nor money. I wrote to a number of prominent brethren. I remember two of the replies. One came from one of the most influential men at the North, and was almost insulting. The other came from a preacher at the South, and was just as discouraging as he had the ability to make it; but I could not get rid of my conviction of duty. Along about this time an opportunity came to me to buy the farm on which I was reared, and I moved from the city to my place in the country. Time flew. In imagination I built colleges all over the farm. In the reality of the thing however, I met most positive discouragements. My friends, instead of helping me, were disposed to discourage me. However, in the fall of 1892 a brother caught a little of my enthusiasm and voluntarily proposed to invest \$100 in the enterprise. This was a small amount compared with what I was resolved to do, but I launched out simply on such promises as the ones I have submitted to you, and ordered the plans and made a contract for the lumber. The enormity of the contract may be grasped when I tell you that I bought one hundred and seventeen thousand feet of rough lumber from one firm. I found no difficulty in making contracts for every thing needed; although, if the firms had asked me where the money was to come from I could not have told them if my life had been at stake, but I firmly believed it would come. We used in the neighborhood of I think, sixty thousand brick, and nails beyond computation! I employed a foreman, and let me remind you that the third anniversary of moving the first load of lumber is not here. Things moved

very slowly. I asked my brethren to help me. Very little help came. I was learning to trust and pray. In the meantime the saw was flying through the logs, and we were hauling brick and digging out the foundation. Very little money came. I was also learning to wait. Now, while learning this lesson I was learning also to give. I reasoned a little, and came to this conclusion: If I can become unselfish in his work, God will raise up friends to help me. In 1882 I had written a book, and in 1885 another, and in 1892 still another. During all these years I had written for the press; and while my books were well received they had not startled any one. We grew. Mrs. Johnson was taking hold of the promises of God also. Finally, after much thought and discussion, we launched out further from the shore. Under date April 21 1893, I find this record in our diary: "*Commenced to turn all funds into the College fund.*" I now consider this the greatest event in my Christian life. Necessity compelled us to increase our force. Frequently we had nearly twenty men employed, and we paid them from 60 cents to \$2.00 a day. I remember one Saturday night that having "paid off" I had less than 60 cents left! In the meantime, financial distress prevailed everywhere. The largest banks and railroads in the country were going down into hopeless ruin, but we kept the presses flying and the mail laden with books. I got a pasteboard box and put it in my drawer, and I record it with everlasting thanks to God and his people that, to my present recollection, while we have worn out a number of boxes, the box has never been empty, and not a single mail has arrived since April 21, 1893, that did not bring something for the work. I kept no account of what came in. When an order came in I filled it, put the money in the box and paid it out to the first man who presented a bill, and thus it has continued to this day. Since that beginning we have brought from the press seventy-seven thousand books, nearly three thousand a month. Contrast this with the few editions brought out from 1882 to 1892, and ask infidelity to explain the difference. The work here surpasses only the work done by these books, for they are bringing thousands out of darkness into the clearer light of the gospel. With these facts before you, I invite you to take a walk through the building. The tower is eighty-five feet high, and the bell is one of the finest in the State, and to me is indeed a "liberty bell." Come in. We will stand here on the front piazza and look eastward. What a grand landscape! Before us is the beautiful French Broad River, and in the distance the grand old mountains. Walk into the library, and then into the chapel. It is a beautiful room finished in natural pine, seated with chairs; a beautiful chandelier hangs overhead. It will accommodate several hundred persons. Let us go into the dining-room. It is neatly furnished, and will seat exactly one hundred persons. Let us go up stairs and see the boys. Here they are, filling nearly all the (thirty-five rooms in the whole building) rooms. They represent about twenty-five States. I am feeding fully fifty of these boys just as I built the college, by trusting God and his people. Let us go outside. Here are our waterworks. The tank holds eight thousand gallons. If you will look toward the river you will see our new combination cannery, laundry, and pump house. This tank connects with the barn and garden. Let us proceed. This is Industrial Hall. Look at the corner-stone: "*Emma E. Johnson Industrial Hall; and the poor have the gospel preached unto them.*" You will notice that it is nearly completed. What a splendid cellar! We hope to fill it with the products of the farm next fall. Look this building over. It will accommodate about sixty persons. Just as soon as it is done I intend to throw the doors open to poor young preachers everywhere, the only conditions of admission being poverty and piety. You see I am not afraid to trust my God and my brethren. Look at that nice cottage beyond the big oak. That is "India." It is for Brother and Sister Brown, who have spent several years in India, and after two years here they expect to return. I trust in the providence of God you may go with them as a missionary of the cross! Beyond this cottage we expect to build two others, "China" and "Japan." Let us go down to the barn. Yes, it is a big one, 48 x 78, two stories high. We have about forty head of milk cattle. You notice the connection for water. We expect to have every thing needful for man and beast. This is the Lord's work. You must see evidences of it, and he will supply all our needs. Are all these things paid for? Not altogether, but we are paying every week, and we have accounts and resources enough to pay every bill; and if these fail beyond them are the children of God, my brethren, and the everlasting

promise of my Lord and King. Here is a peculiar thing: Can you account for it? When I started this work I sent out a man to beg for it, and I sent out letters and newspaper appeals. Every effort of this kind has failed miserably. However, after we practically put our all into it, money has begun to come from men and women who want to share the blessedness of developing these boys into useful men. Recently a banker drove out into the country and gave a brother \$50 for the work. I had never heard of him, and he is not identified with us so far as I know. Last mail I got a letter from a stranger enclosing \$5.00. I did not ask him for it, but he sent it. Who told him to do it? Now a word about these boys. You observed that most of them are big strong fellows from the farm. They are learning the Bible. They are learning English. They are learning unselfishness. They are learning the dignity and grandeur of labor. They are learning to trust and wait. They are learning that the Christian religion is spelled out in thorns and groans and sweat and utter self-forgetfulness. I believe I could find sixty men in the building at this moment who would, if ready to graduate, go out into the benighted regions of the earth and preach to the poor, without a guaranteed salary from any one. Can you find sixty infidels who are willing to go out and deny themselves the endearments of home and the blessings of the Christian civilization they affect to despise, and proclaim the glories and blessedness of unbelief? You can not find one! "By their fruits ye shall know them." You can fling your doubts at the Bible; you can deny the divinity of Jesus of Nazareth; but there stands the School of the Evangelists, and in it young men from all parts of the country, who are learning the way of the Lord and catching the unselfish spirit of Jesus the Christ. I candidly confess that the whole thing seems as wonderful to me as it possibly can to you. I look back over the time since we began and say that right here on Kimberlin Heights, Tenn., are evidences that God is, and that he hears when we cry in faith. I realize that this is just the beginning. Just in proportion as I take hold on God, his people take hold of this work. Money comes in small sums. In this I rejoice. It means that the work is taking root in many hearts, and that from the rising to the going down of the sun, prayers are, like incense sweet, rising from many hearts that God will not allow us to be put to shame in the presence of those who do not believe. God has all things at his command, and I am his. I make my living out of the Correspondence Bible College, and stand pledged before God and men to put every dollar placed in our hands as the result of the sale of my books, or from any other source, dollar for dollar, into this work. Before my conversion, I would not have done this. On the infidel hypothesis, how do you account for the fact that I do it now? Nor is this all. I sound it out far and near that I will not turn a poor young preacher away as long as we have room! I accept your challenge. Pledge yourself on honor not to mention your unbelief to any one; come here a year and see these things with your own eyes, and you may have access to all the classes, and your board will not cost you a cent. I have no time to dispute. "Come and see" (John 1:46).

Trusting that, through the rifted clouds of unbelief, you may soon "see Jesus," I am in warmest compassion,

Faithfully your friend
ASHLEY S. JOHNSON.

After reading the above, even before I had spoken to Mr. Calvert, I wrote to Bro. Johnson, and asked him to let me know what had been done in his great work during the past six years. In reply he sent me quite a pile of literature, full of half-tone engravings of the young ministers he is educating, and of the grand buildings God has enabled him to build and pay for; and, dear reader, I wish you would write to Bro. A. S. Johnson, Kimberlin Heights, Tenn., for some of his free tracts and circulars. I tell you as he told the young infidel, "Come and see;" or perhaps, more literally, send to him for a report of the work, and see for yourself "what God has wrought." Those of you who have Muller's Life of Trust will recognize at once how similar it is in many respects to that great work.

"GUESSING-CONTESTS" AND SIMILAR GAMBLING ENTERPRISES.

We rejoice to see the following in that good home paper, the *Ohio Farmer*. Of course, we give it our hearty indorsement.

We are glad the Postmaster-General has spoken clearly in regard to the "guessing-contests" on the population of the United States and Canada, that have lately filled scores of columns of advertising and editorial space in many otherwise decent papers. It is a lottery business pure and simple, and as such should be excluded from the mails.

The scheme was urged upon *The Ohio Farmer*, and promptly rejected in the interests of common decency. It is not only a lottery—a game of chance—but a dishonest lottery. As nearly as can be computed from the data at hand, the guessing subscribers of any given periodical have only about one-tenth to one-twentieth as good a chance as they are led to believe they have—to win the \$15,000 or smaller prizes; for the prizes go not to the subscribers of that one paper, as they are tacitly led to suppose, but to them in common with those of some ten, twenty, or thirty other papers that are in the scheme. The claim that the subscribers pay nothing for their chance to guess is false, for the chance to guess is the sole objective premium or inducement offered, and often the sole subjective motive for subscribing. We are glad such contests are hereafter to be excluded from the mails—wholly, we hope, as lottery schemes, not partly as illegitimate second-class matter. We are glad, too, of the general reform promised; for if all the abuses that have crept into our postal system—including most of the free-mail matter—can be stopped, we may easily have penny postage on letters, and rural mail delivery.

MENTAL-SCIENCE HEALERS COME TO GRIEF.

We clip the following from the *Cleveland News and Herald*:

ARRESTED ON CHARGE OF USING THE MAILS FOR FRAUDULENT PURPOSES.

Daytona, Fla., August 24.—Helen Post, her husband, Colonel C. C. Post, and her son-in-law, C. F. Burgman, were arrested to day on information sworn to by Post-office Inspector Fred D. Peer, charging them with using the mails for fraudulent purposes. The three were taken to Jacksonville, where they will have a hearing before United States Commissioner William Archibald.

The offense alleged consisted in sending through the mails circulars professing to cure patients at a distance by means of mental science. Mrs. Post claimed to be able to heal all kinds of diseases, even restoring the blind, holding that no disease was incurable by her method of treatment.

I felt like shouting, "May the Lord be praised that the U. S. Postal Department comes out fairly and squarely, and declares these things frauds." The most distressing part of the affair is that so many people, and people apparently gifted with plain common sense, will insist that the government is wrong, and that these mental healers are a blessing to humanity. Our stenographer suggests that these mental healers do doubtless cure *some* kinds of "blindness." In fact, it is to be hoped they do.

STREET FAIRS, ETC.

I am glad to see the following in the *Am. Agriculturist*. I have wondered that sensible people had tolerated such an outrage as long as they have.

The street fair has about had its day. Some towns, however, do not seem to fully understand the pernicious effect of this latter-day nuisance, and quite a number are scheduled for this summer and fall. That no good will come from any of them is a foregone conclusion, as any one knows who has had experience with them.

"\$720 A YEAR, AND ALL EXPENSES PAID."

The above is what a Chicago book firm advertised. One of the readers of GLEANINGS, Mr. W. E. Birch, of Afton, Va., wrote them, and after some correspondence sent them \$10 for the outfit to go to work. After they had got his money they informed him that his salary was to be taken from what he received from other people whom he might be able to set to work; that is, his sub-agents were to pay him some money to bind the bargain, just as he paid the book firm some money, and from this money he was to get his salary. When he objected to this latter explanation, returned the cheap outfit, and wanted his money back, they refused, and called his attention to the printed agreement he had signed. I do not see how he can help himself; neither do I see how anybody should be persuaded that advertisers will do as they agree, when they promise to pay Tom, Dick, and Harry all over the country \$720 a year and all expenses. Notwithstanding, lots of people are losing \$10 or some similar sum by going into just such swindles. Nobody will hire you and pay you wages until he sees what you are able to do and how you do it

GINSENG AND ITS CULTIVATION.

While it is true our own plants did start bright and brisk in the spring, they have so far made only a very small growth. Some of them grew perhaps a few small berries; but with the richest soil we could give the plants, with proper attention, shading, etc., it is certainly the slowest thing I have ever grown in the whole vegetable kingdom. Are any of our experiment stations growing ginseng? We very much need reports from somebody in regard to the business, who does not have plants and seeds for sale. No doubt the business will pay at the present prices of roots and seeds.

ALFALFA—SOWING IT IN THE FALL.

Mr. Root:—I have never read in your writings of your attempt to raise alfalfa on your own grounds. If you have tried it and failed, try my plan. I believe you can grow it as well as we of the West. Try sowing it this fall between the 20th of the month and the 15th of September. You can not put too much work on your ground. Give it a good plow; harrow and roll until you get tired, firming the seed-bed down fine and smooth before sowing. Sow about 20 lbs. to the acre, with a seeder or drill, or broadcast with an even distribution; then harrow lightly; and if there is moisture, in a few days the clover will be up; and if cold weather you will find some of the roots have gone down 12 to 18 inches, and you will have a stand for all time. I will harvest four crops from mine this season, without irrigation, and get a honey crop too, right through the most terrible drouth and heat I ever saw in my 38 years' residence in Kansas. The truth has never been fully told of the benefits of alfalfa. It is king of all forage-plants, as well as a substitute for grain. All kinds of stock except hogs will fatten on the hay in shape for market, and hogs will keep in good order on the hay, without grain. I have been trying for 15 years to grow alfalfa by sowing it in the

spring. I could get a stand, but by fall it was all gone—killed out by crab-grass and hot suns during the summer.

About three years ago I sowed 7 acres, as an experiment, the latter part of August, and got a fine stand; and now we sow in the fall; and so far, when put in right, there are no failures; and, take it one year with another in this locality, land in alfalfa will pay interest on land, even if valued at \$200 per acre. If you have never tried fall sowing in Medina, do so, and I believe your experiments will benefit others. The great value of this plant is known best only to those who raise it; and I believe it can be grown nearly all over the United States. Possibly it would winter kill in some of the more northern States.

Rossville, Kan., Aug. 6.

M. F. TATMAN.

Thanks for your suggestion, friend T.; and my opinion is that all kinds of clovers will succeed if the work is done thoroughly, and put in in the fall in the way you describe. The failures with fall sowing of almost any kind of clover are because the work has been done in a slipshod sort of way. Perhaps heavy clay ground will first need underdraining before we can make a success of it. If the ground is poor, and has not had manure for many years, very likely it will need some sort of fertilizer to get the alfalfa started. The fact that we have succeeded in growing crimson clover year after year, without any failure, for half a dozen years, put in almost exactly as you describe, goes far to convince me that many of our old and successful farmers have something yet to learn in regard to putting in clovers in August and the fore part of September. We have made a success with alfalfa on our grounds in small plots.

SWEET CLOVER THAT HORSES AND CATTLE WILL NOT EAT.

I have had an experiment with sweet clover, and find that no stock will eat it, not as hay and not as green pasture. It is just as thick as it can stand on the road here in some places, and cows and horses turned out on it would starve to death before they would eat it. I have seen it tried myself. It is good bee pasture, and that is all it is good for.

Bishop, Ill.

C. H. ZURBERG.

My good friend, you have made a mistake somewhere, but I do not know exactly where it is; but the plant is not sweet clover, or it is a different kind of sweet clover from that growing along the roadsides here, or else your horses and cattle have not been taught to eat it. Our horses learn the trick by grabbing at green stuff when they are cultivating or doing other work around the farm. A horse that catches on to this trick will, as you know, bite at any thing with green leaves on it; and in this way our horses learned to prefer sweet clover to any other plant. We have at different times owned a dozen horses, and they all learned to eat sweet clover in this way. Cows usually learn how when there is a severe drouth and the pasture is very short so they can not get any thing else. At such time, if they are where they can get a bite of sweet clover when it is young and tender, they very soon catch on. I never saw it fail, and I can not think the cows and horses in your locality are any different from those here. Of course, the plant may be somewhat different in different soils; but when you say they would starve to death before they would eat sweet clover, you are certainly making a mistake. Let us have a lot of reports in regard to this matter.

Has anybody else had an experience like that of friend Z.?

THE EUROPEAN LINDEN AND ITS LATER BLOOMING.

The following is of exceeding importance to bee-keepers. See if you do not agree with me. I extract it from a recent number of the *Farm and Fireside*, and it is from our friend T. Greiner, La Salle, N. Y.:

Within a few rods from the house I have a European linden, planted in 1889. It was full of bloom again this year, and, as last year its blooming season was fully a week later than that of the American linden, or basswood. My bees worked on this tree in full force long after bees had ceased to work on any of the native basswoods. Now I should like to know whether this late-blooming habit is common with all the European lindens or whether it is that of an individual tree. It seems to me of importance to the interests of our bee-keeping friends to see clear on this point, and then, if it be found that the basswood-honey season might thus be prolonged for a week, to plant lindens with the native basswood just for that purpose. Have any of our friends had experience with the European linden? Who will enlighten us?

When we planted our basswood orchard I think I had a dozen or more European lindens; but the matter has been out of mind, I am ashamed to say, so that I can not really state at the present time in regard to later blooming; but I remember this was reported to be the case when the orchard was planted. If this thing is true, then somebody wants to go to work immediately to grow European lindens for us, not by the hundred or thousand, but by the *million*. If my enthusiasm does not abate I will try to start the thing going at once. By they way, if this reaches the eye of any nurseryman who can tell us where to find such trees by the thousand, I wish he would write me at once.

JAMAICA SORREL.

I am always delighted to hear any thing Jamaica well spoken of, and am not less so at the editor's good opinion of Jamaica sorrel, page 484. In Jamaica the sauce that he speaks of has not, so far as I know, been made—at least not to any extent; but at Christmastide there is hardly a home, high or low, but has a plentiful supply of the delicious beverage known as "Jamaica drink." Few drinks there are, made from fruit, that can surpass this sorrel drink—so cool and delicate, and of a rich ruby color, like the plant itself when seeding, and it is considered to be to some extent a blood-purifier. It is made from the "fleshy husk," same as used for sauce. This husk is packed in a vessel, and a sufficient amount of boiling water (about four parts to one) poured on. Adding a few pieces of ginger it is allowed to steep for a day or two, is then strained off and bottled, to keep it from fermenting; and after it has settled it is fit for use when five or six days old. Sugar must be added to taste, but only to that quantity that can be used in one or two days, as it will not keep any longer when sweetened.

The sorrel is an annual, and seeds in December. It is certainly a grand sight to see even a small garden of it at that time.

I shall endeavor to send you some seeds, Mr. Editor, next season, if all goes well, just to try it along with those from Florida as I feel quite sure that Jamaica is the home of the Jamaica sorrel.

Black River, Jamaica.

ERIC FORREST.

We have at present about 40 plants growing with great vigor. Some of them are nearly a foot high; and therefore I feel quite confident we can get "fruit" in our locality if started under glass just as we start tomato-plants.

THAT PUGNACIOUS PLYMOUTH ROCK ROOSTER.

He is dead. He kept getting more and more quarrelsome. He pitched into Mr. Wardell when the latter was at work with the bees in the apiary, and he commenced driving people off the sidewalk. One day he went over into a neighbor's yard, taking his hens along with him. The neighbor's wife undertook to drive the strange poultry back to their own home where they belonged; but instead of being driven away he drove the good woman off *her own premises*. Not long after, he was found in the road dead. I conjectured he might have tackled a buggy-wheel with his undaunted courage. It made me think of Don Quixote fighting the windmill. Well, he is gone, but he left 32 strong healthy chickens. Every one that hatched lived to grow up. About half of the 32 are roosters. One of them that we are to have for dinner to-morrow weighs 5¼ lbs. He was hatched about the first of May, so he is now just about four months old. My impression is that his disposition showed vigor and vitality; and the way the chickens went through the wet month of June, out in the rain, and a cold rain at that a good part of the time, I am inclined to think pugnacity does, at least to some extent, indicate vigor and endurance. Most of his progeny are a cross between the White and the Barred Plymouth. You see I am not working for pure blood. I want vigor and strength without regard to color.

Since the above was written, I notice the Hope Farm man, in the *Rural New-Yorker*, is getting on to the same track that I am on. I have wondered several times whether he was reading GLEANINGS. In a recent number he told us of paying \$10 for a lot of choice eggs to put in his incubator. He had a very small hatch indeed, and what few chickens did hatch had so little vitality that they kept dying off until he had almost nothing left of his \$10. Then in disgust he tries the incubator again, with some eggs from his own poultry yard, and here is his report:

Out of 172 fertile eggs, 154 hatched, and only four have been lost in the same brooder which witnessed the former wholesale slaughter. You never saw a livelier lot of chickens. There is a sore place on my leg which indicates to me the chief reason for this lively crowd. It is where Don the Wyandotte rooster, spurred me when I went to look at the egg record of his family. The sons and daughters of a nine pound bird that is willing to tackle a 175-pound man will not fall down and die without a struggle at least. The fighting blood in that old chap does those chicks more good than the lamp under the brooder! What a great privilege it is to have fight and kick in one's pedigree, so that they may be turned to worthy ends!

Heigh-ho! Since the above was put in type one of the pullets from the fighting rooster has laid several eggs—the first one, a day or two before she was four months old. So we have precocity in weight and precocity in egg-laying from the tiger rooster. No doubt part of this, at least, is accidental; but I think we are safe in saying it pays to save a vigorous, intrepid, and courageous male.

BEE T AND CANE SUGAR.

The editorial on page 757, in regard to sugars, is very gratifying to me for two reasons. 1. It contains the first communication from our youngest boy, Huber, that has ever appeared in print, so far as I recollect; 2. It indorses exactly what I have been trying to tell the friends for years; namely, that the quality of sugar depends on its purity and not at all on whether it was made from beets, sugar cane, or something else. I have for some time back protested against space being given in GLEANINGS to argue the matter; and we can certainly now, it seems to me, drop it without wasting any more time or occupying space with an idle discussion. Mr Gilmore is unquestionably right.

We find the following on a scrap of newspaper:

The anti cigarette law in Minnesota has been held to be constitutional. This is one of the most stringent statutes yet enacted to prevent the sale of tobacco in that form.

A reader of GLEANINGS who has tried Quirin's strain of bees says they are very eue'getic. They are out first in the morning and last at night; in fact they work so late evenings that he has baptized them "Quirin's Night Hawks." H. G. Quirin's ad. appears on the last page of cover.

EGG FOOD! The kind that tones and keeps up the hen so that she simply must lay. **LEY'S POULTRY CONDITION POWDER** puts good red blood into poultry veins; kills all disease germs; tones and nourishes fowls - big and little get all there is in the food when fed in conjunction with it. A Superior Red-clover Queen for 25 cts.

An Offer for New Subscribers:

We want to add a lot of new readers to our WEEKLY AMERICAN BEE JOURNAL list during August and September. For that reason we are making those who are not now reading our journal regularly, this liberal offer: Send us \$1.25, and we will mail you the Bee Journal FOR A WHOLE YEAR, and also one of our SUPERIOR LONG-TONGUED RED-CLOVER QUEENS—untested Italian.

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season. All queens guaranteed to arrive in good condition, and all will be clipped unless otherwise ordered. All queens mailed promptly.

Headquarters in Chicago for Root's bee-supplies at Root's prices. A free catalog and sample of the American Bee Journal on request.

George W. York & Co., Chicago, Ill.
144, 146 Erie Street.

Standard-Bred Queens!

Acme of Perfection; Not a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$4.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover hustlers of America. 75 cts, each; six for \$4.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

Fred W. Muth & Co., Cincinnati, Ohio.
South-west Corner Front and Walnut Streets.

ALBINO QUEENS. If you want the most prolific queens, the best honey-gatherers, the best comb-builders, the hardest and gentlest bees known, try my albinos. My untested queens, 75c. **J. D. GIVENS, Lisbon, Texas.**

BELGIAN HARES!

With every hare sold goes a full pedigree, register number, and score-card, scored by an official judge. Does will be bred to one of our famous high-scoring bucks free. Write for book. **Mgr. of The A. I. Root Co. J. B. MASON, MECHANIC FALLS, MAINE.**

Belgian Hares

I have some fine hares for sale at reasonable prices.

J. F. Moore, : Tiffin, Ohio.

HONEY-PACKAGES.

We still have on hand a good supply of 1 and 2 quart Mason jars, No. 25, and No. 100 jars and tumblers. We are short on $\frac{1}{2}$ and 1 lb. square jars, but expect a new supply within a few days. We can also furnish tin cans and pails as listed. We published a list of stock on hand of the various kinds a month ago. We still have some of most of the items in that list, although the quantities have been reduced somewhat.

COMB HONEY WANTED

We are unable to secure choice comb honey fast enough to fill our orders. Buyers have been over the ground in the West picking up most of the desirable lots. There are a good many bee-keepers who have not prepared their honey for market, perhaps, for lack of time. If any such read this item I would advise them to lose no time in getting their honey ready. When there is a good demand at good prices, let it go. The demand and price usually slack in December, and sometimes before. We solicit offers of fancy and No. 1 white. If you have any to sell, write us how much and what you ask for it.

QUEENS UNTIL NOV. 15TH.

The best of warranted Italian queens, 50 cts. each, \$6.00 per dozen. We breed bees for business, and guarantee prolific queens, and fine honey-gatherers. Your orders will be promptly filled by return mail.
J. W. K. SHAW & CO., Loreauville, La.

I. J. Stringham, 105 Park Place, New York City.

The Best Queens of the Best Kinds.

By special arrangement with The A. I. Root Co. to furnish them QUEENS, I have secured their assistance in procuring the FINEST BREEDING QUEENS that a thorough knowledge of the bees of the country and money can procure. Among them is a SELECT DAUGHTER OF THEIR \$200.00 QUEEN THAT THEY RE-

FUSE TO QUOTE ME PRICES ON. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT says: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

MR. R. A. JANSEN, of Iago, Wharton Co., Texas, bought of me last fall 80 queens. He says of them: "I consider myself the queen and 50 cents per colony BETTER OFF, for the purchase of these queens, on the SPRING HONEY FLOW ALONE. They SURPASSED ALL OTHER COLONIES in my yard during the spring honey flow and KEPT UP THE LICK. Please book my order for 100 MORE queens to be delivered in the fall. I shall, in all probability, increase this order later."

Under date of July 28th, 1901, from Mr. W. E. Burch, of Los Banos, Cal., comes the following in regard to queens from my apiary: "The three that I have are the FINEST queens I ever saw, and the GENTLEST BEES TO WORK WITH. When I am working with these three colonies I do not use the smoker, and they ALWAYS SEEM TOO BUSY ATTENDING TO THEIR OWN BUSINESS to interfere with me; AND THEY ARE THE BEES THAT BRING IN THE HONEY."

From Ramey, Minn., under date of Aug. 8th, 1901, Mr. A. T. McKibber writes: "The cage of bees arrived o. k., and were measured. They ran 24-100 and 25-100, which is just a little longer than any I have, or have measured, and I think by their looks that they're good bees. The bees you sent could probably take honey $\frac{1}{4}$ inch."

Louis Werner writes under date of June 19, 1901, from Edwardsville, Ill.: "The queen I got from you is a good one, and proved to be as good as I EVER GOT FROM ANY BREEDER. When I am in need of queens I know where to get good ones."

Frank Coverdale, of Maquoketa, Iowa, says, under date of July 6, 1901:

"We like those that have hatched. They are exceedingly gentle, and queens prolific. Among the first fifty the tongue reach is very good, generally 20; one measures 23, and another, which is best of all, measures 21. THIS QUEEN I VALUE VERY HIGH. Her bees are uniform in color. I'd like you to send me a cage from your longest-reach queen, as I'm well equipped for measuring."

This is from far off Jamaica:

"Kingston, Jamaica, B. W. I., May 14, 1901.

"Queen received on the 8th in the pink condition. Attendants and queen appeared as if just placed in cage THE DAY BEFORE.

S. E. SURRIDGE."

If I have real good success, by next year I expect to be able to furnish a QUEEN for the Chinese that will be acceptable to the POWERS.

The A. I. Root Co. also knows a GOOD THING when it sees it. LISTEN!

"Medina, Ohio, May 1st, 1901.

"W. O. Victor—Instead of sending us 12 untested queens per week, send us 18 in two installments, a day or so apart."

I have on hand at the Pan-American Exposition a nucleus, with queen. Mr. Orel L. Hershiser, Superintendent Apiarian Exhibit, will take pleasure in showing them, as he always "Seeks after the Good, the Beautiful, and the True."

Prices for September, October, and November Only.

Untested queens, 65c; 6, \$3.50; 12, \$6.50; 50 or more, 50c each. Select untested, 85c; 6, \$4.50; 12, \$8.50. Tested, \$1.00; 6, \$5.50; 12, \$10.00. Select tested, \$1.50; 6, \$9.00. Breeders whose best bees show a reach of 21-100, with an average of 20-100, \$3.00. Breeders whose best bees show a reach of 21-100, with an average reach of 20 $\frac{1}{2}$ -100, \$5.00. Breeders whose best bees show 21-100, with an average reach of 21-100, \$7.00. I have discovered two breeders whose best bees show 24-100, with an average reach of 22-100. These are too good to sell. Don't ask for prices. Yard No. 1.—Long-tongue Root Clover. Yard No. 2.—Imported Stock. Yard No. 3.—Golden, or Five-banded Stock. Yards No. 1 and 2 contain, without question, bees as gentle as was ever handled, and I think equal of any in the world as honey-gatherers from any flower that grows. Don't forget that my FAMOUS BEAR PICTURE goes as a premium with each order for six or more queens at prices quoted. Send for list showing description of stock and arrangement of each apiary.

W. O. VICTOR, Queen Specialist, Wharton, Texas.

See What I Offer.

For \$1.50 I send a queen of the Superior Stock—a strain of dark, leather-colored Italians that is surpassed by none. I guarantee safe arrival, safe introduction, purity of mating, and entire satisfaction. Any time within two years you can return the queen and get your money back and 50 cts. extra for your trouble. The following is a sample of letters that frequently come to this office:

AURORAVILLE, WIS., Aug. 24, 1901.

W. Z. Hutchinson, Flint, Mich. Dear Sir:—The last queen you sent me is all right. She was laying in three days after being introduced. I am more than pleased with the queens that I got of you last year. One of them, or her bees, store double the quantity of honey of any other colony in the yard, and I have over 100 colonies. I have purchased queens of three other breeders, but none of them are doing so well as the ones I got of you. Their bees are out the first thing in the morning, and they stick to it all day.

Yours truly, J. MATHEWS.

Now a few words about the *Bee-Keepers Review*. The quality of its contents, the helpfulness of its character, are unsurpassed. Some subscriber in the

West (I can't recall his name just now) once wrote me that he had often wondered how I could get \$1.00 for the Review when there were other journals published so much oftener at the same price. "but," he added, "after reading it one year I can see the reason why."

Mathilde Candler, of Cassville, Wis., when sending in her renewal, wrote as follows: "I am delighted with the Review. I am sorry that I was not a subscriber years ago. I especially admire its wholeheartedness. Then there are no side issues to take away the energies that might better be devoted to the interests of bee-keeping. It has awakened me out of a Rip Van Winkle sleep, and given me a fresh impetus in bee-keeping."

Just at present the Review is paying especial attention to discussing the subject of improvement of stock by improved methods of selection and breeding.

The Review is \$1.00 a year, but the rest of this year is sent free to all who send \$1.00 for 1902. Not only this, but, for \$2.00, I will send the Review from now to the end of next year, and also send a queen of the Superior Stock.

W. Z. HUTCHINSON, Flint, Mich.

\$1-TESTED QUEENS=\$1.

A nice lot of young golden tested queens at \$1.00 each while they last; selected, \$1.50; warranted queens, 60c;—6 for \$3.50; select warranted, 80c—6 for \$4.50. My bees are a five-band strain, selected for size, energy, working qualities, long tongue-reach—and, lastly, beauty. I have never tested a strain that excels them. A pile of letters assert the above claims are true, and also that they winter well north. Queens are sent promptly.

J. B. CASE, Port Orange, Fla.

LONE STAR APIARIES

Italian Queens.

Estab'd 1885. Prices of queens from imported mothers: Tested, \$1.50; 6, \$6.50; 12, \$12.00. Untested, 75c; 6, \$4.00; 12, \$7.00. Golden, same price. Select tested of either race, \$2.50 each. For a short time I will mail tested leather-colored queens at \$1.00, not satisfied. Address

Your money back if you are not satisfied. Address G. F. DAVIDSON & SONS, FAIRVIEW, TEX.

QUEENS the balance of season, 50c; full colonies, \$3. Mrs. A. A. SIMPSON, Swartz, Pa.

FOR SALE.—Will sell my half interest in one of my apiaries consisting of 300 colonies, 20 miles of N. G. Railroad; at your command. GEO. ROCKENBAUGH, Yaguajay, Cuba.

W. H. Young, Ono, Wisconsin.

QUEENS! Fine, large, gentle, and prolific; long-tongued; either 3 or 5 banded; 75 cents each; six for \$4.25. Try them and be pleased. CHAS. H. THIES, Steeleville, Ill.

ONCE IN A LIFE TIME is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON

Lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 36 in. Lasts because tires can't get loose, no resetting, hubs can't crack or spokes become loose. Fellows can't rot, swell or dry out. Angle steel fenders. THOUSANDS NOW IN DAILY USE. Don't buy a wagon until you get our free book, "Farm Savers," ELECTRIC WHEEL CO., Box 95, Quincy, Ills.

The Storm Proof KING WIND MILL

produces 25-50% more net power than any other kind of wind turbine or windmill. Wheel being only 1 in. thick, cuts the wind like a knife and is 40% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both jumping and power, back geared or direct stroke. Send for circulars and prices before you buy. Medina Mfg. Co., Box 11, Medina, O.

YOU NEVER CAN TELL how soon you will need medicine. Get our Large Drug Book, keep it handy. Contains over 25,000 of the best medicines, family remedies, toilet articles, etc. Mailed for 10c. We refund amount out of first order. "The Only Mail Order Drug House in the World." HELLER CHEMICAL CO., Dept. 40 Chicago, Ill.

Red Clover Queens.

BLACK ROCK, N. Y., Sept. 3, 1901.

Friend Ernest:—I will try and tell you what you want to know about that queen. I got her of you in 1899 as a premium with GLEANINGS. I never saw a small colony of bees build up as that one did. In the spring of 1900 they came out in fine shape, wintered perfect. I raised them up in May and gave them 8 frames more so the queen would not want for room. I never saw such a colony of bees as they were in June, and they actually were storing honey when other bees in my yard were starving. No! they were not robbing. I never saw those two best colonies of mine trying to rob. They certainly work on red clover. This is no guesswork, as I have seen them. As you know, the past two seasons have been very poor, and what honey my bees did get in 1900 candied soon after cold weather set in. I packed this colony in a chaff hive and left them out, thinking that such a strong colony would winter perfect. The snow came on the middle of November, and those poor bees never a fly until the last of March or the first of April. When warm weather at last came I thought they were dead, as they did not seem to be flying much, so I did not pay any attention to them until in June. I noticed they were working a little, so I opened up the hive and found them in the upper story. I took the lower story out and left them in the one body. The queen was laying nicely, and I thought they would make a good colony to winter. Along the last of July I noticed that they needed more room. I gave them a super, 24 boxes, and in a few days they had it full. They have made 72 boxes of as nice honey as you ever saw, and are drawing out some starters now, Sept. 2.

Very truly yours,

GEO. B. HOWE.

Prices of Red-Clover Queens.

Gleanings in Bee Culture 1 year and Untested Queen,	\$2.00.
“ “ “ “ Tested Queen,	4.00.
“ “ “ “ Select Tested	6.00.

If you want something good you can not do better than to order one of these queens. All orders are filled promptly. No extra postage on these to foreign countries.

HONEY QUEENS! Get the Best Queens.

Laws' Long-tongue Leather Queens.
Laws' Improved Golden Queens.
Laws' Holy Land Queens.

Laws' queens are the standard bred queens of America. The largest honey-producers use them and praise them. Laws' queens go everywhere, and can furnish you a queen every month in the year. Four apiaries. Queens bred in their purity. Prices, October to April: Tested or untested, \$1.00 each; 6 for \$5.00. Breeders, none better, \$3.00 each. Address

W. H. Laws, Beeville, Texas.

Dittmer's Foundation !!!

Retail---Wholesale---Jobbing.

I use a PROCESS that produces EVERY ESSENTIAL necessary to make it the BEST and MOST desirable in all respects. My PROCESS and AUTOMATIC MACHINES are my own inventions, which enable me to SELL FOUNDATION and WORK WAX INTO FOUNDATION FOR CASH, at prices that are the lowest. Catalog giving

FULL LINE OF SUPPLIES

with prices and samples, free on application. BEESWAX WANTED.

GUS. DITTMER, AUGUSTA, WIS

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians Golden, Carni laus, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

KRETCHMER M'F'G CO., Red Oak, Iowa.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apiary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Ferguson Supers, etc. Write at once for a catalog.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3 1/2-inch; \$1.10; 3-inch, \$1.00; 2 1/2-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firm ly attached to all four sides, the combs unsoiled by travel stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 2.—Three-fourths of the total surface must be filled and sealed.
 No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

SAN FRANCISCO.—Comb honey, 10@12 Extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Beeswax, 25@27.
 Sept. 11. E. H. SCHAEFFLE, Murphys, Cal.

ALBANY.—Honey market improving in demand, as the weather is colder. We quote fancy white comb, 16 No. 1, 15; No. 2, 14; mixed, 13@14; buckwheat, 12@13. Extracted receipts light, yet good demand for white and light grades at 7; dark, 6. We advise sending honey now, as we believe it will be lower later, especially extracted.
 Sept. 20. McDUGAL & Co., Albany, N. Y.

CINCINNATI.—The supply for comb honey is rather short. Fancy Southern 14½; fancy white clover sells 15@16. The market for extracted is rather dull. Dark sells for 5@5½; better grades from 6@7; extra fancy, 8@9. Beeswax, 27.
 Sept. 19. C. H. W. WEBER, Cincinnati, O.

NEW YORK.—We quote you the market as follows: The honey season is now open, and the demand is about equal to the receipts. The weather has been rather warm, and shipments have not been forthcoming as we should like to see them, but we presume shippers are waiting for cooler weather. Fancy white, 15@16; No. 1, 14@15; No. 2, 11@13; fancy buckwheat, 10@10½; No. 1, 9@10; No. 2, 8½@9. Extracted, white clover and basswood, 6@7; light amber, 5½@6; amber, 5@5½. Beeswax is dull, 27@28.
 CHAS. ISRAEL & BROS.,
 486-8 Canal St., New York City.
 Sept. 20.

NEW YORK.—Replying to yours of Sept. 17, would say that arrivals of comb honey are coming in freely, and in fair quantities. We quote: Fancy white, 14@15; No. 1 white, 13@14; No. 2 white, 12. Extracted is rather dull, and is bringing 4½@6, according to quality. No buckwheat has arrived as yet, but we expect some shortly. But little demand for beeswax at 27½.
 FRANCIS H. LEGGETT & Co.,
 Franklin, West Broadway, and Varick Sts.,
 Sept. 21. New York City.

BOSTON.—Honey is coming forward in fair quantities, and the demand is good considering the warm weather we are having. Str cly fancy, in cartons, 16; A No. 1, 15; No. 1, 14@15. Very little No. 2 being received.
 BLAKE, SCOTT & LEE,
 Sept. 14. 31, 33 Commercial St., Boston, Mass.

CHICAGO.—No 1 white comb honey is selling at 15c per lb., with occasionally a little more being obtained for fancy; that which does not grade No. 1, selling at 13@14, with the light amber at 12@13; dark, of various kinds, 10@11. Extracted in moderate demand at 5½@6½ for the various grades of white, some fancy white clover and basswood bringing 7; light amber ranging from 5¼@5¾; dark, 5@5¼. Beeswax, firm at 28@30.
 R. A. BURNETT & Co.,
 Sept. 18. 199 South Water St., Chicago, Ill.

NEW YORK.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good. We quote as follows: Fancy white, 14@15; No. 1, 13; No. 2, 12; amber, 11. No buckwheat on the market as yet, but are expecting some within a week or so. Extracted is selling slowly, with plenty of supply, at unchanged prices. Beeswax dull at 27.
 HILDRETH & SEGELKEN,
 Sept. 20. 265 Greenwich St., New York City.

SCHENECTADY.—We have received a number of consignments of clover honey, and sold on arrival at prices quoted; but producers are late getting buckwheat ready for market, and we have been unable to fill orders. We quote white 15@16; medium, 13@14; buckwheat, 11@12. Extracted, 5@6.
 Sept. 20. C. MCCULLOCH, Schenectady, N. Y.

WANTED.—Fancy white honey in Danz. sections, also buckwheat honey, comb and extracted. Send sample of extracted, and let us know how much you have, comb or extracted, and how put up, and price at which you will sell.
 THE A. I. ROOT Co.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co.,
 Front and Walnut Streets, Cincinnati, Ohio.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.
 THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Write us if you have any large or small lots of extracted honey to sell. State quantity, kind, and price expected and if possible mail sample. We pay spot cash. Reference, Wisconsin National Bank. E. R. PAHL & CO., Detroit & Bdwy, Milwaukee, Wis.

WANTED.—Comb honey and beeswax. State price delivered Cincinnati. C. H. W. WEBER,
 2146 2148 Central Ave., Cincinnati, Ohio.

WANTED.—We are in the market for honey, either local or carlots commission or purchase. We especially desire Wisconsin basswood, and will be pleased to hear from that State. EVANS & TURNER,
 Town St., Cor. 4th, Columbus, Ohio.

WANTED.—Fancy and No. 1 white-clover honey, one-pound sections, paper cartons preferred.
 BLAKE, SCOTT & LEE,
 33 Commercial St., Boston, Mass.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere what they will have to offer. SEAVEY & FLARSHAM,
 1318-1324 Union Avenue, Kansas City, Mo.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

BEE - SUPPLIES!

ROOT'S GOODS
AT
ROOT'S PRICES.

C. H. W. Weber, Cincinnati, Ohio.
2146-2148 Central Ave.

A NEW AND COMPLETE stock for 1901 now on hand. I am The Root Company's representative for Cincinnati and surrounding territories. . . You save TIME and FREIGHT CHARGES by having goods shipped from here. Convenience of railroad facilities here enables me to do so. Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

THE GLEANINGS

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

BEE CULTURE

ILLUSTRATED SEMI-MONTHLY
Published by THE A. ROOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX

OCT. 1, 1901.

No. 19.

"WE HAVE COMBS over 40 years old that I would not exchange for the same area of foundation," says C. P. Dadant in *Amer. Bee Journal*.

SMALL PLOTS of alfalfa have been raised at Medina, and large fields of it in my county. But if it yields no nectar, and if it is worth no more for fodder than sweet clover, why raise it?

A. I. ROOT, the poultryman, says, p. 762, he doesn't work for pure blood nor color, but for vigor and strength. I prefer pure blood; but if I can find sufficient improvement outside of pure blood, the pure blood can go.

IF RAMBLER doesn't stop throwing stones into my Straw-cutter, p. 745, I'll swap it for a meat-grinder, and put him through. [I will furnish the meat-grinder if you will "put him through." He has been throwing clods of dirt over into my wheat-fields. Yes, pulverize him.—ED.]

IT JOLTS one's feelings to have the editor talk on page 748 as if Eastern bee-keepers must take top-bars they don't like just because it serves the convenience of the manufacturers, and he at the same time so strong on "difference of locality." But one is reassured by reading on the next page that several styles of frames are made.

TO HOLD combs in frame when transferring, C. P. Dadant uses No. 16 wire bent at right angles at each end, long enough to have one end driven into the top-bar and the other into the bottom-bar, holes being previously punched with an awl. For small pieces in corners a short wire may go from top or bottom to end-bar.—*Amer. Bee Journal*.

THE WORST DANGERS of in-breeding are where two beings are mated that are of exactly the same blood, having the same fa-

ther and mother. Fortunately, the bee-keeper need take no pains to avoid such close breeding; nature takes care of that. A drone and a queen from the same mother are not full brother and sister, for the father of the queen is not father of the drone. The only way to mate two of exactly the same blood is to mate a drone to his mother, and the drone is born too late for that.

VERNON BURT's plan of leaving a hive full of brood with no bees till they hatch out, p. 755, would generally result in loss of brood in this locality. [Why? You will recall that I explained that Mr. Burt makes sure there is plenty of hatching brood, and that this work is done during the height of the honey-flow. Try the experiment, doctor. Take a note of the unsealed brood in each comb, and then see whether any of it starves or dies for want of nurses to take care of it.—ED.]

FROM WHAT is said, p. 753, some one has been losing queens by following Doolittle's instructions to set in place of a full colony a hive full of combs of brood, one of them with its bees and queen being from a nucleus. This season I did something nearly in that line, the only difference being that I put no brood except the one or two frames from the nucleus, and it is possible that if the hives had been filled with brood there would have been no failures. Out of 35 cases, 9 queens turned up missing. The queens should have been caged.

YOU THINK, Mr. Editor, that in a normal honey-flow in full blast bees don't lunch on eggs, p. 380. Now when a queen of Stachelhausen's laid 71,400 eggs in 21 days, don't you think it likely there was a normal honey-flow in full blast, or at least full enough to prevent lunching? and then where would you be with your "large force" of 40,000 or 50,000? [I am not familiar with, or perhaps I do not recall, the reference to which you refer, of Stachelhausen's queen that laid 71,400 eggs in 21 days. Mr. Stachelhausen is one of the very best bee-keepers; but how could he or any one say positively that the queen did not lay

more than the 71,400 eggs in the time stated? But such a feat of egg-laying I should think was rather exceptional; and I am still inclined to adhere to my original proposition, that, ordinarily speaking, 40,000 to 50,000 bees would be considered a large force.—ED.]

PRACTICE on a sufficiently large scale is worth more than theory. So when McEvoy has safely used 5000 hives that had contained foul brood, and the Root's have safely used beet sugar for 20 years, we may dismiss anxiety as to those two items. [I am sorry to demolish one of the settled facts; but Mr. Gilmore, that expert whom I met at Buffalo, tells me that, in all probability, we have been feeding *cane* sugar for the last ten or twenty years, and he is a beet-sugar man, you know. See editorial on this subject elsewhere.—ED.]

PROF. COOK pleads for the use of correct terms, and wants us to stop saying "worms" when talking about the larvæ of the bee-moth, which are not worms at all in the language of entomologists. My sympathies are with the professor as to using correct language, and I wish he would tell us what to say in place of "worms." The word is used so often that it would be rather expensive business to use in its place something with five times as many syllables, and say "larvæ of the bee-moth." Give us a correct name in one or two syllables, professor, and we'll all try to fall in line. And tell us, please, what to call "wormy" combs.

TAKING AWAY honey and filling up with sugar for winter is advised, p. 755. I don't know whether there is any thing in the objection, but some German writers strongly object that such feeding will lead to enfeeblement of constitution. [It has been orthodox teaching in this country, or at least it used to be, that sugar syrup was the very best winter food for bees. Indeed, some used to advocate extracting the honey out of the combs, even if the sugar syrup cost as much as the honey removed, pound for pound. Now, I ask for information: Do the Germans mean that feeding induces a drain on the vitality of the bees to ripen or invert the syrup? If they do, I do not recall that any one in this country has observed such weakness.—ED.]

THE DRONE is always a half-orphan, for his father is always dead before he is born. He never has a full sister, for the father of his mother's female children is never his father. In fact, he never has any father except his grandfather, and he never lives to see any of his children. [Perhaps you are right; but how do you *know* that the father of the drone's sister does not exert some potent influence on the drone himself? If so, is he not a full brother to the queen? I have to plead ignorance, as I did not hear the discussion at the Buffalo convention on this point, being out of the room at the time on committee work. Perhaps the Germans settled this long ago; but it used to be said,

and the statement may be true, that the drones from a queen that had never met a drone were not capable of performing the function Nature designed. Really, I do not see how the matter can be proven one way or the other.—ED.]

"SWARTHMORE" makes a "digression," p. 743, so interesting and at the same time so much at variance with generally accepted belief that one wants to ask how he knows. He says young queens will meet the drone 6 to 12 times, and lay the second day after becoming pregnant. [My, oh my! I must have failed to note that "digression" of Swarthmore's, or I should have challenged it. Such a statement, unless supported by the best of proof, borders very strongly on heresy—at least heresy in bee-lore. All our authorities have taught, supported by the best of evidence, that the queen meets the drone but once. If she meets him oftener than this, it is a new and interesting fact. But the other statement, that the queen may lay in two days after becoming pregnant, may not be so far wrong. If I remember correctly, I once saw one queen coming out of her hive, bearing visible evidence of fertilization (threadlike filament), and in two days afterward I have found her laying; but my records, I think, showed that queens usually take three or four.—ED.]

"I BELIEVE," says ye editor, page 742, "the best solution of the hive-cover problem will be two boards $\frac{3}{8}$ in. thick separated by a $\frac{3}{8}$ air-space." It does me a lot of good to hear that, for it's what I've urged this long time, and I'm now using covers unfit for use because the right cover is not yet on the market. But remember the upper and lower board must not have the grain running in the same direction. Rambler says the air-space "is necessary in hot locations." So it is in cold locations, being warmer in cold weather than a single board without the air-space. [Some days ago Mr. Calvert sent some samples of covers, such as I described on page 742, to a number of prominent bee-men, as well as dealers, located in various parts of the country. A good many of the replies have now been received; and nearly all favor a single-board cover in place of the double board with air-space. Indeed, the Excelsior cover with sloping sides and ridge-board is considered quite good enough. This is a surprise, as it seems to us that a double cover would be better on all accounts.—ED.]

W. H. H., *Orc.*—The action of the sun on the face of comb honey is to bleach or whiten rather than to discolor or turn to dirty yellow. There is plenty of evidence to prove that. The statement that the drones lay eggs is the veriest nonsense; and any man who goes to talking that way should be ignored and pitied. Life is too short to waste on any such discussion as that.

In Maurice Maeterlinck's "Life of the Bee" we have for at least once a book on bees that is thoroughly sound, very interesting, and one that every bee-keeper should have. It is by no means technical. It is beautifully written, and abounds in moral reflections and poetical digressions. It will appeal to every bee-keeper and bee-lover. One of the most remarkable passages in the book is a description of a rural scene in Normandy, France. Outwardly it seems like a little paradise, the natural surroundings being so beautiful that man can not improve them. Here we may expect a perfect state of society; but let us, with the writer, get a little nearer. He says:

Can you distinguish the song that blended so well with the whispering of the leaves? It is made up of abuse and insult; and when laughter bursts forth, it is due to an obscene remark some man or woman has made, to a jest at the expense of the weaker—of the hunchback unable to lift his load, the cripple they have knocked over, or the idiot whom they make their butt.

I have studied these people for many years. We are in Normandy; the soil is rich and easily tilled. Around this stack of corn there is rather more comfort than one would usually associate with a scene of this kind. The result is that most of the men, and many of the women, are alcoholic. Another poison also, which I need not name, corrodes the race. To that, the alcohol, are due the children whom you see there: the dwarf, the one with the hare-lip, the others who are knock-kneed, scrofulous, imbecile. All of them, men and women, young and old, have the ordinary vices of the peasant. They are brutal, suspicious, grasping, and envious; hypocrites, liars, and slanderers; inclined to petty, illicit profits, mean interpretations, and coarse flattery of the stronger. Necessity brings them together, and compels them to help each other; but the secret wish of every individual is to harm his neighbor as soon as this can be done without danger to himself. The one substantial pleasure of the village is procured by the sorrows of others. Should a great disaster befall one of them, it will long be the subject of secret, delighted comment among the rest. Every man watches his fellow, is jealous of him, detests and despises him.

The book is published by Dodd, Mead & Co., New York. Price \$1.40.

PACIFIC BEE JOURNAL.

Concerning a new honey-plant and the relative value of different strains of bees, I find the following editorial too interesting to admit of condensation:

Mr. G. M. Hawley, El Cajon, writes me concerning the *Grevillea robusta* as a honey-plant. He says that the flowers are fairly swimming with nectar. By shaking the tree he can wet the ground with the sweet liquid. He remarks that he never saw any thing comparable with it before. The bees have left white sage and buckwheat entirely, and are swarming on the grevillea blossoms. Mr. Hawley also comments on some very white comb honey which some of the bees are producing. These are from a certain queen which he imported from the East last season. The honey from the other bees is much darker. Examination shows that the first bees are gathering entirely from black sage, while the others are gathering their nectar from flowers that yield a darker honey. This black sage is from two to five miles distant. I have often noticed what Mr. Hawley has discovered, that different strains of bees often gather from different

sources. I have no doubt that the vigor of the bees and the relative length of tongues may account for this. Mr. Hawley says these new ones are elegant bees, light-colored, great workers, practically non-swarmers—indeed, the ideal bee for California.

I have also noticed that the grevillea is a very excellent honey-plant, while all our sages furnish honey that is unexcelled in excellence of color and flavor.

Touching the honey crop in California for this season, Mr. F. E. Brown, of Hanford, says:

Our honey crop is the lightest up to date that has been known for the past ten years. Bees as a rule are in the poorest condition for this season of the year that I have ever seen and we shall not have more than $\frac{1}{2}$ the usual yield. What little we have we are storing, not offering any thing to the market, as the price is too weak—believing that, as soon as the buyers find out the true condition of the output, prices will be restored to a reasonable rate.

The reports as to hundreds of carloads from the southern part of California seem to have been premature.

Temescal shipped 40 tons of honey this year—a splendid yield for a little place, surely. Isaiah Anderson, of that town, has, for the first time in 26 years, secured honey from bald sage.

R. A. Holley, foul-brood inspector of Ventura Co., reports having found about 625 colonies in that county afflicted with foul brood.

EDITORS AND OTHER PEOPLE.

BY ARTHUR C. MILLER.

Mr. Root:—In a recent editorial you referred to an article of mine which appeared in your issue for May 1st, and which contained some reflections on the authors of our text-books and the editors of our papers. Another communication by me in the *Review*, leading to subsequent articles by others, has evidently given the matter an interpretation which I never intended—that is, charging the editors with general ignorance.

It is a delicate task to point out to another his ignorance of a subject on which he has written, and perhaps it would have been more considerate had I taken it up in a personal letter, though, as things have developed, and as the publication of the article has set us all to doing a little introspection, it may not turn out to have been a serious error. But a very recent article in one of the papers evinces considerable bitterness of feeling against yourself, and in consequence I feel it necessary to write a few words of caution and explanation. I feel that this devolves upon me because I, figuratively, threw the first stone.

There are none too many contributors to our bee-journals who possess a broad education, and there appear to be some who do

possess a very limited power to grasp and liberally interpret what they read, or, to use a very expressive nautical phrase, appear unable to "take things by and large."

With the utmost care, a scholarly man is not always able so to express himself as to avoid misinterpretation by the latter class above referred to; and when a hurried or careless writer contributes an article it is pretty certain to be misinterpreted by some one. If every one will bear this in mind, and forbear to retort until after sober second thought, it will save much bitterness of feeling and also much valuable space in the papers.

It is neither feasible nor desirable that communications to the apicultural press should be confined to scholarly members of the profession; on the contrary, it is necessary to encourage the eminently practical though nonscholarly bee-keepers to contribute of their experience. But there is one thing most of us, I fear, are prone to do; and that is, to express our opinions on matters about which we have only the most superficial knowledge. Without entering into a discussion as to why, I may assert that an editor's remarks generally have greater weight than those of his contributors. When he writes on a subject about which he is ignorant, or at best but indifferently posted, and attaches that as a footnote to the article of some person who may be deeply learned in that of which he has written, the editor hurts his paper and himself, and inflicts a deep injury on the contributor. It is idle for any one to charge that an editor would willfully do this. It is not within the precincts of this article to say what an editor should do, whose contributions he should encourage, whose shut off; that is a matter personal to himself. But when he misleads us, or by a careless paragraph checks investigation of new lines or profitable researches in old, then he lays himself open to just criticism from the subscribers to his paper.

In our present scrutiny of the editors it should not be forgotten that there are other persons against whom the charge of ignorance, thoughtlessness, or spleen may perhaps often be more justly made. We, the contributors, are those other persons.

Both sides may well consider the oft repeated lines of Burns:

Oh wad some power the giftie gie us
To see oursel's as ithers see us!
It wad frae monie a blunder free us,
An' foolish notion.

[While it may be true that an editor's remarks have greater weight than those of a contributor, it by no means follows that he knows more. It is his business to select the best that is sent to him for publication, and then, as far as possible, direct discussion along profitable lines as best he can. If he errs in an expressed opinion let the contributor point out the mistake. I see nothing in the foregoing article to which an editor or contributor should object. It is all true.—ED.]

NOTES OF TRAVEL.

Bee-keepers' Paradise, Uvalde Co., Texas; the most Extensive Bee-keeper in that Paradise.

BY E. R. ROOT.

Before describing some of the great honey-plants of this wonderful portion of Texas, not over 40 miles square, where a whole trainload of honey has been shipped out in one season, and where one bee-keeper, Mr. D. M. Edwards, with 500 colonies, has secured as high as 75,000 lbs., I desire to introduce to you Mr. W. D. Bunting, the most extensive producer in that paradise of bees.

W. D. BUNTING.

Our friend is not over 31 or 32 years of age. I should say; and yet for all-around success in producing and handling a large number of colonies, no one, I believe, excels him. When Mr. Edwards and I drove up to his ranch we found him and his brother at the house, doing up the dishes, for they are "baching it." Just how much longer they propose to continue in this sort of way I can not say. This is not the first time I have run across bee-keepers doing housework; and while I enjoyed the meals most heartily that these fellows spread out when I had the pleasure of sitting at their boards, yet I most respectfully suggest to them that, if there are any "best girls" left, they join hands for better or for worse, and keep house in the good old orthodox style. I not only believe in Horace Greeley's advice, "Go west, young man," but I also believe

in A. I. R.'s injunction to all good prosperous young men, to win some good girl. Texas is full of them.

As Mr. Edwards and I neared the home of Mr. Bunting, I saw at once the secret of his success. Right along one side of the

my pocket kodak and took a snap shot, and the result is shown in the next cut.

Many and many a time have I run into splendid bee locations, and have seen beemen fairly buried in a honey-shower, but who were not ready to take the honey in

"THEY DO NOT PROPOSE TO BE CAUGHT NAPPING."

"MR. BUNTING AND HIS HELPERS STEPPED OUT IN FRONT WHILE I SNAPPED THE KODAK."

yard there were stacks and stacks of supers piled up and filled with empty combs, ready for the honey-flow. They did not propose to be caught napping; and to give you an idea of those piles of supers I whipped out

any thing save barrels, soap-boxes, and "any old thing." Well, these men seldom get a good crop of honey; and what they do get is hardly fit for market.

As we (Mr. Edwards and I) went into

the yard, having hitched our broncho, we met Mr. W. J. Bunting, and, a little later on, his brother, W. D. Bunting, who is the bee-keeper, and who, as I have said, has the reputation of being the most extensively engaged in the business of any one in the county. A little later on we went out into the apiary, located out in the open, in the sand, without a sign of shade except shade-boards. At this home yard there were between 130 and 140 colonies with a bee-range of one whole square mile, or 640 acres. Mr. Bunting has bought this mile around outright; he does not, therefore, as he says, expect any one to come in and divide up the profits of this apiary. The rest of his colonies are located on other square miles that he leases; so, taking it all in all, Mr. Bunting is shrewd enough (and it is an honest kind of shrewdness) to see that he has a bee-range for all his bees that is not encroached on by any one else. No wonder he gets the honey.

While we were talking we stepped into a one-story building, about 10×20 as nearly as I can remember, in size. As it so seldom rains in this portion of Texas during the bee season, a larger structure is rendered unnecessary. In this small building the Bunting boys do their uncapping and extracting. While we were near the building I requested Mr. Bunting and his helpers to step out in front while I snapped my kodak. The result is before you.

The man at the extreme left is W. D. Bunting; then next in order are W. J. Bunting, F. W. Miller, and D. M. Edwards. The latter will be recalled from our large picture in our previous issue, page 751.

The Bunting boys, while expert bee-keepers, are also expert with the rifle. They have a fine pack of hounds; and whenever they require a little recreation they go out for a hunt. Game is plentiful and the shooting good, and I was urgently invited to come out some time and go hunting. This was tempting, for I enjoy this kind of sport; and some day I hope I can go among our bee-friends, not only armed with a kodak, but with a good shotgun—the first named to shoot my bee-keeping friends, and the last to shoot at (not necessarily to bring down) any wild game in that country.

I had hoped to present in this issue some views of some of the principal honey-plants of this remarkable bee paradise; but as my space is already taken up, I shall have to defer doing so until our next issue. After that I will describe through two or three numbers another paradise of bees and bee-keepers in Arizona. But this paradise is also already overstocked. But, more anon.

WAX-PRESSES.

BY F. A. GEMMILL.

I observed with much pleasure in the Aug. 1st issue of GLEANINGS that you had illustrated and also listed the new Root German steam wax extractor, or press.

This machine, no doubt, is the result of your experiments with the various methods in vogue up to and since the publication and illustration of the articles on the subject of wax-extractors in GLEANINGS for April 1. As stated in correspondence with you at the time the articles appeared, I fully intended commenting on them, my own contribution included; but for want of time I did not manage to do so.

I will merely state now, in this connection, that I was quite sure that the best machine had not, up to the time mentioned, been produced, and had in mind something of my own, the principle being somewhat similar to what you now present; but whether it would be round, oval, square, or otherwise, I had not decided; but it was to combine the very important feature of strong pressure, which I see you approve. Do not, however, imagine you have stolen my thunder, Mr. Root. I am not yet an inventor, but merely one who has taken advantage of the suggestions and improvements of others.

I am, as you are aware, particularly interested in this branch of apiculture; and as I wish to show you and others how much I appreciate the new article, I am going, without delay, to experiment with one as soon as you can ship it to me.

I am quite satisfied that high pressure, while the mass is still in the machine, no matter whether melted by steam or boiling water, is the best method, all things considered, when such pressure can be brought to bear on a *good quantity* of the refuse at one time.

I need not here enumerate the reasons, as no doubt you yourselves are quite satisfied, or else you would not have gone to the expense you have done to manufacture something you have proved a good article, and which, in my humble opinion, will prove a great boon to bee-keepers generally.

On receipt of your press I will experiment with slumgum from the Boardman solar wax-extractor, and also from refuse which has been through my late hobby, the so-called Hatch-Gemmill press, and in every other way that I think will be of benefit to myself and the enlightenment of my brother bee-keepers living under any flag, particularly of America, Canada coming first, of course.

Stratford, Ont., Aug. 10.

OVERHEAD GRAPEVINE SHADE FOR THE APIARIST.

BY T. M. ADAMS.

I send by to-day's mail a view of my apiary and honey-house. It may be out of the common line to your readers to see bees shaded by scuppernong grapevines. The grape-arbor is 80 x 110 ft., 7 ft. high, and posts set 10 ft. apart each way. The hives stand in rows facing each other 10 ft. apart, with a walk at the back of each hive, 6 ft. wide. I use a wheelbarrow after the style of the Daisy, but it has two wheels instead

PLANTATION OF T. M. ADAMS, OAK HILL, FLORIDA.

of one, to overcome the danger of turning over. I use an incline into the honey-house, so I do not have to lift my honey. I have 112 hives in the garden. T. M. ADAMS.
Oak Hill, Fla.

[Somewhere about thirty years ago A. I. Root had high gravevine-trellises, something like those shown in the accompanying engraving; but these were subsequently abandoned for smaller ones, one trellis in front of each hive. But in Florida, the land of sand and sunshine, I should suppose that overhead trellises would be just the thing for the comfort of the apiarist as well as that of the bees.—Ed.]

DEVELOPMENT OF THE QUEEN.

From the Egg to the Hatched Queen.

BY DR. C. C. MILLER.

How long from the time the egg is laid till the larva hatches from it? How long from the laying of the egg to the sealing of the cell? How long from the laying of the egg to the emerging of the perfect queen? These are questions of interest, and at least one of them of much practical importance. There is considerable variation in the answers to the questions; and it is a little strange that, in comparing present views with those of fifty years ago, the time for the hatching of the egg has been lengthened, while the time for the emergence of the queen has been shortened.

In the *Am. Bee Journal* for 1861, p. 11, it is said, "The larvæ emerge from the eggs in the course of from 40 to 60 hours after these are laid—1½ to 2½ days. On p. 43: "Gundelach says that, in one instance, they were hatched within 24 hours after being laid. Berlepsch says he has known them to remain unhatched in the hive for 48 hours, and in one case more than 72 hours." Cheshire says the eggs hatch after 3 days. Cowan and others give 3 days. The ABC says "about 3 days or a little more."

A good many incidental observations lead me to believe that 3 days can not be far out of the way, and I can not understand how one or two days could have been believed right. It is not difficult to understand how a much longer time might occur, for there is good testimony to the effect that bees have kept eggs several days or a week longer than the usual time without hatching. It seems that something more than heat is required to hatch a bee's egg; and until the necessary attention is given the egg will remain unchanged, just as a hen's egg remains unchanged until the hen begins sitting on it. But under normal conditions the generally received three days of the present time may probably be accepted with safety.

"How long from the laying of the egg to the sealing of the cell?" Gundelach says, "Eight days elapse from the time the egg is laid till the cell is capped" (*Amer. Bee Journal*, 1861, p. 11). If we allow 3 days

in the egg state, that makes 5 days of feeding. Cheshire says, "after about 4 days of feeding." Dadant's Langstroth, p. 254, gives 6 days of feeding for the worker, and I suppose the same for the queen. Add to that 3 days for the egg, and we have 9 days from the laying of the egg to the sealing of the cell. Between 9 and 10 days is given in the ABC. Cowan says 8 days. Cook gives 8 days in cases of normal swarming.

The most important of the questions, from a practical standpoint, is, "How long from the laying of the egg to the emerging of the queen?" In the *Am. Bee Journal*, Vol. I., p. 199, in a chapter of the able series of articles on the Dzierzon theory, by the Baron of Berlepsch, after detailing some experiments he says: "These experiments show that the opinion generally entertained, that the queens emerge between the 17th and 18th day after the eggs are laid, is correct." The time of writing this, however, antedates the publication of the *Journal*, 1861; and elsewhere in general throughout the volume 16 days is accounted the proper time. Indeed, on page 266 Dzierzon gives a definite case in which the time was only 15 days. Sixteen days has of late years been accounted the orthodox term, I think, in general, in all the books excepting Cowan's, which gives 15 days. This year I thought I would refer the two latter questions to the bees, so as to get a positive answer in at least one case. July 18, at 10 A.M., I took from No. 85 its brood, leaving in the hive foundation and one comb containing some sealed brood, this comb having been kept for more than a week where there was no possibility of a queen laying in it. Four days later I gave this comb to No. 35, after having removed from No. 35 its queen and brood. July 26, at 10 A.M., when the oldest brood could not have been more than 8 days old, I found 20 sealed queen-cells on the comb, and seven unsealed. The proof is clear and positive that these 20 cells that were sealed contained larvæ not any more than 8 days from the laying of the egg. It is reasonable to suppose that the 7 unsealed cells contained younger larvæ. Desiring to save all the cells, I did not wait till any of the occupants were quite 15 days old from the laying of the egg, but opened the hive at 9:45 A.M., Aug. 2. I was doomed to disappointment, for seven young queens had already emerged.

In this case there could be no question. The cells were sealed in 8 days; and allowing three days in the egg, there were 5 days of feeding; and the queens emerged 15 days from the laying of the egg. These figures agree with those of Mr. Cowan. It should not for a minute be supposed that they admit of no variation. But it is probable that, under normal conditions, they may be relied upon as coming as near the average as any thing that can be given. The question may arise, why it is that 16 days for the full development of a queen has so generally been agreed upon. Many of the observations have been made, not

upon full colonies, but upon nuclei. Development will be retarded in nuclei. In the *Am. Bee Journal*, Vol. 1, page 143, father Langstroth reports a case in which a queen in a nucleus was 21 days in coming to maturity. In my early days of bee-keeping I knew no better than to have queens started in nuclei, and I had cases like that of father Langstroth. But in full colonies I have had many, many incidental proofs that 15 days was the limit. Ought we not to change our belief from 16 to 15?

Marengo, Ill.

[I had not a little difficulty in understanding your experiment; but finally Mr. F. W. L. Sladen, of Ripple Court, England, who is visiting us now, after studying on it a while finally got your meaning. You leave out one or two important points that left us, for the time being, in the dark. As we understand it, No. 85 was a normal colony with a laying queen; and this one comb containing some sealed brood was put into the hive for the queen to lay in. After she had been laying in it for four days, you gave it to queenless colony No. 35. Eight days from that date you found plenty of queen-cells. All of this is now plain.

The only criticism I have to offer is that you are relying for your data on one experiment only, and I should not think it would be wise to change the time from 16 to 15 days until other experiments have been made and are to the same effect.—ED.]

PREPARING BEES FOR WINTER.

"Hello! what are you doing with the bees this morning? I supposed all work with them was over for this year."

"In this you are mistaken, Mr. Smith; for, in my opinion, to reap the best results in wintering bees, September is the month in which they should be prepared for winter. This gives them a chance to get their stores for winter placed just where they wish them, so that, by the latter part of October, they are ready to go into that quiescent state which is always conducive to the best results."

"Well, this is something new to me, as I always thought November would do very well as to time to fix the bees for winter. But what do you do now by way of preparation?"

"The early preparation consists in opening each hive and seeing that each colony has a good queen, plenty of bees, and, most of all, plenty of stores."

"How much do you calculate for stores?"

"I allow 25 to 30 lbs. for each colony, which should be in the hive from September 10 to 25."

"But suppose some colonies do not have that much?"

"If there is not so much as this, feeding must be resorted to; and if we have to feed, it should be done in September, surely, in order that the bees may cap it over before cool or cold weather; for unsealed stores often sour and get thin during winter, thus causing disease. Multitudes of bees are lost each year, where feeding is put off till October and November, by being obliged to eat poor thin stores, this causing bee diarrhea on account of the bees not being able to hold their feces, because they can not evaporate all the water out of their food, it being so thin."

"But suppose the bees are still getting honey from the fields."

"In places where fall flowers abound, so that the bees are storing at this time of the year, of course they should need no feeding if the apiarist manages rightly."

"Do you think if *one* needed feeding *all* would?"

"This is to be ascertained by looking them over, as you see me doing. If I find some colonies are heavy with stores while others are light, the light ones can be fed by taking from the heavy; and if there are some light in stores after so equalizing, then we feed what still remain without a sufficient supply."

"Having all fixed as to stores, etc., what next is to be done? I wish to learn."

"The next thing to do is to put on the quilt, where such is used, and over this the sawdust cushion, or whatever packing material is used, thus tucking them nice, snug, and warm for winter."

"Do you use common enameled cloth for quilts?"

"I do not during winter. Some so use, but the most of our practical bee-keepers prefer some porous substance, like woolen blankets, pieces of old carpet, or something of that kind. For colonies to be left on summer stands, I use chaff hives, which chaff is left on in the hives both winter and summer. Over the tops of the frames I prefer a quilt, as just spoken of, and on top of the quilt a cushion two or three inches thick, made of common factory cotton cloth, filled with cork dust if possible; if not, then filled with dry basswood sawdust. Such cushions seem to keep the bees in better condition than any thing else I am acquainted with. The cork dust allows the moisture to pass up through it and out at the top of the hive, while the basswood sawdust will absorb nearly its bulk in water, so that either keeps all dry, warm, and nice."

"Do you do any thing else by way of preparation?"

"When winter sets in, a board about 8 or 10 inches wide should be set up slanting from the alighting-board to the hive, in front of the entrance, so as to keep out snow and cold winds, as well as to shade the front of the hive, where the hives face south, as they should during winter, so the bright

rays of the sun shall not entice the bees out when it is too cold for them to fly."

"Do you winter all your bees outdoors?"

"No. I prefer to winter a part of the bees in the cellar, for I like the idea of 'mixed wintering,' as by this plan no extreme loss is likely to occur; for a winter which is severe on the bees out of doors is generally good for cellar wintering."

"At what time do you set the bees in the cellar?"

"Somewhere about the middle of November. At any time between the 10th of November and the 1st of December, when the hives are dry, and free from frost. I set them in. If they have a flight along about this time I set them in the next day, if it does not rain so the hives are wet; and I find that this can be done, even if the weather is quite warm, much better than it can on a cold morning when the hives come up from their stands with a jar from having been frozen down."

"Do you give each hive a separate stand when in the cellar, or set them on a plank which will hold several hives?"

"Neither. A cellar stand is made by nailing four pieces of six-inch boards together so they shall be of the right size for a hive to rest on. This raises the first five six inches off the cellar bottom, and away from the damp air which is generally found right at the cellar bottom. The first five is set on this stand, when hives are piled on top of the first till the floor is reached, so that each stand holds from three to five hives, according to the depth of the cellar. In this way the cellar is filled (if I have colonies enough), except a passageway through the center to the back end, through which I pass every two or three weeks to see if all is right so far as temperature, mice, etc., are concerned. Otherwise they are left undisturbed during the winter."

"At what temperature should the cellar be kept?"

"Here practical bee-keepers differ; but I have had the best success with a temperature of from 43 to 45 degrees, or as near that as can be had. With a cellar in a bank, separate from any building, the keeping of the temperature at this point is quite easy; but with a cellar under a room or building it is not so easily done, for the changes from the outside have more effect on the interior of the cellar than they do where the cellar is wholly under ground in a bank or side hill. There are other things which might be said on this wintering subject; but with your consent we will leave them till December, when I am not so busy, when, if you will come over, we will talk them over more at length."

[This is good orthodox advice on wintering, and the average person will not go far amiss in following it. The four pieces nailed together to raise the hive off the cellar bottom make what we call a hive-stand. The same can be used outdoors as well.—*Ed.*]

BEE-STINGS AS A CURE FOR RHEUMATISM.

Along in the '70's I had fever and ague four years in succession, followed immediately by typhoid fever three years in succession. The third attack was very severe, and was combined with brain fever. It left me a wreck, unable to read, write, think, or work. Then when I got up from the last attack of typhoid, rheumatism set in, and I doctored for some time for it without relief. Being unable to work, or occupy myself mentally, I bought a hive of bees and spent many days sitting over it, taking out comb after comb to watch the bees at work and become acquainted with them. I do not think it was good for the bees, and it is needless to say that I became thoroughly acquainted with the business end of a good many of them, and thereby hangs my tale. I began, as soon as my head would allow it, to read your A B C book and GLEANINGS, and soon had calls from my neighbors to handle their bees for them. The result finally was, that my rheumatism left me, its poison being counteracted by that of the bees, and I had no return of it for eight years. By that time I had removed to Wisconsin, and dropped my bee work. The law of entire renovation of the system once in seven years removed the bee-poison from my system; and I then, having exposed myself to damps in a cave I was exploring, had another attack of rheumatism. This I cured by catching bees from the flowers on the lawn, and making them sting me on the wrists. I was then free for six years more, when I again had an attack which I cured in the same way.

I have not taken to bee-keeping since I entered the ministry, 14 years ago, being afraid that my love for it would make me spend too much time with them. But as I have more frequent touches of rheumatism as I grow older, I concluded I had better spend some time with bees than to nurse the rheumatism in bed for a week or two at a time. My theory in the matter is, that one needs to be constantly inoculated with bee-poison, to prevent the rheumatic poison from getting a hold.

When I told my doctor that bees had cured me, he said he had read of that cure in medical journals, but thought it a humbug. I have learned since that in Russia it is common to cure rheumatism with bee-stings. Of course, it may not be safe for every one to use this remedy; but I find it invaluable for myself; and several others who have used it at my suggestion have found relief by it.

Sussex, Wis.

L. P. HOLMES.

[Many thanks, dear brother, for your excellent testimonial in regard to the benefit

of the bee-sting poison. Now, while we have had quite a few communications, pointing almost as plainly to the fact that the poison of the bee-sting cured the rheumatism, is it not possible that the disease disappeared of itself? or that your change of employment, enthusiasm in studying bee culture, etc., had something to do with it? I should be very glad indeed to have it proved that bee-sting poison is such a valuable medicine; but I am sure you will excuse me for being slow to accept this while we have so many remedies for almost every thing. I hardly need mention Electropoise, absent healing, etc. Bee culture is certainly a healthful occupation, and very likely it is beneficial to many to *get stung* now and then. May God help us to get at the real truth in regard to all these wonderful things that are going on around about us.—A. I. R.]

INTRODUCING TO CROSS HYBRIDS THAT ARE
DISINCLINED TO ACCEPT A QUEEN; CON-
STRUCTION OF THE GERMAN
WAX-PRESS.

What is the best way to introduce a queen in a cross hybrid colony that has been queenless some little time, and refuses to start cells, and is positively queenless, with no laying workers?

I never saw queens disappear so mysteriously, or bees to swarm regardless of queen-cells and conditions of the brood-chamber, as the past season, with as good a flow of honey. The average nearly reached the hundred mark.

For the benefit of the slim-pocket bee-keeper who wishes to finker up a home-made wax-extractor, could you not give a better description of the construction of the wire basket and the apparatus that carries the wax to the outside of the machine?

Mohawk, N. Y.

C. R. MORIS.

[Ordinarily, if a colony refuses to accept a queen we naturally conclude that the bees have something which they regard as a queen. It may be a small virgin, or it may be a fertile worker. If the last named is present you will be likely to find eggs, and in some cases two or three of them in a cell. But if you *know positively* that the colony is queenless, and that it has no virgin, then I would take away every bit of brood of every sort, and keep it away until the bees fairly howl in distress. At the end of the second or third day give a smudge of tobacco smoke, and introduce a queen by the candy plan. But in 99 cases out of 100, where a colony refuses to accept a queen I should conclude that they were not queenless; and in any case the best advice I could give would be to give them a frame of unsealed larvæ or eggs. If they are certainly queenless they will start building cells. I never yet knew of a case where they would not do so under such circumstances. If they start queen-cups, let them alone and let them rear their own queen. I remember one colony once to which, for a matter of experiment, we introduced three

different queens, or attempted to do so, and each one of them was killed as soon as they released her. We finally gave them a frame of unsealed larvæ, when they started to build cells; but, strangely enough, after they reared a queen they killed her, because we found her balled and dead. We then gave the colony another frame of larvæ, and this time they raised a queen. Such colonies are very rare, and ordinarily it does not pay to fuss with them.

Regarding the disappearance of queens, this is something that happens very often in the fall. After a heavy season's duty, good laying queens will sometimes be found missing. They possibly use up their vitality, and die a natural death. In the case of colonies with virgin queens, the weather is usually so inclement that they do not get out; or if they do, they do not find drones. If they do not become fertilized, the bees are apt to destroy them.

Regarding the wax extractor, or press, it would be necessary to prepare an engraving showing the internal construction of our machine. We will have such a one prepared, and show it to our readers later. But it is doubtful whether the bee-keeper with a "slim pocket," unless a very good mechanic, could make a machine on the German plan. His better way is to make a Hatch-Gemmill wax-press, as described on p. 279, April 1st GLEANINGS, and render out his wax in an old iron kettle in connection with hot water. The Gemmill press can be made by any one.—Ed.]

DO BEES SWARM WHEN THEY HAVE UNSEAL-
ED BROOD? QUEENS BEING MATED
FROM UPPER STORIES.

1. Do bees ever swarm when there is *only* unsealed brood in the brood-nest, provided there is plenty of room for the bees above?

2. What is given as the reason for young queens intended to be mated from upper stories, as described in the A B C book, to "turn up missing"? Is it that the queens do not find their way back? or is it because they are killed by the bees coming up from below through the zinc? If it is the latter, why not use wire cloth and a nucleus of young bees above that?

C. S. FRITSCHEL.

Waverly, Iowa, Sept. 4.

1. Yes, sir, 'e; but when a swarm is newly hived, and is given a frame of unsealed brood, *it is not as liable* to swarm out again as if it were put on a frame of sealed brood or a frame of honey with starters or empty combs. I have had swarms repeatedly come out again after I had hived them, even when the hive contained unsealed brood. When a swarm persists in coming out thus, I would hive it and take it down cellar until the bees have a chance to "cool off." Then next morning set them in an entirely new location, and let them begin flying quietly before the usual hours for swarming.

2. Both of the reasons that you suggest

may have something to do with the matter, but the second one more so than the other. We, however, are making the plan work successfully by the use of wire cloth between the upper and lower stories instead of perforated zinc. Further particulars are given on p. 756 of last issue.—Ed.]

HONEY (?) FROM CORN.

Mr. Editor:—In GLEANINGS, page 702, it is denied that bees can gather any honey from maize (indian corn). If only the blossoms are considered, this may be true; but how about the sap? Unless my imagination is very much stronger than my judgment, the drops which are to be found in the morning along the edges of the corn leaves are decidedly sweet when the weather has not been too wet. That the weather here has been very wet is perhaps the reason that my bees have neglected the corn. Last year they crowded upon it during August. It is well known that much sugar (glucose, is it not?) is produced by the maize, and also that many plants give off sugar from their pores. Some plants of sultana, after standing in the dry air of our dining-room last winter, had the edges of their leaves fringed with little stalactites of sugar, about a quarter of an inch long.

All the above leads up to what I wish to say—that I can not see why bees should not be able to gather sweets from maize.

GEO. A. BATES.

Highwood, N. J., Sept. 5.

[But, even though those drops along the edges of the corn leaves are sweet, it could not be called honey or nectar.—Ed.]

A GOOD SUGGESTION ON THE USE OF PASTEBOARD FOR MAILING-CAGES FOR QUEENS.

Referring to the occasional failure of bees to gnaw the pasteboard from shipping-cages (page 669) I would suggest that this may be almost always prevented by simply touching the perforations with a little honey. This especially should be done if no moisture penetrates about the perforations from the candy within. I have not yet had a failure when this precaution has been taken.

Last autumn one of a number of queens received through the mails was thus imprisoned ten days after being placed in her new home. The bees would not (or, more likely, could not) tear away the dry pasteboard over the candy; yet this queen, to my surprise, instead of dying, as all her attendants but three had done, proved to be one of the most prolific of the lot, her bees storing over 70 pounds of surplus honey in June last.

J. F. S.

Aikin, Md., Aug. 20.

BEEES THAT WILL SPLIT RED-CLOVER COLLAR-TUBES.

I wrote you the fore part of last week in regard to the honey-flow here. Well, the flow has at this date not abated in the

least. I believe more honey came in on the 20th and 21st than in any other two days yet. They are working now on sweet clover and white, and just rolling the honey in. But I think still, as I said in my previous letter, that the bulk of the honey, until now, has been made from red clover. The bees would alight on a red-clover blow, and, by force, push their heads down to the honey by splitting the petal clear down to the nectar. I have seen them do this every time I have visited a red-clover field. Last year was the first time I ever saw it done; but no black bees were to be seen on red clover here. CHAUNCEY REYNOLDS.

Fremont, O., July 22.

[This splitting of the clover-tubes is something unusual, or at least I do not remember to have read of a case of it before. Has any one else observed it?—Ed.]

A SIMPLE METHOD FOR DETECTING GLUCOSE IN SYRUPS.

Mr. Root:—In looking over your journal I see that you have had a good time up in Michigan and Texas. In your articles on sugars you speak of *natural* glucose in sugar. I was not aware that there was any kind of glucose but that made from corn. My object in writing to you is to give you a test for glucose. I can detect it if there is only an ounce in a gallon of molasses. The way I test molasses is this: Take half a tumbler of water and one teaspoonful of the molasses and stir it up thoroughly, then add, say, one-tenth of a teaspoonful of tannin, or tannic acid as it is sometimes called. If there is any glucose it will turn the mixture *black*, and I suppose it will do it in honey. In the manufacture of glucose they have to use sulphuric acid to separate it from the corn. They get rid of all the acid they can, but there is always enough left to tell the tale. Try it on honey. I believe it will work.

H. HOUPP.

Birmingham, Ala., Sept. 2.

[If I understand chemistry rightly, there is a kind of glucose in natural honey, but it is not corn syrup, and its general character is very different from the artificial stuff. I am greatly obliged to you for your recipe for testing glucose in honey. I have no doubt it will work with honey just the same; for if tannic acid shows the presence of sulphuric acid, then it will show it in honey as well as in syrup.—Ed.]

POROSITY OF LOG GUMS.

The old-fashioned log gum was a hollowed-out section of a log (not a section of a hollow log with a board for a cover nailed over the top). Thus it will be seen the grain in the top of the hive ran up and down. The fact that bees did well in these old clumsy hives, particularly as regards wintering, was due to this very fact of grain running up and down. Reidenbach, in *Pfalzer Bienenzeitung*, makes the assertion that any ordinary board, such as our ordi-

nary bee-hives are made of, practically prevents all exchange of air, paint or no paint, while the top of a log gum is porous and allows an exchange of air. To prove the ventilating quality of the log gum he made the following experiment: He took a round piece of beech wood, 2 inches long, and cemented a small glass funnel to each end. By blowing into the end of one funnel the air could be felt coming from the end of the other, and a lighted candle could be blown out without difficulty. This experiment is pretty good proof of the porosity of timber, grain running lengthwise. If we assume that the propolis with which all old hives are thoroughly glazed and coated over cracks sufficiently during winter, the ventilation of the log gum would be assured. Reidenbach failed to make a similar experiment with the side of a log gum, but simply asserts that air does not penetrate it. It would not be difficult to cement the funnels to a straight board, one on each side exactly opposite another; then blow into the funnel on one side and note the effect on the other. If it is true that air may be forced through timber with grain running lengthwise but not crosswise, as in ordinary lumber, then paint can not play a very important part in the wintering problem of our bees, not taking into account the gluing-up of the interior of hives by the bees.

Naples, N. Y.

F. GREINER.

[I have read somewhere of similar experiments—how one could force air from one end of a log to the other; but I do not recall the details. But now the question naturally arises, "Would the propolis in the old log gum crack sufficiently during winter to allow of the escape of the moisture up into the wood?" I should have my doubts.—Ed.]

THIN AND EXTRA-THIN FOUNDATION FOR BROOD-NEST.

Mr. Editor:—Having been experimenting with extra-thin surplus foundation for brood-combs, I am able to give an additional fact in connection with this subject. This has been an exceedingly warm season—day after day continuing hot. The frames of foundation were placed at the outside of brood-chambers, and in the second story of comparatively weak colonies, with hives well ventilated. It required much care and attention to produce perfect comb. In two instances foundation broke from the weight of bees before time to fasten it thoroughly. I succeeded, however, in securing very fine comb, filled and capped to the bottom-bars; but I am of the opinion that, for practical use, ten sheets to the pound hits the nail about square on the head. One colony, weak in the spring, has built up 21 such extra-thin frames in the surplus chamber, nicely capped them, and is now filling a 32-section case of sections. The average bee-keeper—farmer—would not, nay, could not, give the necessary time to make extra-thin surplus a success. With nothing to do but

care for my bees I have concluded that the difference between ten sheets to the pound, and extra thin, does not compensate for the extra care required to succeed.

This season has not been considered extraordinarily good here; yet many of my colonies have exceeded 100 well-capped sections, and I hope some may crowd the 200 mark before the close. W. W. WHITNEY.

Kankakee, Ill., Aug. 19.

[Your experiments practically confirm our own, and I believe that your conclusion, so far as it relates to the average bee-keeper and farmer, is about correct; namely, that foundation as now made, running ten sheets to the pound, is thin enough. At the same time, if we succeed in carrying out what we have in our mind's eye—an extra-thin foundation, with natural bases having very thin delicate wires incorporated in it, about an inch apart—we shall be able to utilize a lighter weight of foundation, and which, I believe, in the end will be cheaper, per sheet, than the heavier grades we are now using; that is to say, it is not necessary to use wax to get strength when a much stronger article with less cost can be utilized; viz., fine iron wire. The problem now is, how to incorporate this delicate wire, about No. 40, in the septum of natural-base foundation.—Ed.]

ANOTHER HIVE-RABBIT AND HAND-CLEAT.

GLEANINGS of Aug. 15 came yesterday. The hive construction used by Mr. Schaeffle, page 680, attracted my attention. Mr. Thos. Chantry, of Meckling, S. D., told me of a plan used by H. P. Robie, of South Dakota, which (for those who will make their own hives) has great merit, as it provides a non-warpable rabbit and hand-hold combined. Its construction will be apparent from the cut.

We had a fair honey crop from the second crop of alfalfa, and bees are doing a little on sweet clover and red and white clovers.

It seems to me that Harry Howe's capping-box (pages 679, 680) is rather small. I have one which just suits me, 2x3 feet in size.

E. F. ATWATER.

Meridian, Idaho, Aug. 19.

[This idea is a very good one—yes, it is excellent; and it may be well for the manufacturers of bee-supplies to give it consideration. If enough of our subscribers like

this form of rabbit, we might think seriously of adopting it some time in the future. It accomplishes a double purpose, in that it makes an excellent hand-cleat for lifting the hive, and at the same time provides a very strong durable rabbit.

Mr. Atwater is a young bee-keeper, alive and progressive, who left South Dakota for a climate more congenial to his health. I had the pleasure of meeting him at another paradise for bees, Meridian, Idaho, on my recent trip, and shall have occasion later on to introduce him more formally to our readers.—ED.]

BRICKS FOR HIVE-RECORDS : HOW TO MAKE FEEDERS OUT OF TOMATO-CANS.

I use bricks for weights on my Dovetailed hives. The position of the brick lying on its side, bottom, or end indicates certain conditions of the hives and supers. A glance over the apiary shows what is to be done. I use the Alley drone and queen trap for catching the queen when swarming in my home apiary. I prefer it to clipping the queen.

A good home-made feeder for Dovetailed hives can be made out of 3-lb. peach or tomato cans. Cut the top off so as to fit a super; fit a rim of tin about an inch wide over the can, first placing a piece of cotton cloth over the can. Invert it over the brood-frames after filling, placing an empty super and cover on.

I am getting from 15 to 20 lbs. of water-white honey with snow-white capping to each colony of bees, from a wild plant that is common to the Red River Valley in this country. The honey is equal to the best, and is in good demand in the home market.

N. P. ASPINWALL.

Wabpeton, N. D., Aug. 10.

B. M. H., N. C.—It sometimes happens that comparatively well-marked Italian bees behave and act very much like blacks or even hybrids of a darker color. It is even possible to have three-banded Italians, and yet have them the worst kind of hybrids in other respects. For example, a five-banded queen mated to a one or two banded hybrid drone might give three-banded Italians, but bees that are fearfully cross. This has happened in my own personal knowledge; and that is one trouble with four and five banded bees, that it is not always possible to tell whether one has pure Italian stock when he breeds from them.

You can put combs of honey in the upper story and have the bees empty them out; but when doing this it is advisable to break open the cells with a curry-comb or wire hair-brush.

J. W. S., Miss.—A queen balled may live a few seconds or several hours. Sometimes the queen dies of suffocation, and at other times she is stung by some one of the workers in the ball. I have known of cases where a queen has been balled probably all day, and was still alive when released; but in that case the ball was usually small. In other cases I have seen queens that were balled and were stung to death inside of a minute. It is always advisable to get the queen out of the ball as soon as possible. The best way is to use a smoker, blowing light whiffs on the ball of bees until the queen is released. Another way is to drop the ball into a pail of water. As soon as the queen is released, take her out of the water and blow the drops off from her. As a general rule I would use the smoker.

H. M. D., N. C.—From what you write, it is evident it would have been better if you had attempted to transfer only one colony at a time. However, the work is now done, and it is now advisable to make the best of things. Before you attempt to introduce a queen into any of the hives, make sure that such hives are queenless. If there are no eggs, larva, nor a larva in any suspected hive, give a frame of such from one of the other hives, and then wait two days. If they build cells on this frame of eggs or larva, then you may be sure they are queenless, and you can then introduce a queen with safety; but do not attempt it otherwise. Yes, you can introduce queens from now till cold weather sets in; but the sooner the bees get a queen, if they do not already have one, the better. You can leave foundation or combs in a hive; but it must be absolutely bee-proof and moth-proof. Combs will be perfectly safe if they are shut up tight, either in a room or in a box, or even in a hive.

D. W., Ohio.—As to the best way to pack 200 pounds of extracted honey for freight shipment, it does not require any different package for a long distance than a short one. Honey is shipped across the continent, or exported to foreign countries, for the most part in 5-gallon square cans or barrels. In the case of either package, and for a short or long distance, care should be taken to see that the package is of first-class material, and that it is well put together. We have frequently seen shipments of honey in 5-gal. cans badly damaged because the box was so poorly nailed that it came apart in shipping, or honey lost from the barrels because the hoops were not well driven down. Only last year a barrel which was made of first-class material came to us without a drop of honey in it, and one head gone, simply because the iron hoops were not driven down as tightly as they should have been. I think there is no choice of packages for a long or short distance so far as the shipping is concerned, there being only a choice with the shipper and the consignee. I presume, of course, you do not want glass packages, as these are not usually shipped long distances.

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. L. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. F. Marks, Chapinville, N. Y.; J. M. Hambrecht, Escondido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

OUR subscription-list is larger than ever before in our history, and it is still growing at a rapid rate. The increase for months and months is the greatest we have ever known it. We desire to thank our friends for this liberal patronage. We are figuring on some pleasant surprises, and hope to present them a little later on.

THE reader's attention is called to the fact that we are now using a brand-new face of type. We have for some months back been trying to decide between a typesetting machine or continuing the use of hand type in the good old-fashioned way. After considerable investigation we have concluded that, for our purpose, hand type was the best adapted for our purpose.

DURING the Buffalo convention several of us made our headquarters at the home of Mr. Orel L. Hershiser, 361 Huntington Av. He is located within 20 minutes' walk of the Pan-American, and within one block of a street-car line. His terms are \$1.00 per day for lodging and breakfast; and any bee-keepers who yet expect to go to the big exposition will do well to put up with Mr. Hershiser, for he has a nice place.

I AM satisfied that, within ten or twenty years, the larger amount of honey will be produced west of the Mississippi. The advance of intensive agriculture will make bee-keeping less and less profitable in the East, and narrow it down to small apiaries. In the great West there is much of the country that can never be cultivated, but which will always yield plenty of honey from the natural growth of tree and plant indigenous to those localities. Then the irrigated regions are so rapidly increasing in area that bees can follow in the wake without in the least interfering with the agricultural interests.

OWING to the fact that we have just changed the dress of GLEANINGS we find it impossible to give a report or hardly a brief mention, in this issue, of the Buffalo convention, and of the joint meeting of the

American Bee-keepers' Association with the American Pomological Society. But I will say this: That both meetings were exceedingly enjoyable and profitable. At the joint session the fruit-men showed a decidedly liberal spirit toward the bee-men—so much so that it looks as if we do not need to argue the question any further, whether bees are necessary to the proper setting of many kinds of fruit. But, more anon.

WAX IN ORDINARY SLUMGUM.

HERBERT FREAS sends from St. Amos, Ontario, some samples of wax and also some slumgum. Of the latter he says that one man sent him 20 pounds which had been squeezed with an ordinary hand press. From this with a screw press he extracted 7 pounds 2 ounces of fairly well-colored wax. His residue resembled plug tobacco, and had about the same odor, only not so much so, as one smoker put it.

This is only one out of many instances showing how much good wax has been thrown away as so much dross from the old processes of rendering. A good press intelligently used may earn its weight in gold.

A MYSTERY EXPLAINED.

It will be remembered that, some little time ago, I reported that the bloom of the black-locust tree in Central California seemed to intoxicate or kill the bees, when the same bloom in Colorado would have no effect. After some little investigation it begins to appear that the dead and dying bees under the California black locust are due to the attack of the oriole, and not to the nectar in the blossoms. Mr. F. E. Brown writes me that this bird grabs the bee while it is partly covered with the petals of the locust blossoms, and then with a quick movement extracts the honey and drops the poor victim to crawl or squirm about on the ground. This clears up the mystery that was hard to explain, even on the basis of locality.

DISTINGUISHED VISITORS AT MEDINA.

WE have with us Mr. F. W. L. Sladen, of Ripple Court, England. He is one of the brightest and most intelligent bee-keepers in the British Isles. He is especially progressive, looking for that which is new and useful, and has made a trip to this country in order to study conditions of bee-keeping as they here exist. I expect to make further mention of his visit later. In the mean time I bespeak for him a most royal welcome from the American apiarists whom he may be able to visit in the brief time he may be here.

We have also had a visit from Mr. Udo Toepperwein, of San Antonio, Texas, and from Mr. G. F. Davidson, of Fairview, Texas. Both of these men attended the Buffalo convention, having been sent by their local State society as delegates to the big meeting. A little later on we had the pleasure

of a visit from Mr. and Mrs. Acklin and daughter, of St. Paul, Minn., also from the convention, and from Mr. Wm. Rohrig, of Tempe, Arizona, concerning whom I shall have more to say as I take up my line of travels. Mr. Rohrig had intended to attend the Buffalo convention; but owing to a railroad smashup he missed it by one day.

THE INTERESTS OF BEE AND PEAR MEN BEING HARMONIZED.

REGARDING the bee and pear-blight question in Central California, I am pleased to announce that many of the fruit-growers are coming to (or appear to be coming to) the conviction that the removal of the bees during the time the trees are in bloom will not materially abate the destructive effects of the pear-blight virus. It appears that the resolution passed by the bee-keepers in their convention, to move the bees out of the region of the pear-orchards during the time they were in bloom, required some ratifying action on the part of the fruit-men in filling out certain blanks. These blanks were laid before them some time ago, but nothing has been done. It is probably true that the pear-orchardists are not very sanguine as to the beneficial effects of the proposed removal, and many of them are fair men, and therefore disinclined to put the bee-keepers to this expense unnecessarily.

I talked with Prof. Waite (who, it will be remembered, originally declared the bees to be guilty), while in Buffalo, regarding this case. He was not sure the removal of the bees would bring about relief, owing to the presence of wild bees and numerous other insects that would, undoubtedly, spread the disease. He was sure, from extended experiments, that the bees were very necessary for the fertilization and proper maturing of the fruit, although he admitted that possibly conditions in California might be different. Prof. Waite is a careful, candid man, and a friend of the bees, and so much so that he deems it necessary to have a few colonies of them in his own pear-orchard, pear-blight or no pear-blight.

Taking every thing into consideration, it appears now there will be no conflicting of interests between the bee-keepers and pearmen; and it is hoped that the matter will rectify itself when the pear-blight disease loses its hold or "runs out," as we sincerely hope it may.

BEEET AND CANE SUGAR FOR BEES; FURTHER FACTS.

SOME little time ago, in referring to the use of beet and cane sugar for feeding bees I stated that I had been told that some of the Western canneries in Central California would not use beet sugar in putting up canned fruit—that they demanded cane. I have made inquiries since that time, and find that I misunderstood my informant. What he did say was that the grocers had learned that their customers who were canning particularly specified *cane* sugar, say-

ing they did not want the beet, because, when they put up fruit with beet sugar, the fruit spoiled; but that when it is put up with cane, it kept all right. But it now appears that no grocer can tell whether granulated sugar, properly refined, comes from beet or cane; and that, furthermore, not even a chemist can make the distinction. But since printing the article on page 757, from M. R. Gilmore, Superintendent of the American Beet-Sugar Association, at the Pan-American, I would state that I have had a talk with that gentleman; and I also had an interview with the representative of the cane-sugar exhibits. Both assured me that, when granulated sugar was properly refined, no one, be he scientist or farmer, could detect the difference—that they were identical; that there were certain unrefined beet sugars that had an odor. Is it not possible and even probable that some of the grocers referred to on the Pacific coast have been buying this cheap beet sugar, with the result that their customers have complained, and have since demanded and insisted on having what they *suppose* is a better sugar—the product of the cane?

I also learn from the beet and cane sugar representatives that during the last eight or ten years there has been comparatively little beet sugar on the market, when I supposed that quite the reverse was true; but they estimated that, during the past year, perhaps half of the sugar came from beet; and that, in the future, probably a much larger percentage will be from that source, because that vegetable can be produced over much larger areas of country than the cane. I shall have to confess, therefore, that in the ten or twenty years that I *supposed* we were using beet sugar we were probably using cane in the majority of instances.

It has been stated that many British bee-keepers prefer cane sugar to beet; but this is probably due to the fact that some beet sugar that finds its way into the British markets has not been properly refined; but now with the modern methods I think we may safely say that it makes no difference whether we use beet or cane sugar, provided it is *properly* refined.

In this connection I might state that there are on the market some white sugars that are adulterated with grape or corn sugar. Such sugar, if given to bees, undoubtedly would cause trouble. Therefore it behooves one to buy only the best granulated sugar. Don't waste any time in trying to learn its source. If it is granulated, and the grains are crystal and free, not lumping together, it is fit for a king as well as a bee-keeper.

AN UNMITIGATED SHAME; MORE MONSTROUS TALES ABOUT THE PRICES ON HONEY.

IN our last issue I stated that there had been gross exaggeration as to the honey crop of the southern counties of California; but at that time the inflation buyers claimed a maximum output of only 500 cars; but now

they have boosted it to 2000. As I have before stated, there seems to be a combination which has induced some of the daily papers to circulate such reports right and left. These glib falsifiers even go so far as to say, "This year's crop is estimated at 2000 cars;"* that while the prices last year ruled at 8½ cents, they are now down to less than half that, and they will probably have to go lower; and, as if to add insult to injury, they further state that Honolulu honey is being poured into California, and from there it is being sent east.

Such stories have a strong tendency to unsettle the market; and the animus back of it all is very apparent. The Western "bears" are anxious, of course, to have the prices go down. They know the crop is light; and then when they get the producers under their thumbs, they propose, no doubt, to scoop up the honey at a low figure, and then hold it until it advances.

Moreover the Eastern buyers are being scared; and one man, whose honesty is above reproach, wrote, asking for my private opinion. He is a large buyer; and he says *if* these stories are true he would not dare to take on any more honey. But it is evident that there are some other men in collusion with the Western buyers who are anxious that these inflated yarns shall be scattered, because, forsooth, it will depress the Eastern market as well. If, for example, there were 2000 cars in California, and as much more of Honolulu honey, it would be perfectly clear that a large portion of it would have to go east. But no one need be alarmed over the matter. The facts are, I doubt whether 50 cars could be scraped up and sent eastward from California, all told. The large baking concerns have laid in quite a stock—probably all they will require; for when the price was down they snapped up every bargain they could get hold of; but now producers with business heads on them are holding the rest of the crop back.

For some weeks back we have been having men on the Pacific coast make a careful canvass; and it is very evident that the crop is light in comparison with those of some of the big years. I do not believe there is an aggregation of responsible producers anywhere in California who would guarantee to-day to deliver more than 25 cars; and as nearly as we can estimate they are holding back till these exaggerated reports have run their course, and the market seeks its natural level. It is most unfortunate that these canards should have been started at this time; for this is usually the *very* season for disposing of honey, and it may take months to correct the false impression.

The situation in the East, briefly told, is this: There is actually less comb honey produced this year than last; and what there is, seems to be of an inferior grade.

*In its best years, indeed the very best, the entire crop has not exceeded 500 cars, and this year was only fair, with less than half the bees to get the honey.

We have advocated in these columns repeatedly that bee-keepers are running too much for extracted honey, in the East; at least, good comb honey sells all the way from 2½ to 3 times as much as extracted for a like quality. The market on extracted has become a little unsettled, owing to aforesaid "bears" who not only love honey but are contriving to get it for nothing. Yes, we are even told that the markets of the East were being glutted; but some of our friends went into some of those markets to buy honey in car lots. Do you believe they could get any? There was not any in sight. To state the matter fairly, there is probably a fair crop of extracted honey of Eastern production; and the prices on extracted will, therefore, rule about the same as last year, for the same season of the year. Colorado honey is evidently being held until the market recovers itself from these conflicting statements. The crop has been lighter, and so far offerings that have been very meager are as high as or higher than a year ago. There is only a moderate crop in Arizona—about 25 cars all told; and this is likewise being held for the same reason. Texas, one of the big honey States, will show up well; but much of its product will be marketed at home, while Arizona honey, a large portion of it, will have to be sold in the East.

Returning to California, latest advices show that the season has been a flat failure in the central portions of the State. Our men can not find more than three carloads all told. In Southern California it would be a large estimate to allow for 75 cars, if the general reports we get are true, and they come from men who are not inclined to "bull" the market. I know they are very close to the truth, because I was through much of that territory myself, and perhaps two-thirds of the crop had been harvested.

I shall send copies of this statement, prepared this day, to all the large buyers whom I believe to be reliable and honest, and will seek their advice and help. In the mean time, bee-keepers themselves can help us by scattering the real facts. Send to your own buyer a copy of this journal, marking this. If you want another copy, write us, and we will send you another, or as many as you can use.

Later.—Since the above was written one of the best bee-keepers in California who was sent by a San Francisco firm through the best honey country around Los Angeles, to get samples and quantities of honey, writes, after a careful canvass, that he could scarcely find all told 250 tons (20 cars), and that he is informed by reliable parties that the crop further south and east is very light. Moreover he finds that some of the buyers, in the papers, at Los Angeles, credit to a bee-keeper as many *cars* of honey as he has in tons. This may account for the outrageous exaggeration of the reports. Whether unintentionally or purposely, there is no excuse for it. As to prices, the honey is being held firm at 5 cents *or more*.

Children, obey your parents in the Lord; for this is right. Honor thy father and mother; which is the first commandment with promise; that it may be well with thee, and thou mayest live long on the earth. And, ye fathers, provoke not your children to wrath; but bring them up in the nurture and admonition of the Lord.—EPH. 6:1-4.

It was just about 25 years ago that I felt called to commence these Home Papers you are all more or less familiar with. It was when I first began to strive to lead a Christian life; and some way I was impressed that there was more need of the religion of the Lord Jesus Christ right in the family and home circle than almost anywhere else. When we get to such a point of Christian living that we can carry it out thoroughly right in the home, among those we are well acquainted with, and whom we meet in close contact every day of the year, then we are prepared to carry our religion out into the world, and hold it up as a beacon light. So it seemed to me 25 years ago; and I do not know but I feel more strongly in this direction now than I did then. My greatest temptations are many times, as I have told you, right in my own home. Before the great outside world we are under obligations to be gentle, courteous, and kind. A man who does not hesitate to let his bad feelings come out before company—well, to put it mildly, everybody is pained to see that he is but little of a gentleman. We are expected to be courteous and pleasant before company. When one is somebody's guest he would be a brute indeed if he made a fuss because things were not just to his liking. Now, then, why is it we can not show this same spirit in our own homes when the outside world is shut out? I suppose a good many think it is everybody's privilege to do as he pleases when he is at home; and perhaps a good many do not know why their lives are not fuller of happiness and joy, when the great trouble is they give vent to their feelings when they are inside the walls of their own home.

As a rule, children are kind and affectionate. The baby loves his mamma, and he loves the rest of the children, and is loved in return; and sometimes I have sadly wondered why this love for the baby could not keep right on. As he gets older he discovers that he can be a bad boy if he chooses. Unlovable traits creep in. He gets to be selfish and domineering, and learns to have no mercy on his tired mother. I think this must be a good deal the result of example. I fear he catches on to such things when his parents think he is too young to notice or to see what is going on. If this is true, how much does it behoove us to beware how *any sort* of bad example is set before the baby! Sometimes the home is a model one, or almost so, until the children get to be old enough to go

out into the rough outside world and bring in corruption.

My earliest recollections are of being one of a family of seven. With God-fearing parents our home was, as a rule, a happy one. But poor father, work as hard as he might, found difficulty in making both ends meet for that family of nine, parents and children. When my older brother was strong enough to work he got a job in a pottery in our town. His employers were infidels. They had no fear of God in their hearts; and with their infidelity they cherished vulgarity and impurity. O dear father and mother, I would never let the money that is offered be any argument in letting a child go out to work where he may have his whole life poisoned by infidelity and impurity, for they usually go together. My brother was bright, quick, and strong, and they offered him pretty good pay. Very soon he felt it was a fine thing to ridicule the faith of his parents. He is now dead and gone, and, of course, I should speak gently in referring to his mistakes; but in this case I think it was rather the mistake of the father than of the boy. The first poison that ever entered my young heart in the shape of impure thoughts came from stories related to me that he heard his employers tell. How well do I remember how my gentle Christian mother tried to counteract the effect of these new associates! My brother earned quite a little money, and clothed himself nicely, and helped to reduce the expenses of the family. But, oh dear me! who knows the load of trouble and sorrow that followed him almost if not quite through life as the consequence of evil associates at his tender age?

I have just returned from the Pan-American. I took a hurried trip through Midway. I am not either sorry or ashamed that I did so. I should like to have the fathers and mothers of our land see some of the Midway attractions. Before one tent where there was a great crowd of people, a man up on an elevated platform was using all his eloquence to get the people to come in and see their show. Every little while he would say something like this: "Now, if there is any *Sunday-school boy* in this crowd he had better go home. This is not any place for him; but if there is a boy here who wants to be a man, and learn something of the world, we can do him good."

As soon as I heard it I turned around and walked away as fast as I could conveniently. I wanted to have that speaker and all that crowd know that I belonged to the *Sunday-school*, and was expected to stand with it as long as God gives me breath. It is not Midway alone that indulges in this kind of talk and philosophy. I heard it at Omaha, and I heard the same lingo at a street fair in the neighboring town of Akron. These fellows seem to think this kind of talk helps them to secure a crowd. If they should discover that their crowd was dispersed instead of being drawn into the show by such talk, they would probably

give it up. Well, the average boy must sooner or later meet these things as he gets further and further away from his home, and away from his mother's teachings. I know how sadly the Christian mothers and the Christian sisters feel to see the son and the brother drawn down and away by these foolish and silly arguments. Oh how great is the need of grace from the great Father above in dealing with these young boys!

By accident I have recently had a glimpse of one home where the boy ridiculed his mother and sisters when they sought to keep him away from evil. It is sometimes a serious question as to what the mother shall do. Many mothers, and perhaps most of them, feel it a Christian duty to punish the boy in some way for deliberate disobedience. But some of these boys (of recent date), after having their minds poisoned by these things I have mentioned, have thought it a good joke to resist the gentle mother when she attempted to enforce punishment. Can one think of a sadder sight than a boy who exerts his strength to resist the feeble and perhaps broken-down mother—broken down by hard work—when she feels it a Christian duty to insist on obedience? You may suggest that at such a time the father should take the youngster in hand. Well, I presume that, as a rule, most fathers do insist that the boy shall obey the mother. Why, the boy's very life, or something more than life, depends on his being *made* to obey. Suppose he wants to go off with a bad crowd on Sunday, and the parents give way because he is too big and stout to be easily brought under subjection. Of course, the parents may overstep the limits. The time comes when the boy will often leave his home if he can not do as he pleases; but my opinion is that such a state of affairs seldom comes to pass where the boy is kindly and firmly taught obedience in his earlier years. I well remember one youngster who told his mother fairly and squarely that he was not going to school any more—he did not *care* for an education. The mother was weak and frail. I presume her boy could have picked her up and put her over the fence; but she declared then and there that he *would* obey her command, and go to school, and *keep on going*, and she did not call on the father to back her up either. She calculated on the hold she had obtained on the boy's mind and soul by years of faithful work. He made wry faces, and grumbled, and declared he would give up the books he hated, just as soon as he got a little older. But in a very little time he was able to stand alone and reason sensibly by himself. If there is any one thing in this world that makes him respect and almost reverence that mother, even to-day, it is because she insisted on his getting an education. Had he stopped going to school when he was determined on it, he would have been worse than crippled for life. Why, I am not sure but it would have been better for that boy to have lost both arms

and both feet than to have stopped his education at the very time he was determined to give it up. In both of the illustrations I have used, I have supposed that both the father and the mother were professing Christians, or at least that they were at agreement. Well, now, friends, let us suppose the husband does not sympathize with the wife in her efforts to keep the boy pure-minded, and away from evil associates. Suppose the husband just laughs, and seems to think it is a big joke when it is a question as to who will come out ahead—the boy bent on evil, or the mother who is trying to restrain him. I have seen a few such cases. Some of you will perhaps say the mother was partly to blame. Dear brother or sister, we are all more or less human, and it would be strange if, in the conflict, the mother did not exhibit some lack of wisdom or show some imperfection. Now the question confronts us, "What shall a Christian mother do under such circumstances?" She can not appeal to the neighbors, or at least until things get into a terribly bad shape; nor can she appeal to the law. Even an appeal to the pastor of the church might result in doing more harm than good. She must watch and pray. She must especially pray very hard, if I may use the expression, and *strive* very hard to be sure that no wrong spirit enters *her own* heart. Why, in a case like this it is almost beyond human power to do just exactly right. Let us always, under such circumstances, remember, however, that a soft answer turneth away wrath. I have had trials of my own of this kind. I do not mean, dear friends, trials where the dear wife would not help or was not in sympathy, but in matters outside of our own home. I have had difficulties to meet where I am sure I was right, and no one or almost no one would help me. Perhaps some soul was bent on going to ruin. His friends and relatives laughed about it. May the Lord be praised, there are shining examples round about me now to show that I, with *Jesus'* help, triumphed. Yes, and that after I had given up over and over again. "Be not weary in well doing, for in due time ye shall reap if ye faint not."

Right before the whole family is a poor place to settle difficulties of this kind. The husband and wife must, first of all, somewhere or somehow, *by themselves*, come to an agreement. Let the good wife take the opportunity when he is not contrary (if that is the right way to tell it), and plead with him, and get his promise to co-operate with her—if not to the extent she wishes, then get it as far as she can; also by private talks with the older members of the family, say with the boy's sisters. Let each one plead with him alone. Most boys at a tender age think it a fine thing to "show off," and they will often show a stubborn and contrary spirit before others that they would not think of when alone with no one else near. I know there are boys who seem to think the more the mother

does for them the more she ought to do. I know they sometimes get to be cold and unfeeling as well as rude. I do not know any remedy for this state of affairs but constant and loving prayer. Ask the dear Lord to point out to you opportunities to *win* the child's confidence and respect. Do not make the mistake of doing *every* thing for the boy. Teach him to be self-reliant and manly. I know of a poor widow who let her boy lounge on the streets while she dug her potatoes. She gave as a reason that if he dug them he chopped into them and spoiled so many she would rather do it herself. Now, this woman made the mistake of thinking more of her potatoes than she did of her boy—at least, that is the way I look at it. The boy should have been made to dig the potatoes, and dig them carefully and well, even if it cost ever so much more than the potatoes were worth. Boys will never be made *better* by letting them lounge on the streets instead of doing the work they ought to do.

Now, in closing let me say a word to these boys—that is, if they ever get hold of my writings. My young friends, very likely you will some time see that patient, hard-working, faithful mother laid in her coffin. When you do, you will think of your unkind words and acts to her. You will remember when you might have carried the wood or dug the potatoes for her when she was tired and worn out. You will, perhaps, recall every unkind speech you ever made to her. Just once in my life I resisted my good father's authority. I did not strike him, thank God, but I "talked back" as the boys call it. I had been among evil companions. They jeered me because I obeyed my father and never said a word back. They made me think it would be a fine thing if I had the courage to talk back to him. May God forgive me that one time. Father forgave it freely, for I asked forgiveness afterward; but when I sat by his bedside when he breathed his last, I thought of that one time, and I thought, too, that I would give almost every thing in this world if it had never happened. About the last work he did on earth was to dig potatoes. After he was gone it seemed to me it would be the greatest privilege that this world could offer if I had the chance once more to go and work by his side and help him when he was really too sick to work himself. But it is the mothers, I think, that bear the heaviest burdens. I have told you several times that Mrs. Root prefers to do her own work without any hired help; and every day I try to do some of the heavy work for her when I know what she wants done; but should she die first, I am sure that I shall regret—yes, bitterly regret—that I did not try *harder* to lift more of her burdens and to prevent her from getting so tired out as she does almost every day.

And finally, dear friends, there is nothing in this world that can so contribute to gentleness and Christian courtesy in the home, among all its members, as the love

of Christ Jesus. I know it is getting to be a good deal out of fashion to have family worship; but I am sure thousands of homes would be greatly benefited by having just a few words of Scripture read some time during the day before all the family. Let the children learn a text and repeat it at breakfast time, if you can not do better. Let the mother have her text too, and do not be in too much of a hurry; and, if it can be brought about, have the father or somebody else give thanks to God. One verse of some one of our many beautiful hymns is a grand thing to encourage gentleness and courtesy in the hearts of all. May God in his great mercy bless the words I have tried to speak to you; and may they be the means of letting the spirit of the dear Savior find a lodgingplace in homes where he has heretofore found no entrance or welcome.

It is really one of the fine arts to study out how you can get from place to place in traveling, especially in a strange land, and not waste time and money. You want all the aids you can possibly get hold of in the way of maps and time-tables, and study the railroads, ask questions of people you meet, look ahead and plan ahead; and even then you will find every little while, by looking back, where you could have saved dollars in money and days of time had you been thoroughly posted in regard to all the crooks and turns and queer combinations of methods of travel.

Before starting for home I wanted to visit Huntington, Putnam Co., Fla. I knew it was near Palatka, and I had planned to go to Palatka first and then find which way I would have to go to reach Huntington. Finally it occurred to me that Huntington might be on the very road I was going to take from Tampa to Palatka. Sure enough, so it was; and at just the last minute I saved going right past where I wanted to go, in the night, and being obliged to go back over the same ground the next day.

I reached Huntington about an hour before daylight. The station was dark, and, in fact, it was dark everywhere. It was pretty cold, too, for one who had been having malarial chills. I finally found a colored man camping out beside a fire in the open air. He pointed out a hotel, but he said he was afraid nobody lived there. Sure enough, it was the old story—pounding at the doors and getting no response. Then I went to the nearest dwelling, with a like result. I tried another and another. I began to feel homesick, discouraged, sick every way. When one who is sick tries day after day for a week or two to travel and meet friends, and appear as one is ex-

pected to do while visiting them, he is apt to get a severe attack of homesickness, and conclude wisely, under the circumstances, "there is no place like home." I felt especially sick of beautiful homes where nobody lived. Finally I spied a man carrying a lantern. I do not know but I said out loud, "Thank God, there is somebody in this place who has life enough to be up before daylight and to be getting ready for his work." This man took me to his home, gave me a warm place by the fire, and a warm breakfast. He informed me he was in the employ of Dr. Walker, and the latter is agent for and has charge of the large estate of Mrs. Huntington, who gave the town its name. Mr. Walker seems to be the busy man, or the business man of the town. He has charge of the sawmill, the store, of a small mill for making syrup from sugar cane, and he is not only doing every thing he can to open up the different industries of the place, but he is the prime mover in the church, Sunday-school, and all other Christian work. After I was introduced to him and was invited over to his beautiful home, I forgot most of my troubles, and partly forgot my chills.

Huntington, like the rest of Florida, is full of these strange and wonderful strong contrasts. It is my misfortune or good fortune, I hardly know which, to own 160 acres of land within a mile or two of the town of Huntington. In hunting up somebody to take me over there I ran into two or three beautiful orange-groves, pretty well laden with fruit, that promised a good crop for the coming season. I saw some kumquat-trees loaded down with little oranges that almost made one think of a gooseberry-bush but on a larger scale. The kumquat-trees and the orange-trees also, were protected by means of wooden boxes and canvas tents; but, if I am correctly informed, the money expended in canvas tents and wooden boxes and things of a like nature during the past winter were mostly a needless protection; for trees unprotected, at least as far north as Huntington, did just about as well as (and in some cases better than) those that have protection. Many of the people have taken heart as their trees begin to assume their proportions and set fruit as they did before the great freeze. I was much better pleased with the looks of my Florida ranch than I expected to be. The worst trouble is that it is about two miles from the station. Now, two miles in Ohio is near by; but when you come to pull a wagon through the Florida sand, it seems a long way off. There are beautiful lakes that run into my land, with water as clear as crystal, and grassy shores as green and inviting as anywhere in the world; yes, and some of the land along the lake would grow good crops of almost every thing that belongs to that region, including oranges and pineapples. Of course, the latter would have to have protection. At one time there were quite expensive buildings on the place; but now every thing is tumbled down and gone to

ruin. Here and there a plantation is under cultivation, and gives rich promise; but deserted houses and run-down farms are the rule.

Dr. Walker has not only a beautiful home, but a wonderful family. One of the girls tends the village store and postoffice. One of the boys has charge of the sawmill; a third one a sugar-cane mill, and soon with the various enterprises all over the place.

After leaving Palatka I made a brief stop at Lake City, where the experiment station is situated. A great deal of important work is being done here, and I was pleased to notice the improvement in many things, especially in their methods of thoroughly testing grasses, grains, fruits, and every thing else that promises to succeed in sunny Florida; but while the courteous attendant was showing me over the grounds I was taken with another of my chills, and so severely, that I went back to my hotel, and from there took the train for home.

Now, please do not get the impression from what I have written from my own experience that Florida is an unhealthy place. I met people everywhere who can live there, and be comfortable and happy, who can not stand the frosts and snows of the North; but I am inclined to think it is not the best place for one who is subject to malarial attacks.

I was obliged, although reluctantly, to break my appointment with our good friend J. M. Jenkins, of Wetumpka, Ala. I regretted this the more as he had promised to take me over to visit Booker T. Washington's industrial school for colored people.

Some of you may inquire if I found relief on getting back to Ohio. I reply that the frosty nights and the surroundings of home seemed to have for a time a beneficial effect; but just now, as I dictate this, September 17, I have my fur cap pulled down over my ears, and have on my winter flannels and a big overcoat, for I have just been having another spell of the chills. Mrs. Root and I are planning, however, to start day after to-morrow for a month's outing in the Traverse region of Michigan. This locality has seemed especially favorable for people troubled as I am.

As an apology for saying so much about myself and my infirmities, perhaps I should mention there are hundreds of afflicted people reading these travels; and I am constantly receiving inquiries as to which place I would advise for this, that, and the other malady. Dear friends, I am asking God day by day to guide and direct me in my efforts to help my fellow-men in their pursuit of health. If my money and my experience can be of benefit to you, they are freely given.

Convention Notice.

The annual meeting of the Northern Illinois Beekeepers' Association will be held in the court-house in Rockford, Ill., on Tuesday and Wednesday, Oct. 15 and 16, 1901.

B. KENNEDY, Sec.
Rockford, Ill., Rural Route, 5.

POTATOES FOR COOKING INSTEAD OF PLANTING.

I extract the following from the *Country Gentleman*. Of course, they were kind enough to send me the cut that goes along with it.

A vast amount of literature has been written in recent years on how potatoes should be planted and cultivated and sprayed in order to insure a large crop. It would seem that now attention might well be turned to the growing of potatoes which should possess good quality. This matter has been called forcibly to my attention during the past winter, when having occasion to purchase potatoes from the store. It has been almost impossible to secure any which possessed first-class cooking quality.

Most people know a good potato when they eat it, but all are not familiar with the conditions which produce the good qualities, and neither are they familiar with the inherent principles upon which quality depends. When a dish of nicely boiled potatoes is brought upon the table, we have come to recognize the white, flaky, mealy potato as one which will eat well, and we also recognize in the soggy, close-grained potato one of poor quality. Very much depends on the variety of potato grown for a variety which possesses good quality in one section may be very inferior in another. The Carman No. 3 is one of the best varieties grown in Central New York, but we have been informed that in Central Pennsylvania its quality is not good. The Rural New-Yorker No. 2 while one of the best yielders, has with us not much to recommend it in way of quality.

If potatoes then are to be grown for quality, care must be taken first to learn what varieties possess the best quality in the immediate section. But a small part of the problem is solved when the variety is de-

termined as well as another. This is not strictly true. Last October the potato crop at Cornell University was harvested and sold in the local market direct from the field for 60 cents per bushel. There was a greater demand for them than could be supplied. Farmers are to day bringing potatoes to the same market and selling them for 40 cents per bushel. We believe it will pay a farmer to make a special effort to grow good potatoes, and that in every market there can be created a demand for potatoes possessing special quality. Once this demand is created, it will not be satisfied with the watery, soggy potatoes grown upon clay soils, but there will be required a "mealy" dry potato, which when properly cooked is fit for a king.

I can indorse every word of the above. We grow potatoes for seed, or mainly so; but all the time we have orders for choice potatoes for cooking purposes only, and usually from people who say they are willing to pay a big price if they can only get some potatoes that will cook up dry and mealy, like the plateful in the picture. By the way, it has many times made me feel sad to see that our high-priced hotels and restaurants do not seem to have any comprehension of what a good potato is. We pay the biggest kind of prices, and almost every thing else is extra fine; but potatoes, especially the baked ones, are only once in a great while equal to what we find on the average farmer's table. Why, it just makes me hungry every time I look at that plate of potatoes. When I am sampling new varieties for quality, I often watch the process of cooking; that is, I get a potato on my plate, one like those seen in the picture, give it a sprinkle of salt and pepper, and then drop a little butter on it while the potato is hot; and is there in the whole round of food products

DISH OF POTATOES PROPERLY COOKED

termined upon; for the best variety when grown upon improper potato-soil, or with poor care, will be deficient in quality. The ideal soil for potatoes is the sandy or gravelly loam; and where such a soil is selected and the growing crop well cared for, no difficulty will be experienced. A large yield can be secured by growing the tubers in a clay or clay-loam soil, but they will not possess the best quality.

The per cent of starch and the per cent of dry matter in the tubers determine largely whether they will cook well. Starch is manufactured in the leaves of the plants, under the action of sunlight, and from the leaves it is conveyed to and stored in the tubers. If the "bugs" or "blight" or leaf flea-beetles are permitted to impair the vigor of the foliage the starch-manufacturing organs are weakened, and the quality of the tuber grown may suffer thereby.

The assertion is frequently made that it will not pay the farmer to grow potatoes for quality; that one po-

any thing more satisfying and delicious than a real nice potato?

Our friend is right in regard to soils. We get great yields on our clay grounds; but the quality—that is, when they are dug in the fall—is never equal to that of potatoes grown by my cousin in Summit Co., or in the sandy soil of Northern Michigan. Many of our potatoes, however, that are not first-class in the fall are all right in the spring. The New Craig is one of them. Another thing, certain potatoes will be nice one season and not the next. The Mills Prize, grown on our clay soil here in Medi-

na, one fall were almost if not quite equal to Freeman. The next year they were no better than other varieties. Almost any potato will be good if we can keep the foliage bright, green, and healthy until it comes to full maturity. Bugs, blight, and early frost are sure to spoil the quality, at least for a fall potato.

All things considered, one year after another, for our locality, I do not believe we have any thing better than the State of Maine; but, unfortunately, a great many strains of this seed are either mixed or run out. My neighbor Ballasch, mentioned in our issue for Sept. 1, has recently sent to the originator for seed of the State of Maine that is absolutely pure and up to standard. I have obtained from him two barrels for planting next season. Shall we not all work a little harder for quality as well as for quantity?

You will notice the writer in the *Country Gentleman* advocates cooking potatoes with the skins on—at least so the picture shows; and I believe this is generally the farmer's style, and perhaps the best one, although Mrs. Root has a plan of her own with pared potatoes. When they are done to the proper point she pours the water off and takes the kettle (not too many potatoes at one time) to the door where there is a fresh cool breeze, and gives the potatoes a good shaking (or bouncing) in the breeze. This is too get rid of the moisture so that the potato may roll up, and crack open dry and floury. I have several times seen her take potatoes that were watery and very inferior with the ordinary way of cooking, and make them not only look nice but taste nice. There is certainly quite a knack in making poor potatoes in cooking so as not only to make them presentable but really nice to eat.

THE TRAVERSE REGION OF NORTHERN MICHIGAN FOR SUFFERERS WITH ASTHMA.

I have the asthma so bad here that I am good for nothing and I am thinking of going up into the Traverse region to live. I have been up there twice, and find that, as long as I am there, I am all right; but as soon as I come home I go to wheezing again.

I want to find out all I can about bee-keeping up there.

Winchester, Ind., Aug. 26. F. M. HAYNES.

Friend H., I am glad to get your testimonial in regard to the Traverse region. There are a good many bee-keepers around there, but there have been only a few large reports of honey production. There is usually a steady flow of honey, enough to keep the bees from robbing, almost all through the warm months. During this season the willow-herb grows in great profusion, especially where the ground has been burned off. Although I am not afflicted with asthma, my experience so far as health is concerned is much like yours. As I write this, the 19th of September, I am preparing to go up there with Mrs. Root, for a month, mainly to see if my health will be better in that locality for a whole month at a time. Our ranch is close by what is call-

ed the Bingham Dock, about 2½ miles straight east of the town of Bingham, Leelanaw Co., Mich.

THE WHEEL OF TIME
for all time is the
Metal Wheel.
We make them in all sizes and varieties, TO FIT ANY AXLE. Any height, any width of tire desired. Our wheels are either direct or stagger spoke. Can FIT YOUR WAGON perfectly without change.
NO BREAKING DOWN,
No drying out. No resetting tires. Cheap because they endure. Send for catalogue and prices. Free upon request.
Electric Wheel Co.
Box 95 Quincy, Ills.

The Storm Proof
KING WIND MILL
produces 25 to 50% more net power from any kind of wind than any other mill name. Wheel being only 1 in. thick cuts the wind like a knife and is 400% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both pumping and power, back geared or direct stroke. Send for circulars and prices before you buy. Medina Mfg. Co., Box 11 Medina, O.

IT IS A FACT
that poultry pays a larger profit for the money invested than any other business; that anybody may make a success of it without long training or previous experience; that the **Reliable Incubators and Brooders** will give the best results in all cases. Our **20th Century Poultry Book** tells just why, and a hundred other things you should know. We mail the book for 10 cents. Write to-day. We have 115 yards of thoroughbred poultry.
RELIABLE INCUBATOR & BROODER CO., Box B-49, Quincy, Ill.

TREES Fruit and Ornamental
Shrubs, Plants, Seeds.
Best by 48 years test. Try us. Direct deal will save you money. Catalog free. Satisfaction guaranteed.
STORRS & HARRISON CO.,
Painesville, Ohio.

FREE Drug Book
They cost us \$2. each. 1500 illustrations. Contains over 15000 drugs, medicines, home remedies, flavoring extracts, tinctures, electric belts, paints, oils, etc. We save you 15 to 75% on any of them. Send the name of mailing book which amount is refunded on your first order. Send for book to-day, you may need medicine to-morrow. One can never tell. Better get it and keep it handy. We are "The Only Mail Order Drug House in the World."
Heller Chemical Co. Dept 40 Chicago, Ill.

STEEL WHEELS
for your **FARM WAGONS**
any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. Notices to rest. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address
EMPIRE MFG. CO., Quincy, Ill.

In writing, mention Gleanings.

WIDE-TIRED WHEELBARROWS, ETC.

I inclose a slip. Please give your careful attention. The past three months I've had to wheel a great deal of coal at the asylum, and I fully believe that something of that kind is what is needed.

Traverse City, Mich.

R. HADLEY.

The slip referred to reads as follows:

Wide-tired wagons are becoming common. Now why in the name of common sense don't some enterprising manufacturer give us a wide tired wheelbarrow, or a wide-tired wheel-hoe?

We sometimes wonder whether wheelbarrow-makers ever attempted to wheel one of their barrows over a bit of soft ground! We also wonder if these same makers ever stopped to think that the wheel might be placed further back so as to take most of the load-weight off from a man's arms?

We doubt whether any wheelbarrow-manufacturer ever did these things; for, if he had, he never would be content to go on year after year, turning out the same identical kind of barrow that came over in the Mayflower.

What's the sense of putting the wheel way in front so that nearly all the weight comes on a man's shoulders? Why not place the wheel near the center and more under the load?

And, too, are wide-tired wheels such unheard-of things that barrow-manufacturers need to be told of the advantages of using them?

Friend H., while in Florida I heard a great many inquiries for a wide-tired wheelbarrow. I suppose that, in the sandy soil of Northern Michigan, where you are, the conditions are much the same. Our Daisy wheelbarrow formerly had a tire 1½ inches wide. The last carload has tires 1¾ inches wide. If I am correct, soft sandy soils would need 2½ or 3 inches. But you will find a difficulty right here. Unless there is a wooden felloe inside of the tire, the soft sand or mud will run in and pile up on the inside of the wheel, and make it run harder than a narrow tire or one filled with wood so as to prevent sand or mud from running in as I have described. A tire 3 inches wide filled with wood makes a heavy, clumsy wheel. The same objection applies to wide-tired wagon-wheels made of thin sheet steel. A good many times they are heavier to draw than common wagons. There are wheelbarrows made where the load is thrown pretty well over the wheel; but if I am right they are not generally liked. It is true the wheel sustains the greater part of the load; but it sinks into the ground worse, and is not so easy to turn. If you had a chance to try all kinds of wheelbarrows, one after the other, I think you would decide the manufacturers of the Daisy have got it about as nearly right—that is, for most localities—as it can be made. You may not be aware that there has been a great deal of experimenting on this very thing.

ADVERTISING SECRETS, ETC.

In one of our agricultural papers I found a very enticing advertisement to the effect that a secret would be sent to any one on receipt of 25 cents, for making 3 lbs. of butter from 1 lb. The butter was to be of extra quality, and even a child could make it, and with this process any one could get rich, for butter will always sell anywhere in the world. I presume the editor of the

above paper never thought that he might send the 25 cents himself, and do his whole list of readers a big lot of good (?) without its costing them a cent. Perhaps he thought it was not his affair. But I decided, as soon as I saw the advertisement, that it was *my* affair, especially where I could help so many people for so small an investment. Here is the wonderful secret:

TO MAKE THREE POUNDS OF BUTTER FROM ONE POUND.

Take one pound of fresh churned butter (not salted), and put in suitable vessel while warm and soft. Add the yolks of three eggs. Mix well together, then add (slowly) warm sweet milk (just milked from the cow), and beat rapidly with a spoon as you add the milk. The butter and eggs will take up the milk slowly until you have three pounds of butter. When it quits taking up the milk as you pour it in, it is done. Then salt and mold as other butter. Not much working required. J. E. MOLLETTE, Ridgeley, Tenn.

May be the above is all right; but I can not help wondering what will happen to this eggy mixture if it should not be used up in three or four days during hot weather. Never mind. If it turns out all right you can send your thanks to me on a postal card.

15 Months for \$1.00!

To New Subscribers.

To any one not a subscriber to the weekly *American Bee Journal*, who sends us \$1.00, we will send it

From October 1, 1901, to the End of 1902,

or 15 months; which means over 60 copies. This we will do as long as we have back numbers left from Oct. 1; after that, the subscription will begin at the time it is received and continue to the end of 1902.

The Buffalo Convention Report

will appear *in full* in the *American Bee Journal*; that alone will be worth the subscription price for a year, to say nothing of the many other good things it contains each week. Better subscribe *now*. No matter what other bee-papers you are taking, you can not afford to be without the *o'dest*, and what many beekeepers say is *the best*. Ask for free sample copy, and also catalog of

I. J. Stringham, 105 Park Place, New York City.

Keeps in stock a full line of modern appliances for bee-keepers.

SQUARE CANS & SHIPPING-CASES.

One-pound square flint jars with corks, \$5 00 a gross. Cartons of a superior quality at a low price. Tested Italian queens, \$1 ; untested, 75c. Apiaries, Glen Cove, L. I. Catalog free.

I. J. Stringham, 105 Park Place, New York City.

LONGEVITY.

I have never made any great claim for the longevity of the Superior Stock of bees that I am selling, but from the reports that I am getting this year I am inclined to the belief that this quality ought to be added to the other desirable traits that they possess. Here is a sample of the letters that I get:

WARSAW, N. Y., Sept. 4, 1901.

Mr. W. Z. Hutchinson, Dear Sir:—I inclose \$2.00 for Review and queen. Three years ago I lost my breeding queen in the spring, and sent to you for one of your year-old queens. I expected to use her only one season, but she proved to be so much better than I expected that I kept on using her until I now have nearly my entire apiary requeened from your stock. I started last spring with 35 colonies, increased to 75, and have nearly 400 pounds of honey—not so bad for a village where 250 colonies are kept, besides there be-

ing other apiaries near by. One of my neighbor bee-keepers is so well pleased with my bees that he offered to trade apiaries with me, giving me *two swarms for one*, but I declined his offer. The bees of this queen have been trying hard for the last two or three months to supersede her, but I keep the cells cut out, and shall try hard to keep her over into her fifth year.

Resp. yours,

W. W. SHERWIN.

If you send in your order *at once* you will probably be able to get one of these queens this fall, and be all ready for business next spring, instead of being obliged to wait two or three months before your order can be filled.

Queen alone, \$1.50; queen and Review from *now* to the end of next year, only \$2.00.

W. Z. HUTCHINSON, Flint, Mich.

200 lbs. Fine Section Honey

is a big yield for any season, but especially so for a poor one. Read how it was done.

"I feel it my duty to let you know that the queen I received from you last spring broke the record in my apiary by storing over 200 lbs. of fine white section honey, which is fine work for this section of the country, and had it not been for the dry weather would have done much better. Dr. Mason said he could not get any white honey to speak of."

T. J. GRIGGS, care Standard Oil Co., Toledo, O.
Sept. 13, 1901.

Here's another: "During this summer bees from your queens have brought in a surplus of honey while others had to be fed." C. B. FRIERSON,

Sept. 6, 1901. Ceiba Mocha, Cuba.

Queens same stock as above, untested, 75 cts., six for \$4.00; dozen, \$7.50; set of warranted, \$1.00; six for \$5.00. Queens sent promptly.

J. B. CASE, Port Orange, Fla.

100 COLONIES leather-colored Italians for sale. My apiary took 1st premium for these this year at the Minnesota State Fair. All in standard 8 frame hives and Hoffman frames. Strong condition, and will guarantee not less than 20 lbs. sealed honey in each. Single colonies \$5.00, or the lot goes at \$4.00 each on car.

ANSSELL, Box 288, Milaca, Minn.

WANTED.—Fancy white honey in Danzenbaker sections; also buckwheat honey, comb and extracted. Send sample of extracted, and let us know how much you have, comb or extracted, and how put up, and price at which you will sell.

THE A. I. ROOT CO., Medina, Ohio.

FOR SALE.—Extracted honey in 60 lb. cans at 7½ cts. M. ISBELL, Norwich, N. Y.

FOR SALE.—8000 lbs. clover and basswood honey, mixed, in 60-lb. cans, as white as Michigan produces; good body and flavor; the best I ever produced in 26 years' bee-keeping. A free sample will convince you. Eight cts. per lb. at Carson City.

E. D. TOWNSEND, Remus, Mich.

FOR SALE.—5000 lbs. of clover honey; very nice; suitable for bottling. I want 7 cts. at my depot, and the party buying to furnish cans to put it in.

F. C. HUTCHINS, Massena Springs, N. Y.

FOR SALE.—Extracted honey, cans and kegs 7 to 8 cts. per lb. Sample, 5 cts. Comb honey, 13 to 14 cts. Beeswax wanted.

I. J. STRINGHAM, 105 Park Place, New York.

MISMATED and untested queens for 25c each; five for \$1.00. C. G. FENN, Washington, Conn.

Standard-Bred Queens!

Acme of Perfection; Not a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$4.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover hustlers of America. 75 cts. each; six for \$4.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

Fred W. Muth & Co., Cincinnati, Ohio.
South-west Corner Front and Walnut Streets.

LONE STAR APIARIES

Italian Queens.

Estab'd 1885. Prices of queens from imported mothers: Tested, \$1.50; 6, \$6.50; 12, \$12.00. Untested, 75c; 6, \$4.00; 12, \$7.00. Golden, same price. Select tested of either race, \$2.50 each. For a short time I will mail tested leather-colored queens at \$1.00.

Your money back if you are not satisfied. Address G. F. DAVIDSON & SONS, FAIRVIEW, TEX.

QUEENS Until Nov. 15th.

The best of warranted Italian queens, 50 cts. each, \$6.00 per dozen. We breed bees for business, and guarantee prolific queens, and fine honey-gatherers. Your orders will be promptly filled by return mail.

J. W. K. SHAW & CO., Loreauville, La.

TESTED QUEENS, 50c.

A few dozen fine young queens bred for bees, at 50c, W. F. STUART, Ottawa, Kans.

HONEY-CANS.

We still have a fair supply of 5-gallon honey-cans which we can furnish at prices listed in our catalog. We can also supply the smaller sizes, 1, 1/2 and 1/4 gallon, with 1 1/4-inch screw-caps. We have also some one-gallon cans with 2 1/2-inch caps. We have a fair supply also of Record seal-cover and raised-cover tin pails as listed in catalog at catalog prices.

GLASS HONEY-PACKAGES.

Of No. 25 1-lb. jars we have a good supply put up two dozen in partition boxes, but our supply in barrels is exhausted for the present, though we hope to have a further supply soon. We have also a good supply of No. 100 jars similar to No. 25, holding 14 oz. of honey both in barrels and boxes. Owing to our surplus stock of these two sizes in boxes we will sell them at 50 cents per gross advance over the price of the same in barrels, instead of \$1.00 advance, as listed in catalog, for a short time only. We have lately secured 10 gross of pint flint Mason jars, put up one dozen in a box which we can supply at 60 cts. per dozen; \$7.00 per gross. Our stock of quart Mason jars is getting very low, and we have still a good supply of 2 quart.

HONEY MARKET.

The market for comb honey continues good, and we are shipping on orders as fast as received, and have had to check our salesmen taking orders till we could see a larger supply in sight. We have engaged a car of comb honey to come early this month, from California. By next issue we hope to give definite announcement regarding it. We are getting 16 to 17 cts. for fancy white; 15 to 16 for No. 1 white, and other grades in proportion. We feel pretty well satisfied that prices of comb honey will not go higher, and they may be a little easier when bee keepers take the time to case their honey and get it to market. September and October are usually the best selling months. Market for extracted honey continues dull. Either the sale of extracted honey in bottles or other glass packages must be greatly stimulated or else a larger proportion of the best grades of honey should be stored in sections. Raise comb honey by all means if the conditions are favorable, and the quality of the honey good and suitable.

Special Notices by A. I. Root.

JERSEY WAKEFIELD CABBAGE SEED FOR COLD FRAME PLANTS.

When this reaches you it will be just about the right time in most localities to sow the seed in the open air in order to have plants ready at just about the right time to plant in cold-frames for cold-frame plants. With the protection of sashes only, without any bottom heat of any sort, the plants will be well rooted before severe cold weather sets in, and will winter all right in almost any place in the North. Price, for March's best selected stock seed, ounce, 20 cts.; 4 ounces, 75 cts.

FRUIT HARVESTING, STORING, AND MARKETING.

The above is the title of a new book just published by the O. Judd Co. It has often been said that it takes a smarter man to sell fruit at good prices after it is grown than it does to grow it; and I should not wonder if the statement were true. This book is intended to give all the assistance possible in teaching the beginner how to put his fruit up and how to sell it. It has 250 pages, and is amply illustrated. Price \$1.00. It can be mailed from this office. This book also considers very thoroughly the matter of storage; how to keep fruit as long as possible when there is a glutted market; all about packing and packages; how to put up apples so as to stand long shipments and bring the best prices. All sorts of tools are described and figured for the business. The book includes evaporating and canning; and, in short, it covers the whole subject from beginning to end of the saving of your fruit

from loss after you have got it grown, and also how to manage to get the best prices.

EARLY POTATOES FOR SEED.

Before another spring, all sorts of early potatoes will be held at exceedingly high prices, for the reason that growers north, south, east, and west, have been tempted to sell at the unusual prices offered for potatoes for table use. I have no idea what other dealers are expecting to ask; but we have so many applications for prices just now I have decided to offer such as we have, for the present, at the following prices:

Barrel, \$4.25; bushel, \$1.50; 1/2 bushel, 85 cts.; peck, 50 cts.; 1/2 peck, 35 cts.; 1 lb. by mail, 30 cts.; 3 lbs. by mail, 60 cts. This refers to early and extra early potatoes.

We have in stock, ready to ship, the following kinds:

Red and White Bliss Triumph, Early Ohio, Early Trumbull, Boyce, New Queen, Lee's Favorite, Freeman, and Twentieth Century. Seconds of all the above will be half price; but the half price does not apply to potatoes by mail. The Twentieth Century is put in order as being one of the latest of the extra early. This season, however, it grew potatoes as large as hens' eggs, as soon as any in the lot; but it did not arrive at maturity quite as soon as the Early Ohio and others. In making orders let it be understood that the above, firsts and seconds both, will run smaller than usual, and are not as clean and nice shaped, on account of the severe drouth. Please remember, also, I reserve the liberty of advancing the prices at any time when I find the prices from other seed-growers are going to be very much above the prices I have given. Until further notice prices of New Craig also will be as above. Prices on other late potatoes will be given later on.

Now Is the Time to Paint.

The Heller Chemical Co., of Chicago, Ill., whose advertisement appears on page 799 of this issue, have just issued one of the neatest paint catalogs ever sent through the mails. It contains a fine color page showing 60 distinct colors for out and inside painting; for barns, fences, floors, carriages, wagons, enamels, and stains. Besides this fine color selection there is a splendid line of brushes, also painters' supplies of all kinds. This company has been to a good deal of expense in getting up this catalog and making it complete in every detail. They have made it especially for the mail-order customers, and our readers will do well to send for one, especially if they have any painting to do this fall. Be sure when writing to ask for their paint catalog, and kindly mention this paper. These paints are all mixed and ready to put right on.

Wisconsin Farm Lands.

The best of farm lands can be obtained now in Marinette County, Wisconsin, on the Chi ago, Milwaukee & St. Paul Railway, at a low price and on very favorable terms. Wisconsin is noted for its fine crops, excellent markets, and healthful climate. Why rent a farm when you can buy one much cheaper than you can rent, and in a few years it will be your own property? For particulars address F. A. Miller, General Passenger Agent, Chicago, Milwaukee & St. Paul Railway, Chicago.

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" & cat. 288 free. W. Chester, Pa.

I have just received from you a copy of the A B C of Bee Culture, which I value at \$10 to any apiarist. Indeed, it is a "dandy." I now own two editions of this work. Please accept my thanks for the same

King Creek, Ky

DR. M. FIELDS

The untested clover queen, with her escorts, arrived safely last night, all alive and hearty. She is a very likely-looking insect, being as large as if not larger than any queen I have received through the mail. She is now under introduction. Bees are working nicely on swamp flowers, being able to do a good deal more than board themselves; they have no inclination to rob, which will, of course, help with the safe introduction of the queen just received.

GUS. DITTMER. AUGUSTA, WIS

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:

Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.

Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldens, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.
Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by fret-stain, or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 2.—Three-fourths of the total surface must be filled and sealed.
 No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1, Dark," etc.

CITY MARKETS.

SAN FRANCISCO.—Comb honey, 10@12 Extracted, water-white, 5½@6½; light amber, 4@5½; dark, 4@5. Beeswax, 25@27.
 Sept. 26 E. H. SCHAEFFLE, Murphys, Cal.

DETROIT.—Fancy white comb honey, 14@15; No. 1, 14; dark and amber, 11@12. Extracted white, 6½@7; dark and amber, 5@6 Beeswax 26@27.
 Oct. 21. M. H. HURT & SON, Bell Branch Mich.

BOSTON.—We quote our market as follows: Fancy white in cartons, 16; A No. 1, 15; No. 1 14½. Extracted white, 8½; light amber, 8, amber, 6½@7½.
 Sept. 27. BLAKE SCOTT & LEE, 31, 33 Commercial St., Boston, Mass.

CHICAGO.—There is a very good demand for No. 1 comb honey at 15 per lb.; that which will not grade No. 1 or fancy, sells at from 13@14; some small lots of fancy have brought more than 15 light amber selling at 12@13; dark honey of various grades range at from 10@11. Extracted sells fairly well at 5½@6½ for white, according to quality and flavor; white clover and basswood bringing 7; light amber, 5½@5¾; dark, 5@5½. Beeswax steady at 28. R. A. BURNETT & CO.,
 Oct. 10 199 South Water St., Chicago, Ill.

NEW YORK.—Demand for comb honey good; receipts not as plentiful as we should like to see them, particularly buckwheat. Comb honey is scarce, and slow in coming in. We quote you the market as follows: Fancy white clover, 1b; No. 1, 15a16; No. 2, 12@13; fancy buckwheat, 11@12; No. 1, 10@11; No. 2, 9@10. Extracted, white clover and basswood, 6@7; light amber, 5½@6; buckwheat, 5@5½. Beeswax is steady; fancy, 28@29, good average, 26½@27.
 Oct. 10. CHAS. ISRAEL & BROS., 486-8 Canal St., New York City.

CINCINNATI.—The supply for comb honey is rather short. Fancy Southern, 14½; fancy white clover sells 15@16. The market for extracted is rather dull. Dark sells for 5@5½; better grades from 6@7; extra fancy, 8@9. Beeswax, 27.
 Oct. 9. C. H. W. WEBER, Cincinnati, O.

MILWAUKEE.—The offerings of honey continue to be quite liberal from the fields of production, and the supply on this market is seemingly enough at this time to supply current demands; and values are fairly well sustained on choice qualities, and we will quote fancy white 1-lb. sections, 15@16; A No. 1, 14@15; No. 1, 13@14. amber honey not in demand, nominal, 12@13. Extracted white in barrels, kegs, or cans, 8@8½; amber, 7@7½. Beeswax, 25@30.

A. V. BISHOP & Co.,
 Oct. 10. 119 Buffalo St., Milwaukee, Wis.

ALBANY.—Honey market in good shape. Moderate receipts and good demand. White comb, fancy, 16; No. 1, 15; No. 2, 14@15; mixed, 14; buckwheat, comb, 12@13; extracted, light, 7@7½; mixed, 6½@7; buckwheat, 6@6½.
 Oct. 11. MCDUGAL & Co., Albany, N. Y.

SCHENECTADY.—We can report a very firm market. No. 1 clover selling at 15@16; No. 2, 13@14; buckwheat, 12@13. There is also quite a demand for extracted at 6@6½ for light, and 5@5½ for dark, in 150-pound kegs.
 Oct. 11. CHAS. MCCULLOCH, Schenectady, N. Y.

NEW YORK.—Arrivals of comb honey are good at present, and quality first-class. We quote fancy white at 14@15; No. 1 white, 13@14; mixed white, 11@12; buckwheat, 10. There is little doing in extracted honey—prices ruling from 5@6, according to quality. Beeswax dull at 27.

FRANCIS H. LEGGETT & Co.,
 Oct. 11. Franklin West Broadway, and Varick Sts., New York City

FOR SALE.—Extracted honey, cans and kegs 7 to 8 cts. per lb. Sample, 5 cts. Comb honey, 13 to 14 cts. Beeswax wanted.

I. J. STRINGHAM 105 Park Place, New York.

FOR SALE.—8000 lbs. clover and basswood honey, mixed, in 60-lb. cans, as white as Michigan produces; good body and flavor; the best I ever produced in 26 years' bee-keeping. A free sample will convince you. Eight cts. per lb. at Carson City.
 E. D. TOWNSEND, Remus, Mich.

WANTED.—Fancy white honey in Danz. sections, also buckwheat honey, comb and extracted. Send sample of extracted, and let us know how much you have, comb or extracted, and how put up, and price at which you will sell.
 THE A. I. ROOT CO.

WANTED.—Western honey in car lots, also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co., Front and Walnut Streets, Cincinnati, Ohio

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.
 THOS. C. STANLEY & SON, Fairfield, Ill.

FOR SALE.—30 to 35 cases heartsease honey, two cans to a case (120 lbs.); new cans; 8 cts. per pound.
 JOHN A. THORNTON, Lima, Ills.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.
 WM. MORRIS, Las Animas, Cal.

WANTED.—Comb honey and beeswax. State price delivered Cincinnati. C. H. W. WEBER, 2146 2148 Central Ave., Cincinnati, Ohio.

WANTED.—We are in the market for honey, either local or carlots commission or purchase. We especially desire Wisconsin basswood, and will be pleased to hear from that State. EVANS & TURNER, Town St., Cor. 4th, Columbus, Ohio.

WANTED.—Fancy and No. 1 white clover honey, one-pound sections, paper cartons preferred.
 BLAKE, SCOTT & LEE, 33 Commercial St., Boston, Mass.

We will be in the market for honey the coming season in carloads and less than carloads, and would be glad to hear from producers everywhere what they will have to offer.
 SEAVEY & FLARSHEIM, 1318-1324 Union Avenue, Kansas City, Mo.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

BEE - SUPPLIES!

**ROOT'S GOODS
AT
ROOT'S PRICES.**

C. H. W. Weber, Cincinnati, Ohio.
2146-2148 Central Ave.

A NEW AND COMPLETE stock for 1901 now on hand. I am The Root Company's representative for Cincinnati and surrounding territories. . . You save TIME and FREIGHT CHARGES by having goods shipped from here. Convenience of railroad facilities here enables me to do so. Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

GLEANINGS
 IN
BEE CULTURE

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

ILLUSTRATED SEMI-MONTHLY
 Published by THE A. ROOT CO.
 \$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

OCT. 15, 1901.

No. 20.

JUST AS I THOUGHT possible, F. B. Simpson did not mean in *Review* that long tongues were not of value *per se*. I find, however, that Hasty understood him just as I did; and when as bright a chap as Hasty gets from a sentence a meaning other than the intended one, there must have been some reckless use of the English language.

ONE OF THE ITEMS of September preparation for winter, given on p. 785, is to see that each colony has a good queen. Isn't it rather late for that, Bro. Doolittle? A good many of my colonies cease to rear brood in September. [Why late? It is a common practice with us, away up into October. Much of September with us is very warm. Sometimes we then have the hottest days in the year. Perhaps your locality is much colder.—Ed.]

"DO THE GERMANS mean that feeding induces a drain on the vitality of the bees to ripen or invert the syrup?" is the question asked, p. 778. I think that is not the idea, but that the syrup lacks some elements contained in honey necessary to vigor of constitution. [If this is so, then the experience and practice of American apiarists seem to be quite the opposite of those in Germany. Of all things that were settled, I supposed it was that good sugar syrup, fed thin, and properly ripened, was a better food than any honey.—Ed.]

SOMETIMES I find an article in a journal which is too much of a puzzle for me to make out its meaning, and I feel out of patience with the writer, who might easily have made all clear if he had not omitted one or two additional points. It now seems that I have sinned in that way myself, for the astute editor of GLEANINGS could not make out my meaning, page 785, till he got one of our good British cousins to help him. I suggest that hereafter such articles be re-

turned to the writers to have the puzzles unpuzzled.

I INDORSE Arthur C. Miller when he says, page 780, "It is necessary to encourage the eminently practical though non-scholarly bee-keepers to contribute of their experience." And I suspect most of our bee-journals are trying to do that. [That is what GLEANINGS is trying to do. Indeed, I have more than once rejected articles from scientific men that, in my judgment, were too scientific, too theoretical, or too something, to be useful to the plain every-day bee-keeper who keeps bees for the money or for the bread and butter he can get out of them. In saying this I do not wish to give the impression that we have no use for scientific articles.—Ed.]

A QUESTION that will some of these days need to be supplied with a new answer is this: "What is a tested queen?" The answer *has been*, "A queen whose three-banded workers show that she is pure Italian in origin and mating." But since the entrance of five-banders, as the editor correctly says, p. 790, there may be black blood in a queen which produces three-banded workers. That knocks out the old answer. What shall the revised answer be? Don't ask me. I don't know. [This is one objection to the rearing of five-banded bees. But that objection would have no weight with me providing I could see in color greater longevity or more pounds of honey.—Ed.]

"RIDICULOUS" is the label that F. B. Simpson, in *Review*, puts on the notion that keeping a queen in a nucleus will beget longevity in her offspring. Sure. But it had escaped me that any one advocated such a notion. He says his breeders must do their duty in a full-sized hive, so he can compare them with others. All right, F. B.; but after a queen has fully established her reputation I like to give her a light job so as to keep her as long as possible. A queen I'm now trying to winter was born in 1897. After doing extra work during four years I felt she would be insulted if I had said, "Now let's see what kind of stuff's in you,"

so I gave her a soft job for 1901. [You are doing with your breeder just the very thing that we are doing with our best queen.—ED.]

WHAT YOU SAY on page 778 in that last Straw, Mr. Editor, squints in the direction of saying that every shoe must be made on the same last. I protest most earnestly against being obliged to take something I don't want, just because it is more convenient for the manufacturers. Charge what you will for the extra trouble of making more than one kind, but give those of us who want it and are willing to pay for it a cover that will not leak, warp, or twist, and that will be warmer in winter and cooler in summer than a single-board cover. [I might have added that the Root Co. proposes, in spite of the universal preference of the dealers for the Excelsior single-thickness cover, to furnish, on option, two double-board covers, one a gable and the other a simon-pure Dr. C. C. Miller double-tilt cover with paper. There, now, don't you dare say the Root Co. is trying to make every shoe fit the same last. But we feel that we are compelled to make a poorer cover, in our judgment, "regular," until we can convince the trade that the double air-space one is better. It is simply a matter of education and time.—ED.]

"I HAVE SEEN queens that were balled and were stung to death inside of a minute," says the editor, p. 790. Did you ever know such a speedy death when you let the ball entirely alone, Mr. Editor? I never did. But holding a smoker close to the ball, and blowing *hot* smoke upon it, will prove instant death to the queen, and so may punching at the ball to try to get the queen out by force. [I can not remember that a queen was ever killed inside of one minute when the ball was left alone; but the one-minute execution referred to was by Cyprians. These bees, instead of buzzing around one's face, will make a shot straight from the comb, delivering the sting in one's face at the instant of contact; and, as nearly as I can remember, when they ball the queen they are inclined to make short work of her also. But, say—I did not recommend holding the smoker close to the ball of bees. I used the term "blowing light whiffs" of smoke on the ball. Our neighbor, Mr. Harrington, once had a queen, however, that would fight her way through any ball of bees we ever saw. For the sake of experiment he dropped her repeatedly into a number of different queenless colonies. If the bees commenced to ball her she would fight like a little tiger. In a day or two afterward we would find her reigning supreme, without let or hindrance.—ED.]

I ASK, page 785, whether we ought not to take 15 days instead of 16 as the time from the laying of the egg to the emerging of the queen. And then that exasperating editor says, "You are relying for your data on one experiment only," when I had just said, "In full colonies I have had many,

many incidental proofs that 15 days was the limit." Besides, do you think a man like Cowan would brush aside all the traditions of the fathers, and announce a new time-limit with nothing but data secured from a single experiment on which to base his belief? Aroynt thee! [Yes, you may be right; but I am not going to "aroynt" just yet, for you say you had many *incidental* proofs—italics mine. When we come to split hairs, or get down to the exact day, should not the proof be something more than incidental? Should it not be clear and positive? I admit the statement of Mr. T. W. Cowan, supposing it to have been based on many experiments, goes a long way; and for the time being, unless I get better proof, the next edition of the ABC will have the figures 15 instead of 16.—ED.]

YOU ASK, Mr. Editor, p. 778, how I know that the father of the drone's sister does not exert some potent influence on the drone himself. I may answer that Dzierzon, who at 90 is still vigorous in intellect, has always held that the drone is of the same blood as his mother. I do not think, however, that the drone with which a queen mates is entirely without influence upon her male progeny. If my memory is not at fault, there are cases on record in which a white woman bore a child to a negro, and afterward to a white man, and the second child showed distinct traces of negro blood. But I think the influence is so exceptional or so slight, that, in actual practice, we may say that a drone is not affected by the drone with which his mother mated. [Another fact, taken in this connection, is somewhat interesting. I have been told that, if a rooster of a Black Langshan, Black Minorca, or any pure-blooded black stock, gets into a pen of pure White Leghorn hens, or any other white stock, even for one day, that sittings of eggs from these hens will for many months afterward show chickens with black feathers, showing that the male of one variety can exert an influence long afterward, even though other males have been among the fowls for months. Notwithstanding Dzierzon has contributed to the world one of the most interesting facts in nature, neither he nor any other great man is always infallible; so I should be inclined to take the view that a drone was at least part brother to his worker sisters of the same mother.—ED.]

"BREED FROM THE BEST" has been the watchword with myself as well as others. F. B. Simpson, in *Review*, says we're off. Given 5 queens from the same mother, which 5 queens uniformly yield about 10 lbs. more than the average, and another 5 from another mother, which 5 zigzag all around from 35 below to 90 above the average, and he will breed from the first 5 rather than from the one that runs 90 above the average. Now if F. B. will tell us, as I'm afraid he will, that all intelligent breeders of note agree with him, I'll promptly 'bout face and stand in line with him; but if he's only

giving his own opinion, I've a choice assortment of abusive epithets laid up for him, and a lot of brickbats to fling at his battlements. I ought to explain that he reasons that the one that runs 90 above the average is a freak that will not give uniform results, while the 5 of the other mother, being uniform, may be relied upon for future results. [The recommendation of F. B. Simpson is one that we have been carrying out in practice for several years. A breeder whose queens are irregular, zigzagging from one extreme to the other, is one that will cause complaints from customers; but one that will give uniform results in markings, in prolificness, in gentleness, in every one of her daughters, is the one that we select for a breeder providing, of course, that these daughters all score a high average; but if Mr. S. or any one else can find a mother, the bees of whose daughters will average in number of pounds of honey about the same under like conditions—well, we can not do it. The daughters of our best breeder nearly all score well in honey, but there is quite a variation. While the poorest will be no worse than the average, the best will be considerably better. — Ed.]

Green were the leaves at sunset;
 To-day they're sear and red;
 Like men they play their proper part,
 Then fall to earthy bed.

AMERICAN BEE JOURNAL.

Mr. York is about to publish the proceedings of the late Buffalo convention. As it consisted entirely of discussions on live questions it is likely that these minutes will be of unusual interest to bee-keepers. No essays were read. Don't miss a copy.

In regard to the spread of foul brood in California, Mr. J. M. Hambaugh writes an article of so much interest and importance that I give herewith most of it. The reader is requested to keep in mind that, a month ago, I gave the views of a French writer who deprecated the use of movable frames as being conducive to the spread of foul brood. Mr. Hambaugh takes the exact opposite, and his position seems sound.

Here in this salubrious clime, where every month in the year, and almost every day in the year, bees can go forth in quest of pollen and nectar, opens opportunity for the spread of infectious diseases; and this, coupled with the wild waste of rocky cliffs, canyons, and wooded districts, furnishes hiding-places for bees that can wreak and fester in disease unmolested. It is hard for the wide-awake bee keeper to overcome these dangers beyond his reach; but there is a danger of far greater magnitude right at his very door, that he needs to recognize, and which needs a cure in the form of a little legislation.

Here is Mr. A, a practical bee-keeper, with all his combs throughout his entire apiary movable, and ac-

cessible at any time for inspection and in appropriate condition to battle against any disease that may arise. Mr. B, his next door neighbor, is of the slipshod, go-as-you-please make-up, and allows his bees to build their combs at haphazard, half-moons and all shapes that may suit their fancy, in their brood-chambers; and the consequence is, he is locking the door against all knowledge or treatment of any disease that is likely to turn up; he is also in shape to be (as it were) hugging an adder to receive its fatal sting and also to dispense its venom among his neighbors. When there is such a deadly foe as foul brood abroad in the land, these inaccessible hives are a veritable death-trap, and so far as inspectors are concerned, they are simply barren from investigation, save what the exterior may reveal.

In our route through the country these troubles are so manifest, and there is such a universal cry against their toleration, that it seems to me a very easy matter to have a law placed upon our statutes, compelling every one who keeps bees to have them upon movable combs, built in movable frames, and, by so doing, minimize the chances for contagious diseases, besides doing away with the old slipshod way of keeping bees. We believe that every wide-awake bee keeper in the land should cry down the box-hive station-ery-comb evil until every one who dares to keep bees would understand that to do so means they must be up in movable combs, or a penalty of a fine incurred.

We also believe that a little further protection is needed to the bee keeper, by statute enactment; and that is, when a bee-keeper contemplates moving from one location to another he should have a certificate from a lawfully appointed inspector, the said certificate to be an assurance that each and every colony is free from all infectious or contagious disease, otherwise let it be a punishable offense to remove them from their old location.

Regarding the sparing of bees' lives, Mr. Hasty says:

There gets afloat at times a considerable amount of sentimental nonsense and unwisdom, which would fain make us more careful of insect life than the Creator is himself, and which would make apiculture impossible before we got to its logical conclusion.

Dr. Miller says, in reply to a correspondent:

Don't think for a minute of using even the smallest proportion of sugar to finish sections. Just now about the greatest foe bee-keepers have to fight is adulteration; and for them to band together in a national association to fight it, and then feed sugar themselves to get sections finished, would be about as consistent as is the Christian man who prays 361 days in the year for the downfall of the Sabon, and then on the 355th day votes to support it. If you want to have sections finished, use diluted honey. Very few, however, have been able to make it pay. Better sell, at reduced price, sections that are not finished, and let the bees empty out any that are less than half full.

Pile up outdoors supers of sections you want bees to empty, and allow entrance for only one or two bees at a time. If you allow a larger entrance, the bees will tear the combs to pieces.

PROGRES APICOLE.

The following is recommended. For want of a better name we will call them "honey jimeracks." They are doubtless good in both French and English: Mix together one quart of honey, one quart of powdered sugar, one quart of fresh butter, and the juice of two oranges. Incorporate with this, slowly, a little fine wheat flour, and make a dough of it thick enough to be rolled out; knead it, and beat it for several minutes, and finally roll it out with a rolling-pin in layers about half an inch thick. Cut out round cakes, like biscuit, and bake them on a light plate, greased with butter, with moderate heat.

MOVING BEES.

Full Particulars; How to Ventilate the Entrance; How to Avoid Accidents.

BY R. F. HOLTERMANN,

Formerly Editor of the *Canadian Bee Journal*

One hears and sees a good deal of late in connection with the question of moving bees to fall pasture. The question has been discussed at conventions and in the bee-papers. Permit me to make a statement in connection with the subject. Some years ago my attention was attracted by foreign journals to the question of migratory bee-keeping. This is carried on in England, but I believe still more in Germany; but I received no information from these sources as to the best way of moving bees. Experience and careful judgment had to be my teacher to a very great extent. For years I had to prepare and ship a large number of colonies to distant parts of Canada, and these have reached their destination in a uniformly gratifying condition; and of all the bees shipped, I know of only one case in which the colony perished, and that was where a hive of bees was shipped across the continent to British Columbia, and it was delayed by floods for about two weeks.

In our country the majority of bees are shipped for sale or purchase toward the close of spring. It is a time of year when the weather is very changeable, and, as a rule, the temperature at night is much lower than during the day. Again, on the train and perhaps on the railway platform the variations of temperature are very great. How to pack the bees, or, rather, prepare for all these emergencies, was a great problem which has been solved to my entire satisfaction. Simply putting a wire screen over the entrance and another over the top of the hive would answer all right for the hot weather or hives, but not for the cold, for we must remember that the bees do not cluster quietly over brood when constantly disturbed. First I prepared the top in the following manner: The front and rear of the top of the hive were covered with a thin board, and about a third of the top between the two boards had a wire screen, but constructed in the way of a pocket. This was an improvement. When too warm the bees could cluster in it; but it still had the great disadvantage of allowing the warmth to escape from above when the temperature was low.

I then used a portico at the entrance. This was suggested to me by Jacob Alpaugh. It is simply a wire-screen cage at the entrance of the hive, and into this the bees could pass and cluster when too warm. I make them with a wooden frame, and have

two wedges in the lower corner. These wedges shove into the entrance at either side of the hive; and help materially in holding the portico in place. Two little hooks and staples will do the rest of the holding, so not a nail need be driven when closing the hive. This has answered perfectly. It is surprising what relief such an arrangement gives to the strongest hive.

Over the combs at the top of the hive the quilt or cloth can be fastened, or even the cover with a clamp; then no air and warmth can escape from the top. The inside temperature the bees can regulate by ventilation and the number that go to cluster outside.

Let us for a moment look at the difference in the entrance with the old wire screen. The ventilation is very much checked by the wire screens across the entrance, and the current of air again retarded by the friction against the wires strung in regular order across the entrance, and the bees are absolute prisoners in the hive. With the portico made nearly the height of the brood-chamber, the width of the hive, and coming out nearly the distance of the alighting-board, the ventilation through the wires will be quite equal to the capacity of the entrance without any obstruction. Then the bees can come in large numbers out of the hive, as before stated. This applies to the preparation at all seasons.

From my experience with bee-keepers, and my own past thoughts, I know that many more would move bees if they could be prepared with less trouble than is at present generally necessary, and there will be greater certainty of a safe transfer to their destination. That this can be secured I do not think but *know*.

A hive can be used that at any time 100 colonies can be prepared in two hours before shipment. I can see no good reason for using anything else than the self-spacing Hoffman frame as the the Root Co. and doubtless others make it. Some have asked me if they could use this frame in the old Langstroth which has no follower. My unhesitating answer is, "Yes!" There is no need of a follower if you use foundation, and, better, wire; at least with the Weed process of foundation there will be nice straight comb, and you will have no difficulty in drawing out a comb to begin with. With self-spacing frames they need no fastening. When frames are not self-spacing, instead of driving a nail into each end of the top-bar I would use a thin piece of wood. A separator cut into four pieces will do. Lay this across the ends of the frames and drive a small tack through this into the bar and they will not only keep from moving sidewise, but the piece across will prevent the frame from swinging at the bottom.

However, all this is unnecessary with self-spacing frames. I want no beveled hives to move bees in; wood shrinks and swells; and, however much men may demand absolute accuracy, I have found that those who demand this, when set at the saw-

table they can not themselves produce it. (If you have any customer who demands this you can easily cure him by setting him at your tables, and letting him get out his own stuff, on condition that, if every piece is the same in two months' time, he shall have the use of the machinery and power for nothing; if not so, he shall pay double the price of the goods.) Reasonable accuracy, of course, one expects; but beveled hives are pretty sure to spring a leak, especially if they have been in use for a while. But hives with straight joints can be made by any experienced supply-dealer to have no leak. One clamp should be put at each side of the hive and one at the back. The upper story can be fastened on the same way, also the cover. I advise three for each to make interchangeable; otherwise I would have four. If the top cloth is used, free from holes, four pieces of separator with tacks will answer to keep the cloth down. The hives so arranged can be ready for loading any time within, probably, an hour.

The conveyance should be in good shape, greased, tires not liable to come off, as a hired team did once with me when it got on the hot sand. I would have nothing to do with hay-racks and hay if a platform were available, and it would be if I intended to keep up the business. An ordinary wagon will do to make a platform, if you can not rent. Make it to hold three or four rows with an inch strip between. Make at the side of the wagon an inch strip. The two outer rows can project a third over the side; the inch strip will prevent the hives from working out. Any pitch will always throw it toward the wagon; otherwise I would have it perfectly flat, and a rope bound about the load to keep the hives in place. With the porticos on inner rows, place there the weaker swarms; make the portico one inch or even more shallower, and wire cloth on top of portico; this can be done by putting a half-inch strip of wood next to the hive or portico, and bringing the wire in one piece over the front and top, and nailing the wire to this piece. This change in portico is necessary, as the inner hive will be within an inch of the hive in front. A strip one inch square or $\frac{3}{8}$ should be nailed on the platform. Now the two center rows stand back to back down the center of the wagon, and a strip between them and the outside rows, which are held in place as above described. If the wagon platform is not wide enough, three rows must do.

Use a coil spring between the wagon and platform. This can be adjusted to any lumber-wagon, and answers well. Do not use wild horses, but those that will obey promptly. For tools, have a lantern, hammer, nails of different sizes, some separators, and strips of wood, in case of accident; a watering-can, smoker and fuel. Run your wagon by hand close to the bees about the time the bees quit flying; if any are left in the apiary, a few bees shut out will not matter. Smoke gently to get the bees

hanging out in; then smoke again to put the porticos in place. If no one makes a botch it is surprising how quickly this can be done. Next loading. Set them on the ground on each side of the wagon; next to the wagon a hive with an inside portico; out from that, an outside. If any bees have accumulated, brush them off as you carry them to the wagon. What next? Load? No, not a bit of it. Would you load cattle or stock for a long journey without giving water? Water the bees. Give them plenty. If tipped up a little at the front, so water will run in, all the better; and for this, in moving bees a screen on the center row is an advantage added to the portico. You have a better chance to water on the journey. But water well; and unless a very hot night and a long journey, say over 15 miles, this will answer. This is a *great* point in moving bees. Do not forget it. Then load and off. I like to be an hour on the road before it is quite dark. Go rather slowly at first, and get off and go about to see if the load is riding right—if there are any leaks, etc.—say after half a mile, and again after another mile. Pick beforehand your road. Know just where you are going. In the middle of the night you are not likely to meet many people; and if you go to their door they often do not feel much inclined to direct you. Can you trot? A good fast-walking team I prefer; but if you are quite sure of your road you can trot. Clay roads are a little rough; but if not much rutty I prefer them to sand. The weight of the load will break down the clay. If you are going 15 or more miles, give them water again. After 8 or 10 miles, go over them again and sprinkle the porticos.

There should be on each load not only a bee-keeper, but one awake, alive, and active; and if more than one load, make them keep within close hailing distance. Instruct every teamster to unhook the moment there is the slightest accident, and run with his horses. I once moved something like 100 colonies on two wagons. The wagons and teams were hired. One horse balked, and they had to return some five miles to get another. A teamster broke open one hive, after getting the most definite and specific instructions not to sit on the hive. We had some 26 miles to go, and with one thing and another we were much longer on the road than expected. The horses had to feed, the men thought they had to; and when we got on the hot sand, one tire began coming off; and while we watched that wheel another came off entirely, which resulted in another great delay. The man with me came on the wagon on which I was; once or twice I told him he should be on his own, but gave him no absolute orders. It was high noon when we went through a village. Behind us we heard a crash. The rear teamster had fallen asleep; the horses turned a corner too short, and went into a telegraph-post, stripping some porticos from hives. The teamster jumped off to hold his horses. I called out, "Unhook!" which he

did. What the result would have been had he not, I dread to think. But it was 6 o'clock that night before the bees were unloaded. Some had three comb-honey supers on. It was between clover and basswood. They were confined to the hives all night, and through the burning heat of that day; yet all came through in splendid condition—a severe test for the porticos.

In unloading, put all in place, then at once open the hives, having the smoker ready to use. On the way, keep the lantern and smoker going, but turn down the lantern. It must be a dark night indeed when there is not some light to see.

A bee-keeper for fall pasture—indeed, any—must study the conditions, the moisture and flowers, and decide whether it pays. I think I can tell pretty well the chances beforehand, but yet not *know*. Since Adam fell, God has decreed, "In the sweat of thy face shalt thou eat bread." Romans 1:20 tells us, "For the invisible things of him from the creation of the world are clearly seen, being understood by the things that are made." I believe to-day the healthiest and happiest man is the one who, in the fear of God, seeking to live for him, does physical labor; and to produce any thing on this earth, any crop, there is needed constant battle with evil. Thorns, thistles, weeds, and adverse weather come in, and have to be battled with and overcome, to remind us that, if we would produce good fruit, we must root out, weed out, and keep down evil; constant watchfulness and vigilance are required. We know that the word of God is the good seed Christ implanted in our hearts. How many of us have begun the struggle—have Christ implanted there? How many are making no struggle, but letting the enemy have full swing? My heart often yearns over men I know in the bee-keeping profession who have not Christ, no new birth in them, who are harboring their enemy for time and eternity, in their hearts. What awful folly! what worse than physical suicide!

Brantford, Canada.

THE BEE IN LAW.

Animus Revertendi; Identity; Transportation; Larceny.—Article 3.

BY R. D. FISHER.

Bees are *feræ nature*, i. e., wild by nature, and classed with such wild animals as have what is called the *animus revertendi*, or a usual habit of returning whence they have escaped. During this temporary absence they remain the property of the original owner (2 Kent, Com. 348). The law, as Blackstone says, "extends this possession further than the mere manual occupation; for my tame hawk that is pursuing his quarry in my presence, though he is at liberty to go where he pleases, is nevertheless my property; for he hath *animus revertendi*. So are my pigeons, and bees that

are flying at a distance from their home, and likewise the deer that is chased out of my park or forest, and is instantly pursued by the keeper or forester; all which remain still in my possession, and I still preserve my qualified property in them. But if they stray without my knowledge, and do not return in the usual manner, it is then lawful for any stranger to take them" (2 Blackstone, Com. 392).

So, in the civil law, Gaius says: "In respect of such animals as are in the habit of going and returning, as pigeons and bees and deer, which are accustomed to go into the woods and fields and come again, we have this traditional rule: That if they cease to have the intention of returning they also cease to be ours, and become the property of the first taker; now they appear to cease to have the *animus revertendi* when they have discontinued their habit of returning. This theory may be compared to the rights of property in animals at common law only when *animus revertendi* is induced by artificial means, such as taming them or offering them food and shelter, but not to immigrating animals which return from natural causes. The highest authority is that the only ownership in them is *ratione soli*. In consideration of the fact that the character of the forest allows every freeman to be entitled to the honey found within his own woods, affords great countenance to the doctrine that a qualified property may be had in bees in consideration of the property of the soil whereon they are found."

IDENTITY.

One of the chief difficulties in reclaiming bees is in the almost impossible identification thereof. Many curious cases of doubtful or disputed identity might be cited to illustrate the singular fortuous resemblance between bees, not only in their general appearance, but also in the strain or accidental mark. Positive recognition of peculiar habits and workings of bees is too difficult to suffice to prove their identity. Courts judicially recognize photography as a proper means of identification of the thing in dispute; but there is no case on record, so far as we have been able to discover, where a claimant has been able to reclaim his bees by means of photography. Neither can bees be identified or proven by the concurrence of their several characteristics. This proof is too remote, and the question of identity is for the jury. The court can not presume identity of bees.

TRANSPORTATION OF BEES; CONTRACT OF CARRIAGE.

The exact character of the contract for the carriage of animals has been the subject of much judicial discussion. The prevailing opinion, however, is that common carriers are also insurers against all losses except those resulting from the acts of God or the public enemy, or from the peculiar nature of the property carried. Though it may be optional with railway companies whether they will accept the full responsi-

bility of transporting bees, yet if they do so without any express restriction they are liable as common carriers. But they may for a less hire agree simply to transport bees, furnish cars, etc.; and if the shipper and owner of the bees agrees to the lower rate, he can not hold them as common carriers. For a given reward they proffer to become his carrier; for a less reward they proffer to furnish the necessary means that the owner of the bees may be his own carrier (*Kimbal vs. Ry. Co.*, 26 Vt., 247). In the case of *Bily v. Decmar*, 54 Fed. R., 718, the United States court held that, when a vessel struck a hidden obstruction and filled with water, and a cabin containing bees floated to the shore, but no effort was made by the master to use care in saving them, the steamboat line was held liable for damages to them, though the vessel was insured and was abandoned to the underwriters as a total loss.

BEEs THE SUBJECT OF LARCENY.

Bees in the possession of the owner are the subjects of larceny, says the Indiana Supreme Court in *State v. Murphy*, 8 Blackf., 498. Further, the court holds that, when bees are in the possession of any person, they are the subject of larceny. Much depends upon what constitutes possession. Generally it is regarded that the owner of the soil upon which bees may be found is the possessor thereof. While the rights to animals *feræ naturæ*, as between the owner of the soil and others, have been fairly settled by a considerable series of cases, the relative rights of parties, both of whom acknowledge the superior rights of the owner of the soil, seem never to have been precisely described. But in a recent Rhode Island case (*Revroth v. Coon*, 15 R. I., 35), the plaintiff, without permission, placed a hive of bees upon the land of a third person. The defendant, also a trespasser, removed the bees and honey which had collected in the hive. The court found that there was no cause of action, holding that neither plaintiff nor defendant had any title or right to possession to the bees or to the honey. It needs scarcely follow that a trespasser can not maintain, on the basis of mere possession, an action against a later trespasser. There may be some possible doubt in a case of this kind where a person has reduced the bees to possession by collecting the bees in a hive, and left them temporarily on the land of another; and if so it would seem to give him actual physical possession sufficient for an action against one who removed them. But about the honey which the bees had collected while on the soil of a third person, there would be less doubt; but, strange to say, in no case which we have examined does the question seem to have been discussed, much less decided, as to how far the law of animals and bees *feræ naturæ* applies to their produce, such as eggs or honey. The reason on which the law about the animals is founded is wholly inapplicable to the honey; but the Rhode Island case tacitly

assumes that no distinction is to be drawn. Hence, as a dictum, it would appear that the honey, at least, belonged to the owner of the soil.

Bees are likened unto wild animals belonging to no one so long as they are in their wild state, and property in them is acquired by occupancy, hiving, and reclaiming only, and are not the subject of larceny unless they are in the owners' custody, as in a hive, bee-house, or otherwise confined and within the control of the possessor or owner.

CONFINEMENT OF LAYING QUEENS.

Queens Caged when Laying to their Fullest Capacity; does the Practice Result in Injury?

BY ARTHUR C. MILLER.

The article by Mr. F. Greiner, August 15th, on the confining of laying queens in small cages, is well worth a second reading; and his question, "Do queen-breeders practice any such thing?" is most pertinent. That injury is caused to such queens by so confining them is, I think, well established. In the *Amer. Bee-Keeper* for April, 1901, I wrote on the cause of injury to queens in shipment by mail, i. e., starvation; and it is also the cause of injury to caged laying queens, even though the bees have access to them. A laying queen is receiving an abundance of highly nutritious food, and at the same time is developing a large quantity of eggs. Suddenly shut off this food supply, and what happens? The formation of eggs does not and can not immediately cease, and the queen is soon in an exhausted condition. Just how long the development of the eggs continues I am unable to state positively; but from the fact that prolonged confinement increases the extent of the injury, I imagine that it continues for several days, though, of course, in a constantly decreasing degree. We have very little accurate data regarding this subject; and until we accumulate more we must necessarily do some guessing and more experimenting. We do *know* that the sudden confinement of a queen when in the full exercise of her natural functions almost always works serious injury, such queens seldom doing as good work as before, and generally dying early. We also *know* that a queen laying slowly, as in a small nucleus, can be caged with little or no apparent injury. Also, I think I know that the degree of harm from such restraint is modified by the kind of bees confined with the queen. If she has as an escort, young feeding or "nurse" bees, then she will have suitable nourishment for a time, perhaps until the development of the eggs has nearly stopped. But if she has few or no such bees, then she perforce starves; for while honey will keep up the animal heat it will do very little toward restoring wasted tissue. A queen confined in a cage of wire cloth or perforated zinc, even though all the

bees of a full colony have access to her, does not get fed as she would if at large. I base this statement on general observation, and the analogy that confined drones, even though they have available plenty of honey, and are accessible to the bees, soon die.

A careful microscopical and chemical examination of the stomach of queens that had been caged as stated would prove just what kind and quantity of food they do receive under such conditions. Until we know exactly how to cage laying queens safely for an indefinite period we had better avoid it altogether. And when we are compelled to cage them for shipment let us first diminish their laying by putting them in a small nucleus for perhaps a week before close confinement, and then be sure to give them a retinue of "nurse" bees. Mr. Alley's system of a little nucleus colony for the mating and retention of each queen is most excellent, and I believe it is largely accountable for the excellent results in shipping with which that veteran meets.

Properly and closely associated with this subject are Mr. Greiner's remarks on the working qualities of different colonies. A queen whose vitality has been impaired can not be expected to produce bees of full vigor; and just how much such weakened constitutions may be responsible for poor work on the part of a colony is a question worth investigating. Mr. McIntyre has given what seems to be the best plan for getting at the true value of any strain of bees; and that is, stocking a row of colonies in an apiary with queens all from one mother (and presumably all of the same hatching), and then comparing the *average* of the product of those colonies with the average of a similar number of other colonies in the same yard during the same time. Though comparisons may be odious they are certainly very helpful when we would measure the value of strains of bees.

Providence, R. I., Aug. 20.

[You may be right; but is it not putting it a little strong when you say, "We do *know* that the sudden confinement of a queen when in the full exercise of her natural functions almost always works serious injury. . . . We also *know* that a queen laying slowly, as in a small nucleus, can be caged with but little or no apparent injury"? You italicise the word *know* as if the facts were established. Now, is that true? There has been a sort of surmise entertained by many good bee-keepers that both of these propositions might be true; but has either one of them been clearly and decidedly demonstrated? Understand, I do not deny either proposition; but I raise the question whether we have so far reported facts sufficient to prove, beyond a peradventure, both statements. In partial support of one statement I will say that we have sent out sometimes, from our apiary, queens that were in full laying, and yet which on arrival at destination proved to be very unsatisfactory, laid a few eggs, and disappeared. At other times we have taken

queens from their hives in the height of the season, put them up in mailing-cages, and, later on, had most flattering reports from them. We send out a good many thousand queens in a season; and, unless I am very much mistaken, the majority of such queens (even when doing full duty) have departed themselves very creditably on arrival at their new home. If there is any queen-breeder, aside from Mr. Alley, who first cages in a small nucleus before sending out queens, I should like to have him hold up his hand. Now, understand, friend Miller, this is not offered as a challenge, but because I do honestly seek the truth. If it is demonstrated clearly that a queen removed from the hive when laying to her fullest capacity, and caged long enough to make a journey through the mails, is injured, then the sooner we prove the fact, the better it will be for the breeder as well as for his customer.—Ed.]

RAMBLE 192.

Some "Pathetic" Sketches from Real Life.

BY RAMBLER.

We have in Los Angeles one of the most accomplished flower artists in America, and a Frenchman is Mr. Longpree; and wherever you see a Longpree painting of a flower, of whatever hue or shape, it is so true to nature that you can almost smell the aroma. Mr. Longpree turns an honest penny now and then by placing his many flower pieces on exhibition, and it is a real treat to look them over. One day I too rambled into the hall, and there was a bewilderment of subjects. I was admiring one very pretty little picture of white daisies and red clover mingled promiscuously together, with just the outline of a rail fence away in the background. Two young men came along, presumably artists, and they admired the picture. The young man with his hair parted in the middle looked lovingly at the picture, and, with his hand upon his heart, exclaimed, "So pathetic!"

I meandered, and, absent-mindedly, looked at the many pictures; but they all seemed to blend into daisies and clover, and "so pathetic" I finally found myself again before the daisies and clover—just common white daisies and red clover, and for the life of me I could see nothing pathetic about it. A stout, motherly-looking woman came along, and in my anxiety to get on the artistic side of that picture, said I, "Ma'am, can you tell me where there is any thing pathetic in that picture?"

"Why," said she, with her head critically canted to one side, "I wouldn't call it exactly pathetic; I would term it pastoral."

"That's it, ma'am; that's it," said I, with enthusiasm; "that's just my idea of it; they do look so pastoral they remind me of our old cow pasture on the west side of the stony hill in York State, where briars, burdocks, daisies, and clover mingled to-

gether. Why, it almost makes me cry to think of it."

"H-u-m-m." said she, musingly; "and what is your idea of pathetic?"

"Pathetic? Why, ma'am, we had two roosters when I lived on the farm in York State—one a big clumsy lubber, and the other just a little runt. Well, he would everlastingly wallop the big rooster. One day he knocked all of his tail feathers out. You ought to have been there to see that big rooster sneak off into the bushes. Pathetic? Well, I should say so; and that's just my idea of the term."

I know I had the best of the argument, for the lady turned right away and seemed to have urgent business at the other end of the hall. Now, I may not have reported the exact words of our conversation; but any way, it conveys my idea of the pathetic.

Then we have another artist in Los Angeles. Mr. J. W. Ferree. Now, I am not sure as to Mr. Ferree's nationality; but it sounds as much like French as Longpre; any way, he is an artist; and while Mr. Longpre's specialty is flowers and landscapes, Mr. Ferree's specialty is housescapcs. His housescapcs are to be seen and admired in all portions of the city. His reputation is so great in this line that well-to-do people in adjoining towns have employed him to paint housescapcs for them.

"HOW PATHETIC," RAMBLER!

Now, any one would naturally think that being a popular housescape artist would be laurels enough for one man; but that is not the case with Mr. Ferree. He is one of us. He is a bee-keeper; and, still better, he is foul-brood inspector for Los Angeles County. The board of supervisors elected him over several others who hankered for the office, attesting to his popularity in the community, and a genial companion he is, as the following episode will prove.

Mr. Ferree and I were riding along harmoniously one day; and as he removed his hat to a passing lady I artistically remarked, "So pathetic!"

"Why, Rambler, what do you observe that is pathetic?"

"Bro. Ferree, it is the top of your head—so bald—so pathetic."

"Say, Rambler, did you ever look pathetic?"

"Not as I knows on," said I.

"Well, we'll see about that," said he.

Mr. Ferree was driving his old gray mare, and leading another pie-bald critter behind the wagon. As we turned into Vernon Avenue in the southern suburbs of Los Angeles, with Messrs. Brodbeck and Shaffner following us in another rig, he stopped the procession, and remarked that he had always driven the critter on the off side, and now wished to give him a few lessons on the near side, and proceeded to form a connection from said critter's head to the near-side hame of the old gray, with a tow string, and gave me the end of the long halter rope to manage.

The program was all very simple. We started; and that critter, looking the situation in the face, and not liking it, turned right around and looked us in the face and winked his eyes, as much as to say, "There, now, who is on the off side?" The whip was applied to old gray. The critter backed a few steps, got mad, reared, bolted past the buggy, and nearly jerked my arms off as I held to the rope and the seat, and, with hat sailing to the ground, I frantically shouted "Whoa! whoa!"

Ferree laughed and shouted, "So pathetic! so pathetic!"

He was getting his revenge on me in true artistic style.

Well, the procession was stopped again, the critter tied again with the same tow string; the old gray was started again; but this time the critter bolted ahead; and as I hung balanced on the dash-board Ferree shouted again, "So pathetic! so pathetic!"

We stopped again. Bro. Brodbeck was just suggesting that I ride the critter, when his pet dog's tail was stepped on, and, what a howl! "So pathetic!" said Ferree; "so pathetic!" said I.

"What a pathetic howl!" said Ferree.

"Nothing pathetic about the howl," said I; "but that painful frown on Brodbeck's brow—so pathetic—see, Ferree?"

"Yes," said Ferree, "I see."

You would naturally infer from the foregoing, which was only a fragment of the occurrence, that Mr. Ferree is a jolly good fellow, and that's a fact. He is a genial bachelor, a member of Dr. Bresee's church; will go a long way to serve a friend; generous every day in the week; polite and condescending to the ladies; always shows an even temper, and the mantle of foul-brood inspector could not have fallen upon more worthy shoulders.

He reports his work in Los Angeles Co. as follows: Has inspected 148 apiaries; 8010 colonies; 284 foul-brood colonies. Prof. Cook commends Mr. Ferree's method of handling the disease. Where there is a chance for saving the colony it is done; otherwise it is submitted to the flames. Mr. Ferree estimates 300 bee-keepers and 20,000

colonies of bees. It will be observed that Los Angeles Co. is no small corner of the State, and the inspector must necessarily be a hustler to get over the ground.

Mr. Ferree has the disease well in hand, and it is hoped that it will soon be a past trouble so far as this portion of the State is concerned.

J. W. FERREE.

In order that you may get acquainted with our foul-brood inspector I herewith introduce him to you. Bro. Ferree, allow me to present you to the fraternity in this and in foreign lands.

Don't lo'k on life through a smoky glass;
The world is much as you take it
'Twill yi-ld you back a gleam of light
Or a glow of warmth if you make it.
However fortune may seem to frown,
However may scorn the scorners,
Still face your fate with a fearless eye
And a mouth curved up at the corners.

DOUBLE-DECKER COLONIES.

The Use of Foundation or Empty Combs; how the Double-deckers Cut Down Swarming by Half, and Double the Amount of Honey.

BY G. B. HOWE.

Mr. Editor:—I will try to tell you my experience with large v. small hives. I have been experimenting for the last ten years, and think I have found what I want. I

think a ten-frame L. hive too large, and an eight-frame too small; but 16 frames are just right. By this I mean a double-decker. I have tried them the poorest season I ever saw, and they were ahead of any small hive I ever used; and when you get a swarm from one of them, hive it in an eight-frame hive with full combs for the queen to lay in and to store pollen in, and you have a colony for comb honey. One fault with starters in the brood-nest is that they will put pollen in the sections; and another thing is, they build so much drone comb. My advice is to use drawn combs or full sheets of foundation. I use full sheets of foundation in the boxes, and I find that it pays to use it. I have tried both ways, and know that I have lost money by using starters, also by using starters in the brood-frames. Why not save the honey that your bees make drone combs of, and buy your foundation? I used to have the same old trouble with bees that would not work in the boxes; but I find that, if you have the right kind of bees, you will have less trouble in that respect. I would change the queen quickly if the bees had to be coaxed into the supers. I put the extra body under the colony early so they do not get the swarming fever. I do not have half the swarms I did formerly, but produce twice as much honey per colony. Some of these double colonies are so full of bees I put them in the cellar that way. I had one of these double hives that made 96 boxes of honey, then swarmed and made 72 boxes more, and have honey enough to winter in good shape. I do not have any trouble with bees not storing honey over sealed honey. If you do, get a red-clover queen. The queens I have from The A. I. Root Co. and L. H. Robey will and do pile in the honey over sealed honey, and they do not swarm when they get in good shape to make honey either. Of course, the locality has something to do with it, but not so much as some think. We have had a good year here, and my bees are in fine condition for winter.

Black River, N. Y., Sept. 3.

[As our readers will remember, I have long advocated the use of two-story eight-frame colonies under some conditions; and at our basswood yard I have had an experience a good deal like that related by Mr. Howe; but at the time of telling that experience I received some protests; but since that time I have heard from quite a number who say that the double-story eight-frame colonies are all right. I have a private letter from G. W. Brodbeck, who, it seems, has been using the same plan, only his brood-frames are 7 inches instead of 9. He says he gets excellent results, and those results are so marked that some of his bee-keeping friends expect to put the plan in operation next year. I have written to Mr. Brodbeck, asking him to give us fuller particulars, so we will let him tell the rest of the story for himself. But lest I may be misunderstood I wish to say I do not advocate

double-deckers for every one and for all localities. After having traveled over the country as I have, and studied the various conditions of climate, and styles and condition of hives, my conclusion is that it is both foolish and silly to advocate any particular fad or plan as being practicable alike to *every* section of country; but I do feel that the two-story idea has not been exploited as much as it ought to be in some localities. If it works at all it will produce some great results, both in the reduction of swarming and in the harvesting of big crops.—Ed.]

PUTTING UP COMB HONEY IN AN ATTRACTIVE SHAPE.

A very Neat and Pretty Sealing-case.

BY BENJAMIN FRANKLIN.

Mr. Root.—I send you a photo of a style of box I call my border package. Years ago I had a nice crop of honey from the silver maple, the first in over 30 years. Last year I did not get much of any kind. This year I am getting a fine crop from the silver maple. The raspberry and silver maple come in bloom about the same time, but the bees work on the silver maple, so I don't get any raspberry honey but what is flavored with the silver maple. These mountains are covered with it. Two years ago I could not supply the demand for this style of package, for it was just the thing to carry back to the city. What I claim as original of this box is the handle. I tried wire, tape, and other things; but I came across some picture-frame wire cord that just filled the bill. I get different colors and put up nice Danz. plain sections 4×5×1½, that will weigh nearly 1 lb. I can sell them like hot cakes. All I have to do is to raise a box, as you can see in the picture. I have some pink paper around the box to lift them out. I have also paper in the bottom with strips to raise them up from the bottom, like your shipping-case. The holes in the ends are glassed. Where we raised corn and potatoes it was washed away in the freshet last spring. The water came into the bee-yard, and we had to raise the bees up out of the water; but there is not so much loss but that there is some gain. The water filled in above, and washed out below, so it left a fall of 3 ft. or over, so I put in a water-wheel and turn out the molding and hole by waterpower. The wheel is 100 ft. or over from the bee-house. I run the power to the lathe with a wire clothes-line.

It is no trouble to sell nice honey

put up in these boxes. You can see I look rough and ready to sell honey, and tell them all about it. I sold these five packages at one place, and five more to the next house, all New Yorkers.

Griffin Corners, N. Y., July 31.

[Mr. Benjamin Franklin is a bee-keeper whom I met, or, rather, did *not* meet, on my first bicycle-tour through New York in 1890. I had just bought one of the latest safety bicycles, then just out, and was making a tour on the wheel—quite a novelty then—through the hill country of the Empire State. While cycling on one of those days I heard how one bicyclist had been robbed along the way, and I had been warned to look out in going over a certain route, and I did. Along one of the lonely roads a man hailed me to stop; but remembering what I had heard I put on all the steam I had. The supposed robber chased after me; but I turned a deaf ear, and peddled with all my might to gain the top of

the hill ahead of me. Having arrived at the top of it, nearly tired out, I placed my feet on the coasters and let the wheel go as fast as it would down one of those York State hills. Up to that time I had never ridden so fast in all my life. I nearly ran into various objects down the hill. Suffice it to say, I landed safely, feeling sure that I had left my pursuer miles behind, and I had. A week or so afterward, when I arrived home, I received a letter from Mr. Franklin, stating that he had seen me, mentioning the very road where he had hailed me, and saying that, instead of stopping, and being neighborly, I just ran away from him. He had read in GLEANINGS of my proposed tour; and when he saw a chap go along on a bicycle, that tallied exactly with a description of me, he concluded at once who I was.

So much for an introduction. I have long since made my apology to Mr. Franklin, and I now wish to introduce him to our readers as a bee-keeper whom I have kept track of more or less ever since. He is up to date, because he uses the plain tall section. His package is neat and pretty, and, I should judge, inexpensive. No wonder it "sells like hot cakes."—ED.]

UNITING BEES FOR WINTERING.

"Good evening, Doolittle. As the evenings are getting quite long now I came over to have a little talk with you about uniting bees, so as not to bother you during the day, as I know you are very busy getting your honey ready for market."

"For what reason do you wish to unite your bees, neighbor Smith?"

"I have several weak colonies and young after-swarms which I thought would, by placing two or more of them together, make a less number strong enough for winter; and I believe that such strong colonies can stand the winter, while the weak ones, if left to themselves, would most likely perish. Am I right in this matter?"

"I think you are; and if more of our bee-keepers so understood things we should hear of less loss of colonies in the spring than we do now. The novice is quite apt to think that, the greater the number of colonies he goes into winter with, the greater number he will be apt to have the next May; but a careful looking into things shows that such reasoning is, in nearly every case, fallacious. Two or more small colonies placed in one hive, with the right amount of stores, stand quite a good chance of coming out in the spring one good working colony; while, if left separate, the chances are that empty hives and combs will be all that will remain of the two or three the next May."

"That is my mind exactly. But you have not told me how to unite my bees."

"Well, I will tell you of a plan I have used successfully for a score or more of years. The first thing to do is to place an empty hive where you wish a colony to stand; and if you can allow that to be where the stronger of the weak colonies is now standing, so much the better, as in this case the bees from this one will not have any desire to go to any other place, as this is where they have marked their old home."

"But how can I set an empty hive there when the stand is already occupied?"

"If you do this work as you should, on some day when the bees are not flying, and yet when it is not cold enough to chill bees generally, say on some cloudy day, or near sundown, when the mercury stands at from 50° to 55°, you will have no trouble in setting this stronger colony to one side of its stand, and taking your time in arranging the empty hive thereon."

"Yes, I see now. But go on."

"Having the empty hive arranged, go to the several hives having the colonies which are to be united, to form one colony, and blow quite a volume of smoke in at the entrance of the hive, at the same time pounding with the doubled-up hand, or with a stick, on top of the hive."

"What do you pound on the hive for?"

"This pounding on the hive causes the bees to fill themselves with honey, upon which filling depends the successful uniting of bees."

"How long should I pound?"

"I pound on them for about a minute; sometimes two, if it has been cool for some time before, so the bees are quite compactly clustered, as in this case it takes them some time to cluster and fill themselves."

"Do you keep on smoking all the time you are pounding the hive?"

"I smoke only enough to keep the bees from coming out after the first few voluminous puffs. As soon as you are through with the last one, take a wheelbarrow and wheel the hives to where you wish your united colony to stand, which wheeling helps, by its jarring, to augment the fear of the bees, thus causing them more effectually to fill themselves with honey. After thus wheeling them together, do not delay in opening the hives, else the bees may disgorge their load of honey back into the cells again."

"Would not an assistant be good at this time?"

"One would do no harm; but I generally do this work alone. Having all near together by the hive they are to go in, open the hives, and take a frame of comb and bees from one hive and place in the empty one; then take a frame from the next hive, placing it beside the first, and so keep on alternating the frames from the different hives till the empty hive is filled. In doing this, select such combs as you desire, either for brood, honey, all worker comb, etc., thus putting the united colony on the best combs. Having the hive filled with comb,

close it, when you will next take a frame from the first hive opened, and shake the bees off from it down in front of the entrance, holding close down so the bees are in or as near the entrance when leaving the combs as possible."

"Why this close holding and shaking?"

"So the bees will take wing as little as possible, and so that none need fall so far from the hive but that they can readily run in with the majority. Having them off the first frame, next shake the bees off from a frame to the next hive, and so on, alternating in the shaking the same as in filling the hive, thus mixing the bees from the several hives all up."

"Why do you wish them mixed up?"

"The mixing of the bees takes the disposition to fight and kill one another all out of them when filled with honey as above; for when each bee touches another it is a stranger, so that the individuality of each colony is lost, and the combined two, three, or four colonies unite within two or three hours to make one individual colony again, which will protect itself from all intruders, the same as the separate colonies did before."

"Is that all there is of it?"

"Not quite. As soon as the bees are all shaken off their combs, gently blow a little smoke on the outside bees to make them all enter the hive, should any be slow in doing so; and as soon as all are in the hive, place a board about half as wide as the hive against it, standing the bottom out a piece from the entrance so it stands slanting up over it."

"What do you do that for?"

"This is done so that the next time the bees fly they will bump against it, as it were, this causing them to know that it is a new location they occupy, when they will mark the place the same as a new swarm does, after which they will adhere to it instead of going back to the old location they used to occupy before uniting. And to help in this matter further, it is always best to remove every thing from the old stands so that nothing home-like remains to entice them back."

"What about the queens? Do you put them all together?"

"If there is a choice of queens in any of the colonies to be united, hunt out and kill or dispose of the poorer ones, so that the best may be preserved. This hunting-out of the queens is better done some day before the uniting, for in the smoking and pounding process the queens will not be where they are readily found when uniting. If there is no choice in queens, and the extra queens are of no value, the bees will attend to the matter, killing all but one of them."

[This is good sound orthodox teaching, according to our practice in our apiaries, especially that part recommending the *mixing* of the bees to prevent their returning to their old stand.—ED.]

WINTERING IN CELLAR WITH AN UPPER ENTRANCE.

"Good morning, Mr. Carter."

"Good morning, Mr. Patterson."

Mr. P.—I came in to inquire about my bees. What makes them crawl all over the cellar-bottom, and die?"

Mr. C.—Well, as nearly as I have made up my mind it is because they have been shut up so long, and have got so full that they must get outside of the hive a short time; and, as they go one in a place, they get lost, and die.

Mr. P.—Why do you think they get lost?"

Mr. C.—In 1898 you know we had a very long winter.

Mr. P.—Yes, I remember that well, for my bees all died that winter.

Mr. C.—Well, I lost half of my bees that winter, and the other half came through in fine order.

Mr. P.—What was the difference in their wintering?"

Mr. C.—I had a $\frac{3}{4}$ -inch hole in the front of half of my hives, and the other half did not have any hole in, and the colonies that had holes in their hives all lived; and in the hives that did not have a hole in the front, the bees all died.

Mr. P.—Did you let the hives stand on the bottom-boards?"

Mr. C.—No; I raised them all up and put a block one inch thick under all of the hives I had.

Mr. P.—What did that hole have to do with it?"

Mr. C.—The bees came out of those holes and daubed the fronts of the hives nearly all over, and they would crawl back into the hive again.

Mr. P.—About how many bees were there out at a time around those holes?"

Mr. C.—There would be, near spring, a bunch from the size of a dollar to the size of your hand, and they would keep buzzing all the time, and they did not get lost and die, but they lived and went back into the hives. In the summer I keep those holes closed up, and in winter I keep them open.

Eagle Grove, Ia.

C. K. CARTER.

[I can scarcely believe that the presence of a $\frac{3}{4}$ -inch hole a little way above the entrance would make all the difference between successful and unsuccessful wintering. There must have been something wrong in the food or cellar, to have caused the bees to soil up the fronts of their hives so with dysentery. It is a general practice in wintering, either to set the hives up on blocks above the bottom-board, or, better still, take the bottom-board off entirely, and place the hives in rows about 4 inches apart. The next row of hives is set on top of the lower row, over the spaces between the hives below.—ED.]

NATIONAL BEE-KEEPERS' ASSOCIATION.

OBJECT:—To promote and protect the interests of its members; to prevent the adulteration of honey.

OFFICERS:—E. R. Root, President, Medina, O.; R. C. Aikin, Vice-president, Loveland, Col.; Dr. A. B. Mason, Secretary, 3512 Monroe St., Sta. B, Toledo, O.; Eugene Secor, General Manager, Forest City, Iowa.

BOARD OF DIRECTORS:—E. Whitcomb, Friend, Neb.; W. Z. Hutchinson, Flint, Mich.; A. J. Root, Medina, O.; E. T. Abbott, St. Joseph, Mo.; P. H. Elwood, Starkville, N. Y.; E. R. Root, Medina, O.; T. G. Newman, San Francisco, Cal.; G. M. Doolittle, Borodino, N. Y.; W. P. Marks, Champaign, N. Y.; J. M. Humbaugh, Escondido, Cal.; C. P. Dadant, Hamilton, Ill.; C. C. Miller, Marengo, Ill.

FEES:—Annual membership fee, \$1.00. Remittances may be sent here or to General Manager as above.

RAMBLER GOING TO CUBA.

YES, we have made arrangements with J. H. Martin, the Rambler, to go to the Pearl of the Antilles. He is going with camera, bicycle, and that characteristic umbrella and stovepipe hat. While he is making the trip on his own account, he is also going with the view of studying the conditions in Cuba, and writing them up in his inimitable way for GLEANINGS. His notes of travel are always interesting; and after having gone over some of the territory in California through which he had preceded me, I find that he tells the exact truth. We may, therefore, expect a very interesting and valuable series from his pen, and by this time I doubt not he is on the way. Mr. Murray, our artist, will prepare the illustrations as before.

A TRIP TO THE WEST INDIES.

THE bee-keeping industry in these islands has taken such a start in the past few years that GLEANINGS now has many subscribers there. To study the existing conditions, and learn more regarding the requirements of bee-keepers in those islands, Mr. A. L. Boyden, Secretary of The A. I. Root Co., will shortly make a trip to the British West Indies, British Guiana, Trinidad, returning via Jamaica and Cuba. As our friends in these places may wish to communicate with him we outline his trip as nearly as it can be determined at this writing.

Bridgetown, Barbados, Nov. 5.
Georgetown, British Guiana, Nov. 13.
Port of Spain, Trinidad, Nov. 16.
Kingston, Jamaica, Nov. 29.
Santiago, Cuba, Dec. 5.
Manzanillo, Cuba, Dec. 7.
Cienfuegos, Cuba, Dec. 9.
Havana, Cuba, Dec. 14.

These dates are only approximate, especially for Cuban points. Letters may be addressed to Mr. A. L. Boyden at any of the places; and if marked "General Delivery" they will reach him, without doubt. He expects to visit as many bee-keepers at each place as time will permit; therefore many of our subscribers will likely receive a call from him. To save time, as soon as

he reaches each port he will probably arrange a little trip to various points, and would, therefore, like to have parties writing him give explicit directions for reaching their homes or apiaries. No letters can reach Medina from any of these points before he starts, and should, therefore, be addressed to Bridgetown, Barbados, or other points named above.

HOME OF THE HONEY-BEES GROWING AGAIN.

OWING to the fact that the Home of the Honey-bees is being enlarged, and that we are "all torn up," it was not possible for me to continue my series of travels, finishing up my write-up of that bee-keepers' paradise, for this issue. As already hinted at, the Root establishment is being enlarged as well as improved in many ways; and while these changes are in progress it has taken the time of all of us, to a very great extent, to look after things.

Among the improvements is a new foundation-factory that is almost fire-proof. It is designed especially for making Weed process foundation. Removing this department from the basement of the main building gives us additional room to use for other purposes. The wood-working building is also being enlarged, and a new roof has been put on the boiler-house, giving us at the same time a drying-room. Besides the increased capacity of buildings, we are also putting in several thousand dollars' worth of new and perfected machinery. Among these is a new cylinder press to help out the regular GLEANINGS press that has been compelled to run almost night and day to keep up with the work.

BEEET VERSUS CANE SUGAR IN SOME OF THE FRUIT-CANNERIES OF CALIFORNIA.

I HAVE received a letter from Mr. Thomas Wm. Cowan (now sojourning in California), editor of the *British Bee Journal*, and who, through the columns of that paper, has recommended cane in preference to beet sugar for the feeding of bees. In a letter just received, he writes:

Dear Mr. Root:—I have just been staying at a fruit-cannery in the Santa Cruz Mountains, where they use nothing but guaranteed cane sugar for canning purposes, and their experience with beet sugar is very similar to ours in Eng and It may be that the humid climate may have something to do with it; but it is quite certain that beet sugar is bad, not only for bees but also for preserving fruits in England. I suppose in the laboratory it is possible to get perfectly pure cane sugar from beets so that, chemically, it would be identical with that obtained from sugar cane but in practice it is found that there are certain polish salts in sugar from beet which do not occur in those from sugar cane. Leather and beefsteak have chemically the same composition but there is a difference between them. THOS. WM. COWAN.

Pacific Grove, Cal., Sept 23

It may be possible, as Mr. Cowan suggests, that the humid climate of England may have something to do with the matter. If it is not too much trouble I should like to have him give me the address of the cannery to which he refers—not that I in the least question his word, but because I should like to get a detailed statement from

them, explaining why their experience with beet sugar has not been satisfactory.

SNAPSHOTS FROM THE BUFFALO CONVENTION.

As I have already explained in our former issue, this was a very enjoyable and profitable meeting; and, unlike any previous convention, there were no essays—no papers of any kind. It was just simply live discussion, offhand, by plain practical men who came on purpose to give to and take from their fellow-craftsmen. The general subject matter had for its foundation the question-box, and the questions themselves had been carefully prepared by several prominent bee-keepers, all duplicates being stricken out. Then the members of the convention were invited to send in questions; and so, taking it all in all, we had plenty of live material from which to draw. As I was occupied with the duties of the chair, and as I was called out at two of the sessions on committee work, I was not in a position to take notes; but after the convention was all over I asked my brother Huber, now 18 years old, and who has all at once got the bee-fever, to give me some points from memory.

"Oh!" said he; "why didn't you tell me that before, so I might have taken notes?"

But I told him he might write down as much as he could remember of the important points brought out, and this he has done, notwithstanding he was pressed for time, as he had already entered on his college work for the year.

HUBER'S REPORT.

In discussing foul brood it was considered unnecessary to disinfect the hive-bodies. It was, however, shown later, that, if any honey should be spilled on a foul-broody hive, the disease would be almost sure to break out in the colony whose bees took this spilled honey; therefore it seemed that it was far safer to disinfect the bodies. A cheap and effective way was spoken of. Light some coal-oil-soaked rags which have been wound around a stick; place the body around the flame, and, by revolving it with the hands, every particle of wood can be thoroughly scorched. But Inspector McEvoy, of Canada, insisted that when the hives were not daubed with honey it was not necessary to disinfect them.

"Carbon bisulphide," the new moth destroyer, was thought to be much better than sulphur for getting rid of bee-moths from old combs, hives, supers, etc. Instances were given where a strong and continued application of sulphur utterly failed to kill the big worms and the eggs. A subsequent treatment with bisulphide had killed everything absolutely. It was shown that, inasmuch as the fumes of the drug are heavier than common air, the vessel containing the liquid should be put *above* the combs, not *below*; that it was safer, owing to its explosive character, to put the combs to be treated in a large tight box or, better, a tight cupboard suitably constructed outdoors, and then use a sufficient quantity to do the work thoroughly. Some of those who had not obtained satisfactory results had, no doubt, put the bisulphide under the combs or had used too little of it.

A majority of bee-keepers agreed that honey was slightly darkened when taken from old black combs, as compared to that taken from new white combs from the same colony and in the same season.

On the question, "Are long-tongued bees better honey-gatherers than bees of the ordinary length of tongue?" every speaker who had had experience seemed to feel that they were. It was suggested, though that there was the danger of breeding for long-tongues regardless of any other good qualities.

Most of the speakers favored full sheets of foundation in body and super, even for a new swarm.

A large number of remedies were given for cases of severe stinging. It was shown that, "to grin and bear it" would do for some cases, especially children—as a remedy that would cure one, may not answer for another; so a doctor was a good thing to have when serious. Among the remedies suggested was an outward application of castor oil, or kerosene.

In-breeding was thought to be unsafe for a beginner; but Prof. Benton said that very good results could be obtained, and that it was perfectly safe to do so if care be taken.

There was some argument as to whether or not a queen is injured by confinement in the mails. Prof. Benton said no; others said yes. It ended up with, "That probably a queen will not have been injured by the confinement if she can get through alive."

Niver's plan for selling extracted honey was, to go from house to house, giving a sample, explaining how the bees make the honey, wax, etc., showing them a sample of foundation, and of comb. His customers furnished their own fruit-jars, pails, pans, etc., for the honey he invariably sold from his big can in a push-cart at the door. Some objected to this on the ground that a busy bee-keeper has no time to go from house to house posting people on the habits of the bees. However that might be, Mr. Niver said, after he has *once* explained in this way he doesn't have to do so again, and has an easy time selling again at each trip to the same house. Some people, he added, would be astonished at the way supposedly intelligent people talk about bees. Show them some things; prove to them that comb honey can't be manufactured; prove to them that your extracted honey was not adulterated.

The editor of the *American Bee Journal* employed a stenographer at his own expense. There will be a verbatim report in the columns of our cotemporary; and those of our readers who would like to get the full discussion, involving all the good points, the flings and the digs, and the good-natured banter, are referred to the *American Bee Journal*, a most excellent weekly bee-paper, by the way, and one that GLEANINGS cheerfully recommends to all—that is, *providing* you can afford to take another bee-journal.

PRICE ON HONEY, AGAIN.

SINCE our editorial in October 1st GLEANINGS, having the heading, "An Unmitigated Shame," we have received two letters—one from R. A. Burnett & Co., of Chicago, one of the most reliable commission houses in the United States, and another from C. H. Clayton, of Long, California, producers' agent for the Bee-keepers' Exchange of California. The first-named writes as follows:

My Root:—We are a little bit surprised to get a circular letter from you of date yesterday, with another enclosure entitled "An Unmitigated Shame; more Monstrous Tales about the Prices on Honey." There is nothing nowadays better understood than that the newspaper reports, especially these made up from the clippings of other newspapers, are very unreliable; but judging from the information in our possession, the reports that are sent to you by those whom you are having investigate do not agree with those in our possession which we have reason to believe are obtained from sources just as reliable. There have been some very large yields per colony in different parts of the country this season, while very close to those favored locations there have been some unusually light yields; but in nearly all locations there has been a surplus over and above that required for the use of the bees until another season. It is likely that Southern Wisconsin and Northern Illinois came as close to a failure as any one section, but up to this writing none of our correspondents claim that they will need to feed the bees, so that they may have sufficient winter stores.

The Eastern States have produced more honey than at any one time during the past five years. This cuts out the demand that has been coming from that section for the Western honey. There has been this sea-

son a greater tendency on the part of producers to hold their honey than is usually the case. We think this is in part caused by the fact that, during the honey-flow, it came in very rapidly; but as the flow was shorter than usual, this gave the impression to those having a surplus that they were about the only ones who had secured any thing in the way of surplus. As much of this was gathered in the early part of the clover season, and stopped suddenly, and in a good many places, they had no more honey until the asters began to bloom. Inasmuch as this has been a favorable season for them, a great deal of late honey is being gathered and has been gathered, so that the early-gathered honey can be marketed, and is beginning to come forward more freely, now that winter stores are no longer a question.

The cry that has gone out of a large crop through the newspapers, to our minds, is a great advantage to the honey-producer, inasmuch as it gives the general public an idea that honey is plentiful, good, and cheap. This will make them feel inclined to buy it; thus the consumption of honey will be very largely increased, and it is the one thing that will sustain present prices, and make it possible for the crop of 1901 to be consumed before another one is ready.

Very truly yours,

R. A. BURNETT & Co.

Chicago, Ill., Sept. 26.

Our experience regarding offers on honey does not coincide with that of the Burnett Co. It is true there has been more honey produced in the East this year, but that is mainly extracted. On this point there is and has been no diversity of opinion. Indeed, I have already stated in the several reports that I have put forth in these columns that the crop of honey in the East was larger than for several years back, but only in extracted. The amount of comb, for some reason or other, seems to be very light. Last year we were able to get a fair supply, but this year we are not even able to supply our trade, although we can get all the extracted we need. In discussing the honey crop, don't let us get confused on these points.

Of course, it is understood by all of us that accounts in newspapers are not to be taken in any degree as authority; but the dear public, the consumers, are the ones that are misled. Some unscrupulous buyers who are not misled, seeing the opportunity to depress the market, make all the handle of it they can.

But I can not see the force of the statement that the report of a large crop of honey "is an advantage to the honey-producer," if it is untrue. It is the buyers, or middlemen, when these accounts are being floated, who depress the market. It is not the consumers, in my judgment. But the main thing that I was striking at was these exaggerated reports carrying the impression that 2000 or even 500 cars of honey had been produced in California. It is such statements that keep the extracted-honey market in a state of uncertainty.

The other letter to which I referred is one from C. H. Clayton, as above stated. Concerning the recent editorials in our column, he says:

Mr. Root:—I note several editorials in recent issues of GLEANINGS regarding prices on California honey. I am a producer as well as a buyer and shipper of honey, and the present low prices are to be deplored. We are all wholesalers, compelled to be such from our location, and at the mercy of the Eastern buyer, who has other sources than ours from which to draw his stock. At no time this season has it been easy for us

to find buyers, even at present prices. When New York and Chicago will pay but 5 to 6 cents delivered, we can expect but $3\frac{1}{2}$ to $4\frac{1}{2}$ cents for honey here, the freight being about a cent per pound from our terminals to points named.

I do not care to enter into an argument as to whether buyers have overestimated or whether producers have underestimated the crop. It is quite likely that a few of both buyers and producers are not on the best of terms with the truth. I fail to see, however, where either buyer or seller can possibly benefit by misrepresentation.

I have found, after years of experience, that the so-called "estimates" of producers and others scattered over the country are not to be relied upon. This year I base my knowledge of the amount of extracted honey produced upon the number of cases and cans made and sold, which I think is a safe criterion, since it is not likely producers are buying and storing them for use another year. So far as my experience in the sale of them went this season, and I sold several thousand, they bought only when and what they needed from time to time. About the time Ernest Root was on the coast I had a customer for thirty cases. He said he thought he would not need to exceed sixty at the most, and would buy in small lots as needed. Well, that man has 500 cases—30 tons—of honey. The others bought just as carefully, though they did not all have the phenomenal yield that this man had.

In your editorial of Sept. 15 you name Ventura as "one of the best if not the best," and credit the county with 245 tons. I think I could name four producers in that county whose aggregate production would reach almost that figure. There are more than 75 in the county who produce for market, and whose production is from one to twenty or more tons each. I have samples of honey in my office, from producers in Orange County (the smallest county geographically), representing about 250 tons yet unsold, and which I have personally examined (the tons as well as the samples).

I have sampled only part of the honey over there, and I know there has been considerable honey shipped from the county. The counties probably range in production this year in the following order: Los Angeles, Orange, Riverside, Ventura, Santa Barbara, San Diego, and San Bernardino. There have been about 100 carloads shipped to date from these counties, and no one will claim that more than one third of the crop has been shipped, if, indeed, there has been as much as one third.

It is quite true that the loss of bees during the three dry years was enormous, but that loss has been largely repaired, and the bees are differently distributed. Old producers who have dropped out have been replaced by new ones in new localities, as I have learned in my travels during the season.

I have not advised selling at present prices, neither have I advised holding, except in one instance, for higher prices. I have uniformly given what information I had that was reliable as to production, and left the matter to the judgment of the producer. Knowing what I positively do as to the amount produced, I hesitate to advise holding for higher prices, and with that same knowledge in mind I do not advise a wholesale rush to sell. The market will absorb the honey only about so fast, and a rush would be disastrous. The market is extremely tender. A half-dozen cars thrown at once into either New York or Chicago will apparently glut the market, and prices at once go off $\frac{1}{2}$ to $\frac{1}{4}$ cent, which represents the difference between a moderate profit and an absolute loss on the honey.

Lang, Cal., Sept. 23

C. H. CLAYTON.

You say that "no time this season has it been easy for us to find buyers." It seems to me the reason is perfectly plain. The exaggerated reports that are and have been going forth from time to time, of the bigness of the California crop, has a decided tendency to unsettle the market and to make the buyers hold off. The Root Company, as well as a number of others whom we know, hardly dared to make an offering earlier in the season on a car of honey until we knew the facts. No one of us would risk the chance of a high offer with a possibility of that offer being far above the market later on, providing the crop should prove to be as large as has been stated.

The fact is, I don't blame the buyers for being conservative and trying to get it at 3½ to 4½ cents, so long as these monstrous lies keep on traveling. Until their falsity can be proven, they will make an offer that will be safe from *their* standpoint, somewhere about 3½ cents.

You say that you base your knowledge of "the amount of extracted honey produced upon the number of cases and cans made and sold," and that you think this "is a safe criterion." An "estimate" on such a basis would be very unreliable, this year especially. I talked with many bee-keepers from Southern California, and during the early spring it was expected that the crop would be a large one, and the majority of the producers laid in a stock of cans when the prices were low, so as to be sure to have enough. They therefore bought heavily, expecting a big crop, but the big crop did not come to some of them; at least, it did not reach up to their expectations. One bee-man whom I visited had quite a stock of cans on hand, which he said he would not be able to fill this season. It is possibly true that some bought less than they thought they would require; but where there was one such instance as that, there would be dozens of others who had overestimated, and who will, as a natural result, carry cans over for next season.

If one were to "estimate" the amount of comb honey produced by the number of sections sold in a locality in one season, he would run wide of the mark, for the reason that, as a rule, thousands of sections are carried over unused, and this is true of cans.

We have had a number of men in the field who have been looking this matter up very carefully—men who are buyers as well as producers, and I have their reports in our office of the number of tons of honey in sight. Some of our men have made trips independently, and without the knowledge of the others, and their reports agree closely.

You are entirely correct in saying the market is extremely tender, and is, therefore, important that the exact truth and the real facts be presented. But you will agree with me that our eastern reports of 500 cars or 2000 cars is beyond all reason. Even 300 cars is too many, far too many, if the information that has come to me is correct.

Perhaps our estimate of the California output has been too conservative; but far more harm will be done by putting the figures too high than too low. Still, if I erred on the low side I stand ready to be corrected. But I will say this much: That within the last two days our reporters show that the amount of honey in the San Joaquin Valley will be somewhat greater than we reported or was reported to us, because there has been a late and unexpected spurt of honey; but so far as the southern counties are concerned, I still feel that the amount has been exaggerated.

I do not wish to take the view that our reports are correct, and that your estimate is all wrong; but what I do want most of all

is that the truth shall be set forth in a fair and impartial manner.

Editor York, of the *Amer. Bee Journal*, has had considerable opportunity to note the rise and fall of the honey markets. Concerning what I have already said in regard to the exaggerations of the honey crop in California and elsewhere throughout the United States he makes this comment in the last issue of his paper:

Like Messrs. Burnett & Co., we hesitate to advise those of our readers who have honey to sell what to do about marketing it. And yet we think we are safe in saying that whenever you can get as good prices as those of last year, it would be well to accept them very promptly.

Having said that, we may also venture the opinion that, before honey is higher in price a gain, it will likely go lower than the prices quoted now. This we believe because of the feeling that more honey is being held back by bee-keepers this season than in many a year before.

It is exceedingly unfortunate that there seems to be no reliable way in which to get at the exact amount of honey produced. Were that a possibility, the matter of prices could be more easily be controlled.

THE JOINT SESSION OF THE AMERICAN POMOLOGICAL SOCIETY AND THE NATIONAL BEE-KEEPERS' ASSOCIATION AT BUFFALO, N. Y., SEPTEMBER 12.

THIS great meeting was a success in every way. Just before the opening of the session, the bee and fruit men fraternized in a way that would indicate that there never had been any trouble, and never could be, among the intelligent classes of both industries; and the subsequent discussion bore ample evidence of this. The bee-men were entertained most royally, for, indeed, we were the guests of the pomologists. President Watrous called the meeting to order, and then invited the executive officers of our Association to take seats up in front.

The first regular address to which we listened was one from Prof. J. M. Fletcher, of Ottawa, Canada, on the subject of "Bees as Fertilizers of Flowers." Prof. F. is always an interesting speaker, and he gave us a treat. By means of various charts he showed how nature had apparently designed that some sort of strong insect like the bee should scatter the pollen from one flower to another; how she had even gone so far in some instances as to put up certain obstructions, absolutely compelling the bee fairly to wallow in the pollen, dusting itself from tongue to sting before it could escape. He further gave it as his opinion that the interests of the bee and fruit men go hand in hand; that certain kinds of fruit could not mature properly without the work of the bees.

We next listened to an interesting address by Prof. S. A. Beach, of the Geneva Experiment Station, Geneva, N. Y., on the subject of "Spraying Fruit-trees When They are in Bloom." I have already placed before our readers the main portions of a similar address that he made about a year ago. I will just briefly state that, after a long series of experiments conducted by him, at Geneva, and by his colleague, at Cornell University, the conclusion was

reached that the spraying of fruit-trees while in bloom, in some cases not only did no good, but was a positive injury in others, because the poisonous fluids destroy or injure the delicate parts of some flowers as well as the pollen of others. There was no question, he thought, but that the spraying-liquids do kill bees in large numbers when these mixtures are administered at the wrong time; that so many were killed that the bee-keepers in several States secured the passage of laws forbidding spraying while in bloom. Since then a large number of experiments, at the request of the fruit-men, have been conducted, each showing that, aside from the damage done to the bee-keeper, the former could not afford, if they would consult their own interests, to spray at such times, even if the little bee were taken out of the account.

We next listened to Prof. M. B. Waite, Assistant Chief of Vegetable Physiology and Pathology of the Department of Agriculture, Washington, D. C. Prof. Waite issued a bulletin in 1895, detailing a series of experiments that showed, or seemed to show, at least, that the bee plays a very important part in the dissemination of pear-blight from tree to tree. Prof. N. B. Pierce, Pathologist of the Pacific Coast Laboratory, and Mr. N. W. Motheral, Horticultural Commissioner, of Hanford, Cal., together with Prof. Waite, referred to, it will be remembered, have placed the responsibility for the spread of the blight, or at least a part of it, in California, on the bees.

Prof. Waite is a gentleman of pleasing appearance, and, so far as one could see, as we listened to his interesting address, he is one who endeavors to be perfectly fair, and consistent with truth. While he stated before this joint meeting that the bees could and do spread the pear-blight, he did not wish to be understood as urging that they were the only means for its dissemination. He admitted that there are other insects and wild bees in sufficient numbers, possibly, to scatter the pear-blight, so that, if all the bees that are in the control of man should be removed from an infected region, it might not bring any improved condition. He further believed, from a long series of experiments that he had conducted, despite the fact that bees could spread pear-blight, they were very necessary to the fruit-man, and that he has himself, in his own pear-orchard, kept a few bees, not for the honey, nor because he was directly interested in the bee-business, but because he desired them for a purpose, and that purpose was to fertilize the bloom of his trees. Such a statement, coming from a man occupying the position he does, puts him in the attitude of one who recognizes the value of the bee, and who, so far from condemning them, feels that they are necessary to the fruit-men in spite of the damage that they may do.

The last address of the evening was one from Mr. H. W. Collingwood, editor of the

Rural New-Yorker, on the subject of "The Pomologist and the Fruit-grower." This was delivered in a clear, strong voice, and at numerous times his pungent and salient hits brought down the house with rounds of applause from both the bee and fruit men. He very kindly tendered me a copy of the address, and I take pleasure in presenting it to our readers. It is well worth reading carefully clear through.

I am not a bee-keeper, although I help keep my neighbors' bees. I don't pretend to be a pomologist. I'm a plain fruit grower, far enough along to realize that, with all his proud dominion over the lower forces of nature, man can not produce the finest and most perfect fruits without the help of his friend the bee. That, I believe, will be the conclusion of every fruit grower who will really study the question.

The relation between the fruit-grower and the bee itself are physical, mental, and moral. Interfere with a bee's notion of duty and right, and he at once administers a stinging rebuke to those faint-hearted humans who permit others to interfere with their homes and privileges. Perhaps some of you have heard of the young man who said he called his sweetheart "honey," and in 24 hours she broke out in an attack of hives.

The mental relations appear when a thoughtful man studies the wonderful life and habits of the bee, and the social order that prevails inside the hive. That man must admit that even the civilization that has been inspired by human wisdom falls short of this in some essentials of justice and equity. The moral aspect appears when in the latter part of summer, the bees swarm to your fruits, and you try to follow out the principles of the Golden Rule in your relations with the bee-keeper. You learn then how much easier it is to be a bear than it is to be a car. One must learn to use the memory of services rendered as oil for the rusty machinery of patience.

There are two worthy citizens who upset the theories of the scientific men—Jack Frost and Mr. Honey Bee. Ice and honey are two crops which remove no fertility from the soil. A man might cut ice on his neighbor's pond for years, and make a fortune by doing so, yet all his work would cut no ice in the great American game of robbing the soil. The pond will not be injured in the least. In like manner my neighbor's bees may take a ton of honey from my fruit-trees, and it may sell at a good price, yet my farm has not lost five cents' worth of plant food, nor would I have been a cent better off if the bees had not taken an ounce of the nectar, but had simply acted as dry nurses to my baby fruits without pay or reward. Both frost and bee bring unnumbered blessings to man, yet most of us will spend more time growling at some little injury which they do as they pass on than we will in praise and thankfulness for all the benefits they heap upon us. I have known fruit growers and pomologists who, when they find the bee sucking some cracked and worthless old fruit, to forget that the bee did more than they in the making of these fruits. If they were in the bee's place they would probably demand 75 per cent of the finest fruit in the orchard as payment for their labor. Such folks make me think of the housekeeper who found fault with the minister. The good man came into the house of sickness with a message of divine hope and love and faith. He cheered the hearts of all; and yet when he went away the housekeeper found fault with him because he forgot to wipe his feet on the doormat, and tracked some mud upon her kitchen floor. What a world this would be if we could learn to judge others, not by their little weaknesses, but by their great acts of loving service!

If one would look for the ideal relations between the fruit-grower and the bee-keeper he would find them inside the modern cucumber-house. The cucumber is "ecol" way down to the courtship of its flowers. Matrimonial agents are required, and formerly these were men who went about with soft brushes dusting the pollen upon these bashful flowers. It has been found that bees will do this better than the men, and most cucumber houses now have their swarms of bees. Inside the glass house the grower has no desire to throw stones at the bee-keeper, because they both wear the same clothes; and the man who can not get on harmoniously with himself has no business out of jail. I say that, we'll knowing that some of the darkest life tragedies in the world's history have been caused by the evil side of a man's nature obtaining mastery

for the moment over the good. In the orchard or fruit-farm the conditions are very different. Here a man may feed the bees which belong to somebody else, and he does not, like the cucumber-grower, see that the bees actually save him the wages of a workman, which would be nearly as necessary without the bee. Most men do not, I think fully understand who the bee is and what he really does. Let us state his case fairly. I understand, of course, that common facts about the bee must be an old story to those who are here. The greatest value of such a meeting is the fact that one may talk over your heads or through you to the thousands who will never join either society, and yet who will profit by your work.

THE BEE AS A CITIZEN.

Man has never tamed the bee as he has the horse or dog or ox. These animals have surrendered their freedom, and tamely submit to man's dictation, changing even their shape and vital functions at his will. Turn them loose, and after a few hours of clumsy freedom they will come back and beg to be taken under shelter into slavery. Even man himself loses the savage independence and love of liberty he knew when free as the hills, and at the behest of civilization puts his neck under the heel of those who are morally his inferior. Not so the bee. He has never surrendered the freedom that goes with wild things and wild life. Man coaxes and partly directs him, but he is still untamed, and still retains the courage and fearlessness which civilization takes from the heart of most animals, including man. Left to itself the swarm of bees will not come begging shelter from man, but gladly and fearlessly fly off into the wilderness, to live as its ancestors lived.

The bee starts with the scope and purpose of its life-work clear. It does not need to go to school. From the first gleam of consciousness the bee knows that it is born to toil, without reward without hope of posterity. Instinct, heredity, spirit, call it what you will, drives the bee on to labor without ceasing, without holidays or hours of lazy ease, and for what? Simply for the future—that dim mysterious time for which he is ever prompted to provide. I said that the mental side of this question will present itself to any thoughtful man. Truly the lesson of the hive goes deep into the human heart and soul.

THE BEE AS A WORKER.

As a boy I was brought up on the "busy bee" theory. The old man who considered him-elf responsible for my industrial training gave me to understand that the bee is a tireless worker who toils for the love of it and never quits. He wasn't trying to get me interested in the study of natural history—he was trying to get me to realize that some one loved to work, and he knew that he didn't. I am sorry to break down this ideal of childhood, for I have searched hard to find something that has no blood of the shirk in its veins. I can't tell my children the old story, for they will soon know that most bees in New Jersey appear to start work at 7:30 to 8 A. M., and knock off at 4 P. M. On wet days they usually quit entirely. This is much like the average hired man, who will take advantage of a light sprinkle to come in and sweep up the barn floor. The bee works on Sunday while the hired man rides his bicycle. When the bee does start he keeps at his work, while the hired man stops to look at the clock.

When you tear down the childish ideal of the busy bee, and find that it has some of the bad habits of mortals, you do not destroy the whole picture. That would be true with some men; but with the bee it only brings to view a higher ideal than ever. The bee does a fair day's work, and then goes home and puts in a part of the night. A man after doing his work in the field, will hardly help his wife wash the dishes after supper, but the bee works like a slave through the darkness at the wonderful task of manufacturing honey. The short day of hard and consistent work furnishes enough for the hive workers. If all men worked as the bee does, with as fair and just a division of labor, what a world we should have! The short, hopeful day's work would be sufficient if the idle and the rich would cease to live on the earnings of the overworked poor. The society in the hive permits but few drones, and kills them off as winter comes on, while human society increases the number. Thus as we grow older we find that the bee is not the poor aimless drudge we thought him, but rather one who lets his wits save his wings.

THE BEE'S GOOD WORK.

We can easily forgive the bee his short working days when we consider the good he does. There is no

question about the debt fruit-growers owe him. People talk about the wind and other insects in fertilizing our flowers; but I am confident that any man who will really take the time and pains to investigate for himself will see that the bee is nearly the whole story. I have seen the certain results of his good work in a neighbor's orchard. Those bees "broke the trees" down just as truly as though they had climbed on the trees by the million and pulled at them. The appearance of those trees after a few years of bee-keeping would have convinced any fair-minded man that our little buzzing friends are true partners of the fruit grower.

It has been said that the bee does not do this work because he wants to. He is pictured as a greedy, selfish fellow, born into the world with a single idea, who dusts his jacket with pollen, and does his work as dry nurse simply as an incident. Nature puts the brushes on his legs and stomach, and he can not help using them. Here again he is not unlike men. Most of us fight and slave and toil for our own selfish ends. We try to shake the good intentions out of our jacket, and a large proportion of the good we do in this world is done as a side incident, as we press on to accomplish something for ourselves. To my mind this is only another illustration of the wise and beautiful provision of Nature to lead the bee on from flower to flower with some motive of personal gain, and in this way compel him to do his work for pomology. I would that humans who toil, even past the allotted years of man's life, after wealth and power, might as surely leave behind them perfect fruits for the toil of others. The stout legs of the bee, as he crawls from flower to flower, kick life into the baby fruits. Surely with this in mind the pomologist can have nothing to "kick" about.

But ambition and the gratification of personal desires lead both bees and men to scatter evil as well as good. All wings, except those of angels, attract and will carry the germs of evil if they rub against it. It is quite likely that bees will carry the germs of pear-blight from one tree to another—perhaps in quantities sufficient to spread the disease. Let us admit that; and yet no pear-grower who knows his business would have the bees stay entirely away from his trees. The bee also injures fruit to a certain extent. There may be times when he actually leads in this bad work. When he does, he is starved to it. If he were fed at home, as every other farm animal would be at such a time, he would seldom do the mischief. In ordinary seasons I find little fault with the bee for sucking this cracked and broken fruit. We really ought to thank him this year for delivering us from the temptation to pack these worthless culls in the middle of the barrel. Our bee-keeping friends tell us that there is always some rascal that goes ahead with a punch, and breaks the skin before the bee will suck the juice. The yellow-jacket is said to be the culprit, and he is a safe one, for no one cares to argue the point with him. I don't like this hiding behind a yellow jacket. It is too much like the way some of these Christian nations have acted in China. Li Hung Chang and other yellow jackets before him have robbed the Chinese people for centuries, but that is no excuse for the looting and stealing on the part of white men. Should not the bee keeper feed his bees when their natural food is scarce and they really injure fruit? When I neglect to feed my dog at home, and he runs to the neighbor's back yard for food which might feed the pig, have I a right to complain if the neighbor lives up to his legal privilege? My neighbor ought to remember that it was my dog's bark that tamed the hide of the tramp that frightened his children; but some neighbors are not built that way. They are like some pomologists who object when the bee tries to take pay for his services in a few rotten fruits. I am not sure that home feeding would keep bees entirely away from the fruit. There are human beings who will run out of the best of homes. In fact, the more you feed them the more they run. Bees are much like humans in many respects. It is quite likely that a systematic method of feeding during honey-deaths in summer would eventually pay the bee-keeper, just as many dairy-men have become convinced against their wills that it pays to feed grain to cows at good pasture.

THE BEE AS A LAWYER.

Before the law the bee appears to have clearer rights than any other domestic animal. Recent legal decisions have made the bee's position very clear. In one noted case the bees flew into the orchard and unquestionably worked upon or damaged broken fruit. The jury finally acceded, and I think justly, that the bees committed no real damage; yet had a

cow or a hog broken into that orchard and eaten that same fruit the owners would certainly have been liable for damages.

After reading the literature of the subject with great care, I think I am justified in saying that the bee has fuller and more complete legal protection than any other domestic animal. Why should not this be so, since even in its wild state, untamed or directed by men, the bee is led by its very instinct to labor for the benefit of humanity? Certainly no wild animal works for man as the bee does, and no domestic animal accomplishes so much without direct harness or guidance.

Invoking the law against bees is running up against a hard proposition. Laws have been passed against spraying fruit-trees while in bloom. They are intended to give the bee legal protection. These laws have actually led some tough old fellows to spray at just that time, so as to kill the bees. The law was a suggestion of slaughter to them. Some men are so perverted that they see a wrong and coddle it as a "personal right." These laws have helped the fruit-grower more than they have the bee-keeper, because they have led the scientific men to investigate and tell us why it is a mistake to spray too early.

It appears to have been settled that, before the law, bees are to be considered domestic animals—not naturally inclined to be offensive. A fair synopsis of the bee's legal status is about as follows:

1. Bees kept by a regular bee-keeper have become absolute property as domestic animals, and therefore enjoy legal rights.

2. The bee is not naturally savage. It is no more likely to commit serious damage and mischief than dogs, cats, cows, or horses.

3. The law looks with most favor upon those animals which are most useful to man. No animal is of more actual service to man in proportion to his size and the mischief it commits than the bee.

4. After bees have been kept in a certain situation for a reasonable time without serious injury, it can not be said that it is dangerous to keep them there.

5. The bee-keeper becomes liable for injuries done by bees, only on the ground of actual or presumed negligence.

This seems to give the bee a clear field to go ahead about his business in his own way. It must be said that this strong legal position of the bee is largely due to the fact that bee-keepers have picked up some of the strong traits of the bees. When one of their number is attacked, they do not sew up their pockets and run off with their share of the honey, and as much more as they can get. They fly at once to the defense of their comrade, and make, not an individual, but a society matter of it.

The fruit grower will obtain little satisfaction in a lawsuit against the bee or the bee-keeper. The bee is too good a friend of the judge. The relations between these two classes should be settled, not by the scales but by the Golden Rule. Every man who receives a benefit should remember where the benefit comes from. The bee-keeper might say with truth: "It is true that my bees feed upon my neighbor's trees; but they have not injured his farm, because they took no fertility away! He has no reason to kick, because they kicked life into his fruit-buds."

This is all true enough, but it is only one side. The fruit-grower may say:

"These bees have increased my crop of fruit, but have they not been well paid for their work? I fed them, and the money in their owner's pocket comes from my farm!"

Two classes of men with interests which lap and nick in this way should never fight, for when one of them hits the other in the nose he is sure to blacken his own eye. They should recognize their mutual dependence, and treat each other fairly. The bee-keeper may say that the law gives him a right to put his hives close to another's dwelling. Still, if that location is offensive to his neighbor the law which is higher than the decision of any human judge should lead him to put them elsewhere. I have heard of an old farmer who insisted on keeping an old bridled calf tied on his lawn. The calf was in every way offensive to his neighbors, and he had ample space for it behind the barn; but he thrust that calf under the very noses of his neighbors, because the law said he had a right to do as he pleased with his own. That man, like many others, figured that such magnifying of his legal rights gave increased dignity to his personal rights; and what a foolish mistake he made! The man who will use his legal privileges as an offensive weapon against others, when it should be drawn only in defense of true principles, is not a true pomologist or bee-keeper.

I regard the raising of fine fruits, and the training and rearing of bees, as the highest types of soil culture, and hence of human industry. He who can direct and watch the slow development of the perfect fruit and lovingly guard it from plant disease and injurious insects through the long road to perfect maturity; and he who can patiently and skillfully guide and train the honey-bee through its long summer's work—such men ennoble and dignify labor.

Their work may be hard and constant. Their hands may be hard and rough; but the callous on the palm is not a badge of servitude, but an honorable scar from labor's battlefield. Such men are not mere drudges with lory and spirit broken on the hard wheel of labor; but, dealing with the fine and most delicate problems of nature, they keep step with the Creator; they are in direct partnership with God himself; and, as such partners they of all men should be guided by the wisdom and justice of the Golden Rule.

A. I. R. says that the *Rural New-Yorker* fairly bristles with bright, witty, sensible, and practical talk all through. It is a clean Christian paper that takes no advertising of a doubtful or questionable character, and its editor, Mr. Collingwood—well, you can judge of the man by his address as above given. GLEANINGS would like to have every one of its subscribers also a patron of that grand paper, the *Rural New-Yorker*. We will club GLEANINGS and this paper for \$1.75. We can club other papers of equal size for less money; but they may not and probably do not contain the real worth that this does.

STARTING A NEW HOME.

Therefore I hated life; because the work that is wrought under the sun is grievous unto me; for all is vanity and vexation of spirit.—Ecc 2:17.

But Martha was cumbered about much serving, and came to him, and said, Lord, dost thou not care that my sister hath left me to serve alone? Bid her, therefore, that she help me. But Jesus answered and said unto her, Martha, Martha, thou art anxious and troubled about many things. But one thing is needful.—LUKE 10:40-42.

There are many points about the two texts I have chosen that might be considered; but just now I am going to talk about only one of them. Doubtless thousands have felt something as Solomon did, when considering the demands of society and fashion of the present time—so much care and worry if one half tries to do as other people do. Solomon probably kept lots of "help," and very likely the "hired girls" of oriental time were much like those of the present day. Any way, he says he "hated life" because he found it all "vanity and vexation of spirit." Now mind you, friends, I have no special grievance with the hired girls, for I rather think Solomon was somewhat at fault; and, by the way, I fear we are all more or less wrong when we complain of our help. How bright and pleasant the words of the Savior come to us after listening to Ecclesiastes! He knew all about the *care* and *worry*, and yet he tells us so plainly it is all, or at least a great part of it, unnecessary!

You know I have been considering for months a very humble, inexpensive "home in the woods." Perhaps I should say *we* instead of *I*, for Mrs. Root and I have talked it over, and planned, for more than a year; but it was not until Sept. 19 that we got away from our old home. Boxes, trunks, etc., had been shipped ahead, so that, when we reached the new home, our house with its one room, 14 by 20, was pretty well filled up. I went on ahead on my wheel to get the keys, and Mrs. R. came with a friend the last part of the way. As she came out of the bushes and got a glimpse of the house, I waved my cap, and said:

"Well, how do you like the looks of the new home?"

Before she had a chance to answer, her companion replied:

"I think, Mr. Root, perhaps she likes the 'home' rather better than the *road* that leads to it."

Although my leafy avenues are usually very pretty and inviting, they are not exactly suited for a high-seated vehicle so early in the morning. Her hat was pulled off her head by the bushes that meet overhead, and she was drenched with the dew that is always very heavy, and which sometimes lasts until almost noon. Mr. Hilbert's folks had urged us to stay and rest up over Sunday; but we were both very anxious to get to work on our own ground. In a twinkling she was in the midst of the boxes and things, while I stood by as her "obedient servant." While I was gone to the "spring for water" she had planted a box in one corner, covered it with a white spread, and the china and other useful things began to look homelike and inviting as well as useful. With hammer and nails, scissors, tacks, pins, etc., she has been at work now, as I write, a whole week; and I really believe both of us will often look back and call this one of the happiest weeks of our life. My experiment is, at least so far, a decided success; in fact, it is one of the "happy surprises" of my life. I will tell you why. There are thousands who do not make "both ends meet," and are sinking in debt, because they think they must conform to the usages of society. There are other thousands of young people who might get married and start a happy home all of their own if they only knew how few things are really "needful" (the Master has said, "but *one* thing is needful"). Let us look at the matter a moment. This house, where I sit writing, and which is dearer to me than any home I ever saw before, cost, all told, less than \$100. When we moved in, it had cost less than \$40. Of course, lumber is cheap here. A big team drew all the materials complete at one load, and *in one day* the house was fit to live in, in warm weather.*

*The walls are made of inch hemlock that cost, delivered, \$9 per thousand. We took boards 16 feet long and cut them once in two so that one piece was 9½ and the other 6½ feet long. The short pieces made the lowest side, under the eaves, and the long ones the tall side, the roof sloping only one way. The same kind

Let us go back to that first day. Notwithstanding the hurry and disorder, a little before dinner-time Mrs. R. had a repast on our little round table, fit for a king. I don't believe any king *ever* enjoyed a dinner as we did that. We had spotted trout from the bay;* Early Michigan baked potatoes, grown on our own ground; Early Crawford peaches from our nearest neighbors, and every thing else that two tired children ("childreu" over sixty years old) could ask for.

When I wrote about potatoes for table use, and gave you that picture, I had never tasted the Early Michigan, grown in this region, and really did not *know* until that time how nice a baked potato *could be*. This locality, with its bracing air, of course makes every thing nice.

I want to tell you of some of our happy surprises that we never could have had if we had not been doing the work ourselves. Many people who come to this region for a summer outing go to the hotels and pay several dollars a day for board and lodging. Of course, that is all right if they wish to do so; but Mrs. Root and I find happiness in a different way. On the spot I chose for our cottage there is no level ground. Our house is on a side hill. Well, wood is cheap here, so Mrs. Root asked me to have some of the nice maple-trees made into stovewood when we were clearing off a place for the garden last winter. When the wood was nice and dry we had it split fine, and piled under the floor of the building to keep it out of the rain. For several days I got the wood out from under the building, carried it around to the door, and put it behind the little cook-stove almost exactly over, but a foot or two *above*, the spot where it is stored in bulk.

One evening Mrs. Root startled me by suggesting if we had a *trapdoor* in the *floor*, right under the "door" to the *stove*, "carrying in wood" could be done away with. In a twinkling, that very evening, I made the trapdoor, and now our shavings, kindling, and dry maple wood are all close by the stove, and yet they are where there is never any dirt or litter to be swept up. The surface of the ground (which is *always* dry in this region) is about two feet below the floor. I offer this suggestion to those

of 16-foot boards made the ends by cutting them in two once on a bevel. The carpenter said several times my plan would not work; but he was one of the kind who went ahead when I told him I would "take the chances." The ends of the boards were not squared at all, and there was no need of it, for they were all out of sight when the building was done. Building-paper was put over the rough board walls, and then walls as well as roof were covered with cedar shingles. As this is where cedar grows, the shingles cost me but 90¢ per M. The window-casings, cornice, corner boards, etc., are painted green, which makes a very pretty contrast with the cedar shingles.

*Very fair-sized fish, large enough, in fact, for one fish to make me a comfortable meal, are sold here for only fifteen cents a dozen. They are sealed and the insides removed, at this very low price. I verily believe one secret of my good health here is the abundance of nice fresh fish. A great deal of the time my diet is "bread and fishes," "milk and honey." If you will just think of it, it is what the Savior gave his followers when he wanted to give them a little banquet.

who like things nice and tidy, and who may be glad to know of a way of abolishing the whole business of carrying in wood, and its attendant trouble—dust and an empty wood-box. Mrs. Root found that a spring thirty rods from the house would be found a great inconvenience; but so far I have rather enjoyed the walk. We have a rain-water barrel close by the door, and it has so far contained enough, only it is pretty strongly flavored (and tinted) with the cedar shingles.

You may remember I was here in May, and planted a garden. Well, we supposed most of the stuff would have been matured and gone by the latter part of September. Not so. This wonderfully fertile soil (at least wonderfully fertile on our new soil of "woods dirt") seems to have kept the stuff growing; and green corn that was in its prime a month ago is even yet the most delicious green corn I ever ate; and Mrs. Root declared at dinner to-day that the snap beans I brought in were nicer than she ever thought snap beans could be, and yet there were dry pods of mature beans on the same stalks. Well, it surprises us to know what a very small piece of rich ground it takes to provide a great plenty for two people, even if the two *do have* wonderful appetites. A good dinner at 50 cents is usually considered cheap enough; but our meals do not cost 15 cents for both of us, and yet we have fish, meat, fruit, and every thing we want. One great reason for this is that not a thing is wasted. At first we were in somewhat of a quandary without a refrigerator; but Mrs. R. sent to the store for a box, and wire cloth enough to cover one open side. This wire cloth was put on a door to open and shut; and after our meat, fish, milk, etc., were placed on shelves in this box it was placed on a shelf on the north side of the house. The nights are cool, and the air is cool nearly all day, out of the sun. There is nobody around to steal, for we are too far away from the main road; and who would expect to find people living away out here in the dense woods? Our windows slide horizontally instead of up and down, and I greatly prefer this arrangement. Under one of the north windows we have a shelf outside on which to place any thing that is to be kept cool. This shelf and window, and, in fact, all the windows, are covered outside with mosquito-netting to keep out flies.

For a kitchen table we procured a large dry-goods box, of the proper height. One side and one end are open. The box has shelves inside; and as fast as the utensils are washed they are placed on these shelves. Not only every day, but almost every hour, we discover some new short cut in the work of getting the meals. For the first time in our forty years of married life we are working side by side all day long. You may say it is not every man who can afford to drop business and be "hired girl." Well, most men can take a vacation at least a part of the year, and this is *my* vacation.

If King Solomon had carried in wood for his wife (?) to bake with, brought water from the spring, and "whacked" carpets, he would never have "hated life," and called it all "vanity and vexation of spirit."

Ask the doctor why so many people are sick, and he will tell you it is because we are getting so far away from nature and plain and simple living. We two are in the woods all the time, and, in fact, we are out of doors most of the time, in ordinary, rather light clothing. At home I wore an overcoat and fur cap, even when the temperature was above 70; but here I am out of doors in my shirtsleeves, and quite comfortable at 50. Candidly, I do not know *why* this is so. This health-giving locality has much to do with it, no doubt; but "out in the woods" *all the time* is *something* of a factor, I am sure.* Not only my garden but my fruit-trees are growing *wonderfully*. They lay at the depot until in bad shape, and were put out quite late, because I was delayed in getting here. I found several peach-trees to-day that filled the wire attached to the label until said wire had nearly cut off the top of the tree. I went over them in July, and thought I fixed all the labels; but it seems I didn't. My neighbor, Mr. James Hilbert, is now fitting the ground to plant 30 acres of peach-trees in the spring. These sandy hills seem to be specially adapted to peaches. The quality is beyond any thing I ever saw; but the usual way of managing is to let the tree break all its limbs off by its overload of fruit about the third or fourth year.

I have been very anxious to know if Mrs. Root would share my enthusiasm; and I was, therefore, greatly pleased, a few days ago, to hear her say she would like to stay here till Christmas if it were not for the awful job of housecleaning that looms up before her day and night — not housecleaning here (with our one room), but in the big brick house in Medina. You get a glimpse of it in the ABC book. Why not *hire* help? We can't get any. A few years ago, when women were scarce who would clean house, several young men "took lessons," and did very well; but now they too have gone out of the business. She says that, even though a large part of the house is now unused, the empty rooms must be "cleaned" twice a year, just the same. A few years ago we had paper collars that were never cleaned. In some restaurants, even now, they have paper napkins. When they are soiled they are burned up and new ones bought. Well, why can't we have "homes," or perhaps I should say *houses*, that can be burned up or given away when housecleaning time comes, and then just get a new one, bright

* I have told you Mrs. Root has been for years troubled greatly with insomnia. Now she goes to bed early, and sleeps all night until daylight. In fact, she is now sound asleep on the lounge by my side while I am writing. She did the washing for us two this forenoon, because there isn't a washwoman to be hired within miles of us. — she had it nearly done before I knew any thing about it. Now, is this great gift of health and enjoyment due to the locality, or is it because we are getting back to pioneer times?

and clean? Of this I feel sure: Our houses are, many of them, too large. Mrs. R. has for years longed for a little house that can easily be cared for, and now she has one.

What shall we do with friends when they come to see us? Well, that is a serious matter. We might "fix 'em up" on the roof, in warm weather; and, in fact, our roof is only a little way up. So far as meals are concerned, our garden is full of stuff we are trying to give away, and our nearest neighbor has butter, milk, and eggs to sell, the year round.

Dear friends, I have talked about the first text some, but have had little to say in regard to the last. Do you not believe the dear Savior meant to say to us that we are making too much of things that are comparatively *unimportant*? Are we keeping in mind sufficiently the "one thing" needful? It is the fashion almost everywhere to have a great lot of dishes with which to serve a meal. Next time you go to a city hotel, suppose you count the number of dishes brought you. All these must be washed; and in "our homes" dishwashing is almost as much dreaded as housecleaning. In our home in the woods there are only a few dishes to wash, for, to tell the truth, we haven't got them; but please do not understand that our table is uninviting in its appearance. Our 14×20 room is divided in the middle by soft white curtains, and our dining-room and its appointments would do credit to a first-class city restaurant. It is, in fact, *cleaner* than many of them (for you may be sure no liquors are served), and the table contains fewer dishes. Mrs. Root has just declared it is easier to do the work here than in that other home that cost—I declare I am almost afraid to tell the truth, for it *really* cost *forty or fifty times* as much.*

What *should* we do with our money if all the world lived as we do? First, feed the millions that are starving. Send missionaries and expert teachers to the uttermost parts of the earth, and teach the unfortunates how to grow potatoes, and how to make *every* land "a land flowing with milk and honey."

Now, although it seems to me such an *easy* thing to get a living here, I meet people almost every day who are selling out and moving away. They say it is awful hard work getting a living where there are so many "stumps" and "hills." Oh dear me! I only wish we could get rid of our one saloon as easily as we get rid of *stumps*. The saloon is taking the earnings of the poor hard-working people, and then they attribute their bad luck to the "stumps."

It is now the season for "husking-bees," and I told Mrs. Root I thought *we* would

*One reason for this is, that here there is no dust, and almost no mud. Dusting furniture would be labor lost, for no dust can be found. As soon as it stops raining we can walk, or ride a wheel; and the harder it rains, the better the roads, unless in a few spots on swampy ground. With very little care, no mud or dirt need be tracked into the house. No water ever stands in puddles and underdraining is practically unknown except in springy places.

go; but when some one said the boys would not "turn out" unless a keg of beer were provided from the saloon, I uttered a mental prayer that husking-bees, at least that kind, *might* go out of fashion. I have no quarrel with the big wide world. Let every one seek and find happiness according to his own notion; but I have been so happy of late, and in such an innocent and inexpensive way, I felt as if I must tell you about it. Yes, I have thought of Diogenes and his tub, and his freedom from care and worry; but I don't think I should like his extreme doctrine. If he would make that tub about "14×20 feet," with a good roof over it, perhaps I might agree with him.

Does some one suggest that, if I don't look out, I shall get into "small" and "stingy" ways in my old age? God forbid! It has been my privilege for years past to give material help to missions and industrial schools in our own and foreign lands. I do not expect these annual contributions to be lessened as the years go by; in fact, I hope it may be the other way. And now that I think of it, these industrial schools are finding happiness and great success along just the lines I have been writing about. The school for ministers, described in our Sept. 15th issue, is one of that kind.

Finally, dear readers, did not the greater part of our great and good men come from very humble homes, where modern luxuries were entirely unknown?

"Wherefore do ye spend money for that which is not bread, and labor for that which satisfieth not?"

15 Months for \$1.00!

To New Subscribers.

To any one not a subscriber to the weekly *American Bee Journal*, who sends us \$1.00, we will send it

**From October 1, 1901, to
the End of 1902,**

or 15 months; which means over 60 copies. This we will do as long as we have back numbers left from Oct. 1; after that, the subscription will begin at the time it is received and continue to the end of 1902.

The Buffalo Convention Report

will appear *in full* in the *American Bee Journal*; that alone will be worth the subscription price for a year, to say nothing of the many other good things it contains each week. Better subscribe *now*. No matter what other bee-papers you are taking, you can not afford to be without the *oldest*, and what many bee-keepers say is *the best*. Ask for free sample copy, and also catalog of

ROOT'S GOODS AT ROOT'S PRICES.

George W. York & Co., Chicago, Ill.

144, 146 Erie Street.

ONCE IN A LIFE TIME
is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC WAGON

lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electro-Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 60 in. It lasts because tires can't get loose, no re-setting, hubs can't crack or spokes become loose. Fellows can't rot, swell or dry out. Able steel hounds. **THOUSANDS NOW IN DAILY USE.** Don't buy a wagon of this kind until you see "The King" ELECTRIC WHEEL CO., Box 39, Quincy, Ills.

Union Combination Saw

For Ripping, Cross-cutting, Rabbering, Mitering, Grooving, Gaining, Boring, Scroll-sawing, Edge-moulding, Beading. Full line FOOT and HAND POWER machinery. Send for catalog A. SENECA FALLS MFG. CO., 44 Water St., Seneca Fs., N.Y.

The Storm Proof KING WIND MILL

produces 25 to 50% more net power from any kind of wind than any other mill made. Wheel being only 1 in. thick cuts the wind like a knife and is 50% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both pumping and power, back geared or direct stroke. Send for circulars and prices before you buy. Medina Mfg. Co., Box 11 Medina, O.

STEEL WHEELS
for your **FARM WAGONS**
any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address **EMPIRE MFG. CO., Quincy, Ill.**

GINSENG!

For reasons not needful to explain here we have got to move one of our largest ginseng gardens, and will close this garden out at very low rates. Seeding plants, 3c each; yearling plants, 4c; 2-year old plants, 5c; 3-year-old plants, 6c; 4-year old plants that have not borne seed, 8c; strong seed bearing plants, 1/2 to 1/2 in. in diam., 12c; over 1/2 in. in diam., 15c.

Edgewater Seed Co., Skaneateles, N. Y.

Wants and Exchange.

WANTED.—To exchange potatoes for sweet potatoes. JOHN ANDERSON, Oriskany Falls, N. Y.

WANTED.—To sell 8 bushels Egyptian winter onion sets at a bargain. WM. VAN AUKEN, Ellisburg, N. Y.

WANTED.—To exchange Root's No. 5 extractor and Dadant uncapping can for honey. O. H. HYATT, Shenandoah Iowa.

WANTED.—To sell or exchange a 120-acre farm, in Phelps Co., Mo.; house, spring, and orchard. Address 1430 South 10th St., St. Louis, Mo.

WANTED.—To sell cheap, bees, hives, brood-frames, foundation, smokers, etc.; also nice R. C. B. Leg-horns. C. H. ZURBURG, Bishop, Ills.

WANTED.—To buy quantity lots of fancy and No. 1 white-clover comb honey in no-drip cases. BYRON WALKER, Clyde, Cook Co., Ill.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co., 199 South Water St., Chicago, Ill.

WANTED.—To buy your honey. State your lowest cash price, kind, and quantity. EDW. WILKINSON, Wilton, Wis.

WANTED.—To exchange second-hand 60-lb. cans, practically as good as new, at 20c per can in lots of 20 or more. f. o. b. Chicago, for white-clover honey at market price. B. WALKER, Clyde, Cook Co., Ill.

WANTED.—To sell cheap, 20 acres of good Florida land, well situated, at a low price. Address for particulars. MRS. I. B. WEIR, Toledo, Florida.

WANTED.—To dispose of my olive-ranch and 85 colonies of bees, located 12 miles from San Diego, California; near church, school, store, postoffice, and railroad station. Extracted 19,000 lbs. from 50 colonies, spring count, this season; have taken honey every year since I came here. The best of climate. Write for particulars. J. B. RATCLIFFE, Helix, San Diego Co., Cal.

WANTED.—All the bees we can get; must be extremely cheap at this time of year. Parties who will place us in correspondence with those having bees to sell, will receive one to a half-dozen selected queens free next June, according to the number of colonies we succeed in purch. sing from said parties. H. G. QUINN, Parkertown Ohio.

WANTED.—To sell our entire plant and situation, including a complete line of machinery for manufacturing bee-hives, comb-foundation, etc. In connection with same we have a first-class up-to-date planing-mill in every respect. Our good will and list of customers goes with it. This is a bargain and will pay you to investigate. Address W. R. GRAHAM & SON, Greenville, Texas.

WANTED.—To sell 104 colonies Italian bees in the A. I. Root Co.'s 10-frame hives; heavy top frames; wired full brood sheets of medium foundation; all drawn combs; queen excluders; combination stands and bottom boards; 3/4 gable top, 3/4 suzer covers; all new and well painted; located in a 6000 acre pasture just above the mouth of Leona River, on the Prio; the natural home of the honey-bee, and no apiary near; every thing on the range that produces honey in Texas, with over two years' privilege yet to run. This is a bargain—the most complete outfit in Texas; can give time on part; six miles from railroad. I have not extracted since early last spring. My wounds have again broken out, and I can secure no assistance from U. S. Pension Department, no friends on earth to assist me, so I will close out apiary, and go back to the Los Angeles, Cal., Soldiers' Home and wait patiently for reveille to blow lights out for me. Prompt action necessary. J. M. MCCURDY, Box 28, Pearsall, Frio Co., Texas.

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" and cat. 288 free. W. Chester, Pa.

Angora Goats. Delane bucks; good stock; low prices; large circular for stamp. ED. W. COLE & Co., Kenton, O.

I. J. Stringham, 105 Park Place, New York City.

The Best Queens of the Best Kinds.

By special arrangement with The A. I. Root Co. to furnish them QUEENS, I have secured their assistance in procuring the FINEST BREEDING QUEENS that a thorough knowledge of the bees of the country and money can procure. Among them is a SELECT DAUGHTER OF THEIR \$200.00 QUEEN THAT THEY RE

FUSE TO QUOTE ME PRICES ON. This queen shows every superior quality of her mother. Her bees show an actual reach of 21-100 of an inch; are large, gentle, and beautiful to look upon.

MR. E. R. ROOT says: "You have as fine bees as there are in the United States; and with a direct cross of their breeders you should be able to produce queens whose bees show a reach of 25-100 of an inch."

MR. R. A. JANSEN, of Iago, Wharton Co., Texas, bought of me last fall 80 queens. He says of them: "I consider myself the queen and 50 cents per colony BETTER OFF, for the purchase of these queens, on the SPRING HONEY FLOW ALONE. They SURPASSED ALL OTHER COLONIES in my yard during the spring honey flow and KEPT UP THE LICK. Please book my order for 100 MORE queens to be delivered in the fall. I shall, in all probability, increase this order later."

Under date of July 28th, 1901, from Mr. W. E. Burch, of Los Banos, Cal., comes the following in regard to queens from my apiary: "The three that I have are the FINEST queens I ever saw, and the GENTLEST BEES TO WORK WITH. When I am working with these three colonies I do not use the smoker, and they ALWAYS SEEM TOO BUSY ATTENDING TO THEIR OWN BUSINESS to interfere with me; AND THEY ARE THE BEES THAT BRING IN THE HONEY."

From Ramey, Minn., under date of Aug. 8th, 1901, Mr. A. T. McKibber writes: "The cage of bees arrived o. k., and were measured. They ran 24-100 and 25-100, which is just a little longer than any I have, or have measured, and I think by their looks that they're good bees. The bees you sent could probably take honey $\frac{1}{4}$ inch."

Louis Werner writes under date of June 19, 1901, from Edwardsville, Ill.: "The queen I got from you is a good one, and proved to be as good as I EVER GOT FROM ANY BREEDER. When I am in need of queens I know where to get good ones."

Frank Coverdale, of Maquoketa, Iowa, says, under date of July 6, 1901:

"We like those that have hatched. They are exceedingly gentle, and queens prolific. Among the first fifty the tongue reach is very good, generally 20; one measures 23, and another, which is best of all, measures 21. THIS QUEEN I VALUE VERY HIGH. Her bees are uniform in color. I'd like you to send me a cage from your longest-reach queen, as I'm well equipped for measuring."

This is from far off Jamaica:

"Kingston, Jamaica, B. W. I., May 11, 1901.

"Queen received on the 8th in the pink of condition. Attendants and queen appeared as if just placed in cage THE DAY BEFORE. S. E. SURKIDGE."

If I have real good success, by next year I expect to be able to furnish a QUEEN for the Chinese that will be acceptable to the POWERS.

The A. I. Root Co. also knows a GOOD THING when it sees it. LISTEN!

"Medina, Ohio, May 1st, 1901.

"W. O. Victor.—Instead of sending us 12 untested queens per week, send us 18 in two installments, a day or so apart."

I have on hand at the Pan-American Exposition a nucleus, with queen. Mr. Orel L. Hershiser, Superintendent Apianian Exhibit, will take pleasure in showing them, as he always "Seeks after the Good, the Beautiful, and the True."

Prices for September, October, and November Only.

Untested queens, 65c; 6, \$3.50; 12, \$6.50; 50 or more, 50c each. Select untested, 85c; 6, \$4.50; 12, \$8.50. Tested, \$1.00, 6, \$5.50; 12, \$10.00. Select tested, \$1.50; 6, \$9.00. Breeders whose best bees show a reach of 21-100, with an average of 20-100, \$3.00. Breeders whose best bees show a reach of 21-100, with an average reach of 20 $\frac{1}{2}$ -100, \$5.00. Breeders whose best reach show 22-100, with an average reach of 21-100, \$7.00. I have discovered two breeders whose best bees show 24-100, with an average reach of 22-100. These are too good to sell. Don't ask for prices. Yard No. 1.—Long-tongue Root Clover. Yard No. 2.—Imported Stock. Yard No. 3.—Golden, or Five-banded Stock. Yards No. 1 and 2 contain, without question, bees as gentle as was ever handled, and I think equal of any in the world as honey-gatherers from any flower that grows. Don't forget that my FAMOUS BEAR PICTURE goes as a premium with each order for six or more queens at prices quoted. Send for list showing description of stock and arrangement of each apiary.

W. O. VICTOR, Queen Specialist, Wharton, Texas.

Marshfield Manufacturing Company, Marshfield, Wisconsin.

LONGEVITY.

I have never made any great claim for the longevity of the Superior Stock of bees that I am selling, but from the reports that I am getting this year I am inclined to the belief that this quality ought to be added to the other desirable traits that they possess. Here is a sample of the letters that I get :

WARSAW, N. Y., Sept. 4 1901.

Mr. W. Z. Hutchinson, Dear Sir:—I inclose \$2.00 for Review and queen. Three years ago I lost my breeding queen in the spring, and sent to you for one of your year-old queens. I expected to use her only one season, but she proved to be so much better than I expected that I kept on using her until I now have nearly my entire apiary requeened from your stock. I started last spring with 35 colonies, increased to 75, and have nearly 400.0 pounds of honey—not so bad for a village where 250 colonies are kept, besides there be-

ing other apiaries near by. One of my neighbor beekeepers is so well pleased with my bees that he offered to trade apiaries with me, giving me *two swarms for one*, but I declined his offer. The bees of this queen have been trying hard for the last two or three months to supersede her, but I keep the cells cut out, and shall try hard to keep her over into her fifth year.

Resp. yours,

W. W. SHERWIN.

If you send in your order *at once* you will probably be able to get one of these queens this fall, and be all ready for business next spring, instead of being obliged to wait two or three months before your order can be filled.

Queen alone, \$1.50; queen and Review from *now* to the end of next year, only \$2.00.

W. Z. HUTCHINSON, Flint, Mich.

Long Tongues Valuable South as well as North.

How Moore's strain of Italians roll in the honey down in Texas:

Hutto, Texas, Nov. 19th, 1900.

J. P. Moore, Dear Sir:—I wish to write you in regard to queens purchased of you. I could have written sooner, but I wanted to test them thoroughly and see if they had those remarkable qualities of a three-banded Italian bee. I must confess to you I am more surprised every day as I watch them. They simply "roll the honey in." It seems that they get honey where others are idle or trying to rob; and for gentleness of handling, I have never seen the like. Friend E. R. Root was right when he said your bees have the longest tongues; for they get honey where others fail. I will express my thanks for such queens. I am more than pleased. I will stock my out-apiaries next spring with your queens.

Yours truly, HENRY SCHMIDT.

The above is pretty strong evidence that red clover is not the only plant which requires long-tongued bees to secure the greatest quantity of nectar.

Daughters of my 23-101 breeder, the prize-winner: Untested, 75c; six, \$4.00; doz., \$7.50. Select untested, \$1.00; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, Lock box 1, Morgan, Pend. Co., Ky.

(Mr. J. P. Moore is entirely reliable.—A. I. R. Co.)

No more Untested Clover Queens

will be sent this season. All orders received after this date will be filled next season. We are preparing to winter over a large number of our best clover queens, and expect to be fully equipped to take care of all orders next season.

THE A. I. ROOT CO., Medina, Ohio.

Standard-Bred Queens!

Acme of Perfection; Not a Hybrid among Them.

Improved Strain Golden Italians.

World-wide reputation; 75c each; six for \$4.00.

Long-tongued 3-banded Italians.

Bred from stock whose tongues measured 25-hundredths inch. These are the red clover kings of America. 75 cts. each; six for \$4.00. Safe arrival guaranteed. Catalog on application. Headquarters for bee-keepers' supplies.

Fred W. Muth & Co., Cincinnati, Ohio.
South-west Corner Front and Walnut Streets.

Queens. From my breeders, 75 cts.; select, \$1.00, tested, \$1.25. For particulars, see former advts. and circulars.

Queens. J. B. CASE, Port Orange, Fla.

Barnes' Hand and Foot Power Machinery.

This cut represents our combined circular saw, which is made for beekeepers' use in the construction of their hives, sections, boxes, etc. **Machines on trial.** Send for illustrated catalogue and prices.

W. F. & John Barnes Co.,
545 Ruby St.,
Rockford - - Ill.

FOR SALE.—First-class Angora cats and kittens.
MRS. HATTIE S. WEBBER, Monroe Ctr., Minn.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOES, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

GUS. DITTMER, AUGUSTA, WIS

Evansville, Ind., Sept. 27th, 1900.
The Jennie Atchley Co., Beeville, Bee Co., Texas.
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I have bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season.
Yours fraternally, J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per dozen. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per dozen. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of "The Southland Queen," the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.
Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3 1/4-inch; \$1.10; 3-inch, \$1.00; 2 1/2-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs also to be travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well-scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs straight, one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well-scraped of propolis.
 No. 2.—All sections well filled, except the row of cells next to the wood; combs comparatively clean; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 3.—Three-fourths of the total surface must be filled and sealed.
 No. 4.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

MILWAUKEE.—The receipts of honey, both comb and extracted continue very fair, and we have noted a better inquiry for honey and increased sales of comb honey, and the week closes with an encouraging outlook, that, as we have before noted, a better demand would exist when cold weather comes on, and we will now quote fancy 1-lb. sections, 15a16; A No. 1, 14a15; No. 1, 13a14; amber, nominal, 10a12; extracted, white, in bbls., kegs, cans, and pails, 8a9; dark, or amber, 7a7½; beeswax, 26a28. A. V. BISHOP & Co., 119 Buffalo St., Milwaukee, Wis.
 Oct. 19.

NEW YORK.—Demand for comb honey good; receipts small; buckwheat comb honey scarce, and bringing good prices. We quote the market as follows: Fancy white comb, 15a17; No. 1, 14a15; No. 2, 10a13; fancy buckwheat, 12a13; No. 1, 11a12; No. 2, 9a11. Extracted, dull; white, 6a7; light amber, 5½a6; buckwheat, 5a5½. Beeswax, 27a28. CHAS. ISRAEL & Bros., 186-190 Canal St., New York City, N. Y.
 Oct. 21.

CHICAGO.—There is a very good demand for No. 1 comb honey at 15; that which will not grade No. 1 or fancy, 13a14; some small lots of fancy bringing more than 15; light amber selling at 12a13; dark honey of various grades range from 10a11. Extracted sells fairly well at 5½a6½ for white, according to quality and flavor; white clover and basswood bringing 7; light amber, 5½a5¾; dark, 5a5½. Beeswax steady at 28. R. A. BURNETT & Co., 190 South Water St., Chicago, Ill.
 Oct. 19.

PHILADELPHIA.—Comb honey arriving very freely, and prices declining. We quote fancy white, 15a16; A No. 1, 14a15; buckwheat, 11a12; extracted, fancy white, 8c; amber, 5½a6; beeswax, 28. We do not handle on commission. WM. A. SELSER, 10 Vine St., Philadelphia, Pa.
 Oct. 21.

ALBANY.—Honey market steady with good demand. White comb fancy, 15a16; No. 1, 14a15; medium, 13a14; buckwheat, 12a13. Extracted white, 7a7½; amber, 6a67; buckwheat, 6. This is the time to sell honey to give satisfaction. Weather is right for shopping, and people have the relish for honey now.
 Oct. 19. MACDOWALL & Co., Albany, N. Y.

NEW YORK.—Comb honey is in good demand, and finds ready sale at the following quotations: Fancy white, 15; No. 1 white, 13a14; amber, 12; buckwheat, 10a11. Extracted rather quiet at 6a6½ for white, and 5½a5¾ for amber. Beeswax quiet at 27a28. HILDRETH & SIEGELKEN, 82 St. Murray St., New York City, N. Y.
 Oct. 18.

CINCINNATI.—Fancy white comb honey sells at 15a15½; lower grades, 13a14. Extracted dark, 5a5½; light amber, 5½a6½; clover, 7a8. C. H. W. WEBER, 2146 Central Ave., Cincinnati, Ohio.
 Oct. 19.

SCHENECTADY.—Market continues in good shape without change in prices. Fancy white, in cartons, 16; No. 1, 14a15; No. 2, 13a14; buckwheat, 12a13. Extracted, light, 6a6½; dark, 5a5½. CHAS. McCULLOCH, Schenectady, N. Y.
 Oct. 19.

DENVER.—No. 1 comb honey, \$3.00 per case; No. 2, \$2.75. Most bee-keepers have marketed their crops now, and, owing to cooler weather, local demand is more active. White extracted, 7a8. Beeswax, 22a25. COLORADO HONEY-PRODUCERS' ASS'N, 1110 Market St., Denver, Col.
 Oct. 15.

BUFFALO.—Demand for honey fair; receipts rather light, and still there is no scarcity. Fancy No. 1 white clover, 15a16; A No. 1, 14½a15; No. 1, 14a14½; No. 2, 13a14; No. 3, 12a12½; No. 1 dark, 10a12; No. 2 dark, 10a11. Extracted white, 5½a6½; dark, 11a15. Beeswax, 28a30. W. C. TOWNSEND, 81, 86 W. Market St., Buffalo, N. Y.
 Oct. 19.

BOSTON.—There is a fairly good demand for stocks, with ample supplies at the present writing. Fancy No. 1 in cartons, 15½a16; A No. 1, in cartons, 15a15½; No. 1, 15; very little No. 2 is being received. Glass-front cases will bring about 1c per pound less. Light California extracted, 7½a8. Florida honey, 6½a7. BLAKE, SCOTT & LEE, 31, 33 Commercial St., Boston, Mass.
 Oct. 21.

DETROIT.—Fancy white comb honey, 11a15; No. 1, 11c; dark and amber, 11a12; extracted, white, 6½a7; dark and amber, 5a6; beeswax, 26a27. M. H. HUNT & SON, Bell Branch, Mich.
 Oct. 21.

FOR SALE.—Extracted honey in 160-lb. kegs. Buckwheat, 5½; mixed, 6; basswood, 7. Send postoffice money-order on Moravia, N. Y., and will ship promptly. N. I. SLAVENS, Venice, N. Y.

FOR SALE.—Fine ripe extracted touch-me-not honey, in 60-lb. square tin cans, 2 cans to a case, delivered at R. R. station at 7½c. Sample postpaid, 8c. C. A. BENCH, La Paz, Marshall Co., Ind.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station. THOS. C. STANLEY & SON, Fairfield, Ill.

FOR SALE.—8000 lbs. clover and basswood honey, mixed, in 60-lb. cans, as white as Michigan produces; good body and flavor; the best I ever produced in 26 years' bee-keeping. A free sample will convince you. Eight cts. per lb. at Carson City. E. D. TOWNSEND, Remus, Mich.

WANTED.—Fancy and No. 1 white clover honey, one-pound sections, paper cartons preferred. BLAKE, SCOTT & LEE, 33 Commercial St., Boston, Mass.

WANTED.—Western honey in car lots also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati. FRED W. MUTH & Co., Front and Walnut Streets, Cincinnati, O.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more. WM. MORRIS, Las Animas, Co.,

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

VOL. XXIX.

NOV. 1, 1901.

No. 21.

HEARTY THANKS, Mr. Editor, for recognizing the demand for a three-ply hive-cover with dead-air space. Now we're good friends again—for the present.

"ORDINARY queen-cells," as the designation for those intended for swarming or superseding, and "emergency" for the other kind that are post-constructed, is the suggestion of E. E. Hasty, in *Amer. Bee Journal*. Good. [So say I. I am glad you agree.—ED.]

CURE FOR CORNS.—After a warm foot-bath, apply to the corn a plaster of beeswax, or, still better, of propolis, spread upon paper or cloth, and leave undisturbed for three or four days. If the corn is not then easily removed, repeat the process.—*Centralblatt*.

A GOOD DEAL of previous observation, and closer observation this fall, lead me to believe that the *rule* is that queens continue laying for a time after workers cease rearing brood in the fall. At least it is a very common thing to find eggs and sealed brood present, but no unsealed brood.

MR. EDITOR, when you tell a story, why do you leave us partly in the dark? You tell us, p. 823, that when B. Franklin chased you you peddled with all your might; but please tell us whether you peddled honey, bee supplies, or what. [That was a typographical error. It should have been pedaling. The "goak" is on us.—ED.]

F. C. HOLBROOK relates in *Amer. Bee Journal* that he lost many pear-trees from pear-blight, among others a seedling that never had a blossom. He wants to know how the bees could be to blame in the latter case. [Just what I thought when I saw several thousand sprouts that had never been in bloom in California, all struck down by the blight.—ED.]

IN MOVING BEES, I formerly used a wire-screen cage at the entrance. As said on p. 816, "It is surprising what relief such an arrangement gives to the strongest hive;" but unless the cage be securely fastened it may come off, and then the whole hive will come pouring out of the hive, especially if a strong hive be in an old, rotten hive. Much better, however, than such a cage, it is to have a bottom-board two inches deep, with an entrance the same depth. It is more quickly and easily closed than with the cage. All that is needed is a single piece of wire cloth with folded edges, just large enough to close the entrance, with a stick nailed to the hive across the upper part of the wire cloth.

REPLYING to your question, p. 813, Mr. Editor, it would be a troublesome thing for me to tell in all cases in September whether a colony has a good queen. In some cases there will be no eggs or unsealed brood present, and it is unusually difficult to find the queen. If I do find her, how can I know she is a *good* queen? [What Doolittle meant, I think, was that, if a colony had an inferior queen, as judged by its past record, or if a queen was past the prime of life, that the month of September was a good time to remove all such, and put in their stead young, vigorous mothers; that is to say, if the inferior queens have not been removed up to that time, in order to save the colony from succumbing to the rigors of winter, a good queen should be substituted.—ED.]

WHAT IS SAID by A. C. Miller and the editor, p. 819, raises some questions. Is it certain that sudden cessation of laying hurts a queen? Is there really any sudden cessation? Does not the queen keep right on dropping her eggs when caged? Does not all the harm come from mailing her while still heavy? Perhaps the whole thing may be something like this: Several men are sent on a railroad train, each one to stand in the middle of a car, having bound on his back a heavy burden. One gets several falls, and is badly hurt; another goes

through unhurt, a third strikes on his head and is killed, and so on. Without the burden, each one might have gone through safely. Moral: Cage your queen a day before mailing. [All of these points are worth consideration, but I do not believe we can give a positive answer to any one of the questions, with our present knowledge.—ED.]

I'M AFRAID, Mr. Editor, that you and I do not attach the same meaning to the word "incidental," or you would not object to "incidental proofs" that 15 days are enough for the development of a queen. To go by the dictionary, proofs "happening or coming without regularity or design" may be as positive and emphatic as those coming in the course of a carefully planned experiment. Such proofs I have had, and they are none the less reliable because incidental. [I attached exactly the same meaning that you do; but my point was this: That if these proofs happened to come along without regularity or design, you, the observer, would not be watching the matter as closely as if you had set in motion a train of events to prove or disprove the proposition. We may see a thing happen a thousand times, but learn nothing from it, either as to its cause or prevention; but, however, I accept the 15 days, as I think at present the balance of evidence is in favor of that length of time rather than in favor of 16.—ED.]

AFTER TRYING for years to get people to say "colony" when colony was meant, GLEANINGS has given up being so hide-bound, and now allows "stand" for "colony," and on page 816 "hive" is used for "colony." Of course, "swarm" for colony is equally admissible, and is, in fact, used, p. 817. It gives variety to have several names for the same thing and several things for the same name. It's a good deal of trouble always to choose carefully the right word, and it will be a good deal easier if any old word will do. Then there will be a pleasing variety in the various ways in which the same article will be understood. [If you had to read all the proof that goes into a bee-periodical, I am afraid you would find it difficult to *always* substitute the word "colony" for "swarm." But for the sake of avoiding repetition our plan is to allow the use of the word "stock" or "stand" for "colony;" but we always aim to make a discrimination between "swarm" and "colony." Certainly, doctor, you would not compel a farmer always to use the word "cattle," and never say "stock," as applied to the same class of animals. Indeed, the great power of the English language rests in its choice of words.—ED.]

DOOLITTLE, in *Amer. Bee Journal*, speaks of 108,000 bees from one queen being in a hive at the same time, as if it were an easy possibility. I commit him to the tender mercies of the editor of the bee-journal called GLEANINGS. [I have just consulted Doolittle's article, and I can not make out that its writer considers 108,000 bees as within

the range of "easy possibilities" for one colony. To quote him exactly, he says, "We *can* have in that hive, barring accidents, if the hive is properly managed, 108,000 bees." Italics mine. What he means, I take it, is that such a number is a *possibility*, not as if it were a common or "easy possibility," as you put it. Say, doctor, those glasses of yours are slant-eyed—eh? Now, I will make you a proposition. If you can find in any one of your eight-frame colonies next summer—yes, we will make it a two-story eight-framer, 100,000 bees, by actual weight, shaken off the combs into a box, and weighed, and counting 5000 bees to the pound—well, I will give you the best laying queen, outside of our best breeder, we have in our apiary. Perhaps 100,000 bees might be crammed into a two-story hive with comb and brood; but in the ordinary course of events, I do not believe one will find more than half that number as the progeny of one queen. Understand, I am giving you a pick of your *whole* apiary.—ED.]

"ARE THE DRONES from a queen that has never met a drone virile?" is a question suggested by the editor, p. 778. Dzierzon holds that they are. On p. 224 of *American Bee Journal*, Vol. I., the baron of Berlepsch gives a *posteriori* proof that is *almost* conclusive. On p. 246 of the same volume is given the testimony of no less an authority than Prof. Leuckart, which, I think, settles the question. He says: "Those originating from the eggs of unfecundated or drone-producing queens are, as I have ascertained, as perfectly developed and as fully virile as others. So likewise are those dwarf or diminutive drones, which are occasionally bred in worker cells. Nay, even in a drone hatched in a royal cell, though prematurely dead, sent to me by Mr. Kleine, I have unquestionably found seminal filaments and male organs. The case is precisely similar also with drones hatched from eggs laid by fertile workers. Mr. Vogel inserted in a hive of common bees a drone comb containing eggs laid by an Italian worker (which he had seen laying in a queenless stock), and removed the colony to an isolated locality. Italian drones were hatched, and two common queens, fecundated while these drones were flying, producing partly common and partly Italian workers. As there were then no other Italian drones in that neighborhood, those queens must have been fertilized by drones produced from the eggs of the fertile worker." [This ought to be sufficient proof.—ED.]

T. P. K_r.—The statement has been made several times that pure Italian bees are not so subject to the ravages of black brood as are black bees. Beyond this we can give you no information. But if I were in a locality afflicted with that disease I would Italianize as rapidly as possible, as I believe it would pay, whether the yellow bees were or were not immune to black brood.

Summer's reign is almost o'er;
Birds have sought a southern shore;
Leafless trees and meadows bare
Show the work of autumn's air.

In the days of Virgil, and even later, it was generally believed that bees generate spontaneously in the carcasses of oxen—the belief arising, probably, from the fact that bees have been seen around such objects. But it remains for our day to prove that bees sometimes come from a dead horse; and not only bees but honey too. The Richmond *Evening Leader* tells us all about it as follows:

The Lee statue, both horse and rider, has found a new and interesting opportunity for usefulness in these latter days in becoming the home of an enormous swarm of honey-bees. Or, to be more exact, probably of a considerable number of swarms. It is more than likely that the interior of the equestrian statue is well filled with as good honey as ever was found in a Hanover bee-tree.

For some time bees have been noticed in considerable numbers about the small openings at the mouth and nostrils of the horse and the mouth of the rider. More than once considerable swarms have come out of these openings, which are believed to be the only openings to the interior of the statue. When it is remembered that the statue of both horse and rider is merely a shell less than a half-inch thick it will be at once seen what a commodious and comfortable home and retreat for honey-gatherers the interior of the statue provides.

It is not known whether the openings to the statue are large enough to allow sparrows to enter. If so, the statue is probably partially full of the trash which they collect to make their nests. As sparrows can get through a wonderfully small opening this is quite possible; but no sparrows or other small birds have been noticed going in or out of the statue, as has been the case with the bees. The latter have certainly found a safe place for gathering their winter's supplies, and one in which they will not and can not be molested. It will give an added interest to the statue to the many who visit it, to know that it is probably well filled with honey of the best make and reputation.

THE MODERN FARMER.

I fear many do not know what a good journal Mr. E. T. Abbott is sending out. In the last number received he has an editorial on "Anarchy," which, it seems to me, covers the whole ground and goes clear down to the cause of this evil. It will be seen that Mr. Abbott believes there are many anarchists who do not train under a red flag. He says:

The natural home and congenial breeding-place of this vile and perverted monster is the crowded quarters of large cities. Anarchy is bred in saloons, in brothels, in gambling-dens, in the wine-rooms, and even in high society where vice is condoned and violations of law and order are winked at because the culprit belongs to "our set."

Whoever violates a known law, whoever winks at such a violation of law, is sowing broadcast the seeds of anarchy. The police board that winks at the open saloon door on the Sabbath day is helping to breed anarchy. The policeman who is sworn to execute the law, and then winks at these violations on the plea that it is a "side door," or a "back door," is breeding anarchy many times in spite of his "side door" plea. It was said of old that all roads lead to Rome. All doors into a Sunday saloon lead to perdition, and it matters but little to the man who finds himself in hell

by what door he made the start. "But these are bad laws," we are to d. Ah! there's the rub. Any law which men wish to violate is a "bad law," to hear them tell it; but the violation of any law creates a disrespect for law, and this is the beginning—may, I anarchy. Every man who disregards law, whether it be in the name of capital, or in the name of labor, in the name of an individual or in the name of a corporation, has started on the road which leads to anarchy.

The only improvement on the above would be to say that a Sunday saloon is just as good as a Monday one.

THE BEE-KEEPERS' REVIEW.

The issue for October is a gem, and equal to any that Mr. Hutchinson has ever printed. The contributed articles are of a high order, especially one from F. B. Simpson, on selection in breeding. The presswork on the *Review* is as good as that in our big magazines, and that is what enables the editor to give such a fine half-tone engraving in each issue. Mr. Hutchinson does his own photographing; and in that line of work he well deserves the title of "artist."

As I was one of O. L. Hershiser's guests while in Buffalo, I take pleasure in copying the following:

Mr. O. L. Hershiser showed me, at the Pan-American, a new style of glass jar that he had just gotten up for putting honey on the market. It is of flint glass, and square, like the Muth jar; but instead of being closed with a cork it has a screw cap after the style of the Mason fruit-jar. There is a cork lining inside the top of the cap, which makes the whole thing self-sealing. The cost is only a trifle more than for corks, tin-foil caps, and waxing, and, considering the lessening in labor is really about as cheap. Mr. Hershiser is making arrangements to have this style of jar put upon the market.

Mr. Hershiser takes a keen interest in bee-keeping, and a relation of some of his experiments went far toward keeping me from feeling lonesome.

NATURAL SWARMING AND AUTOMATIC HIVING.

Can the Latter be Counted a Practical Success?

BY F. H. CYRENIUS.

During the past fifteen years it has been my study and determination to perfect a device to allow bees to swarm, and safely have them without the necessary time in watching and risk in running away. Now that I have succeeded to my entire satisfaction I feel in duty bound to offer the same to my fellow bee-keepers, believing they will appreciate my efforts. My bees are all in outyards run for comb honey, and allowed to swarm as they please. I have been unable to visit them oftener than once a week, and during these visits it was a great pleasure to find those which had cared to swarm securely hived by the use of the hiver.

Some years ago, while working at crude

hivers, I discovered that, to cage a queen with a zinc entrance-guard beside her own hive, would secure part of the swarm, at least, every time, and they would enter the new hive and begin work with as much certainty as though they were hived by any other process.

To test this plan, remove a queen from her colony and cage her with an entrance-guard in a new hive beside the old one, and shake in front of the hives about the number of bees that would naturally go with the first swarm, and see how quickly you will have a new swarm established and working. This is just what the hiver does; and in less two hours, treated as above, I have observed both eggs and honey deposited in combs to receive them, which should always be provided if possible.

After trying numerous experiments of this character it was conclusive to me that the only remaining feature was to be sure to get the queen thus caged at the issuing of the swarm. As a result, the swarm would be securely hived by the returning plan, and with much more certainty than by any other plan of natural swarming.

My latest hiver affords all possible inducements to lead the queen through the large cone, thus caging her directly in front of the new hive as though she were caged with an entrance-guard.

An important offset in the zinc leads the queen directly to the cone; the end of the hiver over the old hive-entrance is darkened by a shutter, and the end over the new hive is provided with light through wire cloth, all of which are required to produce the best results. When the queen is thus caged, hiving is assured.

To secure convenience in manipulating and adjusting the hivers, the bottom-boards should be placed on double stands about three inches apart, and project about four inches beyond the entrance of the hives, which furnishes a good support. In order to place the empty hive on *either* side of the old hive, the hivers are made *reversible*, the cone always pointing toward the empty hive.

The hivers are securely held in place by a wire spring passing between the hives, one end against the back of the old hive, and the other end over the front and center of the hiver.

The plan I prefer for comb honey is to have all hives arranged on double stands in early spring. At the beginning of the honey harvest one hive (the weaker one) is removed from each stand to another double stand (two on a stand), each of which is to be worked later, as those remaining on the old stand; i. e., if the swarming season is not over when they have gained sufficient strength to work in boxes, and swarm. The remaining hives at once receive the field bees from the hives removed, and boxes are at once given them.

In about one week preparations for swarming may be expected when an empty hive is placed beside the old swarm in the

place made vacant by the one previously removed.

The hiver is now placed in position, being sure that no bee can enter either hive without passing through the zinc.

To empty the hiver of dead drones as often as occasion may require is all the attention required until swarming is over.

When the swarm issues and is hived, about half of the bees will return to the old hive. This is not objectionable, as they are just as valuable in the old hive to store in the boxes as though they remained in the new hive.

Any time within eight days after swarming, the unfinished boxes are removed from the old to the new stand, as also the working force, by any plan best suited to the bee-keeper. He may exchange hives, or he may shake the larger part of the bees off the combs of the old hive in front of the new swarm. He may remove the old hive to a new stand, or divide into nuclei, or use any manipulation to prevent second swarming, and build up in good shape for winter.

I have much confidence just now in a simple chute which covers the entrance of the old hive, and extends to the edge of the entrance of the new hive with a passageway for the bees, so that, returning from a fly, they unite with the new swarm, making the new swarm very strong through the honey-harvest, and making the old one too weak to send out a second swarm. The chute, of course, is to be removed before the young queens wish to fly, or when enough bees have been exchanged to accomplish the desired result. If you wish these hivers to hive your bees successfully, don't allow an accumulation of dead drones to *remain* in them. Don't allow your hives to contain much drone comb. Mr. Doolittle says, "I never knew a swarm to have too few drones to be profitable." Don't use the hiver until the approach of the swarming season. Don't leave it on long after the swarm has been hived and working. Don't remove it before they begin work, and the danger of running away is over.

And now, kind reader, if you follow these directions carefully you will find the above a pleasing way of hiving your bees and securing nice comb honey, besides the satisfaction and gratification of saving the absconding swarms.

Oswego, N. Y.

[Complaint has been made once or twice that I have, in a footnote, weakened or entirely nullified the force of an article. When I have done so, however, it was because I *believed* I was fulfilling a duty to our readers. In this particular case I do not like to throw cold water on the automatic hiving described by Mr. Cyrenius; but as I have had quite an extended experience in the very things he speaks of, I feel it my duty to utter a word of caution.

As our older readers will remember, I succeeded in hiving swarms automatically; and at one time I felt quite enthusiastic

over it. I even succeeded to the extent of having automatic-hived swarms store honey in their new quarters. Now, having said all this, as time goes on I am free to acknowledge that automatic hiving, as well as I succeeded in carrying it out, was not a practical success in every sense of the word. It means a double hive-stand, an extra expense; it requires the use of a complicated trap or box made of perforated metal—another expense; it does not save labor as one might expect. If one counts the time necessary to arrange hives on double stands, the further time of finishing up hiving by dumping the rest of the bees that did not go down into the new quarters, as mentioned by Mr. Cyrenius, he will see that labor is not very appreciably economized, if at all. Automatic hiving at best means doing the work over again. About the only thing that can be said in favor of it is that the swarm is taken care of automatically whenever it arrives at the swarming-pitch, independently of the apiarist, who may be absent. But there are other methods of handling swarms, averting them, or controlling them, which I believe to be more economical of labor.

Perhaps Mr. Cyrenius may say that I am talking about one thing and he another—that he has improved on the methods that I used. From his description, and the trap he has sent, I used practically the same principle, and succeeded as perfectly as he. My conclusion is, then, that automatic hiving is possible but not practicable. Mr. E. L. Pratt, now known as Swarthmore, then of Beverly, Mass., devised one or two of the best automatic hivers I ever saw; but I think his conclusions, if I am not very much mistaken, were about the same as mine. Mr. Henry Alley, the veteran queen-breeder of Wenham, Mass., went all over this ground years ago, and he likewise has abandoned it.—Ed.]

DEEP VS. SHALLOW BROOD-FRAMES.

BY F. GREINER.

After an experience of many years with both styles of brood-frames I have at last come to the conclusion that, all things considered, the frame of normal depth gives the best satisfaction in the end. Under shallow frames I include such as are less than 7 inches deep. The Langstroth frame is regarded as of normal depth. For a long time I have been on the fence—undecided which one to choose. Each kind seemed to possess some advantages. I did not want to give up, so I kept using half-stories and full stories, shallow and deep (11 inches) frames in equal numbers. I can get along very well in my home yard with the shallow hives; but when it comes to outyards, give me deep-frame hives every time. In stocking up an outyard I was obliged to make out the desired number with half-story hives partly. I anticipated difficulties at the time, and I found them when it

came to managing the hives. When two or more sectional hives are used as one, the combs or frames of the upper section will generally be more or less fastened to the lower one by bits of comb or otherwise, making it unpleasant to separate the two; then it requires so much more handling of frames to get through a hive just when time is most valuable that it almost seems like wasting it. When using only one shallow chamber as a hive, the bees have a way of boiling over as soon as opened up, which is very annoying.

I used to think that the shallow frame would be very nice for nuclei; but after trying it for years by the side of deep frames it does not suit me nearly as well as the latter. I can find queens much quicker on a deep frame, because they are not so apt to hide in the space between the lower edge of the brood-comb and the bottom-bar of the frame. Particularly is this so with black bees, as they are inclined to run off the comb and take the queen with them. When taking a deep frame out of a hive the bees have not time enough to run off, while with a shallow one they would. I have decided to decrease my shallow-frame colonies gradually, and change back to the deep frame.

The most vicious colony may be handled with ease as follows: Approach the hive, give smoke liberally at the entrance, and close it up. Proceed to drum on the hive for half a minute; give more smoke, and drum again. After a few minutes the bees will have filled themselves with honey. If the hive is now opened up in the usual manner the most difficult operation may be performed without any material resistance on the part of the bees. We learned this trick during the first years of our bee-keeping when driving and transferring bees. Even without smoke it is possible to conquer a colony of bees by this method if one is quick enough to close the hive without any bees escaping. The drumming alone will have the desired effect. FR. GREINER.

Naples, N. Y.

[This is a very knotty question; but most of those who have tested the two depths of frames seem to incline to the shallow depth. Certainly this is true: That if the standard, or L., frame is just as good, we should by all means use it because it is standard. If we can say that of a frame we have advanced one of the strongest arguments we can for it.—Ed.]

RAMBLE 193.

A Visit with Mr. O. W. Stearns, of San Joaquin Valley, Cal.; How he Manages to Work his Apiaries Without any Tools or Building in them.

BY RAMBLER.

I formed the acquaintance of Mr. O. W. Stearns, of Selma, in the San Joaquin Valley, some seven years ago. He then owned some 200 colonies of bees. Upon a recent visit to Selma I found he had increased con-

siderably in all directions. In the matter of bees he owns 500 colonies, and was running 100 more on shares. He had moved from an humble cottage on a back street to an elegant new mansion in the fashionable center of Selma, and the house appointments were all new and elegant, and as neat as wax—kept so, of course, by the worthy wife and daughter. An elegant upright piano graced the front parlor, and Kitty evidently knew how to touch the keys for harmony.

An older daughter, and she scarcely out of her teens, married about eighteen months ago, also living in Selma, has fairly upset the whole family; for one fine morning Mr. Stearns found himself grandpa, Mrs. Stearns grandma, and Kitty a full-fledged aunt, and I really believe that is the most wonderful girl baby the world ever saw. Well, babies

he is a veritable trick horse—will open gates and doors, and it is decidedly comical to see him turn on the water from the hydrant when he needs a drink. Both horses will eat honey; and if it is not coming fast enough they will whinner for it; and when bees are stinging mad they have learned to carry themselves with due decorum.

The photo shows Mr. Stearns in the wagon, ready for a start to the out-apiary. Mrs. Stearns is on the veranda to bid him *bon voyage*, and many returns with many loads of sweetness.

Mr. S. has no honey-house and outfit at the out-apiaries, but carries it all in that wagon. On account of its compactness and portability the two-frame Cowan extractor is used. Then there is the tall tank, capacity about 50 gallons. A common galvanized-iron wash-tub is telescoped over the top of

MR. STEARNS STARTING FOR THE OUT-APIARY.

will arrive, and will crow and grow, and I am sure we all wish that the richest blessings may be showered upon them.

Mr. Stearns commenced bee-keeping at the age of 14, in Iowa. He has been in California about 10 years; and although he is now owner of 500 colonies he is not satisfied, but is ready to buy any apiary that happens to be for sale. He manages all of his apiaries, and manufactures quite an amount of foundation, and does nearly all of the work himself, and I propose to give you just a little glimpse of how he does it. His bees are in four or five apiaries, all away from home, one apiary being nearly 20 miles away.

The first essential in the management of out-apiaries is a good lively team, and the photo shows such; and, by the way, the front horse deserves special attention, for

it. This is for cappings. Tent and tent-poles, and several five-gallon tin cans for the honey, complete the load.

Upon arrival at the apiary the tent is erected; and right here allow me to remark that, when the temperature is above 100°, that tent is a fearfully hot place, and Mr. S. contemplates using a portable wire-cloth arrangement with a covering of willow branches. This would be a great improvement over the tent.

The tent in place, the extractor is mounted upon a hive, and held firm with a strong cord or wire from the top, to pegs in the ground right and left. If a super is ripe for extracting, the combs are removed and shaken one by one. No brush is used. If the bees do not all shake off, they are taken to the tent, and escape as they may. No wheelbarrow is used. The super in which

the combs are placed is carried in arms. The reason for not using a wheelbarrow is the trouble of carrying it around; but I am quite sure if Mr. S. would get one of those light Daisy wheelbarrows he would not mind the trouble of tying it to the wagon somewhere.

The uncapping-arrangement is made from two five-gallon tin cans. The side is cut from one; the side and the center of the opposite side cut from another, a piece of wire cloth is put over this center hole, and, when placed on No. 1, it is ready for use, and is a very simple arrangement.

The fifty-gallon tank is mounted on another hive; and when the extractor is full the honey is drawn off into another five-gallon can. One side of this can is cut through

Owing to the honey being so thin, all particles soon rise to the surface, and no strainer is used. There is necessarily much refuse comb and lots of dead bees on the surface, and all of this is taken home in the tank, and strained. The temperature also has something to do with the thinness of the honey. When I observed operations it was up to 106°. Mr. S. has never been troubled with sour honey; but as one of my hobbies is having honey thoroughly strained, I believe Mr. Stearns' would be improved by the use of one.

When the apiary is done in one, two, or three days, according to size of apiary, honey-flow, etc., the whole outfit is loaded into the wagon and taken to the next apiary. Every night the team is driven home with a

ONE OF MR. STEARNS' OUT-APIARIES.

the center lengthwise, and the parts rolled back and over the sides. These rolls of tin serve as handles, and a good grip can be secured, though the hands may be sticky with honey. Mr. S. is not a tall man, and he has to lift that honey nearly as high as he is tall. The two-frame extractor works like a charm. I really believe that, owing to the ease in stopping and starting, and the few whirls it takes to extract the honey, just about as much can be done with it as with a four or even a six frame machine. Will some one get up a competitive trial and settle the matter?

Mr. S. aims to fill that fifty-gallon tank twice during the day; and, of course, it has to be drawn right off into cans. The honey is quite thin as it comes from the hives, for it is not much more than a third capped.

load of honey. In the height of the honey season this means work almost night and day. The start for the apiary is made as early as 4 o'clock in the morning, and it is nearly midnight before the load gets home, sticky with honey; and, weary, he often sleeps on the way while the faithful team keeps plodding along.

One of Mr. Stearns' best yields was about 23 tons; and in the securing of it there is something more than a holiday exercise. It requires as much downright hard work as any other rural occupation; but when the work is done, there is the satisfaction of accomplishing large results from a very insignificant source, the little bee.

I present a photo of one of Mr. Stearns' best apiaries, close to Willow Lake. At certain seasons this is a very pretty lake,

and the cooling breeze is wafted from it through the apiary. A firmisternal, tailless, amphibious animal resorts here in great numbers in the winter. They are very musical, though somewhat monotonous. They hardly ever leave their element to perch upon hives, and are perfectly harmless. Not so, however, with the black ant. These pests were so numerous in this apiary that it had to be elevated from the ground, placed upon those benches, and the legs smeared with a mixture of corrosive sublimate. These ants will attack and destroy every bee that happens to miss the alighting-board, and even enter the hive to grasp their victims. I have never seen them so numerous in any apiary as I found them here, and I am sure that the soil so near the lake was adapted to their propagation; but Mr. Stearns has taken prompt and efficient means to get rid of them.

[As one travels through the country it is a little interesting to see how varied are the methods used by extensive bee-keepers—those that can and do produce great results when there is any thing like a honey-flow. Those methods are so different one almost wonders how this one and that one can produce honey economically, for it would seem that certainly one has a good method, and the other a very poor one. "By their fruits ye shall know them," and the same good rule applies to bee-men and the honey they harvest. It seems to be a general rule to have a small extracting-house, be it ever so humble, at each outyard; but here we have the case of a man who actually hauls his extractors—in fact, all his tools—to and from the outyards, besides bringing back the honey.

Opinions seem to be about equally divided between a two-frame extractor and a four and six frame machine. The advocates of the first named will claim every time that they can extract just as much honey, and do it easier; while those who talk in favor of the big machines say they can not afford to fuss with the little ones. I did some extracting while in California, or at least I helped. My own opinion is that a six-frame machine is too large for one man to turn comfortably. Even a four-frame extractor is large enough. I came home with the conviction firmly rooted in my mind that these large machines ought to be run by some cheap gasoline power of a half or a third horse power in size. In the course of a month or six weeks I think we shall have something that will run these big machines, and actually save the time of a big strong man. Labor in California is rather expensive; and the cost of maintaining a little gasoline-engine during the honey season would not exceed two cents a day while being operated. Contrast this with the expense of a \$1.50 man, and figure out how much would be saved. Of course, a man can do something besides turn the extractor; but with a little power he can make his own labor go twice as far, and at the same time do the work more thoroughly.—Ed.]

THE HOFFMAN FRAME.

Criticisms and Suggestions.

BY H. H. HYDE.

I have noted with much interest the recent articles in regard to brood-frames; and while I do not set myself up as authority, yet I have in mind a frame that we have been using the last two years with entire success. We had the Root Co. make us some Hoffman frames as follows: Top-bar, extreme length, 19 inches; width, $1\frac{1}{8}$; thickness, $\frac{1}{2}$; end-bars, $\frac{5}{8}$ thick, and at the top it is spaced as usual with both edges square instead of one square and one V-edge bottom bar $\frac{3}{4} \times \frac{5}{8}$. Now the reasons for this style, or, rather, specifications. We will take the bottom-bar first. I want it $\frac{3}{4}$ wide so as to render it highly improbable that the bees will continue any comb below the bottom-bar, as they will do when it is not wide enough. I want both end and bottom bars $\frac{5}{8}$ thick, as I find that the usual thickness of $\frac{1}{2}$ is hardly rigid enough in proportion to the other parts of the frame, especially where they are intended to support wires in the frames. I want the spacers on the end-bars to have square edges, both of them, for several reasons; viz., easier manipulation, no V edges to split off in manipulation, as so many of the V edges do; and, best of all, permits the use of a top-bar 19 inches long instead of the full length of $19\frac{1}{8}$. This small difference in length makes them very easily manipulated.

I shall order the next top-bars only one inch wide, as we find that is wide enough to prevent burr-combs, and then this width gives a wider space between the brood-frames at the top, consequently freer communication from brood-nest to super. We have found that $\frac{1}{2}$ is thick enough to prevent sagging, burr-combs, etc., and by their use we do not have the brood-nest so far from the super, neither do we have so much useless wood, the space being taken up with comb.

You can experiment as much as you will, but you will always find that, where the above top-bar is used in lieu of the old "fence rails," there will be a decided improvement in the way bees enter the supers, and quite a little less amount of honey will be found in the brood-nest.

There is an objection to this top-bar; and that is, unless it was made thicker the wedge system of fastening in foundation could not be adapted to it. This might be a consideration with some; but with ourselves, where we use our machine and melted wax for fastening in the foundation, we would not turn around for the difference in time it takes, or in the quality of the work done by either method. But why use the long-top-bar frame when the so-called "improved end staples" have been adopted?

I wish to say, in all deference to Mr. Root, that, had they not placed them before the people, and announced that they were all right, there would now be very few of

them in use, and why? Because it is quite an extra cost in time and money to use them; and, besides, after two or three years' use they are a positive nuisance, for, no matter how accurately the staples have been driven in, they are continually getting driven further up; and the result is, that the edges of the top-bars pass each other, and then we have worse than no self-spacing frame. Then the bees commence and put propolis all over the staples, so that they are soon nothing but a ball of wax. The frames are much harder to get out and hold to with the cut-off top-bar frames; and, in fact, they are a nuisance generally. If I were going to buy bees, and found them on that kind of frame, I would knock off half the price on account of the frames. During the year it has been my privilege to see and talk to quite a number of the leading Texas bee-keepers, and they one and all condemned the cut-off top-bar frames. Even Mr. Root's two agents, Robert Rogers and Udo Toepperwein, severely condemn them, and, in fact, I have seen but one man in Texas (and he was from Iowa, and has since gone home) who said he really wanted them. I do not want any of these cut-off top-bar frames in mine, and you couldn't hire me to use them. It is my honest and sincere belief that, if a vote were taken from all who have tried them, the verdict would be about ten to one against them.

Mark my prediction—that, while the frame finally adopted may be very far from the one I use and have herewith described, yet it will not be a frame with cut-off top-bars.

Hutto, Texas.

[Perhaps I shall have to say to Mr. Hyde as I did to Mr. Pettit on this same subject—that he has not taken into consideration other localities with different conditions. His sphere of observation seems to be confined to Central and Southern Texas; and what he says may be true in his localities. As to Mr. Toepperwein, if he at first objected to the short top-bars, he has since changed his mind, or at all events he did not give me the impression Mr. H. does, and he is quite familiar with the conditions in Texas. It is rather unwise for even the veterans to make a prophecy as to what will and will not prevail at some future time. Even so eminently practical a bee-keeper as Mr. Heddon once said, referring to the use of slat honey-boards, that when we could throw a brick up in the air, and have it stay up, then possibly that device, the honey-board, would be a thing of the past. For nearly ten years now the slat honey-board has not been offered for sale by any of the supply-manufacturers in the United States. Many other eminent bee-keepers have made predictions that turned out a good deal in the same way. Mr. Hyde, although an excellent bee-keeper, is only just of age, if I am correct, and yet he says, "Mark my prediction." He should remember that—

There's many a slip 'twixt cup and lip,
And, again, that—
The best-laid schemes o' mice an' men
Gang aft a-gley.

Having seen, as I have, the different conditions that prevail in different portions of the United States, I do not feel that I am competent to contradict the statement of any one man for his locality, because I am well aware that, if I were in his environment, I might think just as he does; but speaking for localities in general, I may say that only in Texas, and that in only a comparatively limited area, have there been any objections to the shortened top-bar or the V edge to the Hoffman frames. Knowing that preference, we have made a small proportion of the frames for that locality with long top-bars. In fact, we are prepared to make for any locality what the bee-keepers in it seem to ask and call for.

The end-bars of our Hoffman frames are made $\frac{5}{8}$ thick; and we can make them just as well, without any additional expense, $\frac{3}{8}$ if any one prefers them so.

With regard to having one edge square, and the other with a V, I am well aware that some in Texas do not like them so; but there are others who do. If the edges are V'd properly, and left blunt, not sharp, I do not think there will be very much breaking of the end-bars as spoken of. On the other hand, if both edges are square, spacing will be destroyed; for in most localities in the United States it will be much more difficult to separate the frame. An interesting fact in this connection is that one who strenuously advocated square edges had a sample thousand of such frames made; and, after trying them on a larger scale, decided that the square edge was a mistake. He is now ordering the frames regular—one edge V'd.

As to having the top-bar shortened, some few have objected to that; but the "howl" would be much greater if we went back to the long top-bar than if we left it as it is.

As to the staples driving in, as explained—that is something I can not understand. I shall have to make another visit to see these things.—ED.]

CALIFORNIA HONEY.

Effect of Local News Items; Where Prices are Made; Low Prices Caused by Crowding One Market; Power of Work Necessary to Organize Bee-men.

BY B. S. K. BENNETT.

For three years past, California has produced no surplus honey for Eastern shipment. The home demand could not be supplied with the small amount produced. Central California and Arizona had found ready market here at fancy prices. Local product last year brought 7½ and even 8 cents a pound for extracted. Comb honey sold at 15 to 20 cents a pound.

Throughout the United States the prices

for both comb and extracted honey last year averaged up with the prices here, showing that the supply was much less than the demand. All markets were steady, and all lots found a ready customer.

Here in California the dawn of the new year and the new century was heralded by plenteous rains which not only gave hopes to the bee-man but to all people. "Now for a good season," was the slogan. Bee-men talked to newspaper workers of the past good seasons, big crops, and what the bees would surely do this year. The reporters got their data mixed, of course, and published stories about enormous expected yields. Eastern buyers and consumers read these stories, repeated in Eastern papers, or received the clippings from California papers, and reasoned thus: "California is to have a big crop again! Well, we'll wait and see how many cars," and then for self-protection, for fear of low prices, they said: "We'll set our figures at four and five cents a pound here for the California crop."

On good authority I learn that the large confectioners and candy-makers thus agreed. And that was why our local buyers quoted three and four cents, regretting that they could not offer more.

Then the careless newspaper man got in his deadly work, reporting 50 tons of honey from 200 colonies when bee-keepers know that it takes 1000 colonies to make 50 tons. The honey-buyers and the general public believed these lurid tales, and the buyers reasoned again: "If bees make honey like that in one locality, what will all California produce, for it is a big State?"

We bee-men know that only a tenth of the area of Southern California yields honey. The general public does not.

Now all is mixed. The honey-buyer wants the honey, and would buy the whole crop at a price he knows will not go lower. Protection! The bee-man gets scared (I've met him), and when buyers show up he is overwhelmed with offers and conflicting prices. Bee-men are at once competitors of one and another. Down go prices. Then when the bee-man gets a good offer he says: "I won't sell, for prices are going up." With the next buyer he plays the same game, sells some honey low, and refuses good offers. Protection!

Whenever California gets a good crop of honey, the small poor lots come tumbling into Los Angeles, crowding the market, and demoralizing prices. These lots may not reach two cars, yet they set a price for the whole crop of 250 carloads.

In my travels I have noticed the following county variations: In Ventura Co., 5 cents is the holding figure. In Los Angeles Co., 4½ cents a pound rules. Inland, throughout Riverside Co., 4¼ cents is the price. Down in San Diego Co. the standard price is 4 cents.

Why is it thus? "Lack of information."

Honey-buyers left San Francisco (nearly 500 miles north) in August to buy at 5 cents,

buying several cars in Ventura Co. When they found that 4½ cents prevailed at Los Angeles they came on to this city and learned of four-cent honey. They were disgusted, and returned to San Francisco to await settled conditions. Then they learned that they could buy cheaper by staying at home.

The world's crop this year is estimated by many good authorities as less than last year; and here we are with only half a crop in California, actually cutting prices in two. Why? "Lack of information." But with this crushing blow will the bee-keeper keep informed? Our comb honey, only 25 cars, has all gone at prices two to five cents per pound less than it would bring now!

Organizing bee-men is a big job. Simple organization would help. Setting a price would advance figures. Co-operation would steady the market. Protecting buyers against low prices would stimulate a demand. Management would compel a better product. Advertising would make new markets. An association would make one seller in place of many. The bee-man stops to think. He says to himself: "Where is the benefit?" "Will my neighbor reap the benefit too?" "Can I market my own honey?" Then he says to others: "The bee-men must run an association if we have one," or, "I won't go in if so and so do." And there is a lot more of selfish reasoning.

Now I say to the bee-men, do not stop to quibble and question. Join your association. You can not be worse off than you are now. With half a small crop still on hand, prospects for a good year ahead, with plenty of bees, three-cent honey in sight, surely you could not be worse off.

Careful management in the hands of men who have the business and mercantile interests of California at heart, who have built up their own business, who buy your honey, they are interested in seeing the crop bring a high figure, for does it not return to them in your increased trade in merchandise?

Be not afraid of the buyer. Protect him and yourself, and he can show you prices, an increased industry, a marketing of the crop before it is ready, and thus a happy united brotherhood of honey producers.

Los Angeles, Cal., Oct. 9.

[There is a great deal of truth and hard sense in this article, and our California readers will do well to give it careful consideration. While the buyer, a man who is influenced solely by the almighty dollar, and who, as you say, against the interests of the bee-keeper is anxious to depress the market, there is a lot of bee-keepers who can not take a bee-journal because they think they know it all. Something ought to be done by which the bee-keepers of California could scatter information at the right time throughout the whole State. There is no reason in the world why extracted honey in California should have sold for less than 5 cents, and it certainly ought to bring as much as that now, or more. Our own read-

ers—in fact, the readers of any bee-journal, I am sure, do not have a hand in this fool policy of rushing their product off to market at any price. It is the bee-keepers who, while saving the price of a live bee-journal that would keep them posted, actually throw away a hundred times its price through ignorance of the market. — Ed.]

LOCATION AND OVERSTOCKING.

"Here I come from Western New York to have a little chat with you regarding a location, and whether there is danger of overstocking a place with too many colonies of bees. What would you advise regarding a location?"

"If I were at liberty to choose a location, when and where I desired, and could find such a one, it would be in a place where the land sloped gently to the southeast."

"But the lay of the land would not be the main feature for a selection, would it?"

"No, by no means; but this has much to do with getting our bees ready for an early harvest. Besides the 'lay of the land,' I should want flowers as follows: some willow to stimulate early brood-rearing, with sugar maple to follow; then apple-blossoms, as an assurance of plenty of honey from then to white clover, which should be in abundance. Next I should want plenty of basswood, and that on a hillside or mountain, so as to prolong its bloom; and, lastly, where buckwheat is raised as the main crop. Of course, if asters and goldenrod could be plentiful in the late fall this would make it still better."

"But I do not wish to go far from my old home. What am I to do in such a case?"

"This shows that you are much like the majority of bee-keepers who have other ties besides the bees which fix their location, and, owing to these ties, they put up with such locations as they may have. And allow me to say that the man is to be honored who can be contented and bring about good results with only limited bee-pasturage about his home, where duty calls him to remain."

"Which of the flowers mentioned do you consider the best for the bees?"

"If I could have but one of the sources named for honey, and were at liberty to choose, I would select basswood first, clover second, and, lastly, buckwheat."

"Why select basswood?"

"Because, from all sources of information which I can gather, basswood is the greatest honey-producer in the United States for the length of time it is in bloom; and if the apiary is located at the foot of a hill or mountain which is covered with basswood-trees, the season is prolonged to such an

extent that nectar is secured from basswood for from 25 to 30 days."

"Which way would you have the hives face?"

"To the south or east, if possible, as the bees start earlier in the morning than when they face north or west; also our prevailing winds are from the north and west; and when blowing in at the entrance during spring and early summer such tend to retard brood-rearing."

"What do you think about overstocking a locality?"

"My views on overstocking may not be considered quite orthodox by some, yet I think I can give facts to prove my position. If I had a location like the first I described to you I should not fear overstocking it with from 300 to 500 colonies; but I think from 150 to 200 would be as many as an average location would support to the best advantage, while there are places I know of that 50 colonies would be as many as would give good results to their owner. When we take into consideration that bees fly, from choice, from two to four miles from home, and are often led on by receding bloom to five, six, and sometimes seven miles, this matter of overstocking is not so much to be feared as many imagine."

"But I have read that bees do not go more than one and a half miles from home; and if they should ever do so it could not be made profitable, as so much time would be consumed in flying that it would not pay."

"I know we sometimes so read; but to the first I would say that plenty of proof can be brought that such are mistaken ideas. In my earlier years in bee-keeping the Italian bee was brought into a village three miles distant in a straight line. The next spring, before there were any other Italian bees about here, I saw those bees at work on the apple-bloom in our orchard; and upon counting I found about one of the Italians to five blacks, and this with apple-bloom in profusion everywhere. It was not necessary for them to come all the three miles for nectar from apple-bloom, for there was orchard upon orchard white with bloom all about where they were kept."

"And you say those Italian bees were at least three miles from home when at work in your orchard?"

"Yes. And this is not all. In haying time, that year, I was cutting a field of red clover which was in full bloom; and on seeing bees at work on this clover I made an examination, and, to my surprise, found an average of about five Italians to two blacks at work on that clover, which was one mile from home, or four miles from those Italian bees, in a direct line. And there were fields red with clover everywhere at the time, so these bees were not compelled to come over this distance of four miles in search of food."

"Well, that does seem to do away with the mile-and-a-half idea. But how about its being unprofitable for bees to fly thus far?"

"To the southeast of my apiary the land rises gradually for about six miles, and at the end of the distance it is nearly 1000 feet higher than at the bee-yard. Unless interrupted by rain the bees follow the receding bloom of basswood till the top of the hill is reached; and I can see no slackening of work in the sections as long as the bloom is plentiful on this hill. And the bees, also, all work in this direction at this time, while during the first half of the bloom they work in all directions."

"But how about the length of time consumed in flying thus far?"

"Well, I can not tell exactly about this, but I judge it does not take nearly so long for a bee to fly five or six miles as many imagine. From what I have seen I judge a bee can fly at the rate of thirty miles or more an hour; and, if so, ten minutes would be sufficient for a covering of the trip one way, or twenty minutes for the round trip."

"But they do not seem to fly as fast as that when coming to the hives loaded."

"Of course, they do not fly as fast when nearing the hives, or when about the apiary; but when they get out and away they move very fast. I have often gone to an elevated portion of ground which the bees must pass over in going to the top of this hill, and, by lying flat on my back and placing my hands on either side of my face so as to cut off the side light, and looking steadily up for a little time, until the eyes became accustomed to the surroundings, the bees could be seen going and coming quite plainly against the sky, while the rapidity of flight seems to approach that of a rapidly moving passenger train on one of our railroads."

"Well, I am glad I came; for if what you say is true I have a fairly good location where I am, when I come to consider all the flora within four to five miles of me in all directions."

FULL SHEETS OF FOUNDATION; WHEN IT PAYS AND DOES NOT PAY TO HAVE A HONEY-EXTRACTOR.

1. Are full sheets of foundation equal to natural-built combs, for use as brood-combs for extracting?

2. Would it pay for a person who keeps 10 or 15 colonies of bees, and to whom a pound of extracted honey would be equal to a pound of comb honey, to buy an extractor? That is, would the extra amount of honey secured justify the expenditure?

3. How could I secure the greatest amount of liquid honey without having an extractor?

4. How is the Red River Valley, in North Dakota, for keeping bees? AMATEUR.

[1. I do not know that I quite understand your question. If you ask whether combs

from full sheets of foundation are better than those built *without* foundation, I would unhesitatingly say yes. If you inquire whether full sheets of foundation not built out are equal to natural-built combs, then I would say yes and no. Natural-built combs if they are true and straight—in fact, any combs—are more serviceable in the apiary than foundation. Where one is running for extracted honey he will be able to get much more honey if he has combs already drawn out than if he has to depend on sheets of foundation; but if he wishes to run for *comb* honey, and keep down swarming, then he should have either full sheets or starters of foundation.

2. If you mean that you could sell a pound of extracted at the same price as a pound of comb, then it surely would pay you to get an extractor. This question will depend largely on the market. It is usually admitted by practical men that more extracted honey than comb can be produced. Some say twice as much, others one-half more; but a conservative estimate, perhaps, would be one-third more. If the market prices are in proportion, then it would pay you to get an extractor, for the liquid honey can be obtained from weak as well as strong colonies. It is not practicable to produce comb honey except from full-sized colonies. In most localities, and especially at the present time, or within the last two years, say, the bee-keeper of 15 colonies had better confine himself entirely to comb honey. Extracted honey is apt to be a drug on the market, while comb honey can scarcely be obtained at any price.

3. It is not practicable to produce liquid honey without an extractor. Do not fool away your time and money.

4. I am not able to advise you; but, speaking generally, North Dakota ranks well as a honey State.—ED.]

HOW SWARMING STOPS IN FLORIDA AT THE COMMENCEMENT OF THE HEAVY HONEY-FLOW.

Your description of how the bees manage their swarming in Southwest Texas and in New Mexico, fits us here in Southern Florida very closely; but Mr. Robbins (p. 752) is right in saying, "The broad assertion that bees will, at the advent of the honey season, destroy cells, kill off drones, etc., needs qualification." I never knew bees to destroy cells or kill off drones at the commencement of the honey harvest; but there are few if any swarms afterward. We have a fair flow of honey, say an average of 20 to 50 lbs. of honey per colony, during December to February inclusive, then a very light flow, usually just enough to keep bees breeding heavily during March, and in April until the heavy flow commences. Practically all of our swarming occurs during the last of February and in March. A hundred miles north of here, swarming lasts longer and more persistently than it does here; and often, entirely too often, swarms issue from hives that do not contain

a single pound of honey. The use of the extractor cuts no figure in preventing swarms there.

Instead of killing off drones at the beginning of honey harvest, they keep all they have, and keep raising more all summer.

Stuart, Fla. O. O. POPPLETON.

[Yet we here in the North have for years been practically ignorant of the peculiar swarming conditions as they exist in Florida, Texas, Arizona, and California; and even at the present time many are inclined to discredit the statement made by me, even when confirmed by you men who have lived in the field for years.—ED.]

TO MOVE BEES A FEW RODS TO A SHED FOR WINTER; CAN IT BE DONE?

Would it be prudent to move bees from summer stands, a few rods, to a shed (it is open to the south), and pack them close together? These bees are in single-walled hives.

In making nuclei by the Somerford method, it tells us to cage the queen. What kind of cage is used, and where is it kept when the queen is in it? AMOS FELEY.

West Hartland, Ct.

[I would not advise putting the bees into a shed just now if they are to be moved only a few rods. You might leave them in their present location until settled cold weather comes on, and then move. Change the appearance of things as much as possible at the old location, taking away all hives and every thing else that may be familiar to the flying bees. If the weather should continue cold for three or four weeks after moving, there would be very few bees returning on the next warm day.

Any kind of queen-cage will answer for the purpose named, providing it is or can be supplied with food.—ED.]

HONEY FROM CORN; THE PROOF OF THE PUDDING.

Do bees gather honey from corn? According to Mr. Gale we might as well expect "figs from thistles" as honey from corn. In Mr. Gale's experience, "We may as well expect to get honey from ferns or mosses as from grasses, or expect a hen that is without ovaries to lay eggs, as to expect honey from a plant that has no nectaries. Bees can not gather honey from maize, because the flowers have no glands wherewith to secrete it." Now, a nectariferous glandule is one that produces nectar or honey. It has been said, that "Seeing is believing; but feeling is the naked truth." If you would determine this "corn honey" secretion for yourself, go out in the corn-field before sunrise; walk in among the stalks, and watch the bees. You will find them fairly swarming over the tops of the corn. Step up closer, and you will observe that they insert their heads well into the bell-shaped cups, and work most industriously. Now pick off some of these cups,

and strip them between the thumb and finger nail, and you will see exuding a starch-like liquid, sweet to the taste. Return to this same corn-patch an hour after the sun has shone on it, and the bees will be absent. If the bees were simply after pollen they would continue their trips throughout the day; but as they are in search of nectar they discontinue their visits as soon as the sun has evaporated the nectar from the flowers. Since the corn nectar is to be had only in the early morning, the bees naturally gather from other sources throughout the day, and, in consequence, the "corn honey" of one section will not be of that of another section, as the mid-day sources of honey will differ. Corn, more than any other plant, closes its flow of nectar early, in consequence of its flowers being all exposed on the extreme tops of the stalks, and is, therefore, more in the direct rays of the sun. Go out into a corn-field and test the matter for yourself.

Within the past month I was asked to take the honey from the apiary of Ira Flanders, of Big Trees, Cal. I found three hives with body and super filled with honey; three with a few combs just started, and twelve with not even a comb started, in the supers. These bees were all in one row, and yet there are honest bee-keepers who *will not* believe that such conditions can exist, because they do not meet with them. E. H. SCHAEFFLE.

Murphys, Cal., Sept. 8.

[Mr. Schaeffle seems to offer indisputable proof, at least for his locality. Strange that no one has before suggested testing the corn-blossoms just as we test the blossoms of white and red clover. It is too late to make a similar test in our locality; but I suggest that those of our readers who can do so try it at the proper season next summer. For the present, at least, I think we may conclude that Mr. Schaeffle is right, and that corn does, in some localities at least, produce honey; but it would be folly to assume that it does so in all localities. Alfalfa, for example, one of the best honey-plants in the world, yields little or no nectar in the East, although it makes a fairly good fodder for cattle.—ED.]

TREATMENT OF BALLED QUEENS.

I have bought about 25 queens this year, beginning during May, having received the last ones this week. With the ordinary mailing-cage, where the bees are allowed to release the queen in from 12 to 48 hours, as the case may be, I have in one or two cases opened the hive in three days and found the queen balled. To introduce her again I put her back in the cage and make a mixture of honey and sugar, so thick that it will not run, and fasten her in the cage with it, and then try her in the hive again. By this means I have not lost one, and I have in some instances introduced this way, so the queen was not in the hive more than six hours before she was released, and I

have had better success than in any other way. I have not lost out of the 25 a single queen.

When the queen is balled, do the bees try to sting her, or do they simply smother her? I should think they would very quickly kill her if they tried to sting her.

If I remove the queen from a hive in which there are plenty of drones, would the bees save these drones until they could rear another queen?

J. S. WISE.

Hazlehurst, Miss.

[Daubing the queen with syrup or honey to introduce has been practiced with more or less success for the last 20 years. The object is to get the bees to clean her off, an act which gives her the same scent as the bees to which she is being introduced; but the plan is not to be recommended in all cases; indeed, I believe it is rarely used. Sometimes the bees will attack the queen as soon as they get her well cleaned off, and there are cases on record where the queen has been attacked before she was hardly clean. It is a risky job at best to daub a queen with honey in order to get the bees to accept her.]

There are some instances where it is evident a balled queen was smothered to death, and there are other instances where it is perfectly plain that she has actually been stung.

Removing a queen from a colony in which there are drones will usually have the effect of keeping the bees peaceable toward the drones, or until a laying mother is supplied or reared.—ED.]

THE PROPORTION OF SUGAR AND WATER FOR SYRUP.

Would 10 lbs. of sugar and 10 to 11 lbs. of water be reckoned as 20 lbs. of syrup for feeding bees for winter, or what amount would it be reckoned at, as the bees evaporate it some?

JOSEPH COOKE.

Enderby, B. C., Sept. 28.

[The proportion you name would be all right, although those who advocate feeding syrup thin recommend 10 lbs. of water to 10 lbs. of sugar. This, when fed, would make 20 lbs. of syrup; but the bees would evaporate it down, probably, to about 13 or 14 lbs. of sealed stores. If they are fed very late, it is advisable to make the proportion two of sugar to one of water.—ED.]

FOUL BROOD NOT AFFECTING DRONE BROOD.

I noticed in GLEANINGS, page 685, the report that any one having foul brood in a frame, and also having drone brood not affected, would report. We had a case of it in my bees here. They would die in the cells while the drones would grow and crawl from their cells.

MAGGIE RICH.

Mahaffey, Pa.

[But we have since had other instances reported where the drone brood was also affected.—ED.]

TRANSFERRING AND ITALIANIZING AT ONE AND THE SAME OPERATION.

I have only two colonies of bees, hybrids, which I wish to Italianize this fall. They are in hives of late pattern, containing Hoffman frames; but, owing to the small amount of foundation used, and the manner in which it was fastened in the frames, the bees did not build their combs straight, and consequently it is very difficult, if not altogether impossible, to manipulate these frames.

Now, my idea was this: When I am ready to Italianize, I shall, no doubt, in order to find the queen of said hives, have to use the method you describe on page 163 of your A B C book: i. e., remove the old hive a short distance. Place an empty hive on the old stand, putting on it an entrance-guard. Now take the frames from the old hive, and (one at a time) shake them in front of the empty hive. The queen, not being able to pass the entrance-guard, will be easily found.

Now, if I should have this hive full of comb foundation, why could I not, when the bees get nearly all inside, introduce my Italian queen? and, after so doing, would not the bees stay and build new combs in the frames of foundation?

You understand my idea is, to get frames of straight comb. I could, no doubt, find one or two frames of comb that are nearly straight, and I could place these in the new hive, and in the rest of the frames have comb foundation.

HARRY GRIFFIN.

Alcona, Ill., Aug. 19.

[The plan you describe would work all right, providing you gave the bees a stimulating feed of $\frac{1}{2}$ pint of sugar syrup daily until the combs were built out and filled.—ED.]

THE VALUE OF BEE-PAPERS.

From what I can glean, Mr. G. R. Frye and myself are the only ones who have secured a good crop of honey. We owe our success to GLEANINGS and other bee-papers. We improved our scrub stock that we started with, by buying queens of different breeders; and the result is, there is a little more vigor in our bees than in our "fence corner" bee-keepers'.

River Falls, Wis.

A. D. SHEPARD.

FOUL-BROOD INSPECTIONS FOR VENTURA COUNTY, CAL.; A CORRECTED STATEMENT.

On page 779 you quote the *Pacific Bee Journal* to the effect that I have found 625 cases of foul brood in Ventura Co. This is as wide of the truth as some of the estimates of the California honey crop. I have found, up to date, just 103 cases of foul brood in this county this year. I expect to find a few more, but not many. The number is as large as it is because we have had no inspector for the last year or two.

Sespe, Cal., Oct. 9.

R. A. HOLLEY.

We are getting good reports of the young clover that is growing all over the country.

More proof is coming in, showing that the amount of honey in the country has been greatly exaggerated. We admit and have admitted all along that there is more extracted in the East, but not nearly the

amount that has been stated in the daily press. Several write that Mr. Clayton, on page 828, overestimated the crop.

It is a real pleasure to me to say a good word for the *Bee-keepers' Review*. That journal shows on the part of its editor a good deal of time and thought. A strong feature of it is the editorial department. Mr. Hutchinson is a good reviewer; and if any man can pick up valuable little kinks at conventions or when traveling, or can glean from the current bee literature of the day, it is W. Z. Hutchinson, of Flint, Mich.

FIG. 6.—MESQUITE LEAF AND BRANCH (LIFE SIZE).

THE stenographic report of the 32d annual convention of the National Bee-keepers' Association, held in Buffalo last September, is now being published in the *American Bee Journal*. As nearly as one can judge, it is not only verbatim but accurate as well.

NEW ADDITIONS AT THE HOME OF THE BEE-KEEPERS' REVIEW.

It is just 23 years this month since GLEANINGS offered its congratulations to Mr. and Mrs. Hutchinson on the advent to their home of twin girls. Later on we showed a picture of the Hutchinson apiary with those same twins in a wheelbarrow, wheeled by their proud dad. At various times since, we have made mention of these girls — once when one of them appeared in a prize picture, holding a swarm of bees; at another time, when the other twin appeared as Mr. Hutchinson's compositor. Well, what is up now? I have just received a note from Bro. H., who is just as proud as he can be over his two new boys — not baby twins, but twins-in-law — who married those first twins. You see a double wedding has just taken place. Mr. H. says of the boys, "They are bright, honest, wholesome fellows, of whom I can feel proud." We all know what the girls are, because — because, you know, they are the "better halves." We offer our congratulations, not only to the parents but to the quartette.

CELLAR V. OUTDOOR WINTERING AT MEDINA.

WE have about 100 colonies at our basswood yard. Most of them are in single-walled hives. Our general practice has been to winter outdoors; but as we have now between 700 and 800 colonies, all told, we found ourselves short of chaff hives. Then the question, in view of the splendid results we secured in our cellar under the machine-shop this past winter, naturally arose as to whether we should put our surplus of colonies in new double-walled hives or winter in the cellar. At our home yard we expect to put all our extra colonies (some 200) under the machine-shop, in the place where the consumption of stores was so very light, and the number of dead bees on the floor so insignificantly small. Now, then, for the basswood yard would it be cheaper for the Root Co. to make a lot of new chaff hives, nail and paint them, and transfer the colonies into them, or would we save money by building a modern bee-cellar and putting all of the single-walled hives in this cellar? A little calculation showed that for the Root Co., at least, it would be just as cheap to build a cellar.

We are now digging one along the lines described by Mr. T. M. Bingham, on p. 174 for last year. It will be remembered that this cellar was wholly underground, access to it being gained through the building, down through the floor.

For some years we have had over on our fairground a display-building, but which

during the last two or three fairs has not been used. We are about to move this down to the apiary, and under it put a modern cellar, embodying the Bingham plan, about 7 feet deep. This will make a repository 12×20 feet, and 7 feet deep. There will be no windows — no two feet of brick walls above ground, as is the case with the ordinary house basement under a private dwelling. While it will be larger than is needed to take 100 colonies, yet we are going on the theory that a large room, with plenty of cubic air capacity, is much better than a small stuffy room just large enough to accommodate a given number of hives. An electric railway, nearly completed, runs directly by this basswood yard, so it will put us in easy connection so that we can watch developments.

We propose to determine, if possible, whether we can duplicate the results of last winter; and whether or not in our comparatively warm climate the indoor method can be rendered more economical than the outdoor plan.

I should, perhaps, have explained that one reason for having the cellar at the out-yard is because the hives have been robbed during the winter on their summer stands. The new cellar will be thief-proof.

OFFICERS OF THE NATIONAL BEE-KEEPERS' ASSOCIATION; SHALL NOMINATIONS BE MADE IN ADVANCE? AND IF SO, HOW?

THIS was the question that was discussed by the Board of Directors at Buffalo. It was finally voted that Mr. Hutchinson prepare a short editorial, submit it to some of the Directors, receive corrections, if any, and place it before the public. This he has done in the last issue of the *Bee-keepers' Review*. He writes:

Nominations in advance of the election of a General Manager, and the Directors of the National Bee-keepers' Association, would be very desirable. As it is now, when a member receives a voting-blank, he does not know for whom any other member will vote. In his desperation, he votes for the man whose term of office is about to expire. As a result, each officer succeeds himself, year after year. Should it ever become desirable to elect a new man, it would be well-nigh impossible with the present system. This question was discussed by the Directors present at Buffalo, but they were unable to devise a plan that seemed wholly satisfactory, and it was finally decided to have the matter taken up in the bee journals for discussion. Suggestions from the readers of the *Review* will be welcomed.

The foregoing was sent to E. R. Root, one of the Directors, for his criticisms, or suggestions. He considered it brief and to the point, and passed it on to Bro. Abbott, who is chairman of the Board of Directors. He penciled on the back of the sheet the following: "While it is desirable to keep the same parties in office as long as they attend to business, and give satisfaction, yet it is important not to have too many Directors in one locality, and to place in office men who will attend the annual meeting as often as possible."

The suggestion that we put in Directors and a General Manager who will attend the annual conventions as often as possible is worthy of consideration. At the Buffalo convention, six of the Directors were present (one more would have given us a quorum) and we did more business than could have been transacted in weeks or months of correspondence. There is nothing like a face-to-face discussion of a knotty question. Other things being equal, we should give our preference to those men who are usually present at the annual convention.

Perhaps I might suggest in this connection, that the Board, in discussing this matter, did not have in mind any director or officer, now holding position; but the facts are, the present set of officers, for the most part, have held their positions uninterruptedly for a number of years, with almost no change. Is this desirable?

Mr. O. O. Poppleton, of Florida, on seeing this editorial, writes, stating that there is not a single Director in the whole South; and, as one will see by consulting the head of this editorial department, there are two or three cases where there are two Directors in one State. For example, there are two in Ohio, two in New York, and two in California. This is hardly a fair representation. A. I. Root, with whom I have been talking, and who is not so much interested in bees as he formerly was, requests that his name be not used again at the next general election; and as for myself, I desire that some one else be put in my place on the Board of Directors, for I feel that my interest in the organization is sufficiently strong to work just as hard for it out of the Board as in it.* In making this suggestion I do not do so with the idea that some other Director in some other State will follow suit, for that would be disastrous. The fact is, all the men who represent the Board are most vitally interested in the success of the Association. The fact that the organization has been successful in every case brought before the courts; that it has prosecuted adulterators; that it has been the means of helping secure new laws; that it now has a membership of nearly 1000; that with its hundreds of dollars in the treasury it is a tremendous moral force—all this and more goes to show that the N. B. K. A. has not lacked for good men to look after its interests; but it should be borne in mind that there are *other* good men who are *not represented* in any official capacity.

CARBOLINEUM AS A WOOD-PRESERVATIVE.

SINCE I called for information concerning this new preservative, I have received a number of circulars and letters. It appears from these that railroad companies have for years been using this substance to preserve wood that is either buried in the earth or exposed to especially trying climatic conditions. It is a preparation of German manufacture, probably having creosote for a basis. Unlike ordinary paint, this preservative, when applied to the surface of the wood, *strikes clear through it*.

Mr. James L. Montgomery, of Americus, Ga., says that "it penetrates the fiber and causes a chemical change which affects the wood, as tanning-fluids affect hides. . . . I have a sample, with which I can paint one

* Perhaps some one may feel that I am sore, or am not satisfied with the work done. Nothing could be further from the fact. I love the National Bee-keepers' Association more than any one man in it; but in order to get a larger and more equally distributed representation, I desire to make room for some Southern man—that's all.

coat on one side of a hive-body (Root's white pine), and in 24 hours a splinter or shaving from the opposite side will taste of the preparation." He further says that it costs less than half the price of good paint. From some of the circulars received it would appear that some of the preservatives in the market bearing that name are mere imitations, and do not in any sense preserve the wood like the original article from Germany.

In one circular I find this: "The effects of carbolineum are partly chemical and partly mechanical. The mechanical effects are the following: By its specific weight, 1.14, it enters easily, expelling the water contained in the pores of the wood, and does not allow any water to circulate in the capillary tubes of the material. Then the fatty matter of the oil protects the wood in a direct way against rain, water, and other atmospheric influences. . . . Among the chemical influences of carbolineum, its antiseptic properties are the most important. Its high contents of specific properties against putrefaction and coagulation of present albuminous parts, operate to prevent them from producing and continuing decay. . . . As an insecticide, it keeps afar all little gnawing and boring enemies of the surface." This last statement lets out the fact that possibly the new material would not be adapted to the use of bee-keepers. If a hive preserved in it is obnoxious to insects, why would it not be distasteful to bees? But however that may be, there seem to be testimonials from railroad companies to the effect that railroad ties soaked in carbolineum will last three times as long as those not so treated.

Those who desire to secure circulars can write to the following named: C. A. Manufacturing Co., Austin, Texas; Fisher, Thorsen & Co., Portland, Oregon; Carbolineum Wood-Preserving Co., 13-21 Park Row, New York, N. Y.

It appears that it can be used on bottom-boards. In regard to that use I have two letters that will speak for themselves. Mr. J. W. Jackson writes:

Some here use carbolineum on sills, sleepers and all timbers of buildings that go near the ground. I use it on hive-stands and fence-posts; but so far I have not used it on the hives themselves, because it turns the wood a dark color—carbonizes it to some extent—and I feared the dark color would absorb heat and cause the bees to suffer. It will blister tender skin, but not the inside of the hands of a working person; and it is usually applied with a paint-brush.

J. W. JACKSON.

Mr. O. O. Poppleton, one whose statements certainly can be relied on, writes:

Friend Root:—Carbolineum has been very largely used in this country, especially by the railroads, for the preservation of bridge timbers and foundations of houses from decay and white ants. I have painted the bottoms of my hives with it for some years past for the above purposes.

There are two strong objections to its general use as paint for hives—its strong odor of creosote, and its dark (almost black) color. This last almost or quite prevents its being used on hives allowed to stand in the sun. It is cheap and durable. It can be easily obtained of the trade in New York, or in many of our stores here in Florida.

O. O. POPPLETON.

Palm Beach, Fla., Sept. 28.

In all thy ways acknowledge him, and he shall direct thy paths.—Prov. 3:6.

But the path of the just is as the shining light, that shineth more and more unto the perfect day.—Prov. 4:18.

I am going to talk about *paths*, and may not, at least until toward the close, have very much to say about the spiritual sense of the two texts above. For a year past I have been very much interested in "foot-paths" and "wheel-paths," and, of course, the whole matter of "good roads," the subject that is at present taking the attention of our whole nation, comes in more or less. One of the pleasant problems to solve, in connection with our present location here in the woods, is the matter of getting access to and with the outer world. The nearest highway is a good quarter mile through woods, fields, and over hills. This is toward the east. There is another on the north, half a mile away, and on the west, perhaps three-fourths of a mile. All of these points are reached by foot-paths. *Some* of these paths are over old lumber-roads, as I have already explained. Another part is of my own making and planning. James Heddon once remarked in one of our bee conventions, that humanity, for some unaccountable reason, always follow *crooked* paths. Who ever saw a foot-path across a field on a straight line, or anywhere near straight? In deciding where to have a path located over to our nearest neighbor (and to the nearest highway), I first stretched a strong slender cord where I wanted people to walk. It would, of course, have been desirable to have the path along the line between two owners; but this would have made it much longer, besides going over bad hills. With my neighbor's consent I went right through one of the best fields diagonally. First, I worked for the shortest cut; secondly, for an even grade. As we are, perhaps, 40 higher, a gradual down grade was desirable; but to get this there had to be more or less winding around rising ground. Please notice, we can not choose a *straight* line, nor can we go to unreasonable extremes in winding about in order to have no ups and downs. Our steam (and especially electric) railways have made a real science of this matter. I am sure it would save a great amount of time and useless fatigue if *we* around *our* homes would make more of a science of the matter. Children in going to school waste hours every day, and strength that might well be put to a better use, because of the lack of a short easy path to and from school. Why, my "scientific" foot and wheel paths right through the woods are already appropriated by the schoolchildren; and if you could see them these October afternoons as they return from school through our woods on "Clematis Avenue," singing as they come

along in their neat school clothing, you would surely be converted to the importance of my new hobby—*better foot-paths* everywhere that many people want to go.

An excuse for the unscientific and absurd paths has been given, that somebody first walked through a field with no thought that it would ever become a "beaten path," and then everybody "just followed" his crooked footsteps. My friend, is it not just possible that *you, to-day*, are going to "break a path" for *somebody*? Read our two texts and then tell me if it is not important that you take some pains to have the great "Judge of all the earth" direct and assist you in this work of path-making?

But I have not yet done with the paths around "Our Homes." Will you not go this minute to see if the path to the well, to the spring, to the barn, to the pigpen, to the out-buildings, to the clothes-line, and everywhere else that you and the children go (especially the women folks and girls), is just the best it can be? I almost forgot the woodpile; but I hope you have by this time got some arrangement so the firewood is piled by the men either *under* the stove, as I described on page 833, or somewhere indoors in the dry, so no woman ever has to go outdoors for wood.

Now for the paths. If you can, by a *day's work*, save just *one foot* of going up and down, it will be a day's work well invested. If some obstacle stands in the way of a shorter cut by just *one yard*, use quite a good deal of time and some money to remove it. Read this Home Paper to your wife (that is, if she hasn't read it first) and ask her if I am not exactly right. We are two miles from the store and postoffice) and my short cuts are appreciated here, I tell you. Of course, I am doing work on land that is not my own; and some of the paths I have spent money on are liable to be plowed up in the spring; but I have had the fun of making them, and have demonstrated their value, so I expect to get help in my work in due time.

Every sort of obstruction should be got out of the patch. In riding a wheel, a round stone the size of a marble often gives the rider a disagreeable wrench, and it has seemed to me that every such round stone or piece of root takes a malicious pleasure in rolling into the middle of the path, and bothering you every time you happen to pass, especially when you are going up a grade, carrying a load. At such a time you make a crookeder course, especially when you slow up when almost at the very summit; and then to have a pebble or root throw you off just when you have exerted your utmost strength to keep *on*—why, it almost makes bad words come into your thoughts, even if you have tried ever so hard to keep them out. Now, whenever I go that way again on foot I make it my business to pick up all such objects and hurl them far away. If you just kick them to one side you are sure to be bothered by that very same crooked stick again. I have some-

times wondered if they "wiggle" back again as soon as you are out of sight. Take a look at the tired horses on almost any highway, and notice the strength that is wasted in making the heavy wheels grind and crunch over round stones scattered all along the road. The next team pulls laboriously over the same stones. They are rolled about in every direction; but the "pesky" things *never* roll out of the road into the ditch, or at least so it seems. I once saw a man picking up these stones, on a stony sidehill in front of his home. He said it was a part of his religion to remove the *cause* of bad words from traveling teamsters. Shall we not all make it a part of *our* religion to remove *all* stumbling-blocks from the paths of tired struggling humanity? Mrs. Root is in full sympathy with me in this work, and I sometimes smile to see *her* stop to clear the path when I thought we were *both* too tired for such *missionary* work.

When a hill is round-top, like the half of a sphere, it is folly to think of going over it, either with path or wagon-road, for it is no further around it, on level ground, than climbing over the top. In laying out roads, it is desirable to follow division-lines between different owners, and for this reason roads are often carried over instead of around hills. But few hills, however, are round, like the half of an apple, and, taking hills as we find them, how far will it be advisable to go around to save climbing over the top? This is one of the problems that are hard to settle. With a wheel I have often thought I could save time and strength by going *two* miles over a good level road rather than go *one* mile over a hilly and stony road; and it is usually easier to get a *smooth* hard road, on level ground, than on hilly or uneven ground.

Going around a valley or hollow is much like going around a hill. In cutting my wheel-path, a very deep ravine lay right in my course. To go around on a level was too far, so I made a curve that was *lowest* where it was furthest from the course I desired to go; and this arrangement makes a very pretty curve, first gradually down, then gradually up again, and the spot of ground we go around is my "ravine garden," where every thing grows so luxuriantly. A few nasturtiums and balsams along the path give a very pretty effect. A path that is easy for the wheel—that is, hard and smooth—and the ups and downs gradual, I have found easiest for foot travel. One who has had much poor health learns to appreciate every thing that saves strength; and I have sometimes thought there was, perhaps, a kind providence in giving me many periods in life when I was really obliged to make it a study how best to ease the burdens I felt compelled to bear. I have chosen the lightest tools for my use that would do the work; the lightest clothing that would keep me warm enough, and, finally, the very easiest paths and short cuts to and from my daily toil. May the Lord be prais-

ed that here in this Traverse region I am not obliged to use so much of this kind of economy, for now I often climb great hills, "just for the fun of it." In fact, the very ground I am clearing off to-day for peaches and potatoes is right over large hills.

I believe I have always had a fondness for paths, especially paths through the woods. Just now the pathways through our woods are all carpeted with soft leaves of the most brilliant hues; and the colors of the beeches and maples overhead, contrasting with the rich green of the hemlocks, make a picture that might call forth words of praise from any one. This view is all the time around "our cabin in the woods;" and the red squirrels and chipmunks, since they have found we are friendly, make an agreeable second to it all by coming clear up on our front doorstep and looking at us inquiringly with their beautiful bright eyes. Yes, and if one *looks* and *listens* he may *hear* and *see*, also, birds of many colors. Why, who is there who doesn't feel a thrill, when pleasure or business calls him into a path through the woods, during these October or November days?

Every foot-path is more or less for the people; it is more or less for the great wide world to travel over, and, therefore, he who makes a better path, or even removes the stone or root that has tripped or caused many people to stumble has done missionary work. "Path-making" is an unselfish work. It not only saves the strength of exhausted, tired, suffering humanity, but it often saves the utterance of oaths and curses. I do not think I ever enjoyed any work of my life more than studying up, and making to my notion, a good foot-path where one is needed. When I first went down through where my ravine garden is now, a year ago, it took me a long time to get through the bushes and climb over rotten logs piled up over each other; and when I got across I was pretty well tired out. Now I go around the curve on my wheel in little more than a second. Since the neighbors have found it is a pleasant and agreeable "short cut," it is traveled so much that the ground keeps hard and smooth, and all the weeds are kept down. This is one of the pleasant things about path-making. After you once get it *started right*, the busy feet of the great wide world keep it in good repair.

Dear friends, is it not so with every thing good and pure and lovely? The person who starts honest and wholesome amusement in any neighborhood, in the place of intemperance and saloon-visiting, is a path-maker, and so with a thousand other good things. Path-making reminds me of that grand old text, "He which converteth the sinner from the error of his way shall save a soul from death, and shall hide a multitude of sins."

I have no hesitation in saying your ABC is the best bee-book ever published, and up to date in every way.

W. P. MEADOWS.
System (near Leicester), England.

HIGH-PRESSURE GARDENING IN THE TRAV-
ERSE REGION OF NORTHERN MICHIGAN.

I have told you already of the fertile soil where I cleared up my garden-plot in the woods. Well, at this date, Oct. 17th, every thing is still growing unharmed by frost, although we have had several nights when the thermometer went below freezing. I am told this is the rule in this locality with so much water around us, and, in fact, I have seen it during two falls. We have had snow and ice, but no frost; and our beans, tomatoes, and all tender things, are still unharmed. In Ohio I have learned to expect frost when the temperature is 50 or below at sundown—that is, if the night is clear and bright starlight; but here it is 40, or still lower, night after night, at sundown, with the brightest starlight I ever saw, and no sign of such frosts as we have in Ohio.

You may wonder what "gardening" I have been doing here in October. To be exact, it has been rather getting ready for gardening next year, or, perhaps we had better say, farming. Our 40 acres is not quite all woods. About 22 years ago four or five acres were cleared and brought under cultivation; but since then nothing has been done with any part of the 40 unless it was to pasture it to some extent. The cleared part was soon covered with a dense and heavy sod of June grass, and, later, sumac has proceeded to make a most luxuriant growth, pushing out further and further every season. Well, the "high pressure" work we have been doing this fall is cutting off the sumac with brush-scythes, and then turning the sod with a strong team and a heavy plow. Besides the sumac, little maples (and, worst of all, elms) we found scattered here and there. It looked to me almost out of the question to get rid of elms 6 to 8 inches through, so as to do a good job of plowing; but we have got it done. They were chopped off about 4 ft. from the ground, the big roots were grubbed and chopped off, and then with a chain hitched to the top of the stump, by alternate pulling and more cutting of roots we got them out. We are getting the land ready to sow rye, at the rate of two bushels to the acre. This rye is to be turned under next June when in bloom, and potatoes planted on the "Bal-lasch" plan.

You may be surprised when I tell you there are no land-rollers around here. The farmers say they have no use for them, for there are never any lumps to be crushed. The harrows used here, especially for new land, are the spring-tooth, and it was one of my "happy surprises" to see what just "once going over" did in the way of making a nice seed-bed. The ground was not only comparatively level, but it was fine and soft, without a lump of any kind—

nothing to be crushed, nothing to be made finer. Mr. Hilbert uses a "float" to make the ground smooth and level for his strawberries; but farmers rarely use any thing of the kind here for their grain crops. Now, this ground is not sand, mind you. It is a sort of loam, and the new virgin soil (like that in our garden) is a sort of black loamy "woods dirt." Of course, the old experienced farmers around here are, as a rule, prepared to teach me; but I have taught them a few things, and compelled them to own up. To get a team and man to do this heavy work of breaking up new ground I had to pay \$3.50 per day, and it took another man at \$1.50 to cut the brush, burn up the trash, etc. Now, when you are paying \$5.00 a day, or 50 cents an hour, it pays to avoid false moves. It is expensive business turning a 30-hundred team clear around 20 or 30 times a day when it isn't really necessary; yet few farmers, so far as I can learn, seem to be aware of this. On this account I urged for long straight furrows. But several other things must be taken into account. First, it is always desirable to turn a furrow down hill unless the ground is quite level; and when there are roots and trash to make the plowing extremely difficult, then it is most important that no furrow be turned the least bit up hill. Our land is quite uneven, much of it made up of quite steep hills. Now, there are several ways of avoiding the necessity of turning any furrow up hill. Of course, there are sidehill plows; but these are complicated, not as strong, and they do not, as a rule, do as good work as the best common plows. Now, then, how can we manage so as to plow hilly land with a common plow, and not turn any furrows very much up hill? First, if the hill admits we can commence at the bottom and plow around it. Second, if there is a ravine between two hills we can run up one side and down the other. This works all right until you get part way up the hill on each side. How shall you cross over from one side to the other? We might go "empty;" but if you are going to waste your own time and the strength of the team in drawing an empty plow, why not plow your sidehill by turning a furrow only one way, and going back "empty"? I do not like this way of plowing, even if Mr. Terry, in the "Potato-book," does give it a sort of sanction. You can cross over from one side of the ravine to the other by turning around on a curve when crossing the bottom of the ravine, so that your strip of plowed ground will be oval-shaped, or at least oval, or egg-shaped, across the ends. Third, if you have level land, or nearly level, turn one furrow up at the bottom of the hill, and back-furrow against it, curving the ends egg-shape as before, so that you turn a furrow down hill, even when going across the ends. If the top of the hill has some level land on it, or nearly level, do the same with the top of the hill and one of the sides. (In my case the opposite side of the hill belongs to my neighbor.) In this case

you must stake out your ground and plow first along the outside, turning all your furrows out. Start it oval, or egg-shaped, as the lay of the land may require. Irregular-shaped hills may require a combination of all—first, second, and third; but whatever you do, never plan so as to turn the team around if it can be avoided. Imagine a big team fussing with little triangles or squares to finish up. One such may be necessary; but some plowmen will have a number of them in plowing five or ten acres in hilly or uneven land.

By the way, do any of our readers know of a book that tells all about plowing—especially plowing on uneven ground, and clearing-up of uneven woodland? Our land here is particularly suited to fruit-trees, especially peaches; and the peaches seem to be particularly suited to the hills—yes, the very tall and steep hills. Now, if you turn a furrow down hill, year after year, where will the trees be, especially those near the top? In our "Potato-book" Terry directs that the plowing be so managed that the fields be not thrown out of shape by repeated plowing, and this is all right for level ground. How about the hills?

How many farmers plow so as to have a stout team do some useful work when going to and from the fields, morning, noon, and night? If every one of them were obliged to pay 35 cents (or more) for man and team every hour he had them, perhaps he would do a little more figuring. I am going to try five or six acres of potatoes on this new land, hiring every bit of the work, and I will try to let you know how it turns out. I do not mean to find fault with my helpers, and so far they are skillful, capable men; but I really wish they had a little more enthusiasm in pushing the work along. Something seems all the while coming along to make them want "a day off." After dinner to-day it rained; but by the middle of the afternoon the weather was beautiful, but not one of them "showed up." Of course, I hire men and teams by the day. I could get my clearing and plowing done by the acre; but then I should get only an ordinary job. If I am going to show people some "high-pressure" work I want the stones picked off, and every thing else that will hinder a first-class job of plowing. Then I want it "first class" all the way through. If I don't get my money back the first year, I have faith to believe I shall later.

Very little manure is used in this region. They say the land, especially the new land, doesn't need it. After the new land is once made clean it is very easy to work and keep out the weeds.

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" & cat. 288 free. W. Chester, Pa.

WANTED.—A man with a small family, who has had some practical knowledge of bee-keeping, to work in apiary and on small fruit-farm.

A. E. WOODWARD, Grooms, Saratoga Co., N. Y.

PLAIN SECTIONS 25 CENTS PER 1000 CHEAPER.

We have decided, for the coming year, to make the price of plain sections 25 cents per 1000 less than the beewax sections. This applies to the Danzenbaker, 1x5x1 $\frac{3}{8}$, the Ideal 3 $\frac{5}{8}$ x5x1 $\frac{1}{2}$, and the 4 $\frac{1}{4}$ x1 $\frac{1}{2}$ x1 $\frac{3}{8}$, 1 $\frac{1}{2}$, or 1 $\frac{3}{4}$. All other widths to remain at last year's prices. This reduction applies to No. 2 as well as No. 1 grade.

HONEY-CANS HIGHER.

We have just received prices on cans from the trust, and find we shall have to mark up our list prices on $\frac{1}{2}$, 1, and 5 gallon cans for the coming season; $\frac{1}{2}$ and 1 gallon cans will be \$1.00 per 100 higher, or 10c per box; and 5-gallon cans, 2 in a box, will be 5 cents per box higher; one in a box, about 3 cents per box higher.

HONEY-PACKAGES.

We are now well supplied with No. 25 jars, both in barrels and boxes, and we hereby renew the special offer made a month ago, to supply these and the No. 100 in boxes at 50 cts. per gross more than the price in barrels. These jars are becoming more and more popular for honey, because they are so valuable as a fruit jar after the honey is used up. With our present stock we can ship promptly large or small lots as may be needed.

A BARGAIN IN MACHINERY.

Any one in want of good second-hand machinery for hive-making can secure a bargain at Knoxville, Iowa. A good wood-frame rip-table and an 18-inch Gem planer can be had for \$60; planer has been used but little, and is a bargain alone at this price. A 10 H. P. boiler and engine, with about about 25 feet of line shafting, pulleys, hangers, etc., can be had for \$165; all together for \$220. We shall be pleased to hear from any one interested. The owner has made other plans, and must move the machinery promptly, as it is in the way; hence the very low offer. If you wish further particulars regarding the outfit, write to J. W. Bittenbender, at Knoxville, Iowa, who will cheerfully give you what information he can.

HONEY MARKET.

We are now well supplied with both comb and extracted honey, and prepared to make prompt shipment. We shall be pleased to hear from those in need of honey, either comb or extracted. For comb we are getting from retailers 17c for fancy 16 for No. 1 white; 15 for fancy amber, and 14 for No. 1; one cent per pound less in large lots. We have two or three good-sized lots of very nicely flavored white honey in well-filled plain sections which is somewhat travel-stained, and not very carefully graded. We offer these lots at No. 1 white price, although there is quite a proportion of fancy in them. We have just received a car of comb honey from Inyo Co., Cal. This contains over 1400 cases of fancy and No. 1. Inquiries solicited.

CONVENTION NOTICE.

THE COLORADO ANNUAL MEETING.

- The place? Denver.
- The dates? November 18th, 19th, and 20th.
- The papers? By successful bee-keepers.
- The discussions? By men and women who know something.
- The stereopticon lectures? By E. R. Root and Prof. C. P. Gillette.
- The exhibition? Of the best and sweetest and whitest (and yellowest) honey in the United States; and the sharpest vinegar.
- The premiums? Valuable enough and varied enough to appeal to every competent bee-keeper.
- Interested? Write for a premium list to box 432, Denver, Colorado.

D. W. WORKING, Sec'y.

FOR SALE.—Two cars comb and extracted alfalfa clover honey. VOGELER SEED & PRODUCE CO., Salt Lake City, Utah.

Red Glover Queens -FOR- 1902

Warranted Purely Mated.
The Long-Tongue Variety.

How to get One for Only 30 cts.

We have arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all he mails for us will be **warranted** purely mated.

We want every one of the readers of Gleanings in Bee-Culture, who is not now a reader of the old weekly American Bee Journal, to have one of these Superior Red Clover Queens. We have received most excellent reports from the Queens we supplied during the past season. And next year our breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoker.

Orders for these fine, "long-reach" **warranted** Queens will be filled in rotation—"first come, first served"—beginning as early in June, 1902, as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you receive the new queen, no matter from whom you order).

In order that all who are not now readers of the American Bee Journal can have one of these fine Queens, we will make the price **only 30 cents** each, when taken in connection with a year's subscription. That is, send us \$1.30 (if you are a **NEW** subscriber), and we will book your order for a Warranted Queen, and enter your name on our list of subscribers and send you the Bee Journal **every week** from the time we receive your name and \$1.30 **until the end of next year (1902)**. So the sooner you send in your order the more copies of the Bee Journal you will receive. If you have not seen the weekly American Bee Journal, send for a free sample copy. Address,

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

We are headquarters in Chicago for **ROOT'S BEE-KEEPERS' SUPPLIES AT ROOT'S PRICES.**

CALIFORNIA SAGE HONEY.

The world again sweetened with our famous sweet. Bees increasing fast. Bee-men very active. Tons of nectar lost for want of bees to gather. The PACIFIC BEE JOURNAL controls thousands of acres of fine field. Many fields to let. A few bees for sale—and climate too. Four hundred pounds to the colony, twenty tons to the 100 colonies in some instances.

Pacific Bee Journal, Los Angeles, Cal.

\$1 per year; 25c for 3 months' trial; 50c this year and six months of 1902; \$1 for this year and all of 1902; with Gleanings, \$1.25 a year.

Mr. A. I. Root's Writings

of Grand Traverse territory and Leelanau Co. are descriptive of Michigan's most beautiful section reached most conveniently via the

PERE MARQUETTE R. R.

For pamphlets of Michigan farm lands and the fruit belt, address W. C. Tousey, D. P. A. Toledo, Ohio.

BELGIAN HARES!

With every hare sold goes a full pedigree, register number, and score-card, scored by an official judge. Does will be bred to one of our famous high-scoring bucks free. Write for book, Mgr. of The A. I. Root Co. J. B. MASON, MECHANIC FALLS, MAINE.

Belgian Hares

I have some fine hares for sale at reasonable prices.

J. F. Moore. : Tiffin, Ohio.

Subscription Combinations!!

We take pleasure in offering the readers of GLEANINGS a few of our combinations. If you do not see what you want we have a 11-page catalog free for the asking. These prices are for a full year, and may be either for new or renewal except where stated. Sent to different addresses if desired, and will be mailed direct from the publisher the same as they would if you ordered direct. The offers are made by the publishers, and we are their special agents. Success, Leslie's Monthly, and Cosmopolitan, \$2.00. In the above offer, in place of Leslie's or Cosmopolitan you may substitute any of the following: Gleanings, Farm Poultry, Good Housekeeping, Household, Practical Farmer, Designer, Health Culture, Hints, The Era, new subscription to Recreation. Success must be in any list made from above—the others are interchangeable. Everybody's Magazine, Practical Farmer (new subscription), and your choice of a new subscription to either Harper's Bazar, American

Box, Little Folks, or Sunday School Times.....	\$1.75

Strong Testimony in Favor of Moore's Prize-winners.

Oland, Mo., Sept. 13, 1901.
 J. P. Moore, Dear Sir:—Enclosed please find \$2.25 for which you will send me three of your red-clover queens. I am pleased with the one I got of you. They make honey when other bees are idle.
 Yours truly, JOS. T. WHITTIG.

Daughters of my 23-100 breeder, the prize-winner: Untested, 75c; six, \$1.00; dozen, \$7.50. Select untested, \$1.00; six, \$5.00; dozen, \$9.00. Safe arrival and satisfaction guaranteed. Descriptive circular sent free. I am filling all orders by return mail, and shall probably be able to do so till the close of the season.

J. P. Moore, Lock box 1, Morgan, Pend. Co., Ky.
 (Mr. J. P. Moore is entirely reliable.—A. I. R. Co.)

Wisconsin Farm Lands.

The best of farm lands can be obtained now in Marinette County, Wisconsin, on the Chicago, Milwaukee & St. Paul Railway, at a low price and on very favorable terms. Wisconsin is noted for its fine crops, excellent markets, and healthful climate. Why rent a farm when you can buy one much cheaper than you can rent, and in a few years it will be your own property? For particulars address F. A. Miller, General Passenger Agent, Chicago, Milwaukee & St. Paul Railway, Chicago.

FOR SALE.—15 colonies of bees at \$2.50 each; all in 8-frame Langstroth hives; all strong healthy colonies; have plenty of honey to winter on. Put on train in good shipping condition.
 GUY LIPSCOMB, Demapolis, Ala.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.
 SEAVEY & FLAKSHIP,
 1318-1321 Union Avenue, Kansas City, Mo.

WANTED.—We are in the market for honey, either local or carlots, commission or purchase. We especially desire Wisconsin basswood, and will be pleased to hear from that State.
 EVANS & TURNER,
 Town St., Cor. 4th, Columbus, Ohio.

FOR SALE—Extracted honey, cans and kegs, 7 to 8 cts. per lb. Sample, 5 cts. Comb honey, 13 to 14 cts. Beeswax wanted.
 I. J. STRINGHAM, 105 Park Place, New York.

WANTED—Comb honey and beeswax. State price delivered Cincinnati.
 C. H. W. WEBER,
 2146 2148 Central Ave., Cincinnati, Ohio.

FOR SALE—30 to 35 cases heartsease honey, two cans to a case (120 lbs.); new cans; 8 cts. per pound.
 JOHN A. THORNTON, Lima, Ills.

An Old Friend.

Among the very first of the incubator and brooder concerns of the country to advertise in our columns was the "Reliable," of Quincy, Ill. Although a number of years has passed since their first advertisement appeared in our paper, there has not been a year since that first time when they have not been with us during the regular advertising season. It affords us, therefore, more than usual pleasure to state that they will advertise with us again this season, and their announcement appears on another page of this issue. Our relationship with these people has been most pleasant through all these years; and while we feel that our paper has been the means of doing them much good, we also know that they have done much good to our readers. The Reliable goods are reliable in works and results as well as in name, and those of our readers who contemplate the purchase of machines of this class can do no better than to buy the time-tested old Reliable. Their 20th Century Catalog is, as usual, a work of great value. Write them to-day for a copy. Address Reliable Incubator & Brooder Co., Quincy, Ill., and mention this paper.

200-Egg Incubator for \$12.80
 Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day.
 GEO. H. STAHL, Quincy, Ill.

Angora Goats. Delance bucks; good stock; low prices; large circular for stamp.
 ED. W. COLE & Co., Kenton, O.

FOR SALE.—80 colonies of bees at \$1.50 each.
 H. VOGELER, New Castle, Cal.

Books for Bee-keepers and Others.

Any of these books on which postage is not given will be forwarded by mail postpaid, on receipt of price. In buying books, as every thing else, we are liable to disappointment if we make a purchase without seeing the article. Admitting that the book-seller could read all the books he offers, as he has them for sale, it were hardly to be expected he would be the one to mention all the faults, as well as good things about a book. We very much desire that those who favor us with their patronage shall not be disappointed and therefore we are going to try to prevent it by mentioning all the faults, so far as we can, that the purchaser may know what he is getting. In the following list, books that we approve we have marked with a *; those we especially approve, **; those that are not up to times, †; books that contain but little matter for the price, large type, and much space between the lines, ‡; foreign, §. The bee-books are all good.

As many of the bee-books are sent with other goods by freight or express, incurring no postage, we give prices separately. You will notice that you can judge of the size of the books very well by the amount required for postage on each.

BIBLES, HYMN-BOOKS, AND OTHER GOOD BOOKS.

MISCELLANEOUS HAND-BOOKS.

5	A B C of Carp Culture, by Geo. Finley	25
5	A B C of Strawberry Culture,** by T. B. Terry... ..	35

Probably the leading book of the world on strawberries.

5 | A B C of Potato Culture, Terry**.....35
 This is T. B. Terry's first and most masterly work.

8 | Barn Plans and Out-buildings*..... 90
 Canary birds, paper..... 50

2 | Celery for Profit, by T. Greiner**..... 25
 The first really full and complete book on celery culture, at a moderate price, that we have had. It is full of pictures, and the whole thing is made so plain that a schoolboy ought to be able to grow paying crops at once without any assistance except from the book.

15 | Draining for Profit and Health, Warring..... 30

10 | Fuller's Grape Culturist**.....1 15
 8 | Domestic Economy, by J. H. Mayer, M. D.**... 30
 This book ought to save at least the money it costs, each year, in every household. It was written by a doctor, and one who has made the matter of domestic economy a life study. The regular price of the book is \$1.00, but by taking a large lot of them we are enabled to make the price only 30 cents.

10 | Farming for Boys*.....1 15
 This is one of Joseph Harris' happiest productions, and it seems to me that it ought to make farm-life fascinating to any boy who has any sort of taste for gardening.

7 | Farming with Green Manures, postpaid**..... 90

7 | Farm, Gardening, and Seed-growing**..... 90

12 | Gardening for Pleasure, Henderson*.....1 35

12 | Gardening for Profit**.....1 35

8 | Gardening for Young and Old, Harris**..... 90
 This is Joseph Harris' best and happiest effort. Although it goes over the same ground occupied by Peter Henderson, it particularly emphasizes thorough cultivation of the soil in preparing your ground; and this matter of adapting it to young people as well as old is brought out in a most happy vein. If your children have any sort of fancy for gardening it will pay you to make them a present of this book. It has 187 pages and 46 engravings.

3 | Grasses and Clovers, with Notes on Forage Plants 20
 This is by Henry A. Dreer, author of the book, "Vegetables Under Glass" that has had such a large sale of late. This little book tells how six tons of grass has been grown to the acre, and gives much other valuable matter.

10 | Greenhouse construction, by Prof. Taft**.....1 15
 This book is of recent publication, and is as full and complete in regard to the building of all glass structures as is the next book in regard to their management. Any one who builds even a small structure for plant-growing under glass will save the value of the book by reading it carefully.

12 | Greenhouse Management, by Prof. Taft**.....1 15
 The book is a companion to Greenhouse Construction. It is clear up to the times, contains 400 pages and a great lot of beautiful half-tone engravings. A large part of it is devoted to growing vegetables under glass, especially Grand Rapids lettuce, as well as fruits and flowers. The publisher's price is \$1.50; but as we bought quite a lot of them we can make a special price as above.

5 | Garden and Farm Topics, Henderson**..... 60

5 | Gregory on Cabbages, paper*..... 20

5 | Gregory on Squashes, paper*..... 20

5 | Gregory on Onions, paper*..... 20
 The above three books, by our friend Gregory, are all valuable. The book on squashes especially is good reading for almost anybody, whether they raise squashes or not. It strikes at the very foundation of success in almost any kind of business.

1 | Handbook for Lumbermen..... 05

5 | Home, Pork-making; 125 pages, illustrated..... 40
 I think it will pay well for everybody who keeps a pig to have this book. It tells all about the care of the pig, with lots of pictures describing cheap pens, appliances, all about butchering, the latest and most approved short cuts; all about making the pickle, barreling the meat, fixing a smoke-house (from the cheapest barrel up to the most approved arrangement); all about pig-troughs; how to keep them clean with little labor; recipes for cooking pork in every imaginable way, etc. Publisher's price is 50 cents, ours as above.

10 | Household Conveniences.....1 40

15 | How to Make the Garden Pay**.....1 35

2 | How to Propagate and Grow Fruit, Green*..... 15

2 | Injurious Insects, Cook..... 10

10 | Irrigation for the Farm, Garden, and Orchard*..... 85
 By Stewart. This book, so far as I am informed, is almost the only work on this matter that is attracting so much interest, especially recently. Using water

from springs, brooks, or windmills to take the place of rain, during our great drouths, is the great problem before us at the present day. The book has 274 pages and 142 cuts.

3 | Maple Sugar and the Sugar-bush**..... 32

4 | Peabody's Webster's Dictionary..... 10
 Over 30,000 words and 250 illustrations.

5 | Manures; How to Make and How to Use Them; in paper covers..... 30

6 | The same in cloth covers..... 65

1 | Nut Culturist, postpaid.....1 50

3 | Onions for Profit**..... 40
 Fully up to the times, and includes both the old onion culture and the new method. The book is fully illustrated, and written with all the enthusiasm and interest that characterizes its author, T. Greiner. Even if one is not particularly interested in the business, almost any person who picks up Greiner's books will like to read them through.

1 | Our Farming, by T. B. Terry**..... 1 50
 In which he tells "how we have made a run-down farm bring both profit and pleasure."
 If ordered by express or freight with other goods, 10c less.

1 | Poultry for Pleasure and Profit**..... 10

8 | Practical Floriculture, Henderson* 1 10

10 | Profits in Poultry*..... 75

1 | Silk and the Silkworm 10

10 | Small-Fruit Culturist, Fuller 1 10

2 | Sorghum, Stock Beets, Strawberries, and Cement Floors. By Waldo F. Brown..... 08

10 | Talks on Manures* 1 35

10 | The New Agriculture; or, the Waters Led Captive (a \$1.50 book) 40

11 | The New Egg-Farm, Stoddard**..... 70
 This is an enlarged edition of the 50-cent book published 25 or 30 years ago by H. H. Stoddard. If I could have only one poultry-book it would be the New Egg-farm. This book is of special value to me because it not only discusses most emphatically the value of exercise to poultry, but it touches on the value of exercise to all other animated natures, including humanity. The book has over 300 pages and 150 illustrations. It is entirely different from any other poultry-book in the world, inasmuch as it discusses mechanical contrivances so that all the varied operations of a poultry-farm may be done as much as possible with the aid of machinery. The regular price is \$1.00, but by buying a quantity we are able to furnish it at price given.

2 | Treatise on the Horse and his Diseases..... 10

5 | Tile Drainage, by W. I. Chamberlain..... 35
 Fully illustrated, containing every thing of importance clear up to the present date.
 The single chapter on digging ditches, with the illustrations given by Prof. Chamberlain, should alone make the book worth what it costs, to every one who has occasion to lay ten rods or more of tile. There is as much science in digging as in doing almost any thing else; and by following the plan directed in the book, one man will often do as much as two men without this knowledge.

5 | Tomato Culture 35
 In three parts. Part first—By J. W. Day, of Crystal Springs, Miss., treats of tomato culture in the South, with some remarks by A. I. Root, adapting it to the North. Part second.—By D. Cummins, of Connecticut, treats of tomato culture especially for canning-factories. Part third—By A. I. Root, treats of plant-growing for market, and high-pressure gardening in general.

3 | Vegetables under Glass, by H. A. Dreer**..... 20

3 | Vegetables in the Open Air*..... 20
 This is a sort of companion book to the one above. Both books are most fully illustrated, and are exceedingly valuable, especially at the very low price at which they are sold. The author, H. A. Dreer, has a greenhouse of his own that covers one solid acre, and he is pretty well conversant with all the arrangements and plans for protecting stuff from the weather, and afterward handling to the best advantage when the weather will permit out of doors.

3 | Winter Care of Horses and Cattle..... 25
 This is friend Terry's second book in regard to farm matters; but it is so intimately connected with his potato-book that it reads almost like a sequel to it. If you have only a horse or a cow, I think it will pay you to invest in a book. It has 44 pages and 4 cuts.

3 | Wood's Common Objects of the Microscope**..... 47

8 | What to Do and How to be Happy While doing It, by A. I. Root 65

GREAT CLUBBING OFFERS!

My friends, how many of you are reading some of the many most excellent magazines of the day? If you are reading none, you are missing a great treat. Perhaps you regard them as luxuries. Possibly they are in some instances. They certainly help to fill out our lives, and give to us broader views. They are like windows that allow us to look out over the wide world. This life is not wholly one of dollars and cents—at least it ought not to be. Enjoyment, pure and simple, enjoyed just for the sake of enjoyment, is desirable and beneficial. To many there are few things that are more enjoyable than the bright pages of a really good magazine. To those who wish to give the magazines a trial, and to those who are already reading them, I can offer some of the lowest clubbing rates that have ever been offered. Here is a list of magazines, together with the regular prices at which they are published:

Review of Reviews.....	\$2.50	Cosmopolitan.....	\$1.00
Current Literature.....	\$3.00	Leslie's Popular Monthly.....	1.00
New England Magazine.....	3.00	The Household.....	1.00
Leslie's Weekly.....	4.00	Good Housekeeping.....	1.00
North American Review.....	5.00	The Designer.....	1.00
Success.....	1.00		

If you subscribe for one or more of these magazines, in connection with the Bee-keepers' Review, I can make the following offers:

Success and the Bee-keepers' Review for only.....	\$1.75
Success and any one of the above \$1.00 magazines and the Bee-keepers' Review for only.....	2.50
Success and any two of the above \$1.00 magazines and the Bee-keepers' Review for only.....	3.00
Success and any three of the above \$1.00 magazines and the Bee-keepers' Review for only.....	3.50
Success, Review of Reviews (new), and the Bee-keepers' Review for only.....	3.00

NOW READY!

64-PAGE CATALOG OF EVERY THING BEE-KEEPERS NEED. Illustrated and fully described. Especially valuable to beginners for the information it contains. Send your address on postal and get it now. Established 1884.

J. M. JENKINS, Wetumpka, Ala.

Notice!

QUIRIN, the queen-breeder, still has 100 of those long-tongued red-clover queens on hand at \$1 each, or 6 for \$5. If you want one speak quick. For testimonials see former adv'ts.

Bees Wanted!

We are expecting to establish several out-apiaries next season and desire all the bees we can get: want 'em on movable frames, and near home. They must be cheap at this time of year. Parties placing us in correspondence with those having bees to sell will be remembered next season when we have a nice lot of those long-tongued red-clover queens on hand (in case we succeed in purchasing of said parties).

In our circular we list numerous articles used by bee-keepers, on which we will give 10 to 20 per cent discount from now until the coming March. Address all orders and inquiries to

H. G. Quirin, Parkertown, Ohio.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOS, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

A. E. OUTERBRIDGE & CO., Agents.

39 Broadway, New York.

ARTHUR AHREN, Sec., Quebec, Canada.

Wants and Exchange.

Notices will be inserted under this head at 10 cts. per line. You must SAY you want your adv't in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We can not be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange Buff Cochin bantams for Danzenbaker hives or offers. VAUGHAN, 86 Lander St., Newburgh, N. Y.

WANTED.—To exchange first-class bees for Collie dog, incubator, Brown Leghorn fowls. DR. CORVA, Dupont, Ind.

WANTED.—To exchange Angora goats, or first-class bees, for incubator, or Brown Leghorn fowls. DR. CORVA, Dupont, Ind.

WANTED.—To exchange new Tokologys; less than half price (MRS.) A. I. DUPRAY, Folletts, Ia.

WANTED.—To exchange or sell, a 2d-hand bicycle in good condition Write H. C. WEST, Medina, O.

WANTED. To exchange Root's No. 5 extractor and Dadant uncapping-can for honey. O. H. HYATT, Shenandoah, Iowa.

WANTED.—To buy quantity lots of fancy and No. 1 white-clover comb honey in no-drip cans. BYRON WALKER, Clyde, Cook Co., Ill.

WANTED.—Comb and extracted honey. State price, kind, and quantity. R. A. BURNETT & Co., 199 South Water St., Chicago, Ill.

WANTED.—To buy your honey. State your lowest cash price, kind, and quantity. EDWARD WILKINSON, Wilton, Wis.

WANTED.—To exchange second-hand 60-lb. cans, practically as good as new, at 20c per can in lots of 20 or more, f. o. b. Chicago, for white clover honey at market price. B. WALKER, Clyde, Cook Co., Ill.

WANTED.—To sell cheap, 20 acres of good Florida land, well situated, at a low price. Address for particulars. MRS. I. B. WEIR, Toledo, Florida.

WANTED.—To dispose of my olive-ranch and 85 colonies of bees, located 12 miles from San Diego, California; near church, school, store, postoffice, and railroad station. Extracted 19,000 lbs. from 50 colonies, spring count, this season; have taken honey every year since I came here. The best of climate. Write for particulars. J. B. RATCLIFFE, Helix, San Diego Co., Cal.

WANTED.—All the bees we can get; must be extremely cheap at this time of year. Parties who will place us in correspondence with those having bees to sell, will receive one to a half-dozen selected queens free next June, according to the number of colonies we succeed in purchasing from said parties. H. G. QUIRIN, Parkertown, Ohio.

WANTED.—To sell our entire plant and situation, including a complete line of machinery for manufacturing bee-hives, comb-foundation, etc. In connection with same we have a first-class up-to-date planing-mill in every respect. Our good will and list of customers goes with it. This is a bargain and will pay you to investigate. Address W. R. GRAHAM & SON, Greenville, Texas.

WANTED.—To sell 104 colonies Italian bees in the A. I. Root Co.'s 10-frame hives; heavy top frames; wired full brood sheets of medium foundation; all drawn combs; queen excluders; combination stands and bottom boards; $\frac{1}{2}$ gal. top, $\frac{1}{2}$ super covers; all new and well painted; located in a 6000 acre pasture just above the mouth of Leona River, on the Frio; the natural home of the honey-bee, and no apiary near; every thing on the range that produces honey in Texas, with over two years' privilege yet to run. This is a bargain—the most complete outfit in Texas; can give time on part; six miles from railroad. I have not extracted since early last spring. My wounds have again broken out, and I can secure no assistance from U. S. Pension Department, no friends on earth to assist me, so I will close out apiary, and go back to the Los Angeles, Cal., Soldiers' Home, and wait patiently for reveille to blow lights out for me. Prompt action necessary. J. M. MCCURDY, Box 28, Pearsall, Frio Co., Texas.

HONEY QUEENS!

Laws' Long-tongue Leather Queens.
Laws' Improved Golden Queens.
Laws' Holy Land Queens.

Laws' queens are the standard bred queens of America. The largest honey-producers use them and praise them. Laws' queens go everywhere, and can furnish you a queen every month in the year. Four aparies Queens bred in their purity. Prices, October to April: Tested or untested, \$1.00 each; 6 for \$5.00. Breeders, none better, \$3.00 each. Address

W. H. Laws, Beeville, Texas.

Dittmer's Foundation !!!

Retail---Wholesale---Jobbing.

I use a PROCESS that produces EVERY ESSENTIAL necessary to make it the BEST and MOST desirable in all respects. My PROCESS and AUTOMATIC MACHINES are my own inventions, which enable me to SELL FOUNDATION, and WORK WAX INTO FOUNDATION FOR CASH, at prices that are the lowest. Catalog giving

FULL LINE OF SUPPLIES

with prices and samples, free on application. BEESWAX WANTED.

GUS. DITTMER. AUGUSTA, WIS

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co. Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I've bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season. Yours fraternally,
J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per doz. Un-
tested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per doz. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Goldenes, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want *the best*, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of *The Southland Queen*, the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of aparies for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Ferguson Supers, etc. Write at once for a catalog.

BINGHAM SMOKER.

Dear Sir—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3 1/4-inch; \$1.10; 3-inch, \$1.00; 2 1/2-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.
 No. 2.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 3.—Three-fourths of the total surface must be filled and sealed.
 No. 4.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

CHICAGO.—The market is easier in tone, while prices are nominally the same, but would be shaded to effect sales. Some cars of honey en route to the eastern cities have been diverted to this and surrounding points, which is having a depressing effect. Comb brings 14 @ 15 for best grades of white; light amber, 12 @ 13; dark grades, 10 @ 11. Extracted white, 5 @ 6 1/2, according to quality, flavor, and package. Light amber, 5 1/2 @ 5 3/4; amber and dark, 5 @ 5 1/4. Beeswax 28.

R. A. BURNETT & Co.,
 Nov. 1. 199 South Water St., Chicago, Ill.

SCHENECTADY.—There is a very good supply now of white comb honey on our market, but buckwheat is scarce. We quote the former at 13 @ 16, according to style and quality; buckwheat, 12 @ 13. There has been quite a demand for extracted. We quote light, 6 @ 7; dark, 5 @ 5 1/2.
 CHAS. MCCULLOCH,
 Nov. 7. 1 Eagle St., Schenectady, N. Y.

CINCINNATI.—Fancy white comb honey sells at 15 @ 15 1/2; lower grades, 13 @ 14. Extracted dark, 5 @ 5 1/2; light amber, 5 1/2 @ 6 1/2; clover, 7 @ 8.

C. H. W. WEBER,
 Nov. 7. 2146 Central Ave., Cincinnati, Ohio.

BOSTON.—There is a fairly good demand for stocks, with ample supplies at the present writing. Fancy No. 1 in cartons, 15 1/2 @ 16; A No. 1, in cartons, 15 @ 15 1/2; No. 1, 15; very little No. 2 is being received. Glass-front cases will bring about 1/2¢ per pound less. Light California extracted, 7 1/2 @ 8; Florida honey, 6 1/2 @ 7.

BLAKE, SCOTT & LEE,
 Nov. 8. 31, 33 Commercial St., Boston, Mass.

ALBANY.—Honey market steady, especially for buckwheat comb, which is most sought after for its price, 12 1/2 @ 13. White comb, 15; No. 1, 14 @ 15. Extracted white, 7 1/2; mixed, 6 1/2 @ 7; buckwheat, 6. Beeswax, 27 @ 30.

MACDUGAL & Co.,
 Nov. 9. 380 Broadway, Albany, N. Y.

NEW YORK.—The demand for comb honey of all grades is exceptionally good, and prices are ruling as follows: Fancy white, 15; No. 1, 14; No. 2, 12; buckwheat, 10 1/2. Beeswax is very quiet at 27.

FRANCIS H. LEGGETT & Co.,
 Nov. 7. Franklin and Varick Sts., New York.

NEW YORK.—Comb honey is in good demand, and, while the market is not overstocked, receipts are sufficient to supply the demand. Fancy white sells at 15, with an occasional sale at 16 for attractive lots; No. 1 white, 14; No. 2, 13; fancy buckwheat, 11 @ 11 1/2; No. 1 and 2, 10 @ 10 1/2. Extracted remains quiet at 6 @ 6 1/2 for white, and 5 1/2 @ 5 3/4 for amber. Very little demand for dark at 5 1/4 @ 5 1/2. Beeswax quiet at from 27 @ 28.

HILDRETH & SEGELKEN,
 Nov. 8. 82, 81 Murray St., New York City, N. Y.

MILWAUKEE.—The receipts and offerings of all kinds of honey have increased since our last, and sales also have been somewhat improved; yet the demand is not what it should be at this particular season. Yet we feel, to encourage, that it will be better later on. We now quote fancy 1-lb. sections, 15 @ 16; A No. 1, 14 @ 15; No. 1, 13 1/2 @ 14. Extracted white, in 20-lb. kegs, and cans, 7 1/2 @ 9; amber, 7 @ 7 1/2. Beeswax, 26 @ 28.

A. V. BISHOP & Co.,
 Nov. 7. 119 Buffalo St., Milwaukee, Wis.

BUFFALO.—Below I quote you the honey market as it is now. Demand is slow for this time of the year. Expect better trade soon. Fancy No. 1 white comb, 15 @ 16; A No. 1, 14 1/2 @ 15; No. 1, 14 @ 14 1/2; No. 2, 13 @ 14; No. 3, 12 @ 13; No. 1 dark, 11 @ 12; No. 2 dark, 10 @ 11. Extracted white, 5 1/2 @ 6 1/2; dark, 4 1/2 @ 5. Beeswax, 28 @ 30. White extracted honey in jelly-glass, \$1.15 @ \$1.25 per dozen.

W. C. TOWNSEND,
 Nov. 11. 84, 86 W. Market St., Buffalo, N. Y.

PHILADELPHIA.—Comb honey has been arriving quite freely, and lower prices are the result. There seems to be very little fancy honey in the market. We quote fancy, 15; No. 1, 13 @ 14; amber, 12. Extracted white, 7; amber, 6. Beeswax, 26. We are producers of honey—do not handle on commission.

WM. A. SELSER,
 Nov. 9. 10 Vine St., Philadelphia, Pa.

NEW YORK.—Quite a little honey has been arriving of 1-lb. and the trade, having been supplied for the present, there seems to be a little quietness in the market. We quote as follows: Fancy white, 15 @ 16; No. 1, 14 @ 15; No. 2, 12 @ 13; fancy buckwheat, 11 @ 11 1/2; No. 1, 10 @ 11; No. 2, 9 @ 10. Extracted, white, 6 @ 7; light amber, 5 1/2 @ 6; buckwheat, 5 @ 5 1/2. Beeswax, 27 @ 29.

CHAS. ISRAEL & BROS.,
 Nov. 11. 486-490 Canal St., New York City, N. Y.

FOR SALE.—Basswood, clover, and sweet-clover extracted honey, at 7¢, in kegs and cans.

DR. C. L. PARKER, Station A, R. F. D.,
 Syracuse, N. Y.

FOR SALE.—Extracted honey in 100-lb. kegs. Buckwheat, 5 1/2; mixed, 6; basswood, 7. Send postoffice money-order on Moravia, N. Y., and will ship promptly.

N. L. STEVENS, Venice, N. Y.

FOR SALE.—Fine ripe extracted touch-me-not honey, in 60-lb. square tin cans, 2 cans to a case, delivered at R. R. station at 7 1/2¢. Sample postpaid, 8¢.

C. A. BUNCH, La Paz, Marshall Co., Ind.

FOR SALE.—8000 lbs. clover and basswood honey, mixed, in 60-lb. cans, as white as Michigan produces; good body and flavor; the best I ever produced in 26 years' bee-keeping. A free sample will convince you. Eight cts. per lb. at Carson City.

E. D. TOWNSEND, Remus, Mich.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.

THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED.—Western honey in car lots also northern fancy white comb in no-drip cases; state price delivered. We pay spot cash. Reference, German National Bank, Cincinnati.

FRED W. MUTH & Co.,
 Front and Walnut Streets, Cincinnati, O.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more. WM. MORRIS, Las Animas, Col.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

ROOT'S GOODS
AT
ROOT'S PRICES.

C. H. W. Weber, Cincinnati, Ohio.
2146-2148 Central Ave.

A NEW AND COMPLETE stock for 1901 now on hand. I am The Root Company's representative for Cincinnati and surrounding territories. . . You save TIME and FREIGHT CHARGES by having goods shipped from here. Convenience of railroad facilities here enables me to do so. Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

GLEANNINGS

A JOURNAL DEVOTED TO BEE AND HONEY INTERESTS.

BEE CULTURE

ILLUSTRATED SEMI-MONTHLY

Published by THE A. P. ROOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

NOV. 15, 1901.

No. 22.

MY OBSERVATION has been that, in a good year, a large part of the queens will be superseded, and but few in a poor year.

B. C. HUGENTOBLER writes: "Sweet clover yielded two tons for me, while the severest drouth of years was upon us." Just like sweet clover.

I'M GLAD you're going to do some more cellar wintering, Mr. Editor. That may be a real benefit to some of us who wish we could winter outdoors but can't.

W. Z. HUTCHINSON has my hearty congratulations. To have those twin daughters married to two young men whose lips are never defiled by tobacco, whisky, or profanity, is something to be profoundly grateful for.

THE EGG of a queen-bee, according to German bee-journals, weighs $\frac{1}{4}$ of a milligram. According to that, 170,097 eggs weigh an ounce, and 2,721,552 weigh a pound. If a queen lays 3000 eggs in a day, it takes her 8 weeks to lay an ounce.

CARBOLINEUM ought to be fine for bottom-boards. It would keep away the large wood ants that make bottom-boards dangerous in moving, for they honeycomb them, leaving a mere shell. What's the cost? [I have not yet obtained the price, but I understand it is less than that of paint.—ED.]

F. BEHNE, in *Australian Bee Bulletin*, says that, when he has in a nucleus a queen more than two years old, he gives a cell in a protector, leaving the old queen in the nucleus, and in three cases out of four the young queen will begin laying without disturbing the old one, when the young queen can be removed and another cell given.

I DON'T UNDERSTAND, as you do, that J. S. Wise, p. 861, daubed the queen with honey, but that he put her back in the cage and then plugged the cage with soft candy. That would be all right. [You are right.

I misread Mr. Wise. But my advice in the matter of daubing queens was all right, even if I did shoot clear over the head of our querist.—ED.]

IMBEDDING WIRE in foundation, says M. F. Reeve, in *Amer. Bee-Keeper*, works better if the board on which the foundation is placed be first covered with burlap, or with tapestry carpet reverse side up. [I suppose this is to prevent the marring of the cells of the foundation, because the board has a hard and unyielding surface; but if imbedding is done as it ought to be, by means of electricity, it will make no difference what sort of backing is used.—ED.]

COLOSSAL LADINO is the name of a new white clover originating in Germany, and well spoken of in *Revue Internationale*. It winters well, does well on poor soil, is larger every way than common white clover, and yields about 70 per cent more green fodder and 38 per cent more dry fodder than the common. [Why, see here; here is a little gold-mine. I am interested, as I am sure all American bee-keepers will be. Now, Dr. Miller, can you not arrange for us to get some of that seed?—ED.]

DR. PACHNER says 1000 drones consume a little more than 4 oz. daily. That means that the drones reared in 28 square inches of comb will, in 5 weeks, consume about 9 lbs. of honey. [This is interesting and valuable, and, moreover, it has a most practical bearing, because, many times, bee-keepers are careless in allowing a considerable quantity of drone comb to be in the brood-nest. Assuming that the brood-nest is broken open only once during the height of the season, it will be possible for a large quantity of drone brood to mature and hatch out drones. The wise bee-keeper will look to his profits by preventing this waste of energy and loss of what might otherwise be surplus honey.—ED.]

DR. B. F. JONES, in *Review*, quotes from GLEANINGS, p. 522, "When one practices clipping for a series of years he will be surprised how many colonies he will come across that have changed queens unbeknown to him," and takes that as proof that clip-

ping has caused the death of the queens! Why, bless your heart, doctor, in the natural course *every* queen is superseded, clip or no clip, making a fourth to half the queens in an apiary superseded every year. [This is a good point well made, but I should not have thought of it. This illustrates the importance of having a prominent apicultural writer almost constantly working with the bees during the height of the season, so that he may be able at once to recognize truth from fallacy in deductions.—ED.]

MR. EDITOR, on p. 850 I committed Doolittle to your tender mercies, and then you proceed to let him alone and to go for me. Bless your heart! I didn't say it was a possibility, easy or hard, to have 108,000 bees the progeny of one queen. Go for Doolittle. [Why, bless your heart, doctor, Bro. Doolittle was as much on my side of the fence as on yours; in fact, I claim that, if you had not read him with slant-eyed glasses, you would have seen he was, if any thing, more on *my* side of the fence. Mr. Doolittle is no doubt laughing in his sleeve over the rumpus that he has unwittingly kicked up between us. We may yet have to call on him to explain what he did mean, and thus settle the row. Well, he is respectfully requested to do so.—ED.]

"LAST WINTER," says A. C. Miller in *Amer. Bee-Keeper*, "I had two colonies, each in a ten-frame Dovetailed hive with a half-story full of sawdust over the enameled mat, and the whole hive from the under edge of cover to the ground surrounded by a single thickness of tarred paper." They wintered so finely that he will repeat the experiment on a larger scale. [In packing hives for outdoor wintering, experiments have shown that a good generous supply of packing material over the top of the brood-nest is much more important than around the sides. Of course, it is desirable to have it all around the hives—top, sides, bottom, and ends. We have had reports where whole apiaries have wintered outdoors by simply having the upper story packed with packing material; but better results are secured, of course, by packing all around.—ED.]

"IT MIGHT not be a bad idea for each annual convention to nominate three candidates for General Manager, and nine candidates to succeed the three directors whose terms expire with the following December." That's a suggestion of Editor York as to the National. It's worth considering for the future. [I do not believe it would be wise to bring about conditions or a precedent whereby the office of General Manager, at least, should be changed as often as once in two or three years. When we get a good man, as in the case of our present General Manager, we ought to hang on to him. One who has been in the harness, and knows how to pull, should not be made to give place to one who may be merely popular in the eyes of bee-keepers or members of the Association, and yet possibly be entirely unfitted for the exacting and important du-

ties of the office. But I do believe Bro. York's suggestion is all right for the Board of Directors. Some of us who have been so long on that Board could just as well get out, and thus place the responsibility for the success of the organization on other men whose help we need.—ED.]

I WANT to say, in language somewhat emphatic, that some better way should be provided than to have Directors' meetings that keep Directors out of the sessions of the annual convention of the National. It isn't fair to the Directors; and if they are good for any thing it isn't fair to the convention. [You are right; but the time of our national conventions is so much taken up by general convention work that it is often difficult to squeeze in a little side-committee work between the sessions. I think the time will have to come when the Directors will have to consult by letter, and that the discussion of some of these questions will have to be done through correspondence. Such a plan is unsatisfactory, in that it gives the chairman of the Board almost exclusive power to direct, if he chooses, the work of the entire Board.* If he suggests, for instance, that such and such a thing ought to be done, and gives his reasons therefor, in the absence of any counter-argument his proposed policy is sure to carry, when it may not always be wise.—ED.]

CUT-OFF TOP-BARS spaced endwise have been condemned by some, and I have wondered why. H. H. Hyde now says, p. 857, that the staples are continually driven further in. Surely I shouldn't like that. I think I have used them about as long as any one, and I find them a boon. It is much easier to handle the frames than with long top-bars glued at each end. Not a staple has ever been driven further in, to my knowledge. But my end-bars are $\frac{3}{8}$ thick, and top-bars $\frac{7}{8}$ thick; so the staple is driven through the end-bar into the top-bar.

What is really wanted—I've hankered after it for years—is a spacer that *can't* be driven in more than the right depth, say a nail with a head $\frac{1}{4}$ inch thick. If that can't be got, why not a shouldered staple? I can't understand Mr. Hyde's saying the staples become a ball of propolis. Propolis is so bad here that a Hoffman frame is a nuisance; but there has been no trouble with propolis on the end staples. [I take it that staples do not push in with (you even without the shoulder) under the projections of the top-bar; but what you desire is something that can be used as spacers *between* the bars. If there were demand enough to warrant it we could make staples shaped as in the diagram you have made, and the expense would be insignificant; indeed, an order for 100 lbs., sent to the wire-goods people, would bring the desired article, and at a price within the range of all bee-keep-

* I speak from an experience based on the time I was Chairman of the Board; and at that time I saw how easy it was to get indorsed any plan I had.

ers, I suspect. Mr. Hyde's experience, as related by him, is quite unusual; but I did find this in California, that the short top-bar was objected to because there was not handle enough to handle the extracting-frames by. This is because bee-keepers making that objection have not become accustomed to handling brood-frames at the corners, or, rather, at the intersection of the end of the top-bar and the top of the end-bar.—Ed.]

HALF THE TIME to election has expired since the Buffalo convention, and there has been some talk in the bee journals, but not a candidate named. Wake up, Mr. Gleanings; name the Directors whose term expires in December, and then name candidates for their successors. Editor York says, "Suppose a hundred members nominate as many different candidates." Well, that will be better than no nominations. [At the suggestion of Mr. O. O. Poppleton, of Florida, I would nominate a capable and honest gentleman, and one who is greatly interested in the success of the Association, Editor H. E. Hill, of the *American Bee-Keeper*, Fort Pierce, Fla. He would represent a good portion of the South. Then I would respectfully make mention of another, Mr. Wm. Rohrig, of Tempe, Ariz. Arizona is one of the great territories for the production of honey, and should not be ignored in the representation of our Board of Directors. Mr. Rohrig came all the way from Tempe to Buffalo, a distance of 2500 miles, to attend the meeting of our Association; but owing to a railroad wreck he just barely missed it. A man who has such an interest in our organization, and who went paying his own way, ought to be honored with an office in the Association. There are two of the old Directors, A. I. Root and myself, who, when our terms of office expire, desire to drop out and let the two gentlemen named be nominated in their stead.—Ed.]

I AGREE with you, Mr. Editor, page 862, that 10 lbs. sugar and 10 or 11 lbs. water would make 14 lbs. sealed stores, and just because of that I wouldn't have very late feed so thin as two of sugar to one of water, but five of sugar to two of water, which would make 14 of syrup from 10 of sugar. I've fed barrels of it that way. [I should rather hesitate about feeding bees sugar so thick as a proportion of 5 to 2, because that surely would not give them an opportunity to invert the syrup. The chances are limited enough with 2 to 3. One year when we fed syrup as thick as honey we had a loss the following spring that was the heaviest we have ever known. Some of the syrup turned back to sugar, and that sugar was shoved out of the entrance of those colonies that survived. Whether the food was responsible for it or not I am not able to say; but of this fact I am sure: That a *thin* syrup, about like raw nectar, which the bees can invert, is far to be preferred to thick, which they can not change in their most wonderful of all laboratories to a food that

has been digested, or partially so, at least. Prof. Cook, at one time, was almost persecuted for advancing the "heresy," as it was then called, of "digested nectar." While the term, perhaps, may have been unfortunate, yet he struck at a grand truth; and the foundation of that truth is that honey, having been predigested by the bees, is far more easily assimilated than the ordinary cane sugars of commerce. Bee-keepers, I believe, can not make too much of a handle of this point. Slowly and surely the great physicians are waking up to this fact, and are urging the consumption of honey rather than the sugars of commerce. Pardon me for making so much of a side point not directly suggested by your Straw; but I propose to "harp" on it, and keep on harping, until our friends, the great consuming public, will begin to recognize the fact, and thus shall we be able to open up a new avenue of trade never before known.—Ed.]

FROM THE biological standpoint the bees are doing their natural work in visiting blossoms; and, in spite of what harm they do, they are necessary to the best results in our orchards.—*Editorial in Farmers Review*. [This is only one out of a thousand favorable comments that have been coming right straight along from sources that are in no way biased, because they have no connection with bee-keeping. It is a pleasant and interesting fact that the great outside world of intelligent farmers and fruit-growers now recognize the almost indispensable office of the bee in bringing about the perfection and full development of certain plants and fruits.—Ed.]

Nature slowly sinks to rest;
Fields and trees are bare;
Bees rejoice within the hive
As their common wealth they share.

A writer in the *Bee-keepers' Record*, in speaking of an easy and quick method of destroying bees when it is necessary, as in the case of foul brood, says:

Close the doors, separate two frames, and push between them a little tow, cotton, wool, or shaying. On this, pour a tablespoonful of bisulphide of carbon; drop a lighted match on the tow, and immediately cover up with the quilt. The unfortunate bees will be dead in less than a minute. When the light is applied there is a slight explosion, but nothing alarming, only care must be taken to hold one's head away from the top of the hive.

A year ago a friend from New York tasted some alsike-clover honey here. Last summer he wrote he had been tasting that honey, in imagination, ever since, and ordered a gallon, then four gallons for another party, who says, "Never tasted any thing like it—can't get such honey here.

Send —." The result is, the supply is about all gone. These parties would not have hesitated to pay 20 cts. a pound there for such honey, and, in fact, it did cost them about that.

A few days ago a friend from a neighboring town in this county was taking dinner with the writer. We had some of that identical alsike honey on the table, and he was as much pleased with it as were the New York parties; but he was surprised at its cheapness, 10 cts., and said he wondered why folks in his town would pay 25 and 30 cents a pound, as they do, for comb honey, when 10 cents would get so much more. He took a gallon. Each one can make his own moral from this.

AMERICAN BEE JOURNAL.

In regard to unqueening too soon. Mr. York says:

Quite a number of beginners in bee-keeping make a big mistake when, after they have ordered queens from a dealer or breeder, they immediately kill the queens of the colonies where they wish to introduce the new queens when they arrive. This is a risky and unnecessary thing to do. Never destroy a reigning queen until the queen sent for is received. Very often queens can not be sent by return mail, even if so advertised. A breeder may be able to send by return mail almost invariably, but more than likely the beekeeper who has been so hasty as to kill the old queen before the new one arrives is so unfortunate as to have the mailing of his queen unavoidably delayed several days or a week. Even a queen-breeder can not control all circumstances at all times. So the safest way is to wait until the new queen is on hand, then proceed to remove the old queen and introduce the new one according to directions.

The editor pleads for a careful discrimination in the use of the words "stand" and "colony." He says:

A reputable journal has so many times used the word "stand" when "colony" was meant that it can hardly be otherwise understood that such use is approved. The word "stand" having a specific use in bee-keeping as designating the thing upon which a hive stands, its use in another sense serves just as much for confusion as for variety. Is there any argument for the use of "stand" when colony is meant, that will not equally support the use of "hive" in the same way?

While the word "stand" may at times be used for "hive," the word "swarm" should certainly be applied only to a colony of bees when swarming. As well might we call a thousand men in the street a "regiment" when they are not organized as such. Yet here comes a writer who speaks of the bees he put into the cellar Nov. 20 as good *swarms*, when he never saw a swarm that month. I feel sure that more than half the writers on bees use "swarm" for "colony;" and at times we are utterly at a loss to tell which word to use, as one might be as good as the other. But the outside world will probably always speak of a hive of bees as a swarm; and in doing so it nearly follows the German custom of using the word *Schwarm* loosely

for any collection of bees; also the French *essaim* and Spanish *enjambre* in the same way. As illustrative of how the gentiles get things mixed, I will mention that the editor of a Coshocton, O., paper, a little south of us, saw a hive of bees from the Root Co., *en route* for the South, at their station. He makes some ado over it, but calls it a hive of *queens*.

RAMBLE 194.

A Visit with Mr. O. W. Stearns, of San Joaquin Valley, Cal.; How Mrs. S. Managed to Make the Foundation-mill Work; Continued from Last Issue.

BY RAMBLER.

When Mr. Stearns purchases as apiary, if it is in a good location he usually secures the right to keep the bees there. Such a purchase and such a right he secured from Charley Williams, in Tulare Co. This was an excellent bargain for Mr. Stearns, for, adjoining the apiary, is an adobe honey-house, and a charming place in which to run an extractor on a hot day. The walls are a foot thick, and the openings on the four sides are covered with wire cloth, and all can be used for doors or windows as desired. The shake roof, instead of resting on the walls, is elevated with studding some 18 inches above the walls, and that space entirely around the building is covered with wire cloth, giving plenty of air. The roof terminates in a point, as shown in the photo; and instead of a chimney, as you might think from the appearance, that is a square ventilating-hole through which the bees escape, and it is at such an elevation that robber bees never try to enter it.

When I visited the apiary with my camera there was only a portion of the family at home; and the pig portion was so familiar that a hatful of pears from the adjoining

AN ADOBE HONEY-HOUSE.

trees had to be thrown down as an inducement for them to pose for a photo. They fulfilled their part admirably. The piggees are fairly good for the destruction of weeds, and do not molest the hives.

Mr. Stearns and I could not agree on the subject of hives. He uses a half-inch side and the attendant weewaw. I called attention to one hive with a piece split out to a loose knot. You could almost chuck your fist through it.

"Oh! that's nothing," said Mr. Stearns.

He then related an incident where an old gummy sack had been thrown on to a bush. A swarm of bees had taken possession of the limb under it, and made it their home. I told Mr. S. that he had better adopt that sort of hive in the future. It would be nearly as good as the half-inch hive.

"Much better," said he, "than the Heddon hive. Nobody but the veriest cranks use that and the Hoffman frame."

If Mr. S. purchases an apiary in which are Hoffman frames, out comes the jack-knife and off come the spacing sides to the frame, or, as he terms it, he cuts off their ears.

When buying bees, Mr. Stearns has occasion to move many colonies. His moving plan is very simple. He drives into the apiary after dark, and just loads the hives right on without fastening the covers or stopping the entrances. Of course the bees cluster to quite an extent on the outside of the hives. "But what is the harm?" says Mr. S.; "they will get back again when the wagon stops." He had moved bees over sixty miles; was two days on the road, and every colony arrived at destination all right. During the day the wagon and its load were left alone, and the bees went to work without much confusion.

When Mr. Stearns first came to California he worked his bees for comb honey, as did nearly every bee-keeper in this valley; but owing to low prices there has been a revolution, and extracted honey is now almost exclusively the product. A good share of the crop comes late, and Mr. S. cited an instance where a colony with only two frames of brood on the first of June built up and produced 64 lbs. of comb honey. Quite a few bee-men claim that only half of the crop is secured up to Sept. 1; but this is a varying condition, owing to climatic changes.

Mrs. Stearns and the two daughters are quite an important factor in Mr. Stearns' prosperity. They can nail hives and crates as dextrously as a professional carpenter; dip wax, roll foundation, and, if the rush of the season demands, they can work the extractor.

It is right that Mr. Stearns should be

proud of his helpers, for they have helped him to lay by many dollars. For instance, Mr. Stearns needed a new foundation-machine, and sent to The A. I. Root Co. for one. In due course of time it arrived all right, and as bright as a new dollar, and Mr. Stearns proceeded to roll some foundation; but he found it one thing to proceed,

"NONSENSE! YOU STAY RIGHT HERE; I'M GOING TO WIN THAT NEW DRESS!"

and quite another to roll. Although he was already an expert at the business, all of his experience was thrown away upon this machine. After repeated efforts it would not work. Mr. S. evidently became nervous. Almost anybody would in such a case. Mrs. Stearns heard unusual sounds in the shop. She knew right off something was going wrong, and she presented herself before her husband. His hat was off, hair tousled, sleeves rolled up, a frown upon his usually placid brow, and "his mouth was drawn down at the corners."

"Why, Orville! what is the matter?" said she, as she beamed kindly upon him.

"What is the matter, hey? Why, Anna, this machine a'n't worth a—a—" He was going to use a real bad word, but a better spirit prevailed, and he said, "It a'n't worth a row of pins. I'm going to send it right back to the Root Co. Why, they don't know how to make a mill that will work. The good-for-nothing mangy thing!" And he looked as though he could kick the machine and the Root Co. into the middle of next week.

"Well, Orville," said Mrs. Stearns, "men are always impatient. Now, I believe I can make that machine work. The rolls look so nice, bright, and perfect, that I believe it will work—it *must* work."

"See here, Anna," said Mr. Stearns,

and there was less hardness in his voice. "I'll tell you what I'll do. If you will make that machine work all right I will buy you a new dress."

"All right, Orville," said Mrs. Stearns; and she went into the house and soon returned with a box of pearline and a stiff scrubbing-brush. "Now you see, Orville, you men don't know how to scrub things. Those rolls may have had oil or acid on them, and it must be scrubbed out."

So Mrs. Stearns went at it with hot water and cold, and, after a long scrubbing, the sheets of wax were tried again, but the machine would not work.

"There, Anne, I told you the measly thing wouldn't work. I'll send it right back to the Roots;" and he grasped the screwdriver to loosen the mill from the table. But Mr. S. didn't reckon right. That promise of a new dress, and a woman's will, had that machine in hand, and the hot water and pearline were again applied with more vigor than ever. Scrub, scrub, scrub. Mr. Stearns stood first on one foot and then on the other; pulled his mustache occasionally, and lent a helping hand now and then. But Mr. Stearns suddenly remembered something.

"Oh! say, Anna, there is the mail train. I must go to the postoffice."

"No, you don't, Orville. You have got to stay right here and see this thing out. In the words of General Grant, 'I'll fight it out on this line, if it takes all summer.' I am bound to have that new dress. I'm just thinking it will be brown alpaca, made up biasing."

The machine was all ready for the wax again. It was tried, and the trial was a failure. Scrub, scrub, scrub, hot water and cold.

"Oh! say, Anna, what in the name of common sense is the use of scrubbing the thing any more? Why, you'll wear the thing out, and then the Root Co. will not allow me anything if I return it; but if you have got to scrub, I'll go and feed the chickens. I've clean forgot them."

"Here, Kitty," said Mrs. Stearns, "you stop nailing hives, and feed the chickens. Your pa wants to stay and help me."

"Scrub, scrub, scrub, hot water and cold. All the forenoon the exercise continued. Mr. S. was clear out of patience, times without number; but finally, just before dinner-time, after an unusually long scrub and strong scrub, the machine was tried, and, to the surprise of Mr. Stearns, and the gratification of Mrs. S., the sheet went through like a charm, and sheet after sheet followed in quick succession.

"There, Orville, I told you so," said Mrs. Stearns, waving her scrubbing-brush in triumph. "Now, my dear Orville, this evening we will consider the new dress."

Of course, Mrs. Stearns received the dress. It was a good one; and now whenever the machine has a tantrum Mr. Stearns knows who can scrub it into good behavior. In fact, an energetic "Mrs." to mind the

house and the husband is something I would heartily recommend to quite a number of bachelor bee-men in California.

[I especially indorse your last sentence, Mr. Rambler; but why not practice your own preaching? How you Western bee-keeper bachelors (and there are many of them) can get along and keep house, and find things when you are in a hurry, without a "Mrs.," is beyond my comprehension. Why, when my "Mrs." is gone for only one week things get all mixed up, somehow.

Mrs. Stearns has our thanks for vindicating the Root Co. by demonstrating that the machine was all right; but perhaps the "Mr." did not read the directions thoroughly.

But, say; Mr. S. does something that many of us can not do, even if he can't handle Hoffman frames or run a foundation-machine; and that is, haul a load of bees without shutting up the hives. I am not sure but if we went at it right, we might do it too.

As to those Hoffman frames, I suggest that he give his wife a chance to show him how to use them. She would earn the dress.—Ed.]

DO QUEENLESS BEES PREFER TOO OLD LARVAE FOR QUEEN-REARING?

Some Final Conclusions.

BY DR. C. C. MILLER.

Last year I attempted to get an answer to this question. I think the result was conclusive; but Hon. R. L. Taylor thought the position of the combs was such as to favor starting queen-cells from the younger brood. This year I thought I would make the test in such a way that no such objection could be made. At the same time I simplified the question put to the bees, putting it in this form:

"Which do you prefer for queen-rearing, a cell in which an egg was laid not less than six days ago or one in which an egg was laid not more than four days ago?" Or, assuming that the larva hatches from the egg in three days, the question would be, "Which do you prefer, a larva three days old or one 24 hours old?"

July 16th, at 10 A.M., I took from a nucleus the only comb it had, which comb we will call comb *a*. The queen in the nucleus had been laying about a week, and during that time had been confined to one comb, so I could be morally certain that eggs had been laid just before removal. The comb was about two-thirds filled with brood and eggs. I put it in an upper story of a strong colony over an excluder, along with other unsealed brood that had been there for some days, a feeder being on top, so that it would be well cared for.

July 18th, at 10 A.M., I took from a nucleus (in which was my best queen) its two

brood-combs, and gave it a comb that had not been with a queen for more than a week. It had a few cells of sealed brood, and its cells were well polished, ready for immediate use. This I called comb *b*.

July 22d, at 10 A.M., I took from a full colony its queen and all its brood, putting in the center of the hive combs *a* and *b*, and filling out the hive with combs containing some honey. A feeder was on top.

The combs were thus put on equal footing, so far as I could determine, nearly the same amount of brood being in each, comb *a* having a little the most. Being side by side, in the middle of the hive, neither one could have any advantage in position.

July 24th, at 10 A.M., I examined comb *a* and comb *b*. (I must confess that I forgot to look at them July 23.) On comb *a* I found one cell started. On comb *b* there were 28, a few of them not yet drawn out, only the cells were enlarged. I may as well say here that no other cells were started later, somewhat to my surprise. Perhaps the bees thought it was enough to start 29. All but one were completed.

In this case the bees had their choice of brood of all ages from eggs just laid to sealed brood, *excepting* larvæ between the ages of one and three days. If it were true that they were in such haste for a queen that they would select too old larvæ, certainly one would have expected comb *a* to have greatly the preference, instead of their being content with larvæ so young as 24 hours. But their general preference was for something younger than the three-day larvæ—not only younger, but very much younger. Just one cell was started with a larva as old as three days. One can not be positive as to the age of that one, but one can be very positive as to the other 28. July 24th, when they were inspected, not a larva on the comb could have been more than three days old, so it is not possible that a cell on that comb was at any time started with a larva beyond that age. As they were all started *before* 10 A.M. of that day, it is certain that none of them could have been as much as three days old, and probable that most of them were much younger.

Some one may ask, "Why are you so persistent in trying to show that the universally accepted opinion is wrong? What difference does it make, anyway?" The simple desire to have the truth known ought to be incentive enough. But there is something else that makes it seem to me a matter of very great consequence.

It is probable that not one in fifty of the bee-keepers of the land takes the pains to use the means that are now taught to be necessary to secure the best queens, using cell-cups and that sort of thing. Nor will they. It looks like too formidable an affair. So forty-nine out of the fifty might be supposed to talk something after this fashion:

"I am told I ought to breed from my best stock. I can make queenless the colony having my best queen, and start queen-cells galore, and from these I can have all the queens

I want. But if I do that the bees will select larvæ too good for old queens, and I can't use the complicated plans that queen-breeders use, so all I can do is to go on as I have done." And that means to have his increase and his queens from swarming colonies instead of honey-gathering colonies. And so the persistence of the fallacy that queenless bees prefer too old larvæ cheats that man out of the chance of easily improving his stock.

He should be told the truth in something like these words:

"A queenless colony will rarely, if ever, prefer larvæ too old for good queens. None of the most improved methods of modern times will produce queens a whit better than those the bees will rear in a colony you have made queenless, so long as they have young enough larvæ to select from. After the larvæ have become too old they may still start cells, and these will produce poor queens. If you give to a nucleus or a colony two or three good-looking cells, there is small chance of a poor queen. Or you may give to the queenless colony a fresh frame of brood and eggs five or six days after being made queenless, and then you need have no fear of poor cells on any of the previous frames."

Marengo, Ill.

[If I understand you, doctor, this last experiment fully confirms the former one you made, and which you related in GLEANINGS. Bees, then, if given their choice, do not take larvæ too old. Nature's plans are usually not so far faulty that they result in a retrograde of stock. We may, therefore, assume that, even in this case, Nature does not make a mistake, but takes, when she can have them, young larvæ—those which, according to best practice, are the most suitable for the growing of vigorous full-sized queens.

Here is something more on the same subject.—Ed.]

THE CHOICE OF LARVÆ IN QUEEN-REARING; APPARENT CONTRADICTIONS HARMONIZED.

Mr. Editor:—Dr. Miller's remarks on the choice of larvæ, p. 717, cause me to write of the following observation. I gave, as an index, to a colony I believed to be queenless, a frame containing brood in all stages, from the egg to the sealed cell. Looking at it two days later I found that the bees had been distributing royal jelly in the most indiscriminate way. They had started queen-cells in the regular way; but some of the full-grown worker larvæ were sloppy with food, and were being sealed up in dome-shaped coverings that made them look like drone brood. There were also all stages between the two extremes. I then gave the frame to a nucleus with a young virgin, when all the cells were destroyed except those of the normal worker brood. If the dome-shaped cells had contained drones (they were certainly on worker comb) they would hardly have been destroyed. Don't

you think they would have produced fertile workers if I had left them with the first bees?

As little more than a beginner (this is my second year) I hardly know how much my observations are to be trusted, but I am confident that the facts are as stated.

GEORGE A. BATES.

Highwood, N. J., Sept. 5.

[In reply to the above, Dr. Miller says:]

Taking the last part of your letter first, I may say that I haven't the slightest idea.

The item to which you refer, p. 717, 1900, was written more than a year ago, and was a reminder of a challenge to Messrs. Brice, Taylor, Hutchinson, and others, to produce proof that, when a colony is made queenless, the bees are in such haste for a queen that they choose larvæ too old for good results. I said the season was well along, and neither of the gentlemen named had offered any proof, adding: "Here's a simple thing that any one can try: Take away a queen; then watch whether the first queen-cells started contain small or large larvæ. Either give a proof that queenless bees are in such haste for a queen that they choose to their hurt, or else abandon the belief as a false tradition of the dead past." Another year has now passed, making an opportunity of two full seasons to furnish the required proof; and as they have not furnished it the conclusion must be that the matter was not worth their while, or else that they could not give the proof. It isn't reasonable to believe that they did not think worth while, from the fact that they had already taken the pains to give the matter as much time in trying to refute my view as it would to furnish the proof if it were possible to furnish such proof; so I think I am justified in saying that they could furnish no such proof.

In your observations you found that, two days after giving brood to queenless bees, they were sealing full-grown larvæ. That leaves the matter a little indefinite. If you had observed when they were sealed we should have something more definite. If you are not familiar with such matters it is possible you might think they "were being sealed up" a considerable time before the actual sealing. Suppose, however, a still greater advance than you name, and that the cells were actually sealed two days after the brood was given. The bees having been already queenless would begin work upon the queen-cells immediately upon the brood being given, and there would be two days of feeding before sealing. As there are five days of feeding, the bees would, under our supposition, have chosen larvæ three days old. As the worker larvæ are not weaned till three days old, or, in other words, are fed for three days the same as royal larvæ, they would not appear to be too old for good queens. So you will see that the case you cite is not a proof that the bees chose larvæ too old.

In the absence of any proof to the contra-

ry, I am strongly of the opinion that the larvæ were not actually sealed until more than two days after the brood was given. I base my opinion upon observations extending over a period of forty years, and especially upon observations of hundreds of cases during the last two years, with my attention carefully directed to the matter. In no case have I ever found the bees selecting a larva that seemed to be as much as three days old, and I feel pretty sure that Messrs. Brice, Taylor, and Hutchinson would mention it if they had found a larva more than three days old chosen. I may say, in passing, that I do not believe that a larva three days old is quite as good as one younger, in spite of the fact that such larva has not yet been weaned. My only reason for this belief is the fact that I have never known the bees to select by preference a larva as old as three days.

You ask if I don't think that the "dome-shaped cells" would have produced laying workers if they had been allowed to come to maturity. I do not at all believe they would. It was formerly supposed by some that laying workers had in some way secured some royal jelly during their larval period. Later investigations have shown that, where laying workers are found, a large number are present, perhaps half of the workers in the hive containing eggs; and in some cases laying workers appear so soon after queenlessness that their larval period must have been completed before the colony became queenless.

You are entirely right in thinking that what you call dome-shaped cells did not contain drone brood; but you are just as far wrong if you think such cells could not contain good queens. If you find at any time a queen-cell that is rather small and smooth, *in a place where there is plenty of room for it to be made larger*, as on or near the edge of a comb, you are safe to reject it as one not likely to produce a good queen. The case is different if the cell is in the middle of a comb with all the surrounding cells occupied with brood. The bees do not seem to have room to enlarge and ornament such a cell; and all that I have ever seen in such situations had the surfaces as smooth as the cappings of drone-cells, a slight difference in size and shape being the only thing to distinguish such a cell from a drone-cell. But you may generally expect a good queen from such a cell; and I think it probable that, if you had allowed the cells you mention to go on to maturity, instead of laying workers you might have had good queens.

C. C. MILLER.

Marengo, Ill.

"SHOOK" SWARMS.

The Ideal Plain Section.

BY GEO. SHIBER.

The past season I have practiced quite largely the plan of "shook-off" swarms, the same as described by Mr. L. Stachel-

hausen (p. 840, 1900). I have found that, as a rule, this method of swarming of normal colonies toward the time of natural swarming obtains the best results in comb honey, and is a tiptop method in my locality, where the only surplus comes from clover and bass-wood, if done at the right time. I followed almost precisely the same method as Mr. Stachelhausen, at the beginning of the flow; but I added, during fruit-bloom, another story of eight empty combs below the brood-chamber to prevent swarming until clover bloomed. I think this had a tendency to make colonies build up faster and stronger than if I had not added the empty combs below.

When the time came to put on the supers (each one had a few baits) a new hive with starters in six frames, and some with only five frames, was placed on a stand of the colony to be operated on, and every bee was shaken from the combs into a new hive. A frame of brood I put in the new hive for a few days to hold bees; but this comb of unsealed brood served a double purpose—it kept the pollen out of the sections, for I noticed when this comb was not added the bees carried pollen into the sections. Mr. Stachelhausen used half-story bodies, while mine were full-size eight-frame. I like the plan first rate. It is just what I want; for, with very near neighbors, on each side of the apiary, it's not just the thing to have swarms come off, filling the air in the neighborhood with bees.

One colony so treated gave me 146 filled sections ($3\frac{3}{8} \times 5$) of white-clover honey. My average was 91 sections to the colony.

I have tried the Ideal sections this year for the first time. I am pleased with them. It is my opinion that a super of 30 of them will be filled about as quickly as a 24-section $4\frac{1}{4} \times 4\frac{1}{4}$ super.

Speaking about red-clover queens reminds me that this year both black and yellow bees worked on red clover in July.

I think the effort for breeding longer tongues is all right. But if we will use a little logic that we used to study in school, we shall find that queens have always been raised with the one thing in view: i. e., better workers. The queen-breeders and honey-producers, large and small, have always bred from their best queen, the one whose bees have done the best, and that's just what is being done now. All that we gain is the *knowledge* that the "long tongue" is what does it; so the matter can be summed up by the following syllogism: All good workers (bees) have long tongues. These workers (bees) have long tongues. Therefore they are good workers. So all we have gained is that we know what makes good workers, provided it is entirely long tongues that do the trick.

Since writing the above, GLEANINGS for Oct. 15 has come to hand, and I see that Mr. G. B. Howe (page 822) gives two eight-frame bodies to his colonies to enable them to build up in the spring; and I suppose we are to understand that he leaves them the 16

combs when he puts on the supers. I have used only the one body when the sections were put on. But anyhow, I think the practice of giving colonies two bodies in which to build in the spring is all right, and has a very great tendency to delay swarming until the time of the flow, and makes booming colonies.

Franklinville, N. Y.

[It is not yet proved that long tongues "will do the trick." All we know is that some good workers have extra-long tongues; but we have no absolute proof yet that the amount of honey is in proportion to the length of the tongue. But even if long tongues are an important factor, there will have to be *other* factors in order to produce a good all-around worker-bee.

I do not know what is the practice of Mr. Howe; but at our out-yard we sometimes leave on the two stories; but as a general rule we take off one story and put in its place supers of empty sections with foundation.—Ed.]

HONEY STATISTICS NEEDED.

Seeking Government Aid; how shall it be Done?

BY W. A. H. GILSTRAP.

Some time after the honey crop for this year in Central California made such a poor record, it occurred to the writer that all honey-producers and dealers should know it. Some way the dealers learned there was a large crop in the southern counties. They failed to learn that comparatively few bees were left to gather it. GLEANINGS kept the actual facts before the public eye, or tried to, but who saw it? A few dealers and a sprinkle of the honey-producers. How many dealers believe such reports from an apicultural editor? Not very many, perhaps. To my mind, a "long-felt want" would be supplied by having the Department of Agriculture report the condition of bees and yield of honey at proper times of the year. A statement of the need of such information, with some reasons for the same, was sent to the Statistician of the Department. His reply expressed a desire to take up the work when Congress places sufficient funds in the Department's hands for the work. My reply contained the following:

"While thanking you for your kind letter in regard to reports of honey-bees and their chief product, I am especially pleased that you state why reports are not made; and it seems to me that such objection could and should be overcome. When Congress becomes convinced that the measure is decidedly for the public good, the funds will be placed in your hands with which to conduct the work.

"If you will kindly give me some estimate or data to work on I shall place the same before those most interested, and endeavor to have the matter brought before

Congress on the earliest practical occasion. As to how your office can handle this additional work to best advantage—bees and other lines, or bees and their products alone—of course you can best judge.”

UNITED STATES DEPT. OF AGRICULTURE,
DIVISION OF STATISTICS,
Washington, D. C., Oct. 17, 1901.)

Dear Sir:—In reply to your letter of October 12, I can only repeat the statement made in my previous letter, that the funds at the disposal of the Department for making statistical investigations are inadequate to pursue subjects other than those already dealt with. There are many agricultural products of interest that the Department would be glad to include in its investigations were the funds sufficient; but unless substantial additions are made by Congress to the appropriations for these purposes it will be impossible to enlarge the statistical investigations to any great extent. I should be very glad if you can present the matter in such a way as to induce favorable legislation, as communications are constantly received from persons interested in various agricultural products of importance not dealt with by this office, which show the desirability of including them.

Thanking you for the interest you take in this matter, and trusting that your efforts may be successful, I am
Very truly yours,
JOHN HYDE.

It will be noted that my main inquiry was not replied to; but it may be better to let the amount of the needed appropriation remain indefinite for the present. However, we know a few things.

1. While bee-keepers know more about the honey crop than others, they are not properly posted.

2. We have no way of getting such information, or of making such information sufficiently public, at present.

3. The Department of Agriculture can give us the desired assistance, and will do so if we make the proper effort.

This is a big work, and every journal of our pursuit can help, perhaps, more in stirring the fraternity than in all other ways. To the honey-producers I would say, "Let's be enterprising and public-spirited for once, and that once all the time." If each bee-keeper in the United States would present the matter to his Representative in Congress it would have weight. Honey-producers should report their townships to the Statistician when possible. By so doing we may influence legislation, and will be in position to get reliable information when apiarian reports come in. See that crop reports are posted monthly in all postoffices. That will keep statistical work before the people. When the people call for an increase in statistical service it will come. Bee-keepers' societies, especially our National Association, may exert a strong influence.

We need a report in the spring, say May 1, showing how bees have wintered. The report on both comb and extracted honey should be taken the first of July or August, also Oct. 1. These reports should be as accurate and public as possible. If there is any other plan as good as the above, let us have it. If not, let us all take hold of the above plan, and we can get it to work. This widespread ignorance and uncertainty is too costly to be endured.

Grayson, Cal., Oct. 28.

[Mr. Gilstrap is on the right track. If there ever was a time when bee-keepers needed reliable statistics as to the amount of honey produced, that time is now. Private enterprise can hardly secure them. Even if all those who produce honey would take a bee-journal, there would still be a lack of exact data. Mr. Gilstrap is quite right in saying that we should write to our Representatives and Senators in Congress; but until Congress meets it would be quite useless to waste our powder now. I would, therefore, suggest that he take this matter in hand, and at the proper time make a general request, through the bee-papers, calling on their subscribers to write to their Representatives in such a way that we can at least start the ball rolling, even if we do not secure at once the needed appropriation. In the first place, some one in Washington—perhaps Mr. Danzenbaker or any one else who is equally interested—can ascertain for us what would be the *proper time* to pour in this deluge of letters.—ED.]

SUDDEN STOPPAGE OF EGG-LAYING.

Is it Proven that the Removal of a Queen in the Height of Her Egg-laying, from a Strong Colony, and Sending Her Through the Mails, is Detrimental to Her?

BY ARTHUR C. MILLER.

Mr. Editor:—In your footnotes to my article in GLEANINGS for Oct. 15 you express doubt as to whether sufficient data exist on which to base so positive an assertion as I made regarding the effect of the sudden confinement of laying queens. Some years ago Mr. Alley and Mr. Doolittle made extended experiments to determine this very point, and they arrived at the conclusion that the injury so often noticed in queens received by mail was caused by the *sudden cessation of egg-laying*. I expect to prove to you that it is *starvation* which does the damage. They found, and you have found, that not all queens caged when at the height of their laying showed signs of harm. If you will consult the back volumes of our papers you will find many records of *fine queens from full colonies "going bad"* after shipment. *Contra*, you will find very few records of *untested* queens acting the same way. I believe this is because nearly all "untested" queens have not reached the height of their egg-production, and are generally shipped from a "nucleus," which, when newly formed, contains mostly young bees—"feeding" bees, so the queen is pretty sure of a retinue which can supply her with *proper* nourishment. A constant supply of nitrogenous food is more essential to the well-being of a laying queen than to any other bee in the hive, as you can well realize. Mr. Simmins is very emphatic on the folly of keeping young queens confined in frame nurseries for a number of days after hatching, claiming at that age, while they feed themselves, they need nitrogenous

food, and that it is vitally important to their development. But, on the other hand, so careful a breeder as Mr. Alley keeps virgin queens in cages for a *short* time, and presumably with no ill effects, or he would discontinue the practice. The nuclei from which his queens are fertilized, and in which they usually remain until shipped, contain five frames, five inches square. You can see that there is little chance for full rate of egg-production. Mr. Alley, I believe, very seldom has reports of his queens "going bad" after shipment.

Isn't the foregoing evidence of sufficient weight to warrant a pretty positive assertion? But I will amplify and elucidate: If a queen taken from a full colony in the height of her activity has caged with her, say twelve attendants which happen to have their stomachs charged with a full supply of pollen and honey, there is a fair chance of her receiving sufficient nutriment to take the place of the waste of tissue caused by egg-development. But if such queen has as attendants twelve bees, only a few of which are so supplied, how and from whence is she to get the needed food? And that she does need such food I believe is indisputable.

I think you gave in the A B C the advice to pick for escort bees those with their heads in a cell, getting honey. Such bees are usually the field bees, and are very seldom the "nurse" bees with a full supply of chyle. Cage such a queen alone and put the cage in a full colony, and she is little, if any, better off than in the shipping-cage with the attendants; worse off, unless she is near unsealed brood. To appreciate this, please note that, except in the exercise of the latent "mother instinct" in feeding larvae, a worker-bee never *voluntarily* gives food to any other bee, either queen, drone, or worker. Food always has to be *asked* for—sometimes apparently taken by force. Under such conditions, what hope has the caged queen of getting needed nourishment? She has to depend on the chance of a properly supplied worker coming within asking distance, and then risk getting her to give up some of her supply. If her cage is near unsealed brood the nurse-bees are numerous; but if she is in an upper story, do you wonder that she suffers for want of nitrogenous food?

A bee wanting food (other than honey or when honey is not accessible) "holds up" all comers until one is found with a supply. As soon as the latter can be persuaded to give, she opens her mouth and the hungry bee puts its tongue well into it. The *giving* bee at the same time generally curves and contracts its abdomen, much as if to sting, which is probably necessary to enable it to disgorge the food when the stomach is not *full*. The curving of the abdomen is not always done. The tongue of the giving bee during the operation is curved back under her "chin" nearly as close as it is normally carried when not in use. The abdomen of the *taking* bee palpitates

just as when taking nectar from the flowers or honey from a cell. I have often seen a drone seize the worker by the "cheeks," tip up the worker's face to a convenient angle, and hang on until either it had no more to give or he had gotten his fill. The sudden show of tongues when a queen or other bee is getting food thus is purely a case of trying to get dainties, and is *not* an offering of food to their royal mother or distressed sister.

Remember that a queen in the full exercise of her functions is developing two and a half times her own weight of eggs every 24 hours. It is not the sudden taking of the queen from a place in which to deposit her eggs that injures (for she can and will continue to extrude them as they develop), but it is the lack of sufficient proper food to restore the drain on her system. If such food is not available in sufficient quantity, she starves, and on the duration of such starvation depends the extent of injury to her vitality. Knowing these things, and knowing that a queen free in her hive can ask and obtain food from thousands of bees, is it irrational to believe and assert that she must suffer when compelled to depend on *twelve* bees, only a few of which may be able to supply her needs? These statements may be readily verified by any one who cares to take the necessary pains.

Mr. Editor, have I made my case good?
Providence, R. I., Oct. 22.

[You have presented some facts that seem to point in one direction; but so far, if I am any judge of evidence, not enough has yet been offered to warrant a positive assertion one way or the other. True science would demand more and better proof than an opinion based on certain phenomena that might take place from a combination or a variety of causes. Too many times have we sent queens in the height of their egg-laying, from strong colonies, without any bad results, and the escorts were those having their heads in honey, for I have put them up myself. You may be aware that the Root Co. has probably had as extensive an experience in queen-rearing as anybody in the United States. Queens "go bad" for all the breeders, and even for Mr. Alley. While he does produce some very fine queens, some of them, as I have known, have gone very bad.

Now, having said this much, I do not wish to appear set in my way. I am open to conviction; and to show you that I am anxious for the truth I present a letter that seems to support your views. Mr. H. G. Quirin, one of the largest queen-breeders in the United States, writes:

Mr. Root:—When first engaging in the queen-traffic we used and adopted the two-frame full-sized frame, L. size; but it soon occurred to us that it took too many bees to stock 600 or 800 of these boxes, so we gradually changed to a smaller frame, just a trifle less than half the L. size. By having a division in our old nucleus-boxes we can have two nuclei where we formerly had but one. Of course, these small nuclei can not stand the extremes that a larger one will; but by giving them the proper attention, just as many queens can

be taken from them as from a large box (did not Mr. Sladen tell you about our small nuclei?); besides, queens kept in these small boxes are never so heavy with eggs as in the larger boxes.

As to queens being injured when heavy with eggs when stripping, this is quite reasonable. Our experience would indicate that queens taken from full colonies, when heavy with eggs, do not turn out quite as well. We have had some very discouraging reports from some such queens sent out; but it rarely happens that we have a bad report from queens taken from these small boxes. As a rule our higher-priced queens are kept in full colonies or in three or four frame nuclei. It unfortunately happens that these queens appear to get the worst of it; in fact, we have come to the conclusion that hereafter we shall be obliged to keep our very best queens in nuclei instead of in full colonies.

It often happens that a queen receives a dent in the abdomen when sent in the mails. Many might give a queen a passing glance and call her O. K., but this dent will prevent her from being a good layer unless it is removed. The removing of the same is very simple. Take the queen between two fingers, and press gently. If done properly the dent will snap out. To illustrate, take a sheet of writing-paper, roll it up the size of your thumb, then dent it; then try to remove the same by pressing on each side of the dent. Practice with the paper, then try the queen. It may take a little practice to do it. We have gotten so we can take a dent in two or three seconds.

Of late years we have come to the conclusion that many queens are injured while being introduced, both as virgins and as laying queens, the bees themselves doing the mischief. But in our own apiary we have practically overcome even this difficulty. The remedy is to have brood of the proper stage in the nuclei; and when no honey is coming in, feed them. Permanent feeders are attached to all our nuclei. An ounce or two of feed to such a small nucleus is equivalent to five or six pounds to a full colony; and should there be no nectar in the flowers we can very easily make an artificial honey-flow, which we consider quite essential to get the young virgins developed into good laying queens as it is to feed the cell-building colonies to get good cells.

H G QUIRIN

Parkertown, Ohio, Oct. 31.

[We should be glad of further evidence from queen-breeders. Those who make a business of sending queens by mail in large numbers are more competent to give an opinion in this matter than the general bee-keeping public who buy them. In saying this, I do not in the least question the ability of Mr. Miller. It is important that we get at the truth of this, let that truth cut where it may. If a sudden stoppage of egg-laying, or if the queen, as Mr. Miller believes, is starved for want of proper food, then knowing the fact we can provide the remedy. As to how much the queen needs of one element of food over another I should like to hear from Prof. Cook. And right here, let me ask, has it been demonstrated that a queen needs more nitrogenous food in the time of her egg-laying than at other times? All of this is deep water, and I hesitate to wade out where I can not swim.—ED.]

THE SWARMING IMPULSE AND A GOOD HONEY-FLOW.

The Relation of the One to the Other; an Interesting Theory that Possibly Explains Certain Phenomena in the Bee-hive Economy.

BY L. STACHELHAUSEN.

Since E. R. Root mentioned, page 520, that in Southern Texas "the bees commence swarming early in the spring, and, when the

main honey-flow commences, actually stop swarming," this matter was discussed somewhat in the bee-papers. I observed this fact when I commenced bee-keeping here in Texas, 21 years ago. If we consider all the circumstances we shall find it not so very astonishing.

In our climate the bees commence breeding when the first pollen-sending plants are in bloom. This is at the end of January or the first half of February. From this time we have a moderate honey-flow, more or less according to the weather. If the conditions are favorable our bees build up very fast. I had swarms as early as the middle of March. Generally they are strong enough to swarm the first half of April. The main honey-flow in my locality generally commences in May, about a month later than the regular swarming time.

If we use small brood-chambers, the colonies will have cast prime and after-swarms, and these will build up to good colonies before the main honey-flow commences. This is so in favorable years, and then we get more honey from these divided colonies than from an undivided one. In this case it is quite natural that we should not expect more swarms during this comparatively late honey-flow.

If we use large brood-chambers, by which we can, to a certain degree, prevent swarming, we may think, as some say, the bees would swarm later, and would give larger swarms. In some very favorable springs, when these large hives get full of brood before the main honey-flow commences, they will, in fact, swarm more or less. So it was in 1900. In most years the colonies will not reach this maximum of brood before the main honey-flow commences; and during this honey-flow even these strong colonies will not swarm any more.

Why this is so is a problem very little understood as yet. We knew, long ago, that a good honey-flow will stop swarming, sometimes even when queen-cells are already started. I do not know who the first one to observe this, but I do know that Gravenhorst told us so about 25 years ago, without explaining why.

The question, then, is, "By what circumstances are the impulses of the bees incited and governed?" At present we have a theory based on the knowledge of the nourishment of the bees. In my opinion this knowledge of the nourishment is as important as the Dzierzon theory for practical bee-keeping, of which A. I. Root says: "It is the cornerstone and solid rock upon which nearly all we know about bees is based." But I am sorry to say this theory of nourishment is so much neglected as yet by the bee-keepers of this country that one of our prominent writers confounds "chyme" and "chyle."

It would take too much space to explain all this thoroughly. As briefly as possible I will say that the fully digested food called chyle, which is prepared in the true

stomach of the bee, is fully identical with the blood of the bee; the only difference is that the latter has gone, by osmosis, through the walls of the stomach. The young bees prepare this chyle, and feed it to the young larvæ, to drones and queen, and sometimes even to old workers. As long as the number of young bees is small compared with the number of larvæ, the bees will have enough customers for the chyle; but at a certain state the queen will not lay enough eggs compared with the number of young bees; the chyle will remain longer in the stomach; more of it goes through the walls of the stomach, and this causes a certain extension of the blood. This causes at first the wax-glands of the bee to secrete wax. The material for the wax is, of course, taken from the blood; but no albumen is necessary for it, consequently the blood will get richer in albumen, and hereby the drone impulse is induced. At first, drone-cells are built. As the same chyle is fed to the queen she is governed by the same impulses, and will lay eggs in the drone-cells. But still more and more young bees are gnawing out, while the queen either has no room to lay more eggs or is not able to do so. More chyle is accumulated, and the blood is still getting richer in albumen, till the swarming-impulse is incited, queen-cells are built, and the queen will lay eggs in them, and a swarm is a necessity. That is, theory teaches that the impulses of the bees are, *gradatim*, advanced from breeding-impulses to wax-secretion, drone-impulse, and swarming, by the different extension and chemical composition of the blood of the bees.

If, at the right time, a very good honey-flow commences, the swarming-impulse will not be incited, for different reasons. The first one is, the bees gather less pollen, which is the albuminous food of the bees. The main reason, I think, is that a large part of the young bees will be engaged in changing the nectar to honey, as Doolittle explained years ago, consequently they can't prepare chyle. The old bees are busily engaged in field work, and this needs a good nourishment of the muscles with blood rich in albumen. These old bees do not prepare chyle, but the same is fed to them by the young bees. We see now we have plenty of customers for the prepared chyle, even if the brood is diminishing. The blood of the bees will get poorer in albumen, consequently the swarming-impulse is diminishing.

It is easy to see, the faster the honey-flow the more it will suppress the swarming-impulse, and may even diminish the desire for brood. Many other astonishing actions of the bees may be explained by this theory, for which we have had no explanations. Converse, Tex.

[Mr. Stachelhausen draws a distinction between chyme and chyle, and very properly. *Chyme* is pollen *partially* digested. Chyle is the *fully* digested product, and is what is commonly known as "royal jelly."

Chyme is fed to nearly full-grown larvæ just before capping, while chyle is probably fed to the very young larva up to three days old. But this young larva in a queen-cell is fed continuously with this rich food till the cell is capped over. The theory advanced by Mr. Stachelhausen, in a nutshell, as I understand it, is this: The swarming impulse is incited by too much albumen in the blood—that is, too much digested pollen food; and as soon as a heavy honey-flow commences, this rich food is diminished (for lack of pollen), and the surplus previously stored in their chyle-stomachs is given off to the field-bees to supply the rapid waste incident to the flights to and fro with the heavy loads of nectar from the fields. The nurse-bees then do not have enough of this rich food to bring about the conditions favorable to drone-brood rearing and queen-cell building; consequently swarming will cease.

But there is one thing that this theory does not fully explain. It will be remembered that in Texas and Arizona the cessation of swarming is often followed by the destruction of cells and of drones. The cells that have been capped over, and the drones that have been raised to maturity, do not require the rich food, which is getting short. Why, then, should this capital (cells and drones) be destroyed *unless* the bees feel that swarming at a time of year when honey is coming at its height will be not only wasteful but a great loss in the amount of honey secured?—[Ed.]

PURITY VS. GOOD WORKERS.

"Hello, Doolittle! I came over this morning to have a little talk with you about the purity of bees. Are your bees absolutely pure?"

"What do you mean, Mr. Brown, by absolutely pure?"

"Well, I supposed you would know, and so I asked you. I see in some old bee-papers I ran across that pure stock was the best, and so I asked the question I did to see if you had the best."

"Much has been said during the years that are past about a standard of purity for our bees; and I have often been led to ask myself the question, 'Can we, as apiarists of America, adopt a standard of purity that will always secure to us the best working qualities in our bees?'"

"And how did you answer this question?"

"As doubtful."

"But queen-breeders have a standard of purity, do they not?"

"Possibly some do; a standard which they adopt as breeder of Italian, Carniolan,

Syrian, Cyprian, etc.; but for the masses of honey-producers to adopt the same standard would be quite another thing."

"Why so?"

"Because the workers from different queens of the same color and general appearance show a vast difference as to working qualities; at least, such is my experience."

"Oh! Then you think the honey-producer should breed from his queen that gives workers proving the most valuable in bringing in nectar from the fields, rather than for those of the most uniform markings or purity?"

"That has been my idea all through the past 30 years, since I tried for better working stock."

"Thirty years! That is a good while. And do you think you have better bees to-day than when you first commenced—better bees regarding their honey-gathering qualities?"

"Well, I do not know that I secure a larger yield from single colonies now than I did then; but the average yield of the whole apiary is very much better as compared with the best colony than it was then."

"Please explain."

"When I first began work along this line of improvement of stock I would have some single colony in the yard that would produce a large yield of honey, while at the same time it would take a dozen of the poorer ones to give as much surplus as did this one, quite a few often giving scarcely a single pound of surplus."

"That is just the way I find it with my bees. Do you think that such a state of affairs can be remedied?"

"Perhaps a bit of experience will best help you to understand what I mean. In 1877 I had one colony in the yard, which had not swarmed when all the other colonies, or nearly all, had got through swarming. Thinking it a little strange that such was the case I went to it and found that it had 60 pounds of comb honey nearly ready to come off. About a week later this colony gave a fine swarm, which was hived; and, although the parent colony had none of its queen-cells cut, it never offered to swarm again; and the result, at the end of the season, was, according to an old diary bearing that date, 195 pounds of box honey from the parent, and 114 lbs. from the swarm, or 309 lbs. from the old colony in the spring, all told. And that same year I had other colonies that did very little."

"Whew! Of course you raised queens from the mother of those bees which did so well?"

"Yes, I reared nearly all of my queens from this one as long as she lived, and found many of them giving good workers which were long-lived, and great honey-gatherers. I always raising from the best and superseding the poorest. After the old queen died I began to secure queens from other parties who reported good yields of

honey through the bee-papers; but as many of these did not prove equal to those I had, these were superseded as soon as I found out that such was the case."

"Did you use any of those obtained from others as breeders?"

"Yes. Some of them proved very good indeed, and these were used, in connection with those I have told you about, although I have kept the first very largely in the majority ever since, till to-day the yield from all colonies is more nearly equal each year, unless it is from colonies from queens which I have procured from other apiaries. Working in this way I have bred up a strain of bees which please me; and from the many queens I receive from other parties, by way of exchange and by purchase, I am led to believe that any one taking this course can breed up a race of bees second to none as to honey-gathering qualities. But I am free to confess that, for purity and yellow bands, there are bees in the United States which far excel those bred in this way."

"And I suppose you think that your bees thus bred are very near or quite perfect?"

"No. All I claim is that a great improvement has been made, for I am still striving to advance my bees further along the honey-gathering line, so each year finds me procuring queens from the most approved sources, although it is seldom I find one I care to use in connection with my own for breeding purposes; but as this 'seldom one' is of great value, I consider myself well paid for all trouble."

"But have you not got tired of sticking to this one thing for so long a time?"

"No, not by any means. There is nothing in all the realm of bee-keeping that gives me more pleasure than does this improvement of stock for its honey-gathering qualities; and as we have several of our most prominent apiarists at work along this same line, I believe the day is not far distant, if it has not already come, when the bees of America will be considered and conceded to be the best in the world."

"This, probably, is only your own thought. I suppose each nation might think the same of its bees."

"I may have been a little egotistical regarding our American bees; but the sending here for queens from nearly every bee-keeping nation in the world would show that I could not be far wrong in my conclusions. If I am correct, The A. I. Root Co. has had orders for queens from many of the nations of the Old World, and from the islands of the sea. And I have sent queens to fully fourteen different countries besides our own. It may not seem so to you, but I do not consider it an unpardonable sin to have a feeling of pride over the achievements brought about in our American bees through the untiring energy and well-directed efforts of our apiarists to bring about the results in the honey-gathering qualities of our bees which we now enjoy."

NOTES OF TRAVEL.

Another Bee-keepers' Paradise, in Arizona; some Peculiar Conditions as we Find them in the Tropical West.

BY E. R. ROOT.

In my remarks concerning the bee-keepers' paradise of Central Texas I spoke of the desert-like appearance of the country for miles and miles; of the vast tracts of sand; low shrubbery, and how utterly impossible it seemed that such a country could produce so many carloads of mellifluous sweetness from such land and such plant-life. On leaving Uvalde Co., Texas, and riding all one day and one night and the next day, I saw thousands and thousands of acres of just such land as I had seen in that paradise—land totally undeveloped, without animal life, except, perhaps, the jack-rabbit and the coyote, and without inhabitants except here and there small settlements along the railroad. So far as I could see, all of this country, or at least a great portion of it, would support bee-life, for there were mesquite and catclaw by the square mile. As civilization pushes on, we shall find bee-keeping, probably, following in its wake.

On and on I rode into Arizona, and still there was a desert-like country, until I came to Maricopa County, and then I began to see irrigation and the evidences of tropical vegetation. On the one side of the railroad, I might see ranch after ranch of alfalfa, and on the other a perfect desert of thorns, sage brush, and mesquite. On arriving at Tempe, where there was an uncle of mine living, the delightful aroma of new-mown hay, of the well-known alfalfa, greeted me for the first time, in all its perfection. Along the irrigating-ditches, and wherever irrigation went, in fact, there was the most beautiful and luxuriant growth of all kinds of vegetation.

At the train I was met by my uncle, Mr. J. H. Root, my father's youngest brother, and a typical Root he is. Indeed, it seemed as if I were shaking hands and looking into the face of my father as he looked ten years ago, for Uncle Jess is a younger man. It was not long before one of the principal bee-keepers of the place, Mr. Wm. Rohrig, drove up to the residence of my uncle. I explained that my time was limited, and that I desired to make the most of it, and both of the gentlemen kindly offered to help me make it go as far as possible. We got into Mr. Rohrig's carriage with scarcely a moment's delay, and drove out to the first apiary—that of Mr. J. Webster Johnson, a short distance from Tempe. All the way along I was struck with the beautiful tropical vegetation. All was new and interesting, and I kept my uncle and Mr. Rohrig busy answering questions about as fast as I could ply them. Arriving at the Johnson residence we found our friend away; but he soon returned. He is now Secretary and Manager of the Arizona Honey Ex-

change, a flourishing organization that handles a large part of the honey of this Arizona paradise. Of this organization I will have more to say later on. I requested him to sit out in his front yard close to one of the century-plants that grow so luxuriantly (a very common "weed" for that country), where I might take his picture, and thus give the readers of GLEANINGS something of an idea of what I saw. Here is the result.

Mr. Johnson sits in a chair, *painfully* close to that species of cactus with its sharp spines sticking out in every direction. I have not forgotten the exquisite pain I felt when I stepped back of him in order to size up the position of the camera, for just then I backed up against three or four of those needle-like spines which you can see in the picture. Posing Mr. Johnson, I went back, touched the shutter, and the effect is here reproduced.

But one picture was not enough, so I requested our friend to step in front of another big plant—one of those magnificent over-spreading palms. This he did, in the full glory of the sunshine; and while he stood there, again the shutter clicked—there, you can just see him fairly wreathed in the splendor of the plant, for it is a most beautiful thing.

I have seen these palms 50 or 60 feet high; but when so tall they lose much of their enchanting beauty. The older the tree, the higher the branches. The palm before us is not so very old—just how old, I will not venture to say, as my guess would be wide of the mark.

I produce both of these pictures, not because they are directly related to bee-keeping, for they are not, but because they illustrate better than any thing else that I can show the wonderful fertility of some of the lands in Arizona, which can be and are being reclaimed by irrigation—lands which are destined to be the garden spots of the United States, equaled only by some portions of California. No wonder, then, that in this portion of Arizona alfalfa grows the most luxuriantly of any place in the United States. I have seen this celebrated honey-plant in California, in Utah, and in Colorado—States where it is grown so extensively, and where it is such a valuable hay crop; but in none of the States does it grow as rank as it does in Arizona. But the trouble now is the want of water for irrigation purposes. There is no lack of water, if I understand aright, because there are millions of barrels of it going to waste from the melting snows down the mountain-sides; but at present there are no appropriations from State or nation to provide for the building of great ditches whereby this water can be carried into lands that will yield as abundantly as do those now under irrigation.

Thousands of people have been flocking to Phoenix and Tempe from the East and North, away from the long bleak cold winters—away from the damp bone-chilling at-

ANOTHER SPECIMEN OF PLANT LIFE IN ARIZONA; THE PALM IN THE FOREGROUND.

J. WEBSTER JOHNSON, OF PHOENIX, ARIZONA; A SPECIMEN OF LUXURIANT PLANT LIFE.

mospheres to the warm balmy air of Arizona "God's country," as people call it who have moved there. Indeed, they say there is "no other place in all the earth" that is quite as delightful, luxuriant, so beautiful, and so perfect in every respect, as these reclaimed desert lands, and, if we except portions of California, I don't know but that I agree with them.

It was quite warm the day I arrived, and during some of the subsequent days the mercury ran up to 110, I think, and I had heard of its going up to 120; but the people who told me that that was "God's country" denied that it ever went up as high as that; indeed, they doubted if I ever saw the mercury up to 110; but I insisted that I *did* see it, for I remembered distinctly how

the hot sun poured down on my back, and that I wanted to get out of "God's country," and go where he had made it cooler. Why, I became so tanned that I looked every whit as black as—as—a typical Mexican greaser. But however warm it may be in summer for a time they do not seem to mind the heat; notwithstanding, it was comfortable for the old residents to go around in shirtsleeves. And, by the by, I must introduce to you Mr. Wm. Rohrig, of Tempe, who sits on a hive with his coat off, rough and ready. He objected to being shown up in GLEANINGS in that style, but I told him not to mind, as I would apologize for him.

In our next issue I shall, perhaps, give you some views of typical Arizona apiaries, how they are placed under sheds or trellis-

WILLIAM ROHRIG, IN ONE OF HIS APIARIES AT TEMPE, ARIZONA.

es. something as shown in the picture herewith. In the mean time, if there are questions that our subscribers desire to ask regarding these bee paradises, I should be pleased to answer them as I go on. Let me tell you right now that the bee paradises about Tempe and Phoenix are already overstocked with bees. The only way a bee-keeper can get into them at all honorably is to buy of some one else who is already located—or go out on the desert, buy a water privilege, and go at it in true Arizona style. But, more anon.

A NEW SCHEME FOR A TOP-BAR.

I send by this mail a sample of top-bar. Draw the four small brads, and you will then have it. These pieces can be used for bottom-bars—a very economical top-bar. It has the advantage of the thick top-bar for strength, with none of the sawlog disadvantages.

FISHER'S PLAN FOR A TOP-BAR.

The last four years have been failures with me with the bees. I have had no chance yet to test this top-bar. This is why I should like to have you bring it before the public so they can have a chance to test it as to its merits; then should the bee-keepers in general pronounce it a meritorious invention, all I shall ask is justice.

A. J. FISHER.

East Liverpool, O., Oct. 8.

[I do not think that you would find this kind of top-bar would prevent burr and brace combs. While it might not sag, yet so far as those nuisances are concerned I am of the opinion that you will find many more of them on it than you would of the old-fashioned $\frac{3}{8}$ bar. The two pieces taken out of the side would be no direct saving in expense, for every supply-manufacturer has usually enough refuse to make all the bottom-bars he can possibly use; so that what would be saved out of the top-bar would be of no particular value. After an experience of one or two years you will probably find that your bar will be much better with the wood all left in.—ED.]

RESPONSIBILITY FOR LOW PRICES; PUTTING THE SHOE ON THE OTHER FOOT.

Your article in the Oct. 1st issue, page 792, has the right ring to it; but let us see if it is all the "animus" of the "bears," or if some of it is not the stupidity of the bee-men themselves. There is a small town in this county, Escondido by name, which boasts of a bee-association. Just on the eve of extracting-time, this association called a meeting to ascertain (so I am told) how many honey-cases would be needed among the members, and in a day or two after I heard they had decided that there would be 10,000. Think of it—1,200,000 pounds of honey, 40 carloads of 30,000 pounds each, and the area covered by the bee-keepers of the association is a mere speck compared with the rest of San Diego Co.; and there are other locations in the county that are much better. With such a yield through the entire State of California, I am thinking you folks in the East, who are in the bee and honey business, would have to hunt another job or "go west."

Now, the next issue of the San Francisco *Chronicle*, after the meeting referred to, had a clipping from a paper printed at Escondido, stating that there would be 10,000 honey-cases needed in that vicinity. I think it was the next issue after the one referred to above, or the next but one at furthest, that quoted honey half a cent lower, and it's been going lower ever since, until within the last two or three weeks, and now buyers who would hardly answer a letter from a producer are writing, asking the producer *his* price. I think we should not blame the "bears" too much when such statements come from bee-keepers and bee-associations themselves. There is no excuse for such statements being printed and sent abroad to be reprinted. Why do not the members of the association see to it that such reports are given the lie? If they are to benefit the bee-keepers, that is one way, and one of the very best ways, they could do it. This is only one of many instances I could cite; but this one is sufficient to show that the honey-buyers have something to base their reports on.

I was in San Diego a short time ago, and met a bee-keeper from Escondido, and he told me there was not nearly so good a crop in that section as there was last year, and the average would not be more than half a crop.

E. M. G.

Jamul, Cal., Oct. 10.

[What you say is very true; and while it may and probably does apply to some subscribers of bee-papers, yet the very persons who ought to see it are the ones who do not take any bee-paper, but they *think* they know it all. It was a strange thing to me that so many large bee-keepers in the West do not take any journal at all. If they but knew it they could save the price of a paper a thousand times over, even by the market reports alone, to say nothing of keeping

in touch with the rest of their brethren in the craft.

The reference to those 10,000 cans is one of many to show that Mr. Clayton's estimate of the California honey crop, based as it was on the number of cans sold, was far too large.—Ed.]

THE EUROPEAN LINDEN.

In regard to the article about European linden, in GLEANINGS for Sept. 15, I would advise you to be careful to find out if all European lindens bloom later than the American kind. In Germany they have two kinds—one with small leaves, *Tilia parvifolia*, and a large-leaved kind, *Tilia grandifolia*. I think this is the botanical name. The first has leaves that measure about 3½ inches across, and the other leaf measures about 5 inches. Some that I have seen were almost 7 inches. The trees don't differ in any other way. I don't know whether both kinds blossom at the same time. The small-leaved kinds seem to be more common.

In front of our house in Germany were two lindens of the large-leaved kind, and I never saw blossoms on them. They were planted in 1872, came from a nursery, and were about 12 feet high. In 1889, when I left home, they were almost as high as the house, but had never bloomed.

CARL VOLLMER.

Columbus, Montana.

[The size of basswood leaves depends largely on the season and locality, but more particularly on the size of the tree. A sapling will have much larger leaves than a tree ten inches through at the base, and yet both may be of the same variety. Whether the *Tilia grandifolia* is the same as our *Tilia Americana*, I am not botanist enough to say; but I am of the impression they are one and the same.—Ed.]

BEE AND HONEY BUSINESS AT SPOKANE, WASHINGTON.

Will the editor, or some one else, please tell me through GLEANINGS what the possibilities are for the bee and honey business at Spokane, Washington? I would write to some real-estate man there, but think I am more sure of getting the facts through GLEANINGS.

I have spent the summer here in Colorado, and, being afflicted with dyspepsia, I have found that, between the very hot sunshine and alkali water, I shall be forced to "move on." I don't suppose Washington is perfect; but I am told they have an abundance of soft water, the best of fruit, and more moderate weather. I must say this is a fine country for those who have good health; but you can't build up a good digestion on alkali water.

Sterling, Col.

J. O. HAYNES.

[Will some correspondent please answer?—Ed.]

A. I. R. is once more at home, and at his desk; and although he has not as yet looked over the great heap of letters awaiting him he will do so at once.

ON a second reading of my footnote in this issue to A. C. Miller, where I refer to some of Mr. Alley's queens as going "very bad," I see the impression might be gathered that his queens were worse than others'. This I did not mean. I only meant to show that the simple fact of his using small nuclei does not prevent good queens from going to the bad after their journey. I believe his queens average well with others'.

NOT A HONEY TRUST BUT A NEW HONEY EXCHANGE IN CALIFORNIA.

OWING to the fact that there have been great exaggerations as to the California honey crop, and to the further fact that prices have been slashed and cut to pieces on the coast, simply from a lack of co-operation, a movement was started by B. S. K. Bennett, of the *Pacific Bee Journal*, to organize a honey trust, to take in all the large honey-producers as well as the small ones. The object was to control prices by taking the entire output of honey; but the effort, I understand, fell flat, as bee-keepers do not take kindly to trusts, although they do believe in co-operation. A meeting was held in Los Angeles, and, instead of a trust being formed, a sort of exchange was organized that will be known as the Southern California Honey Association. To this all bee-keepers having 50 or more colonies will be eligible to membership. The Board, as announced in the newspapers, takes in some of the most influential bee-keepers of California. This Board consists of W. T. Richardson, of Ventura; Frank McNay, of Los Angeles; W. W. Bliss, of Grange; M. H. Mendleson, of Ventura; G. W. Brodbeck, of Santa Ana; D. A. Wheeler, of Riverside; G. S. Stubblefield, of Los Angeles; H. C. Williamson, of Redlands. Full particulars will probably be furnished our readers. For the present we are able to give them only the reports as we gather them from newspaper accounts.

THE DEATH OF MRS. MOSES QUINBY.

We have just received notice of the death of Mrs. Martha Quinby, wife of the lamented Moses Quinby, which took place Oct. 31, at the residence of her son-in-law, Mr. L. C. Root, Stamford, Ct., in the 88th year of her age. Her husband died in 1875, so that she survived her husband over a quarter of a century.

In the rapid advancement and many changes in bee culture that have taken

place during late years, and the advent on the stage of many new leaders, we of the younger generation are liable to forget the names of two of the great bee-lights, fathers Quinby and Langstroth, who, more than any one else during the infancy of bee-keeping in the United States, first placed the industry on a paying and substantial basis. Quinby was one of the most successful bee-keepers who ever lived; indeed, if I am right, Mr. Quinby was the first to produce and ship a whole boatload down the Hudson to New York city. Such an amount of honey at that time (the early '50's) literally broke "the market," for no one knew what to do with so much honey. This remarkable feat was performed with *bar* hives. Yes, father Quinby made his bees pay; and, as I understand from Capt. Hetherington and others who knew him, he was one of the most lovable and unselfish persons the world has known. Never a beginner went to him for instructions without receiving generous advice, even though that advice might bring into his territory new and disagreeable competitors.

As is often true in the case of a great man, we know little or nothing of the wives who shared their toils equally in their successes and failures. This is true of Mrs. Quinby; but I think we may safely say that some degree of her husband's success was due to his kind and loving helpmeet who has for so many years survived him.

HONEY-PRODUCERS THAT OUGHT TO BE SCORED.

WE are just getting in considerable quantities of comb honey. It is evident that some of it, having been held back, is now being unloaded on the market. This is unfortunate, but I do not know that it can be helped.

But there is one thing I feel like *scolding* about, if I may use this disagreeable word, and that is the carelessness of some comb-honey producers. Much of otherwise good comb honey that we have received is not properly graded, with the result that we are compelled to go over it section by section. We now have on hand about a carload that will all have to be re-sorted before we could offer any of it as fancy and No. 1. This we must charge up to the producers, for we can not afford to do this grading for nothing, nor risk our reputation in putting out such a mixed lot. Much of it was graded, or an attempt made at it; but, such grading! And, to make matters still worse, some lots were unseparated, and a little was either broken or leaking.

I do not blame the commission men for being disgusted occasionally, and for charging good round commissions, if this is the way honey sometimes goes to market. The use of separators first, last, and all the time, will, in the great majority of instances, earn from one to two cents a pound; and why will bee-keepers be so foolish as not to separator (or, better, fence) their supers?

Still again, we are continually getting lots not scraped. One little lot was wormy; and would you believe it?—the producer even went so far as to dust flour on the surface of the sections to cover up the tracks of the nasty things.

It does not cost any more to produce first-class honey, or but very little more, than it does second-rate goods; and after having produced some good honey, to mix that with No. 2 puts it all down to No. 2 grade.

For the sake of good prices and fair dealing, brother bee-keepers, do be careful. When I say this I am afraid I am not reaching the very people who ought to read it; but if a man will not take a bee-journal, or, still worse, will not read it when he does take one, he surely ought to take the consequences, and will.

MARKETING COMB HONEY; WHY GOOD HONEY SOMETIMES BRINGS LOW PRICES; INEXCUSABLE IGNORANCE.

THE honey-man, Mr. A. L. Boyden, of our firm, has been having some "experience" of late; and in response to my request he has prepared a statement which producers of comb honey should read carefully.—E. R. R.

As most of our readers know, we handle large quantities of comb and extracted honey each season. Without thought of going into this as a source of profit, we have for years taken honey, sometimes as a convenience to bee-keepers who had more than they could use in their home markets, and wanted us to handle it for them. Other times we have taken it in exchange for supplies; and during the past few years we have been obliged to buy large quantities to supply the demand of our established trade. Many times we have received complaints from bee-keepers that they have been unfairly dealt with by commission merchants and others to whom they had sent their honey, and we are aware that these complaints are often justly made. It has been our experience, however, that many bee-keepers do not realize the importance of using every means to insure the delivery of their honey to the merchants in a condition that will be creditable to them, and bring for them the best price. For years we have recommended that the cases be packed in crates like those shown below. As a matter of information we publish here the directions we send out to our shippers.

TO SHIPPERS OF HONEY.

1. Put your name on the *crate*. *No name on cases.*
 2. Put a caution card on each crate.
 3. Put the gross weight, tare, and net weight on each case before packing honey.
 4. Put the total weight of all cases on the upper side of the crate, so this can be found without opening the crate.
 5. Mark each case with the grade.
 6. Mark each crate with the grade.
 7. Put only one grade in a case.
 8. Put only one grade in a crate if possible.
- Never think of shipping your cases of nice comb honey unprotected, for they are almost sure to go through in a broken or damaged condition. The cases of comb honey should always be crated something as shown below; and in the bottom of the crate,

under the honey, should be a quantity of loose straw, the purpose of which is to act as a cushion. Honey put up in this way can go by freight, and is rarely if ever broken in transit.

Our shipping-cases when sold are put up in the flat in a crate of this description. This crate will hold fifty 2-lb. shipping-cases in the flat, or eight of the same filled with comb honey; or it will hold 100 2-row 12-lb. cases, or 16 of the same when filled with comb honey. In the latter cases, handles are nailed on the sides to insure careful handling. Additional comb-honey crates in the flat, 50 cts. each, or \$1.00 for 10.

This crate holds twelve 3-row 12-lb. cases, and has been used successfully by Geo. E. Union and others, without any straw, and, so far as our experience goes, we would not hesitate to saip in this crate without straw. If you use a larger case, however, making a different-sized crate, then we would recommend the straw. The success of this crate we think lies in its shape, and unless you conform to this shape closely we would fear the results would be a lot of broken honey.

Gross WeightLbsOz.
Case WeighsLbs.Oz.
Honey WeighsLbs.Oz.

CAUTION CARDS.

These cards are 5-7 inches, to tack on crates of comb honey, cautioning against rough handling. Printed in red ink.

When these rules are followed we seldom have a shipment reach us in bad order, and we think it will pay bee-keepers everywhere, when shipping their honey in less than carload lots, to put it up as described above. We have just received two large lots which have been sent us without crates.

There is something like 3000 lbs. in each lot, and there is not a case in either lot that is not badly soiled by dripping honey. The honey is well filled out in sections, and a caution card is on each case; but in spite of this, enough honey has been broken to make a very sticky mess of it. Another party sent us some put up in crates as we requested, and has used covers on his cases made of two pieces not tongued and grooved or shiplapped, consequently there is a little crack in the cover where the two boards meet, and the honey is badly soiled by dirt sifting in through these cracks. This might have been avoided by using paper, which we recommend, even though his covers were not exactly suitable.

In another respect bee-keepers fail because they omit the marking of the cases with the gross weight, weight of the cases, and net weight. If the little labels which are had for this purpose are not convenient it is much better to mark the cases with pencil than to omit it. Otherwise the dealer must weigh up every case separately, entailing a vast amount of work. In another lot we have just received, billed to us as "fancy honey," we find unmistakable signs of the bee-moth; and on examination we find quite a number of cases in bad order from the work of these pests.

It seems to us if bee-keepers would use more care in putting up their honey they would earn just the difference between a high and a low price on their honey. We can not see why they will allow it to be sold for less than it is worth, simply because they have neglected two of the most important points—grading and shipping.

We have also to call the attention of our readers to the great difference in price received by bee-keepers for the honey produced in the same locality. During the past month we have paid from 13½ to 15½ cents for No. 1 and fancy white honey. At one time we were entirely out, and could have used several tons at the latter figure had we known exactly where to get it without delay. Since then we have been informed that bee-keepers in Western New York have in a number of instances sold the same grades, and equally good honey, at 11 cts. per pound, or at least 25 per cent less than its real value at the time they made their sale. Bee-keepers who take a bee-journal, and know the value of their crop, do not lose in this way, and it would be to their interest to induce their neighbors to take such a journal, so that their market may not be demoralized by sales being made at such figures. Not many years ago, good honey was selling at 10 to 11 cts. per pound, and very likely bee-keepers who sell at 11 cts. now think that they are getting a good price simply because it is as much as was received in previous years.

We heartily wish all of our readers would give their best attention to the grading and shipping of their honey, and help the industry by getting other bee-keepers to post themselves on the market price of honey.

In all thy ways acknowledge him, and he shall direct thy paths.—PROV. 3:6

Yesterday afternoon I gave the children at a Sunday-school convention a talk on "paths and path-making," using the above for my text. For a week or more I have been getting much happiness in repeating the text over. No matter how many times I repeat it, each time it comes over me like a strain of sweet music. I have in times past told you of how my life is made joyous by texts of Scripture that come to me suddenly with a new light and a new meaning. It was so with this one. While thinking about my subject of path-making, and the number of beautiful texts containing the word *path*, this one suddenly occurred to me, and I began wondering if it was not one I had already used. We have no concordance of any kind in our humble home out here in the woods, and I began to wonder if we could find where it was in our little Bible. Mrs. Root said she thought it was in Proverbs, and in less than a minute I had it. It seemed to burst on me like a volume of sunshine, all at once. What a glorious promise it contains for *all* who are, day by day, all through their lives, striving to "acknowledge him" in all their daily acts and ways! How often do we say, "If I only *knew* what to do!" or, better still, "If I only knew what *God* would have me do in the matter!" and here is the promise, that, while we are acknowledging him, he *will* direct our paths for us.

Sometimes it is a little hard to stop our busy work long enough, or, if you choose, to *interrupt* our busy work, to acknowledge him. A man was plowing for me, breaking up ground in the woods. It was trying work for both man and team, and he commenced to swear. I hesitated a little about hindering him long enough to remonstrate; and, in fact, I feared, tired and heated up as he was (for it was near dinner-time), he might swear worse. Well, the result was one of my "happy surprises." He stopped, looked a little foolish, and then began to laugh. He said his wife would be "awful glad" if I could *cure* him of swearing, and finally admitted *he* would be glad too. He said he got "into it" among the lumbermen, and he had tried hard many times to break off. I stopped him several times when he forgot, for a few days, and it is now months since I have heard him swear at all. Later on I learned he told some of his friends how I had helped him to get over and away from his bad habit.

Now, friends, this kind of work is "acknowledging him" before men. It is letting everybody know, *especially* when you are among strangers, that you belong to Christ Jesus, heart and soul. Of course you know I mean a *reasonable* and *consis-*

lent acknowledging. If a man engages to work *for* you, and may be *with* you for some little time, it is your duty—*may*, your *privilege*—to try to do him good.

Well, God *promises* to "direct" the "paths" of all who are in this way "showing their colors" for him and his work. Is it not a glorious promise? and is it not a glorious *privilege* to feel that the great Father above is *directing* and *guiding* us?

Now, I often feel it is a strange thing that I have felt called to come away off here in this out-of-the-way place and start a little humble home. I have wondered at it myself, and I have often prayed over it. I have asked God to indicate to me plainly if it was his *will* and his *call*, instead of only one of my many hobbies, and only a craze for something new and different. When I urged Mrs. Root to come with me and share this "cabin in the woods" she felt sure she would be homesick; and when I was absent on my wheelrides, etc., she felt sure she "couldn't stand it." This seemed reasonable, and I confess I feared it would only prove a blunder and a loss of time and money. Now for the result.

We came here for three or four weeks; but she enjoyed this new life in the woods so much she proposed extending it to *eight* weeks or more. When I was away last evening (at the convention) she was alone, far from neighbors, during a pretty severe storm, after night, but she wrote home to the children, explaining the situation, but added she was well and *happy*, and not the least bit homesick. *Why* (do you ask?) does God want us off here? Well, I don't know exactly just yet, but I think I can now see pretty clearly *one reason*. By this experience I am learning more about the *homes* of the average country people than I ever could have learned otherwise. Perhaps I should say of the *humble* country homes rather than of the average. Let me go into detail a little.

Our home in Ohio is warmed by an apparatus (hot water and exhaust steam from the factory), so automatic that we have nothing to do with fuel. Last night the rainstorm turned to snow, and to-day the ground is white; but we have a new wood-house filled with blocks of dry wood, and we can get to it all through that trapdoor near the stove, which I have told you about. The smallest size of cooking-stove was our first purchase; but we found that expensive in two ways—the wood must be cut up very fine to go into it; and to keep the room warm the stove needed almost constant replenishing. The wood itself costs nothing, and during the winter it is cut into 18-inch blocks, and piled up, for about 50 cents a cord. Well, after we decided to stay until after November we built an annex (8½ × 10) for the cook-stove and utensils. Then we got a very pretty drum stove (named the "Flirt"), for \$4.50, that will take any of the blocks of wood without splitting; in fact, the opening in the top for fuel is a circle 11 inches across. This stove will make

our whole room, 14×20, nice and warm, and it can be closed up so as to stop instantly, and it holds fire all night or even longer.

Our first stove had the pipe go out through the wall, and then up into the air; and, in fact, most of the houses in our neighborhood have stovepipes sticking out through the roof. But this arrangement was always an "eyesore" to me. I asked the carpenter who built the annex if he could build a chimney. When he admitted that he built the chimneys to his own house I borrowed his team and hauled the brick, and now we have a very pretty chimney that answers for both our stoves, and yet it cost less than \$5.00; the brick cost only \$1.50, and brick is very expensive here. Every home, no matter how humble, should have one of these fuel-saving air-tight stoves. Get one to take big knotty *blocks*, so as to save the expense of splitting. Our stove will take a cut from a log 10 inches in diameter and 2 feet long. Such a block of hard wood will keep fire 24 hours.

We soon learned that, to keep the house warm, every thing must be tight and snug under the floor. This we managed with rough boards covered with shingles, putting building-paper between the boards and shingles, using this in place of a wall, so no wind could possibly ever get under the floor. Our little "annex" has building-paper all over under the floor and under the shingles on the roof. The result is, we can go into it to take a bath, and not feel the least bit of a draft of air through any crevice or crack. For a bath-tub we use one of the largest-sized galvanized tubs, costing only 70 cents. During a short dry spell we ran out of rain water, and Mrs. Root then put in strong for a cistern. There are very few cisterns in this neighborhood. They depend on tubs and barrels; and when there is a dry spell they get along with hard water. Very few of the springs or wells are really soft water. Every home—yes, every *individual*—should have plenty of soft water the year round. The shower bath with cold spring water, such as I have described, for warm weather, may be taken with hard water.

Before I forget it let me say, use building-paper for every thing you build (unless it be "the corn-crib"), for it costs less a cent a square yard, and it keeps off drafts of air that might cause much sickness (if not death) to some loved one.

TWO AND A HALF MILES FROM THE POST-OFFICE.

We have had another experience out here in the woods. People who have all their lives been in the habit of having mail brought to their places of business three or four times a day can hardly imagine the inconvenience of having to go two or three miles to the postoffice. We have got along very well by getting the schoolmaster to give our mail to the children coming our way through the woods (we give them a nickel each trip); but when it is very bad

weather, and on Saturdays, the children do not go to school. I have also had glimpses of the way our neighbors manage. During busy seasons the mail is often left almost a week. At other times journey after journey of several miles is made for an important letter that doesn't come. You see Mrs. Root and I are now ready to discuss understandingly "free delivery of mails in country places" that is so much talked about. We take a daily Cleveland paper (*News and Herald*), and we could hardly get along without it; and you may judge with how much interest we read the following in the daily of Nov. 2:

GOOD NEWS FOR THE FARMER.

WITHIN FIVE YEARS EVERY RUSTIC IN THE COUNTRY WILL HAVE MAIL DELIVERED AT HIS DOOR.

Washington, Nov. 1.—Within five years every farmer in the country will have his mail delivered at his door. Superintendent Machin, of the free-delivery division of the Postoffice Department, made this prediction to-night, and is confident it will be fulfilled.

"At the rate we are extending the system," he said, "it will spread all over the United States in the period mentioned. It will cover an area of one million square miles, and include practically all the inhabited area of the country."

"There will be in operation by Dec. 1 about 6000 rural routes. Of these, 4700 will have been established since July 1, 1900. During the fiscal year ending June 30, 1900, 1300 routes were put in operation. There are now on file 6000 applications for new routes, and they are coming in by the hundreds. It will take us from a year to a year and a half to dispose of those already on hand. The people living in the country are widely enthusiastic for this service, and we are supplying it as fast as our appropriation permits."

It is Superintendent Machin's aim to apportion the routes among the Congressional districts as uniformly as possible. Congress will be asked to make a largely increased appropriation for this service at its next session.

Our nearest country store is where the postoffice is kept, and we have had some new experiences in finding ourselves all at once out of soap, matches, coal oil, sugar, and even flour. I can now see a very good reason why land may be very cheap in remote places compared with that near towns and cities. I can also see, I think, how it is that poor hard-working people waste so much valuable time, even a busy season, in going to the "store and postoffice." By free delivery of the mail Uncle Samuel says to these folks, "You keep right on with your work. When there is any mail for you I will bring it right to your door." In the matter of groceries, both *time* and *money* are saved in getting enough to last.

"In all thy ways acknowledge him, and he shall direct thy paths." The great Father not only directs the "paths" of his followers when they go through the woods to the postoffice, but it is on account of the fact that we are as a people a *Christian nation* that he is just now directing our government in this matter of free delivery of mails to both *rich* and *poor*. I believe God was directing *my* path when he gave me this longing for a life in the woods; and I verily believe that the experience of the two months that are now almost ended will help *me*, all the rest of my life, to feel more than I ever did before that I know at least *something* of the trials and difficulties that

beset great masses of the hard-working people. May God be praised that it is my privilege, even in advancing years, to be *one* of them, outdoors, under his clear skies, and in his woods, claiming the promise he has given, to direct *my paths*.

POTATOES IN LEEANAW CO., MICHIGAN:
TESTING DIFFERENT VARIETIES.

Some time in May I sent friend Hilbert a barrel of assorted potatoes, of our best varieties, to be tested on his farm. Along in July I found we had about a barrel of Red Triumphs that we had no room for. They had been spread out in the light on the barn floor for nearly two months, and were a wilted, dried-up, sorry-looking lot. I shipped these also to him, telling him he might get from them enough for seed next year. They were so poor his boys threw out a large part of them as "no good" at all; but when Mr. Hilbert saw them, remembering what I had said, and perhaps also from his own experience, he had the "poor trash" planted also. They were put on new ground, and had very little care, or cultivation of any sort; in fact, they were put in so late no one thought they would amount to much. Let me say here, that, during the past season in Medina, we have had so much trouble with blight on the Triumphs I had about decided not to plant any more here. About four years ago they gave good yields with but very little blight; but since then it has been worse and worse every year. In Medina they don't stand hot dry weather at all. Well, here at Mr. Hilbert's there was very little or no blight at all, and the poor dried-up wilted seed gave the handsomest smooth, round, red potatoes I ever saw; in fact, they looked more like beautiful fruit than like potatoes. They are exactly like the Bermuda Triumphs; and, in fact, this soil is about as soft and yielding as that in Bermuda. No wonder the potatoes are of such nice shape, for there are no lumps of dirt or any thing else to hinder them from taking shape just as the apples and cherries do right out in the air. The yield was very fair, considering.

Now, I have a small test-plot of potatoes in my ravine garden, and a dozen hills of Triumphs there gave a beautiful yield—no blight, and some of the potatoes are as big as a goose egg. Of course, we can not, so far north, grow potatoes for the early city markets; but we *can* grow Triumphs and other extra-early potatoes *for seed* for all the rest of the world. Some one may suggest that, after potatoes have been grown so many years on the same ground, we shall have blight here, perhaps, as badly as we now have it in Medina, O., and other places.

Early Ohio does hardly as well here as in Medina, and it seems of late to be rather strongly disposed to blight everywhere, but not nearly as badly as is the Triumph.

Bovee has been a fair success here, both on Mr. Hilbert's test-ground and in the ravine garden. In fact, it yields equal to some of the best late potatoes, and is almost as early as the Early Ohio. As with the Freeman, there are a good many small ones, but the shape is not as good as the Freeman. The latter has given a fine yield on this soil—in fact, about as well as it used to do for Terry. It is not only ahead of every thing else in quality, but it is the smoothest and best-shaped of all the potatoes. The eyes on good specimens grown in this soil are almost exactly on a level.

Maule's Commercial gives a very good yield. The potatoes are all large (almost none so small as to be called seconds), and the shape is very much better than in Medina. Carman No. 3 is beautiful in shape, all good table size, and the yield is the largest of any of the five kinds I sent for trial. I was not disappointed in this, for I expected it to show quite a little improvement over the Rural that is so common through this region. It is so much like the Rural it will doubtless be sold as such. The Carman (and I think the Rural also) has the very valuable trait of giving a very even stand. There are almost no missing hills where the planting is carefully done.

The New Craig was the greatest disappointment of all. In the ravine garden, with its rich "woods dirt," the accumulation of decaying vegetation of no one knows how long, I expected something wonderful of the Craig, and, in fact, there was a great show of tops. I could find hills where I could raise up the vines and twine them about my neck; but after they were killed by the frosts, about Oct. 20, to my great surprise we had only a lot of rather small immature potatoes. It was the same at friend Hilbert's. He said he wanted no more of the Craig. Now just contrast the above with the following letter I just received from Medina:

Dear Mr. Root:—We got 200 bushels of Craigs in the swamp, and they were fine. I wish you could have seen them roll out. They lay thick in the rows. We got 95 bushels of Craigs by the windmill, and they were nice ones too—very few scabby. We got 10 bushels of Craigs across the creek, about 155 bushels of Sir Walter by the windmill. They were of good size, but not quite so smooth as the Craigs. We dug about 200 bushels of Russets, but they were not very nice in shape. Most of them were prongy, and not very big. We got about 20 bushels of Whitton's white Mammoth. They were all fair potatoes, and good yield.

Medina, Oct. 21.

FRANK RITTER.

The swamp mentioned in the fore part of the letter is a little less than one acre; and for this poor season, when almost all potatoes are pretty nearly a failure, the Craig on our Medina clay soil has scored away ahead. Another thing, they are clean, and free from scab and blight, on upland, when almost every other kind is more or less affected. We always get a big yield of nice clean Craigs on any of our Medina ground; but up here in this great potato region they

are "no good." I wonder if it can be that the season here is not long enough for the Craig. In both tests the potatoes looked as if they were only half grown, yet both were planted near the first of May. I think I will try again next year, planting them in April, or just as soon as they *can* be planted.

Now for the Russet. Frank says the yield was small, and the potatoes were "prongy," in Medina. I think this was due largely to severe drouth that almost stopped their growth, but that they afterward started a new growth with our abundant rains in August. Well, there was something of the same conditions here; but, listen to my story.

A few days ago my help was all missing. I soon found the farmers were getting anxious about their potatoes, and were offering 4 cts. a bushel for digging and picking up. One of the boys whom I had been hiring for \$1.00 a day was making \$2.00 in the potato-field. Another boy, only 14 years old, was sure he could do the same (dig and pick up 50 bushels a day), and he did it. Then came a report that Holly Hilbert, aged 19, and his sister Erna, aged 15, had (the two together) dug and picked up 125 bushels in a day. Mr. Hilbert sent word I must come over at once and bring my kodak. Let me go back a little.

Last fall I sent friend Hilbert a copy of the book entitled "Farming with Green Manners,"* and he has become quite taken up with it. Some time in the fall he plowed under a fine field of clover, and sowed rye. This spring, just after the rye was out of bloom, he turned it under and planted Russet potatoes. His neighbors thought it a great waste; but to-day he has been getting *three hundred bushels per acre*, during this poor season, of the handsomest Russets any one ever saw. The potatoes are all large or very large, and they are almost as handsome and smooth as the Carmans, only of different shape. It was these beautiful Russets that Miss Erna and Holly got out 125 bushels of in a day. Their mother told me they did not commence till after 7, and they stopped at night before 6 o'clock.

I noticed Holly pulled out his potatoes with a light hook, such as is in general use about here; but he told me he preferred a fork, as a rule; but on this crop the rye straw, that was not fully decayed, interfered with the fork more than it did with the hook. Both forks and hooks are made much lighter for use in this locality than in Ohio.

I find, by conversing with experts, that there is a difference of opinion as to which is best. Holly says he could have dug 150 bushels or more, had he been able to use the fork. I find, in the country about here, that most of the schools have a vacation during potato-digging time. Buyers are now offering about 50 cts. per bushel. Perhaps I might here mention that the Russet

is about the whitest, inside, of any potato known, and it now commands as high a price as any other potato in the market. A scabby Russet is something I have never seen in this locality, although they have had trouble with scab with almost all other kinds—that is, when potatoes have been grown on the same ground year after year. My kodak pictures of the potatoes and the Hilbert family I expect to show you in due time.

Potatoes are kept over winter right in the field where they are dug, all over this region. Just dig an oblong pit, say from 3 to 6 feet across, 2 or 3 feet deep, and have the top of the potatoes about level with the surface of the ground. Put on an armful of straw, then a foot or two of dirt; and if you are in a depression where the snow will drift over the heap, and not blow off, your potatoes are safe. Scattering the potato-tops over the heap will help to keep the snow from blowing off. If your pit is in the sand, say in soil sandy enough to dig easily, there is never any need of making any provision for drainage.

Since the above was written Mr. Hilbert tells me he dug a square rod, carefully measured, and it showed at the rate of 354 bushels to the acre. Mr. Martin Olsen, of Keswick (the carpenter who built our "cabin"), has also succeeded in getting this season 300 bushels of Empire State potatoes to the acre on a part of one of his fields. On the same field he has, on former seasons, taken 200 bushels of corn from an acre, and this is not considered a corn country. Now, both Mr. Olsen and Mr. Hilbert are "high-pressure" farmers. I might tell you of seven acres of potatoes near here that gave only a little over 100 bushels all together.

PLANERS

The above cut shows one of our small Planers, of which we make twelve different styles and sizes. Also large Planers, Band Saws, Buzz Planers, Moulders, Wood Lathes, and all kinds of

OUR NEW POTATO BOOK—A CORRECTION.

On page 877, Nov. 1, the price of Terry's A B C of Potato Culture is given as 35 cts. That applies to the old edition. On account of a considerable increase in the size of the 1904 edition we are compelled to put the price of the new edition at 45 cts., paper; by mail, 50. Bound in cloth, 68 cts.; mail, 75.

BUSINESS OUTLOOK.

The prospects for the coming year's business are quite promising from present indications and reports from various fields. We are booking orders earlier this year than has been customary in the past. We have the work on the revision of our catalog well advanced, and hope to have them ready to mail some time next month. There are practically no changes in price to note, other than those already mentioned in this column. Make up your orders early, and take advantage of leisure time in winter to get your supplies all ready for the bees when the spring rush comes.

HONEY MARKET.

A carload of comb honey from the West had just arrived as we were going to press with the last issue. We have since shipped several tons out of this car. It is packed in single-tier cases of 21 sections each, with a wood slide in the place of glass. The honey is very thick and of heavy body, and sections well scraped. In lots of 10 cases and upward we are selling fancy at 16, and No. 1 at 15 cts. We have also a good stock of eastern comb honey of various grades. Inquiries solicited from those wanting honey, either comb or extracted. We are having a good trade in the latter, and solicit offers of amber, with samples. State how put up, and price asked. We have a good supply of clover and basswood and white sage; have also several lots of buckwheat. We need some of an intermediate grade.

SEED POTATOES FOR 1902.

On page 676, Aug. 1, I gave prices on seed potatoes for planting in 1902 as follows: 1/2 peck, 35 cts.; peck, 50 cts.; 1 bushel, 85 cts.; bushel, \$1.00; barrel, \$1.00. Small seconds, half the above prices. I have been watching quotations since then, and no reliable seedsmen has made any better prices. Our potatoes are now all dug and safely stored away; but we will ship them the remainder of this month at our risk against frost, at the above figures; or we will keep them safely for you till next spring in our specially arranged potato-cellar. We can furnish, at the above prices, White Bliss Triumph, Earl of Ohio, Bovee, Sir Walter Raleigh, New Russet, and Craig. As our supply of many is limited, you had better order at once if you want them. Seed potatoes, especially the earlies and extra earlies, are likely to be away up before another spring. Our seconds will probably all be gone very soon at the above low figures.

CONVENTION NOTICE.

The Minnesota Bee-keepers' Association meets in Plymouth Church, corner Eighth St. and Nicollet Ave., Minneapolis, Wednesday and Thursday, Dec. 15, 1901. W. Z. Hutchinson, 1 But. Mich., will give a stereopticon lecture on Wednesday evening, and a good program is prepared and now in the hands of the printer. Joining the National Bee-keepers' Association in a body will be voted on Wednesday. All bee-keepers are invited. H. G. ACKLIN, Chairman Ex. Com.

Red Glover Queens -FOR- 1902

Warranted Purely Mated.
The Long-Tongue Variety.

How to get One for Only 30 cts.

We have arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all he mails for us will be warranted purely mated.

We want every one of the readers of Gleanings in Bee-Culture, who is not now a reader of the old weekly American Bee Journal, to have one of these Superior Red Clover Queens. We have received most excellent reports from the Queens we supplied during the past season. And next year our breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoker.

Orders for these fine, "long-reach" warranted Queens will be filled in rotation—"first come, first served"—beginning as early in June, 1902, as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you receive the new queen, no matter from whom you order).

In order that all who are not now readers of the American Bee Journal can have one of these fine Queens, we will make the price only 30 cents each, when taken in connection with a year's subscription. That is, send us \$1.30 (if you are a NEW subscriber), and we will book your order for a Warranted Queen, and enter your name on our list of subscribers and send you the Bee Journal every week from the time we receive your name and \$1.30 until the end of next year (1902). So the sooner you send in your order the more copies of the Bee Journal you will receive. If you have not seen the weekly American Bee Journal, send for a free sample copy. Address,

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

GREAT CLUBBING OFFERS!

My friends, how many of you are reading some of the many most excellent magazines of the day? If you are reading none, you are missing a great treat. Perhaps you regard them as luxuries. Possibly they are in some instances. They certainly help to fill out our lives, and give to us broader views. They are like windows that allow us to look out over the wide world. This life is not wholly one of dollars and cents—at least it ought not to be. Enjoyment, pure and simple, enjoyed just for the sake of enjoyment, is desirable and beneficial. To many there are few things that are more enjoyable than the bright pages of a really good magazine. To those who wish to give the magazines a trial, and to those who are already reading them, I can offer some of the lowest clubbing rates that have ever been offered. Here is a list of magazines, together with the regular prices at which they are published:

Review of Reviews.....	\$2.50	Cosmopolitan.....	\$1.00
Current Literature.....	\$3.00	Leslie's Popular Monthly.....	1.00
New England Magazine.....	3.00	The Household.....	1.00
Leslie's Weekly.....	4.00	Good Housekeeping.....	1.00
North American Review.....	5.00	The Designer.....	1.00
Success.....	1.00		

If you subscribe for one or more of these magazines, in connection with the Bee-keepers' Review, I can make the following offers:

Success and the Bee-keepers' Review for only.....	\$1.75
Success and any one of the above \$1.00 magazines and the Bee-keepers' Review for only.....	2.50
Success and any two of the above \$1.00 magazines and the Bee-keepers' Review for only.....	3.00
Success and any three of the above \$1.00 magazines and the Bee-keepers' Review for only.....	3.50
Success, Review of Reviews (new), and the Bee-keepers' Review for only.....	3.00
Success, Review of Reviews (old), and the Bee-keepers' Review for only.....	4.00
Success, Current Literature (new), and the Bee-keepers' Review for only.....	3.00
Success, Current Literature (old), and the Bee-keepers' Review for only.....	4.00
Success, the New England Magazine, and the Bee-keepers' Review for only.....	3.00
Success, Review of Reviews (new) any one of the above \$1.00 magazines, and the Review, for only.....	3.50
Success, Leslie's Weekly, and the Bee-keepers' Review for only.....	3.75
Success, Review of Reviews (new), Leslie's Weekly, and the Bee-keepers' Review for only.....	4.75
Success, North American Review (new), Review of Reviews (new), and the Review for only.....	5.00

Magazines will be sent to one or different addresses as desired.

New subscribers to the Review will receive the rest of this year free.

N. B.—For \$1.00 in addition to any of the above offers I will look your order for a Superior Stock queen, to be delivered next spring.

W. Z. Hutchinson, Flint, Michigan.

THE SMITH PREMIER TYPEWRITER

Occupies an Imperishable Position in the BUSINESS WORLD.

Unquestionable Superior Merit

Annually adds thousands of names to the long list of Smith Premier users, representing every line of trade and every profession.

ILLUSTRATED CATALOGUE FREE.

The Smith Premier Typewriter Co.,

NOW READY!

64-PAGE CATALOG OF EVERY THING BEE-KEEPERS NEED. Illustrated and fully described. Especially valuable to beginners for the information it contains. Send your address on postal and get it now. Established 1884.

J. M. JENKINS, Wetumpka, Ala.

Notice!

QUIRIN, the queen-breeder, still has 100 of those long-tongued red-clover queens on hand at \$1 each, or 6 for \$5. If you want one speak quick. For testimonials see former adv'ts.

Bees Wanted!

We are expecting to establish several out-apiaries next season and desire all the bees we can get; want 'em on movable frames, and near home. They must be cheap at this time of year. Parties placing us in correspondence with those having bees to sell will be remembered next season when we have a nice lot of those long-tongued red-clover queens on hand (in case we succeed in purchasing of said parties).

In our circular we list numerous articles used by bee-keepers, on which we will give 10 to 20 per cent discount from now until the coming March. Address all orders and inquiries to

H. G. Quirin, Parkertown, Ohio.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOS, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

A. E. OUTERBRIDGE & CO., Agents.

39 Broadway, New York.

ARTHUR AHERN, Sec., Quebec, Canada.

Queens! Untested, \$1.00; tested, \$1.25 and upward. See former ads. and circular.
J. B. Case, Port Orange, Florida.

Angora Goats. Delaine bucks; good stock; low prices; large circular for stamp.
Ed. W. Cole & Co., Kenton, O.

PARTIES in Southern California having small poultry and bee ranches for sale, please write with description to
N. A. BLAKE, Newhall, Cal.

PRINTED noteheads, 35c 100; 25c postpaid. Circulars, price lists—cash saved. List and samples free.
Downer Printing Co., Box 544, South Haven, Mich.

Wants and Exchange.

Notices will be inserted under this head at 10 cts. per line. You must say you want your adv't in this department, or we will not be responsible for any error. You can have the notice as many lines as you please; but all over ten lines will cost you according to our regular rates. We can not be responsible for dissatisfaction arising from these "swaps."

WANTED—To exchange Padant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax
O. H. HYATT, Shenandoah, Iowa.

WANTED—To buy quantity lots of fancy and No. 1 white-clover comb honey in no-drip cases.
BYRON WALKER, Clyde, Cook Co., Ill.

WANTED—To sell cheap, 20 acres of good Florida land, well situated, at a low price. Address for particulars,
MRS. I. B. WEIR, Toledo, Florida.

WANTED—To exchange second-hand 60-lb. cans, practically as good as new, at 20c per can in lots of 20 or more, f. o. b. Chicago, for white clover honey at market price.
B. WALKER, Clyde, Cook Co., Ill.

WANTED—To exchange, or sell, a choice 3-acre lot in Florida; near church and depot. Address
C. G. ADAMS, Sorrento, Florida.

WANTED—Comb and extracted honey. State price, kind, and quantity.
R. A. BURNETT & Co.,
109 South Water St., Chicago, Ill.

WANTED—To buy your honey. State your lowest cash price, kind, and quantity.
EDWARD WILKINSON, Wilton, Wis.

WANTED—To sell 12 acres land, good house; fine location for apiary. Address
SABATIER, Bernstadt, Laurel Co., Ky.

WANTED—A man with a small family, who has had some practical knowledge of bee-keeping, to work in apiary and on small fruit-farm.
A. E. WOODWARD, Grooms, Saratoga Co., N. Y.

WANTED—A good farm hand, with temperate habits, by the year who wishes to learn the bee-business. I keep 500 colonies.
W. J. STAHMANN, Bruce, Wis.

WANTED—To buy 300 colonies bees in Mississippi, Louisiana, Arkansas, or Texas. Write
M. STEVENSON, Wardeine, Missouri.

WANTED—To exchange or sell, gent's bicycle; second-hand, but in good condition. Make offers or write for particulars.
H. C. WEST, Medina, O.

with prices and samples, free on application. BEESWAX WANTED.

GUS. DITTMER, AUGUSTA, WIS

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:
Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I've bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season. Yours fraternally,
J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per doz. Un- tested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per doz. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want *the best*, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of *The Southland Queen*, the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice mated queen in order to get our paper introduced. Catalog giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

KRETCHMER M'FG CO., Red Oak, Iowa.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apiary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Ferguson Supers, etc. *Write at once for a catalog.*

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used.
Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel, stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
 A No. 1.—All sections well filled, except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 1.—All sections well filled, except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
 No. 2.—Three-fourths of the total surface must be filled and sealed.
 No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

PHILADELPHIA.—Comb honey has been arriving quite freely, and lower prices are the result. There seems to be very little Fancy honey in the market. We quote fancy, 15; No. 1, 13@14; amber 12. Extracted white, 7; amber, 6. Beeswax, 26. We are producers of honey - do not handle on commission.

WM. A. SELSER,
 Nov. 21. 10 Vine St., Philadelphia, Pa.

DENVER.—No. 1 comb honey, \$3.00 per case; No. 2, \$2.75. White extracted, 7@8. Beeswax, yellow, 24@25.
 COLORADO HONEY-PRODUCERS' ASS'N.
 Nov. 22. 1440 Market St., Denver, Col.

NEW YORK.—Demand for comb honey is not as brisk as it has been, with the supply about equal to the demand. We quote as follows to-day: Fancy white, 15@16; No. 1, 14@15; No. 2, 12@13; buckwheat, 10@12. Extracted, dull; white clover or basswood, 6@7; light amber, 5½@6; amber and buckwheat, 5@5½. Beeswax, 27@24.
 CHAS. ISRAEL & BROS.,
 Nov. 23. 186-190 Canal St., New York City, N. Y.

CINCINNATI.—There is a good deal of extracted honey offered, and prices if any thing, are a little lower. Fancy white comb honey sells at 15@16; lower grades, 12½@14½. Extracted dark, 5; lighter, 5½@6; fancy, 6½@8.
 C. H. W. WEBER,
 Nov. 23. 2146 Central Ave., Cincinnati, Ohio.

MILWAUKEE.—The supply of honey of all kinds—good, bad, and indifferent, comb and extracted—seems quite sufficient for the demand, and values are ruling easy, especially for the grades below standard grade, and we continue to quote fancy 1-lb. sections, 15@16; A No. 1, 14@15; No. 1 amber or white, 13@14. Extracted white, in lbs., kegs and cans, 8@9; amber, 7@7½. Beeswax, 26@28.
 A. V. BISHOP & CO.,
 Nov. 22. 119 Buffalo St., Milwaukee, Wis.

NEW YORK.—The receipts of comb honey at present are very good. Prices are quite firm at the low quotations below with a good brisk demand. We quote fancy white, 15; No. 1, 13@14; No. 2, 12@13; buckwheat, 10@11. Extracted, fair demand, 5@6½, according to quality.
 FRANCIS H. LUGGOTT & Co.,
 Nov. 21. Franklin and Varick Sts., New York.

CHICAGO.—Honey is selling fairly well at about the prices that have prevailed for the last two months, viz., choice grades white comb honey, 11½@15; good No. 1 white; light amber, 13; dark grades, 10@12. Extracted white, 5½@7; amber, 5¼@5¾, according to quality, flavor, and package. Beeswax, good demand at 28.
 R. A. BERNETT & Co.,
 Nov. 19. 199 South Water St., Chicago, Ill.

ALBANY.—Honey market steady, with a scarcity of buckwheat comb honey. Fancy white comb, 15@16. No. 1, 14@15; amber and buckwheat, 13@14. Extracted white, 7@7½; mixed, 6@6½; dark, 6. Beeswax, 27@29.
 MACDONALD & Co.,
 Nov. 21. 180 Broadway, Albany, N. Y.

BOSTON.—The demand for honey is easing up somewhat, due in part to the holiday season, at which time it is much neglected. Our market at the present time runs as follows: Strictly fancy in cartons, 16; No. 1, 14@15; No. 2, 12½@13. Extracted light amber, 7½@8; amber, 7.
 BLAKE, SCOTT & LEE,
 Nov. 20. 31, 33 Commercial St., Boston, Mass.

SCHENECTADY.—There are no new features to note in our market. Sales are about equal to receipts, and prices unchanged. We quote fancy clover, 16; No. 1, 14@15; No. 2, 13@14; buckwheat, 12@13. Extracted is selling freely at 6@6½ for light, and 5@5½ for dark.
 CHAS. McCULLOCH,
 Nov. 20. 1 Eagle St., Schenectady, N. Y.

WANTED.—Comb honey in any quantity. Please advise what you have to offer.
 EVANS & TURNER,
 Town St., Cor. 1th, Columbus, Ohio

FOR SALE.—Two cars extracted alfalfa and sweet clover honey.
 VOGELER SEED & PRODUCE CO.,
 Salt Lake City, Utah.

FOR SALE.—Extracted honey, basswood or clover, in 100-lb. kegs, at 7c; amber, 6c; buckwheat in kegs, cans, or 30 to 75 lb. wooden pails, 5½c; sample, 6c.
 C. B. HOWARD, Romulus, N. Y.

FOR SALE.—How much am I offered for 500 lbs. of Michigan white clover and basswood comb honey, mostly in plain sections, put up in new 12-lb. 3-row cases, with 3-inch glass, all labeled?
 CHAS. C. CHAMBERLIN, Romeo, Mich.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere what they will have to offer.
 SEAVEY & FLARSHHEIM,
 1318-1321 Union Avenue, Kansas City, Mo.

FOR SALE.—30 to 35 cases heartsease honey, two cans to a case (120 lbs.); new cans; 7 cts. per pound.
 JOHN A. THORNTON, Lima, Ills.

FOR SALE.—Basswood, clover, and sweet clover extracted honey, at 7c, in kegs and cans.
 DR. C. L. PARKER, Station A, R. F. D.,
 Syracuse, N. Y.

FOR SALE.—Extracted honey in 100-lb. kegs. Buckwheat, 5½; mixed, 6; basswood, 7. Send postoffice money-order on Moravia, N. Y., and will ship promptly.
 N. L. STAYENS, Venice, N. Y.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.
 THOS. C. STANLEY & SON, Fairfield, Ill.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.
 WM. MORRIS, Las Animás, Col.

FOR SALE.—Extracted honey, cans and kegs, 7 to 8 cts. per lb. Sample, 5 cts. Comb honey, 13 to 14 cts. Beeswax wanted.
 I. J. STRINGHAM, 105 Park Place, New York

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

GLEANINGS IN BEE CULTURE

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

ILLUSTRATED SEMI-MONTHLY

Published by THE A. I. ROOT CO.
\$1.00 PER YEAR MEDINA, OHIO.

VOL. XXIX.

DEC. 1, 1901.

No. 23.

ARTHUR C. MILLER says that, when he said sudden confinement of a queen works injury, he did not mean that sudden cessation of laying was the trouble, but starvation.

R. C. AIKIN, in *American Bee Journal*, says his average for ten years has been 40 lbs. per colony, and the general average for all except the best bee-keepers in his region has been only half that.

I HARDLY THINK that shouldered staple, p. 890, would suit me as well as a common wire nail for a spacer *between* bars. But for those who find that the common staple used as an end spacer will not stay in place, the shoulder might make all the difference between failure and success.

"SHOOK SWARMS," p. 896. It's a small matter, but it might be as well to use correct English, and call them "shaken swarms." [Ye-s-s-s; but the correct grammatical form does not, to my mind, express the idea. A "shook" swarm indicates to me one that has been jarred or bumped, not "shaken" by a feeble backward and forward motion.—Ed.]

I SECOND the nominations of Messrs. Hill and Rohrig for directors. And in that connection I want to ask that, when my term expires, my friends will do me the kindness to vote for a new man in my place. [Look here, doctor, it is not going to do at all for all the other directors to follow the example of A. I. R. and myself. There ought to be some old timber left on the Board. No, sir; I will nominate you again, see if I don't.—Ed.]

"WHEN A COLONY is made queenless, will the bees, in their haste to rear a successor, select larvae too old to secure the best results?" When that question was up at Buffalo, you and I were absent at a directors' meeting, Mr. Editor, and on now

reading the excellent report in the *American Bee Journal*, I am surprised to find there was not one (Hutchinson was absent with us) to say a good word for the hoary error that teaches that bees can not be trusted to select young larvae.

THE TWO AMERICANS are not agreed as to the profits of bee-keeping, the *American Bee-Keeper* supporting the statement that at least \$5.00 a year for each colony is a conservative estimate. I wish I could be sure of at least \$1.00 a year. [Here again is a case where locality should have something to say. In Marengo, perhaps you might be satisfied with \$1.00 per colony; but in Florida, Texas, Arizona, California, and Colorado, during *some* seasons as much as \$5.00 might be made. I say *some* seasons, because the *year* likewise has something to do with it. —Ed.]

THE QUESTION is whether it is starvation that hurts a queen in the mails or being bumped about when heavy with eggs. Possibly both. It seems reasonable that she will not be so well fed as when surrounded by thousands anxious to feed her. But with the cessation of laying will there be the same need of food? And if the trouble comes from starvation, ought there not to be about the same damage in each case? Instead of that, some queens are fatally injured and others unharmed—seeming to favor the accident theory. [It looks somewhat that way.—Ed.]

THANKS, Stenog, for turning your batteries with such good effect on the use of "swarm" for "colony," page 895. Now please train them on the wrong use of the word "stand." This last error has not yet got so strong a foothold as the first, and will be more easily routed. [There is no use in your laboring with Stenog. He maintains, as does your humble servant, that the word "stand," as we have used it in our columns, is correct enough; and, besides, it avoids the repetition of the word "colony" every time. Then by general acceptance it has crept into all bee-literature to such an extent that I doubt whether we could change it if we tried.—Ed.]

I'VE READ with some care Maeterlinck's "Life of the Bee." Its charming style and exquisite word-painting delighted me, and for some pages I thought, "Here's a book at once thoroughly reliable and delightful." Then an occasional error in its teachings jolted me. Further on, bee-lore became more and more diluted, and many pages in succession without a word about bees were occupied with outside philosophizing that was much of it pessimistic, and some of it left a bad taste in the mouth. One familiar with Root's A B C will learn nothing from this book about bees, and the cutting-out of a third of its pages would leave the book improved. On the whole it is not a book for unqualified commendation.

YOU SAY, Mr. Editor, page 897, that you sometimes leave two stories of brood-combs when putting on supers. I wish you could tell us how the yield compares with that of the colonies that have the one story removed. I tried it pretty thoroughly, and was obliged to give up sorrowfully that I couldn't get as much surplus with two stories as when I took one story away. [If the two colonies are the same in strength, then the one that is contracted down to one story would, of course, have more honey. But if one colony is so strong, so boiling over in bees that it could not be squeezed down into the brood-nest of a single hive-body, then I should expect more honey from that stock than if we tried to squeeze it into one brood-nest and then made it get the loafing or swarming fever. ED.]

FROM FAR-OFF NEW ZEALAND comes a good hive-tool invented by C. E. England. It is of $\frac{3}{8}$ -inch steel, 10 inches long, 2 $\frac{1}{2}$ wide at one end, and continuing that width for 2 $\frac{1}{4}$ inches; then one side is abruptly cut away to 1 $\frac{1}{2}$ in width, tapering from that to the smaller end, which is $\frac{1}{4}$ wide, making it very nice to clean out tin rabbets. Near the small end a notch is cut so as to make a hook to lift out a dummy by the end of the top-bar—a useful thing. The large end is good for raising covers and supers, and for a scraper. [We illustrated a similar instrument of Mr. England on p. 645; but the new tool you describe embodies, as I understand it, later improvements. One like it was sent here; but if I were making a special hive-tool I would have it somewhat different, and Dr. Miller would have his still different. After all, I doubt whether we shall get any thing much better than the screwdriver and putty-knife that every one can get. ED.]

I THINK, Mr. Editor, that hereafter it will be better for you to come to Marengo each time you write footnotes to Straws. Then we could have a better understanding, and not get so much mixed up. We're tangled up about that feeding business, p. 891. I think that you forget that what we were talking about was the advice, p. 862, to use 2 of sugar to 1 of water for *very late* feeding. You are entirely right that a syrup as thin as nectar is the right sort of thing,

but it will not do to feed it *very late*. If fed very late, do you think the bees would either invert or evaporate it? If they will do neither, is it not best at least to do the evaporating for them? I have fed barrels of 5 sugar to 2 water, as already said, and none of it ever turned to sugar; but then I used acid with it. [Yes, I understood that you had reference to late feeding; but our own experience had been so disastrous that I felt like putting in a word of caution. But we did not try the use of acid, and therein might be the difference between our failure and your success.—ED.]

THE BEES with heads in cells getting honey, says A. C. Miller, p. 899, are usually field bees, seldom nurse bees. As that runs directly counter, so far as I know, to all previously expressed authority, don't you think, Arthur, that you ought to furnish a bit of proof? [I had not thought of this before; but my own recollection is that the great majority of the bees that have their heads in the cells have put them there to get away from the smoke poured in by the beekeeper during the operation of opening the hive. In the height of the honey season, perhaps a good portion of such bees would be those just from the field; but if Doolittle's observation is correct (and I believe it is), to the effect that the field bees in the rush of the season give their loads gathered to the nurse bees, and that these in turn deposit them in the cells; then those bees that have their heads in the cells are *not* the field bees. I have observed this: That most of the bees thus engaged appear to be young ones. The burden of proof rests on your distant cousin to show that the contrary is true.—ED.]

Thanks! thanks for the peace that reigns
 Within our land to day;
 Thanks for the harvest, thanks for all things
 For which we're taught to pray.
 Thanks for the hopes the present brings
 Concerning future days;
 Thanks for the firm belief we have
 That thanks are half God's praise.

In cases of great weakness, accompanied with constant thirst, a remedy will be found by pouring the white of an egg into a glass and mixing with it about two teaspoonfuls of liquid honey and a few drops of lemon juice or a little citric acid. As a general rule in the sick-room, food and drinks should be fresh—nothing warmed up, and not too much at a time.—*From the German.*

In Stray Straws Dr. Miller has something to say about Maeterlinck's Life of the Bee. Although I spoke highly of the work

in our issue for Oct. 1, the doctor's criticism is about right, although I do not think "pessimism" is necessarily an evil. The *Irish Bee Journal* gave about three pages of quotation from the book, and praised it highly, and here comes *Le Rucher Belge* giving a translation from it in French. The writer of it himself says no one will learn how to open a hive by reading his book. Bees are his text but not his subject, as I understand it.

On page 862 Mr. R. A. Holley says :

On page 779 you quote the *Pacific Bee Journal* to the effect that I have found 625 cases of foul brood in Ventura Co. This is as wide of the truth as some of the estimates of the California honey crop. I have found, up to date, just 103 cases of foul brood in this county this year.

The fault was not on the part of the journal quoted. The mistake arose from my concluding that the total number of colonies examined was the number affected with foul brood. I beg Mr. Bennett's pardon for causing him to appear so inaccurate. But the revised report by Mr. Holley is certainly bad enough, and should arouse vigorous action among bee-keepers there.

THE IRISH BEE JOURNAL.

This new paper was started last spring, and has all the outward marks of an old journal. It is devoted to the development of apiculture in Ireland, and presents a table of contents that is very creditable. It has 16 pages the size of this. It is the organ of the Irish Bee-keepers' Association, and is edited by J. G. Diggs, M. A., Lough Rynn, Dromod, Ireland. In regard to overstocking the market the editor well says :

Low prices are entirely due to bee-keepers themselves. One correspondent lays the blame on the "women bee keepers, who think that they can never sell their honey quick enough." We do not know whether the complaint lies properly in that quarter. But certain it is that the prices are made by the sellers, and that the drop last month from 7s 6d. to 4s. was caused by the sudden rushing of honey on to the market in very large quantities. In the first week in August one large firm in Dublin was looking everywhere for sections at 7s 6d per dozen. Within five days glazed sections were going a-begging at 5s., and there is no knowing how far the prices may fall if sellers throw discretion to the winds in this fashion. Honey will keep, and it should be kept until the price is raised again to a fair level. £14,000 worth of foreign honey was imported into England in July, and sections were selling in Scotland last month at 1s. 6d. each. The bee-men who poured their honey into Dublin at 5d per lb. got all that they deserved, and should not complain.

AMERICAN BEE JOURNAL.

Mr. York has given us a treat in his issue for Nov. 21. Chicago is a suburb of Marengo, where Dr. C. C. Miller lives, and Bro. York has been out there on the trolley to see the doctor and to get some permanent impressions of things around the doctor's home. And he succeeded. First we have a view of the genial doctor himself with an immense hat on, looking very "summery." Then follows a picture of his residence; a surreyful of John Wilson's children; a picture of Miss Emma Wilson, just ready to

smoke the bees; a picture showing the doctor at his typewriter, thrashing out Straws, perhaps; and a number of other half-tones equally interesting. Few pictures have ever interested me more than these; and they come in very opportunely with Prof. Cook's words in the same issue, where he says: "Our American homes could not exist outside of America. Britain is the only other country that comes within telephone call of us in the matter of honey homes; and Britannia pales as poverty crowds comfort, health, and even life, from so many of Britain's households. Think! any boy, the poorest, can safely aspire to his own beautiful home in this grand American country."

These inspiring articles of Prof. Cook on the domestic life of the nation deserve universal attention. Some might disagree with him in his rigid rule of never contracting debt, as it is often a great benefit to both parties to lend and borrow; but by a general application of his rule the world would be far better off. He says our national debt is \$14 a head; Russia, \$24; England, \$72; France, \$150. These foreign countries are sinking deeper and deeper in the mire, while our debt is so small as not to be felt, is rapidly disappearing, and can be paid by 1920.

WINTERING INDOORS AND OUT.

Why a Combination of the Two Methods is Advisable; Feeding and Feeders; Heddon Hives and their Advantages for Feeding Back; Feeding Back on Foundation.

BY J. E. HAND.

"Good morning, friend Hand. I see you are busy among the bees as usual."

"Yes, I am taking advantage of these fine days to prepare my bees for their winter quarters."

"Do you practice cellar wintering, or packing on the summer stands?"

"Outdoor wintering in packed hives has my preference; but there are some advantages in cellar wintering, so I combine the two methods. I examine each colony carefully as to bees and stores. Those that are heavy in stores and strong in bees are packed in chaff or other material on the summer stand. Those that are a little light in stores, or are not so well supplied with bees, are carried into the cellar about Nov. 20, usually. These are good average colonies, but are not quite up to the standard for outdoor wintering, and will do better in a good cellar. Since adopting this plan my losses in wintering have been very much lessened."

"But would it not be better to winter them all in the cellar? As they consume so much less honey, would it not be a great saving in stores?"

"It is true that there would be a considerable saving in stores, other things being equal; but some winters are favorable for cellar wintering, while others are much better suited to outdoor wintering; and so a combination of the two methods is the safest plan."

"Would not location make a difference in this matter of wintering?"

"Possibly. But these rules will hold good wherever it is at all desirable to winter in the cellar."

"Do you prefer permanently packed hives or winter cases?"

"You will notice that most of my bees are in Heddon hives, and therefore can not well be permanently packed. For this and other reasons I prefer some kind of outside case for each hive wintered outdoors, with 2 inches of packing on the sides, and 5 or 6 inches on the top of the hive. The cover can be left on, or the hive may be covered with pieces of heavy cloth or carpet, with a good tight cover over the whole case. I know of nothing better for this purpose than the winter case made by the Root Co."

"But what are these boxes with slat partitions—something new?"

"Oh, no! on the contrary, they are older than the movable-frame hive. Those are Quinby feeders. I got the idea from an illustration in Quinby's *Mysteries of Bee-keeping Explained*, published in 1858. I do not know whether they are mentioned in the revised edition or not. You will notice it is a bottom feeder, and was made for feeding bees in box hives. The hive rests square on the feeder, which is 2 inches deep, the same width as the hive, and 3 inches longer. This space is at the back of the hive, and is to fill the feeder. It is covered with a little board. The feed flows through a wire screen into 10 or 12 little troughs, or partitions, $\frac{5}{8}$ wide by 2 inches deep the length of the hive, excepting about an inch in front for the bees to come up. The inside of the feeder is lined with tin to keep it from leaking. There is no feeder illustrated in any of the catalogs that can approach this one. It is especially adapted to feeding back."

"What about those other feeders with the glass jar?"

"Oh! that is my own invention. Like the other it is a bottom feeder, and it is at the back end of the hive. It is on the 'atmospheric' principle. The feed flows through a hole in the top of the inverted glass jar through a wire screen into a trough which extends the width of the hive. The bees have access to the feeder by removing the cleat from the back end of the bottom-board. The trough is always full. As long as there is any in the jar, the bees can not pass beyond the trough, and are not in the least disturbed in removing and refilling the feeder; and the feed is in a lit-

tle trough right under their noses, and will be taken up very rapidly. I mention these two feeders at length because they have been the means of solving the problem of feeding back and reducing it to a science. No top feeder is of any account for feeding back. You may paste that in your hat."

"Do you find it profitable to feed back extracted honey to have it stored in the sections?"

"Yes, with the right kind of hive and appliances, and considering the difference in price, as well as the greater demand for comb honey, I find it very profitable. Note what E. R. Root says on page 828, about the demand for comb and extracted honey. I had noticed that, and had about concluded to produce comb honey next year."

"What do you think of Mr. Doolittle's experience in feeding back, as given in the Aug. 1st GLEANINGS?"

"I am not at all surprised at the results of his experiments. I have had about the same experience, and so will any one else who tries to feed back with a frame as deep as the one he uses. However, I consider his frame about as well adapted to feeding back as it is to producing comb honey when gathered from the fields."

"Then you consider that a hive that is well suited to the production of comb honey is just as well suited to feeding back?"

"Yes, that is my experience exactly. Mr. Doolittle fed his bees 50 lbs. of honey, and they only just got to building comb nicely, and then they struck and refused to do any thing, after which he gave up the whole business in disgust, as almost every one else does who tries it."

"What do you think became of that 50 lbs. of honey?"

"Well, I will tell you what I think became of it. You will notice he says he fed them about 15 lbs. each, which they carried off during the day. At that rate it would take only a little over three days to carry off the 50 lbs. They were not building any comb; and as it takes three or four days of feeding to start comb-building, there could be no place to store the feed except in the brood-chamber; and as his frame is $11\frac{1}{4}$ inches deep, there was plenty of room for it, or the queen might have been a poor one, and the bees simply crowded her out and filled up the brood-chamber. I have often found this the cause of a failure in feeding back. A good queen will compel the bees to move the honey out and give her room, while a poor one will be crowded out completely, and the brood-chamber crammed full of honey, after which the bees will work about as Mr. Doolittle says his did."

"Do your bees ever refuse to work in the feeders?"

"Well, not so bad as that; but there is a great difference in the working qualities of bees. Some will build comb faster, and cap their honey whiter. I keep a pedigree of these bees, and use them for feeding back. They are also likely to do better field work. I had three colonies this year

out of fifty that I could not make do satisfactory work. Two of them were poor comb-builders, and the other capped the honey so badly that it was not fit to sell. Those queens will lose their heads next spring."

"How much do you find it profitable to feed at a time?"

"I give them all they will take up in 12 hours if they are building comb; if not, I feed about a quart per day until comb-building is started nicely. My best colonies would take about 2 qts. every 12 hours."

"How long would they keep this up?"

"They kept it up this year from Aug. 1 to Sept. 25, when the weather became too cool for comb-building."

"What kind of hive do you consider the best suited to feeding back?"

"There is only one kind of hive that I know any thing about that is at all suited to feeding back. It must have a very shallow frame, and must be capable of contraction horizontally so that the brood will be spread out evenly under the super. The Heddon is the only one that will do it."

"How deep is the frame in the hive you use?"

"My frame is $4\frac{1}{4} \times 17$ inches, comb surface, and 8 of these combs make a section of my brood-chamber as I use it for feeding back. There is a queen-excluding honey-board between the brood-chamber and super, just as in hiving swarms."

"But will not such contraction of the brood-chamber, combined with heavy feeding, induce swarming?"

"No, not to amount to any thing. I wish it would, for then they would build comb faster and cap the honey whiter. I had only two such swarms this year."

"Have you ever tried producing comb honey from foundation by this feeding-back process?"

"Yes, I have produced over 2000 lbs. this year of extra-fancy comb honey from foundation by this system. I can assure you it is no mere theory with me, and there is nothing I like better."

"Well, friend H., how is it that you succeed in getting your bees to accept foundation when others report nothing but failure?"

"Well, friend Charles, it is as I told you before—it all depends on using the right kind of appliances. There are several different kinds and makes of foundation, and it may be possible that they have not tried them all yet, and this may account for it in a measure. If you will excuse me, it is getting nearly time for the local, and I have to ship two crates of honey. Come over again and I will tell you all about how it is done, as well as I can."

"Thank you, friend H. I am very much interested in this subject, and I assure you I shall not fail to avail myself of this privilege."

[Mr. Hand has promised to write a series of articles telling of his experience along

various lines, and this is the first of the series. He uses the conversational method, as that is very easy to follow, and, besides, it has the further advantage that the question brings out in every case the reason for using this or that method. Mr. Hand, it seems, has made a success of feeding back on foundation. This is going further than most of us have practiced, and we await with interest what he will have to say on this subject next time.—ED.]

THE VENTILATION OF BEE-CELLARS.

The Construction of the Bingham Bee-cellar.

BY E. K. ROOT.

As explained elsewhere in this issue, we have at our basswood yard a 12×20 bee-cellar, built on the lines of the Bingham repository, which we described early last year. As some will probably have forgotten how this was built, I present a cross-sectional view, giving its general construction. As indicated in the diagram, the cellar is 16 feet square at the top, and 12 at

the bottom. The sides are sloping (to prevent caving in), and lined with cement. A double floor, packed with sawdust, covers it, and over this is a gable roof. Through this floor there is a trap-door, and along about the center a 16-inch ventilating-flue connects through the top of the cellar to the roof in the upper structure. Mr. Bingham's idea seemed to be that the bees need a great deal of ventilation. In the drawing the ventilator is shown to be only about 3 inches in diameter; but, as he explains, this was not found to be large enough, and was subsequently replaced by the larger one.

Our cellar at the out-yard was built on the same general plan, with the exception that the sides are less sloping, and are lined with a single thickness of hard brick laid in cement—that is, the sides are lined with a 4-inch wall. In our clay soil we were afraid to trust the cement lining; but to strengthen the wall further, the sides and ends were made slanting, so that the top of the cellar is 8 inches wider and longer than the bottom.

Instead of constructing a plain cheap gable roof we moved a building, which was out of use, over this cellar, put in it a double floor packed with sawdust 10 in. thick,

this floor serving as a ceiling to the room below. The building had been constructed, and bees put into the cellar, before I happened to think that no ventilator had been provided; then remembering that some of the prominent advocates of indoor ventilation had said that no ventilation, or but very little, was required, I began to wonder whether any was really needed. I accordingly wrote to Mr. Doolittle (a no-ventilator man), who has used successfully for a number of years a bee-cellar built on a side hill, having walls somewhere about 20 inches thick. I explained the construction of our cellar, and asked him if, in his opinion, a ventilator would be needed. This is his reply:

Mr. E. R. Root.—I have made no provision for ventilation of my underground bee-cellar for the past 15 years. It is 21x7, and 7 feet deep, and I winter from 60 to 85 colonies in it each winter with good success. The walls are of stone mason work, 16 inches thick, and the top covered with 4-inch-thick flag-stone, with 3 feet of dry earth over this. But the joints between the flag-stones are so open that a little dirt sometimes sifts through. Then, of course, a little air gets in through the four doors used for the entrance. I suppose you will have an entrance also with doors. If so, the only question would be whether your double floor, packed with sawdust, will give less ventilation than my flag-stones. I confess to not being able to answer that question satisfactorily in my own mind, as dry dirt is quite porous, and the cracks between the flag-stones are large enough to stick your finger through in some places.

On one still, damp, misty time, holding on a week, I went into my cellar, and the air was so impure that the candle would not burn; and, when nicely burning between the entrance doors, it would fade away and soon go out on going into the cellar. It seemed a little hard for me to breathe, but the bees came out all right. This was the only time but that the air has seemed pure. At the time the candle would not burn there was four feet of wet snow all over the whole ground, roof and all. Just what advice to give you I hardly know; but if your cellar were mine I think I would risk it without a ventilator; but I do not feel like advising you to do so. Perhaps my experience as given above may help you a little in deciding what to do. I know nothing personally of clamps.

Borodino, N. Y.

G. M. DOOLITTLE.

On receiving this I sent copies of it to Dr. Miller and Mr. Bingham. Concerning this matter, Dr. Miller writes:

Dear Ernest.—I've studied over the problem as to your cellar quite a little, but without feeling competent to advise. With the right kind of soil and covering I think there would be no need of special attention to ventilation. But if conditions were not all just right the results might be disastrous. Perhaps the sure thing to do would be to have the shaft put in and closed up just as if no shaft were there. If all went well it could be left thus all winter, and you would practically have no shaft. But if an inspection every two or three weeks should show that the danger-line was reached, then you could open up the ventilator. The point is that, with the ventilator, you can do either way, and without it you are helpless if it should be needed. The temperature and the number of colonies have something to do in the case.

Marengo, Ill.

C. C. MILLER.

Following is the letter from Mr. Bingham:

Mr. Root.—Your esteemed letter is at hand, also Doolittle's. The door on the level of the floor of his cellar, and the difference shown by his candle, would demonstrate that the carbonic laden air found a place where it could be mixed with pure air at the door. My experiments with a three-inch tin conductor-pipe opening into the room over the cellar demonstrated that under such conditions, it would not be safe to enter such a cellar or any other place where a lamp would go out. If there was no danger one would like to be able to see his bees now and then.

If a 16-inch-square flue does not reduce the tempera-

ture below 32° (and mine did not as low as that last winter), it would seem needless to endanger oneself, even if the bees were not injured by an air-tight cellar. It may safely be borne in mind that a cellar entered from the top would not have as reasonable opportunity to mix its vitiated air as one with an entrance on a bottom level.

My bees were taken into my cellar yesterday afternoon, Nov. 15. The temperature is about 35°, flue and doors above them open. The upper room has two large ventilators, one at each end (darkened partial y, and located at the point of the gable).

If the temperature should fall below 30° my doors will be closed. At 32 to 30° the light does not seem to cause the bees to fly out. It would be a nice temperature outside. Your cellar being new may need more constant ventilation than if older. My ventilating flue stops on the ceiling-floor. Said flue is supported on 6-inch joists on the lower side of said joists, covering a space about 4 feet square. Thick building-paper, two thicknesses, is secured by cleats. This leaves two 4 feet by 6 inch entrances as a supply for the flue, and no light is let in. The top of the flue has a cap over it to keep out dirt, rags, and rain.

The greatest enemy to wintering out or in doors is dampness, either in the air or hives. The reason why your bees under the machine-shop were so quiet was because so dry with sweet good air.

I intended to put in another duplicate flue before my bees went into the cellar, but was so busy I did not. If I were to build another cellar I would double the size and increase the height of my flue ventilation all I could.

It is the upper air in a cellar that needs removal. The steam and dampness are there while the lower stratum of air remains ready to supply the flue-draft, which is proportionally greater according to its immense elevation. This is not the sub-ventilation idea, you see. The lower stratum is all right if sufficient y mixed with air that goes down the flue from an altitude of 20 or more feet. The flue must not reach below the ceiling, or be away from the center of the cellar. A flue reaching to the bottom of the cellar showed a temperature at its lower end nearly equal to that outside, while the general air of the cellar remained at 40 to 45° a few feet away from the inlet, and the air was stuffy and damp. The large tall flue enables the cellar to be kept dry and cool without admitting light. This is valuable when bees become uneasy from any cause, most noticeably in the spring. Mr D., I think, has been in the habit of opening his doors at night in spring. The large tall flue from the ceiling would have prevented that. That others have found y air in cellars, and not reported, shows the value of bee-journals, all of which placed my lantern experience before the bee-keepers at once as soon as received.

Farwell Mich.

T. F. BINGHAM.

P. S.—Nov. 18.—Clear, 25° at 6 A.M.; air in cellar, doors open, betters it, and the room above, 35°; room above cellar, 32°; doors all around open all day the 17th; cellar at 40°; bees hibernating peacefully, as if outdoors; no effort to fly to the open doors. T. F. B.

It appears from these letters that much depends on special conditions. Taking the advice of Dr. Miller I have had a ventilator put in. But this was made before the receipt of the letter from Mr. Bingham, and is only 6 inches square instead of 16; and I am now wondering whether I have made it large enough. If I had it to do over I would make it fully 16 inches square as described by Mr. Bingham, and will do so later if the bees become uneasy during winter.

But the special feature of the Bingham cellar is that it is virtually a cistern—that is, the walls of the cellar proper are all under ground, without any part of them projecting to the outside air to get through, thus affecting the temperature inside.

Our experience in wintering bees in the machine-shop cellar last winter was most favorable; indeed, I never heard or read of a case where there were so few dead bees as we had on our cellar bottom. As Mr. Bingham points out, it was absolutely dry, and then it received a great amount of ven-

tilation from the larger cellar surrounding the wintering-room; and, as I have before stated, the larger cellar contained several carloads of potatoes, and it was necessary to keep the temperature down for these as low as possible. During warm weather the cellar was kept closed to keep out the warm air. In cold weather it was ventilated, and that quite often. Perfect ventilation, and an entire absence of moisture or dampness, resulted in the phenomenally good wintering of all the bees. This year we have in that same cellar 250 colonies instead of 40, and about the same number outdoors. These are in addition to 100 colonies in the Bingham cellar at our outyard.

It is my purpose to make repeated observations to determine the effect of ventilation or no ventilation, and report through these columns.

THE BEE IN LAW.

Finding Bee-trees; Early Code; Licensees; Recovery of Reclaimed Bees.—Article 4.

BY R. D. FISHER.

Having laid down the general rules that govern property in bees, their identity, transportation and larceny thereof, it will be our purpose in this article to give the result of the different actions at law growing out of the finding of "bee-trees." In primeval days "bee-hunting" and "honey-gathering" were both profitable and fascinating pastimes. Even in this day, old bee-hunters can not refrain from following a "course" when it points to the forest. As evidence of this, a bee-tree was cut recently on the Young-farm forest, five miles west of Kokomo, Ind., which beats all records for size and yield. The "gum" in which the honey was stored was 18 inches in diameter and 11 feet in length. Pieces of solid comb 15 inches wide and 10 feet long were taken out. There were nearly two barrels of choice honey, weighing nearly 600 lbs. George Harness, who helped cut the tree, is 84 years old, and says he has hunted bee-trees all over the West for 70 years, but declares that this tree beats all former records.

There was a sort of code among bee-hunters in the earlier days of this country, and it is said to have been generally observed. It was to the effect that, when a bee-tree was located and marked with the initials of the finder, his rights were *prima facie*, and zealously observed. But this code did not hold good in law, especially against those holding an interest in the land. "If a person finds a bee-tree containing honey, or a hive of bees on another's land, and marks it with his initials, he does not reclaim the bees and vest the exclusive property of bees or honey in himself, as against one of the heirs having an interest in the land; nor does he acquire the right to bring an action of trespass against the heir for cutting down the tree and carrying away the bees and

honey," says the New York Supreme Court in the case of Gillett v. Mason, 7 Johns, N. Y., 16. An early and noted case is reported in 1 (Root) Conn., 209. Goodwin sued Merrill for cutting down a tree in the forest, that had a swarm of bees in it, and taking the honey which he (Goodwin) had previously discovered. Merrill plead that said bees were a swarm from his hive; that he had frequently "lined" them to near said tree, and that said bees were his property. The plaintiff replied that he found them wild in the woods, and had a good right to take them. The trial court gave the plaintiff judgment of 30 shillings damage. The Supreme Court reversed this judgment, and said: "A man's finding bees in a tree standing upon another man's land gives him no right, either to the tree or bees; and a swarm of bees going from a hive, if they can be followed and known, are not lost to the owner, but may be reclaimed."

As early as 1804 the New Hampshire Supreme Court held that one who finds a swarm of bees in a tree on another's land, marks the tree with his initials, and notifies the land-owner, can not maintain trover against the land-owner for the bees and honey which he obtained and converted to his own use by felling the tree. Fisher & Parmlee *versus* Smith. Smith's New Hampshire Report, page 60.

LICENSE; POSSESSION.

Where one discovers bees in a tree, obtains a license from the owner of the soil to take them, and thereupon marks the tree with his own initials, he gains no property till he takes possession; nor can he maintain trespass against a third person who cuts the tree and takes possession of them on a subsequent license from the owner of the soil. The two licensees stand on an equal footing; and he who first takes possession becomes the owner.—Ferguson 75. Miller, 1 Cow. (New York), 243.

This case has been commented on adversely, and critics say it is bad law. The better law on this point is promulgated by the Vermont Supreme Court in Adams 75. Burton, 43 Vermont, 36, where it is held that one who has obtained a tacit consent from the owner of the soil to cut down a bee-tree thereon, and get the honey, has, while in the act of cutting down the tree, a superior right over a third person to whom the owner has given subsequent consent, but without revoking the former's authority. The court said: "These parties stand, as between themselves and as respects the legal principles applicable to the case, in precisely the same position as though neither had any authority from the owner of the tree, and both were trespassers upon his rights, or as though there were no individual owner of the tree. How, then, would the case stand? No principle is better settled than that a person in possession of property can maintain trespass against any one who interferes with such possession who can not show a better right or title."

The law of the bee-trade, so far as discovery is concerned, seems to be in an unsatisfactory state as to the relative rights of trespassers. The relative rights of parties, both of whom acknowledge the superior right of the owner of the soil, seem never to have been precisely described.

RECLAIMED BEES MAY BE RECOVERED FROM TREE.

We have treated bees found in trees as wild and unreclaimed; but a different rule of law applies to bees that have been reclaimed and once hived. If bees temporarily escape from the hive of their owner who keeps them in sight, and marks the tree into which they enter, and is otherwise able to identify them, they belong to him and not to the owner of the soil. In such a case the property draws after it possession sufficient to enable the owner of the bees to maintain trespass and recover damages against a third person who fells the tree, destroys the bees, and takes the honey, notwithstanding such owner himself is liable to trespass for entering on the land of another for a similar purpose without authority. The right of ownership continues; and, though he can not pursue and take them without being liable for trespass, still this difficulty does not operate as an abandonment of the bees to their liberty by nature. Hence the dictum that "the owner of the soil is entitled to the tree and all within it" is true only so far as respects an unreclaimed swarm.

We have endeavored, so far as case law is concerned, to define the rights of the finder of bees and a person interested in the soil, and between persons each claiming to be the finder, and between licensees having authority to enter the land of another to take bees and honey.

In addition to authorities already cited, see *Idol v. Jones*, 2 Dev. (N. Car.), L., 162; *Goff v. Kiltz*, 15 Wend. (N. Y.), 550; *Wallis v. Mease*, 3 Brim. (Pa.), 546.

HEREDITY AND THE VARIATION IN ANIMALS.

The Fundamental Rule of Uniformity.

BY RIP VAN WINKLE.

Referring to a Straw, in your Oct. 15th edition, asking a question, "What is a tested queen?" I will take the risk of your quoting Pope's celebrated line, "Fools rush in where angels fear to tread," and make a suggestion if you will permit; and with all due deference to Dr. Miller, for I may always say of him on bee-keeping, as James Russell Lowell does of the "Bosting" people, "Wat they don't know ain't hardly wuth the knowin'." I do not see much difficulty in determining the matter if we go by the fundamental rule of *uniformity* in her workers. Any queen which produces all uniformly marked workers—all three-banded or all five-banded—I should pronounce pure Italian. Mr. Darwin, in his "Plants and

Animals under Domestication," has shown by abundant evidence that the tendency of all crosses is for offspring to revert back to some previous ancestor, near or remote. This, of course, is among vertebrates; for we have few if any well-defined experiments as to insects. We know that the cross between a black drone and Italian queen produces workers of all three degrees; viz., of pure black, one band; two bands and three bands, from the same queen. I should expect to find the rule hold good among five-banded bees, which I regard as only a recent "sport" from the Italian, *not* a distinct variety. A queen of the five-banded stock may throw a variety of *bands* in her workers, and still be pure or purely mated; but if she throws a black worker, or one with less than the three normal *Italian bands*, then I would say she was impurely mated.

Heredity, the variation of animals under domestication, the laws of breeding, are very interesting studies, and all the more from being intensely intricate, as is instanced by another fact bearing on this same subject, mentioned by Dr. M. and yourself on the next page of Straws, 814, about the influence, or, as Mr. Darwin would call it, the "prepotency," of the male in the matter of the negro and white woman, and black and white fowls. These are not isolated instances. There are many such on record, and it is extremely difficult to say what the extent of such influence is.

Prof. Cook, in his "Manual of the Apiculture," second edition, 1878, page 89, under the general heading of "Influence of the Drone," is inclined to think, as Dr. Miller does, that the influence is not sufficient to vitiate the blood of the offspring in mammals, but only a temporary one. It might add to our knowledge if some one would breed from one of these marked offspring and note the result; and I would say the point to be ascertained would be whether such influence produced not merely change of color, but any well-defined change in the program from the known characteristics of the brood, which would be of most importance to the breeder. There is a case on record of a thoroughbred English mare being bred to a jack, and having a mule colt; and, though bred to thoroughbreds afterward, her progeny showed mule markings. But it is not stated that their other thoroughbred qualities were changed, which, I repeat, would be the practical question for the breeder.

Just how far the question of parthenogenesis in bees, discovered by Dzierzon, would modify the fundamental laws of heredity which we have learned about other domestic animals, remains to be ascertained; for upon this subject, to quote the words of Darwin, "Our ignorance is profound."

[There may be something in what you say, to the effect that queens of the five-banded stock would, if they had met a black drone or a hybrid, show the fact in

their progeny, in accordance with the "fundamental rule of uniformity" in pure stock; but I never yet have seen *all* the bees of so-called five-banded queens show uniformly five yellow bands. The best average for one queen is, perhaps, 50 per cent with five bands; 25 per cent with four, and the rest with three. As a rule we do well to get 25 per cent five-banded workers, and the rest three and four banded, all from the same queen. I never yet have seen a uniform number of bands from any one queen of the extra-yellow stock; therefore I have my doubts whether the "rule of fundamental uniformity" would apply in this case, although it might do so.—Ed.]

BEE-KEEPING IN MONTSERRAT.

BY A. J. JORDAN, AGRICULTURAL INSTRUCTOR.

Montserrat is a small island 16° 45' N., 62° 7' W., 8 miles broad and 12 miles long, forming one link in the chain of beautiful islands known as the Lesser Antilles. The bare statement of the length and breadth of the island would give the bee-keepers used to a flat country no idea of the possibilities of a place like this. There is not an acre of level land in the whole island. As in the case of Dominica and St. Kitts, Montserrat is of volcanic origin, and was, in ages past, thrown up into the most fantastic peaks. The heavy rains, too, have lent themselves to the cutting-up of the surface of the land. As the water pours down on the steep slopes of the mountain-sides it gathers together and forms torrents which cut deep chasms, called here "guts," in the surface of the earth. Many of the trees and plants growing at or near the top of the guts send down their long aerial roots to the bottom of the gut; and upon these many of the climbing plants (iponeas, legumes, etc.), which obtain sufficient soil to root in at the bottom, climb upward. The mountain-sides are like a greenhouse stage, rising in such a way as to enable the plants to grow far more thickly than they could possibly do on the level.

Bee-keeping has been carried on for many years in a rough-and-ready way, the bees being kept in boxes and barrels, and the combs containing young bees as well as honey being periodically cut out. The comb, when cut, was, as a rule, put into a coarse cloth, and squeezed; and you may guess that the honey obtained was not of the best quality, and was useless but for consumption among the people themselves.

Some two or three years ago Mr. I. T. Allen commenced to keep bees in the modern hives, and a little more than a year ago Mr. E. F. Dyett obtained two ten-frame hives; but the actual beginning of the present bee-keeping stimulus was the sending, by the Imperial Commissioner of Agriculture for the West Indies, of Mr. W. K. Morrison to lecture here on bee-keeping. Since then

several people have got hives, and are experimenting in a small way. Three colonies of black bees were obtained by the Agricultural Department, in barrels, from one of the people here, and were transferred to ten-frame hives. Nine colonies have since been obtained from these three, making a total of twelve.

The two Italian queens you sent are working well. It is interesting to see how the bees from these queens dash in and out of the hives, very differently from the deliberate movements of the Creole black bee.

The three difficulties the bee-keepers have to overcome here are bullfrogs, moth, and lizards. The first is, I suppose, peculiar only to this place. Bee-keeping with the hives on the ground would be a failure here, for the frogs would simply lick up the bees as fast as they could come home. We keep the hives two feet from the ground.

The moth has given a little trouble in slack time—that is, September, March, April, and May; but they do not trouble strong colonies.

Nothing as yet has been discovered to prevent the lizards from attacking the bees; but as about three bees satisfy a lizard the damage done is not great.

I see by GLEANINGS that "covers" are still under discussion. I may say those sent here are a failure in this climate. No matter what is done, water finds its way to the combs.

WIRED FRAMES WITHOUT FOUNDATION.

Are they Practicable? Use of Woolfen Stays in Place of Wire; an Unwelcome Fact about Alfalfa-growing.

BY O. R. WEAVER.

I wish to secure the advantages of wired combs without the expense of using full sheets of foundation. I am not able to stand the expense. Can I have combs built from starters on a wired frame? I never tried it, but don't think I can have them built that way.

I have another plan that I never heard of any one using, so I wish to ask your idea of it. This is my plan: Take strips of $\frac{1}{8} \times \frac{1}{4}$ -inch stuff; cut them off $\frac{1}{16}$ inch longer than the distance from the top of the bottom-bar to the bottom of the sawed grooves on the under side of the top-bar. Cut a notch $\frac{3}{16}$ deep in top of the bottom-bar; spring the bottom-bar down a little, and slip the strip in, putting one end in the groove where foundation goes. First, one would have to cut the starters so they would go in between the strips, and strips and end-bars of frames. Now, would the bees cover the strips with comb so the comb would be stronger? I am up 6500 ft. high; winters are cold, and snow gets deep. Don't you think double-walled hives would give better results?

While you are writing so much about alfalfa, I think it would be advisable to sound

a word of warning. It is this: The experiment stations are advising the cutting of alfalfa when from 10 to 25 per cent in bloom, and the farmers are beginning to put it into practice. At this place it used to be two crops; now they are beginning to cut three. At Aztec, N. M., they used to cut three; now some are cutting four, and more will do so in a few years. When cut three times here and four at Aztec it is no use for bees. I believe that, in a few years, it will do bees no good except where kept for seed.

How many strips should I use in a standard frame to make it good and strong, so it will stand the extractor?

Bayfield, Col., Oct. 12.

[It is perfectly feasible to use wired frames without foundation, providing one understands the art of getting *worker* combs built. The presence of the wires interferes little if any with such work; but when starters of foundation are used, the bees will draw out the starters, extend them down over the wires, and the work is almost as perfect (providing one knows how to get all worker comb) as when full sheets are used. But the majority of beekeepers who have tested the matter agree, I believe, that, as a rule, and under conditions as they ordinarily exist, it is better to use full sheets of foundation on wires, and mainly because of the difficulty of getting all worker comb. Your wooden "stays" might answer, but they would be too large and clumsy, and the tendency would be for the bees to build ridges, or what we call "dead furrows," along the line of each stick. Better far better use wire.

With regard to alfalfa-growing, I fear there is too much truth in what you say. If the ranchmen keep on in this way, then the great alfalfa-fields, where hay is the object, will, as time goes on, be no more the paradise of the bee-keeper. All along the line of travels I heard how the ranchmen were, year after year, cutting their alfalfa earlier and earlier, until it seems now that, just as soon as it comes into bloom, they must start their mowers, and that, too, when bees are just beginning to roll in the honey by the earload. Ed.]

G. H. H., Maine. Yes, excessive smoking does have a bad effect on bees, as I believe it has a tendency to shorten their lives even if it does not kill them on the spot. Beginners are apt to smoke their bees to excess. Very often two little whiffs of smoke are sufficient. If the bees are very cross, and are inclined to rob, a little more smoke to bring the colony under control may be necessary. Too much smoke has a tendency to cause the bees to gorge themselves, and even uncap comb honey. This gorging is wasteful of honey, and the uncapping spoils the appearance of the face of the honey.

STARTING IN BEE-KEEPING.

"Good morning, Mr. Doolittle. I am about to make a start in the bee business. I think of buying 50 colonies of Mr. Smith, and I came over to see what I could find out in the matter which would be helpful to me."

"What do you have to pay Mr. Smith for bees?"

"He said he would let me have 50 colonies this fall, hives and all, for \$200, or he would let me have them next May for \$250, as there is some risk to run in wintering bees. Which would you prefer to do—buy them this fall or next May?"

"How many colonies has Mr. Smith?"

"He has about 250."

"If Mr. Smith will give you your choice out of the 250 colonies next spring, I should prefer to wait till next May, and pay the \$250 extra. Otherwise I would take them now."

"Why?"

"Because, in the former case Mr. Smith practically insures the bees against all loss in wintering; while if you do not have your pick he agrees to give you only so many colonies; and you might not have as good an average if you took them as they come as you would have did you take all good colonies this fall. But why do you wish to buy so many colonies?"

"So as to have a good start, and a sufficient number to pay me for 'dabbling' in bees at all."

"I hardly think this the part of wisdom. It seems to me that 50 colonies of bees would be about twelve times as many as a beginner should buy."

"Why?"

"Have you had any experience with bees?"

"No—nothing more than that I have been at Mr. Smith's two or three times, and have read about the profit there was in bees, out of a paper I picked up."

"As I thought. You are a beginner, and the beginner should guard against going recklessly into bee-keeping by putting a lot of money into a business he knows nothing of. It is this getting crazy over a business which looks to be a good thing, but with which we are not acquainted, and putting a lot of our hard-earned money in it, expecting to make a fortune, which ruins so many. To be successful in any thing, a man must 'grow up' into it, as it were, by years of patient toil and study, till he becomes master of the business, when, in 99 cases out of 100, he will succeed."

"When and how did you begin?"

"During the winter of 1868 I became interested in bees by reading a book on the subject, which I found in the house; and,

as father had kept bees several years before, I knew something about them, but not after the improved fashion, as father kept his bees in box hives. Next I subscribed for the *American Bee Journal*, read Quinby's and Langstroth's books, and in March bought two colonies of bees, and the hives which I needed for two years, at a cost of \$30 for the whole."

"How did you succeed?"

"There being a poor season in 1869 I had but one swarm from the two colonies purchased, and had to feed \$5 worth of sugar to get the three through the winter of 1869."

"Whew! If I had such success as that with my 50 I should wish I had never gone into the business, as that would add \$125 to the first cost of commencing. But did you do no better the next year?"

"During 1870 I received enough from the bees to buy all the fixtures I wished for 1871, and a little to help on my other expenses on the farm, for farming was my main business at that time; and the first \$35 was all I ever paid out for the bees but what they brought me in; for I resolved, after this first \$35, I would lay out no more money on them than they brought in, believing that, if I could not make 3 colonies pay, I could not 300. But had I had 75 colonies at that time, with little or no experience, the loss of throwing the business up would have been greater by many times than \$35."

"But it seems you did not throw it up."

"No. During 1871 I got enough from the bees to a little more than pay expenses, besides a lot of experience, which was of more value to me during the years to come than many dollars would have been without the experience; for in the fall of 1872 I found that I had an average yield of 80 pounds of comb honey from each colony in the spring, which was sold so as to give me \$559, free of all expense incurred by the bees."

"Pretty good pay, was it not?"

"Well, yes. But you will see that this was the first I had really gotten, so it must be spread out so as to cover a period of four years. At this time I did not have as many bees as you propose buying to start with. My opinion is that, had I bought 50 colonies to start with, I should have turned from the business in disgust, with a loss of several hundred dollars, and that the bee-world would have been spared the scribbling done over Doolittle's name for the past 30 years."

"But you succeeded?"

"Yes. But before we go further I wish to tell you about something which pleased me during 1872. I bought an extractor, and, being determined to give the bees the care they needed, and knowing that the time the bees needed the most attention came in haying time, I hired a man to take my place in the hay-field. It so happened that he commenced work on the day bass-wood commenced to bloom. Previously I had hived a prime swarm, and concluded to devote them to extracted honey. The man worked 16 days at \$1.75 a day, and I

extracted honey enough from that swarm during those 16 days to pay the man for his work. I tell you this to show that, when properly managed, in a fairly good season, one swarm of bees is equivalent to a man at work in the hay-field, and so it will not pay to neglect a whole apiary to go into the field to work, as many would-be bee-keepers so generally do, and afterward growl about the bees not paying them. You can hire a man to take your place in the hay or harvest field; but if you expect to become master of the bee business, so as to make it pay, you can not hire a man to take your place in the apiary during the honey season, as it takes much more skill to be a successful honey-producer than it does to pitch hay successfully. When the bees do not require any special attention, then they can be left to do other work as we have time; but if the bee-keeper would be successful, he can not afford to neglect them for a single day, when that day will put them in condition to bring him dollars in the near future."

"I think I begin to see that much which I have thought about 'bees working for nothing and boarding themselves' has been merely an idle dream. But what of the years after 1872?"

"Since then my average income from the bees has not been far from \$1200 a year, above the expense incurred by them. In other words, the bees have paid me a salary of not far from \$1200 a year, on an average, for the past 28 years, and that with only about 75 colonies on an average each year. I have not kept a larger number, on account of other things which demand my attention more or less of the time. Had I bought 50 or more colonies to start with, the expense in starting would have been from \$350 to \$500, which, in all probability, I should have lost in the business, for I should not have had a knowledge equal to doing so large a business on the start."

"I am glad to have had this talk with you; and now on leaving tell me in brief just what you would advise in the matter of my keeping bees."

"My advice to you, and all others thinking of bee-keeping as a business, would be, purchase from two to four colonies of bees; post yourself by reading and experimenting with them, as you can find time from the business you are already in, and thus find out for yourself which is the better for a livelihood 'the business you are already in, or keeping bees. If successful after a series of years, you can give up your other business if you wish to; and if bees are a failure in your hands, then you are but little out for having tried your hand at it."

[Although Mr. Doolittle has cautioned beginners against expecting too much from bees, yet in spite of that caution some may imagine they can do as well as he. When he began, prices on honey were much higher than now, and the results, from a dollars-and-cents point of view, would be cor-

respondingly higher. Then Mr. Doolittle is also a queen-breeder; and had he not been such it would have been difficult for him with only 75 colonies, average, to secure such good results. I do not mean to belittle what our friend has done—not in the least; but one who begins *now* should understand that the possibilities from so few bees are not so great.—Ed.]

E. M. E., Ohio.—Queens will sometimes lay two eggs in a cell, provided they are crowded for room; but if a queen is somewhat defective she may do so when there is plenty of room.

L. L. B., Va.—It is a very difficult matter to get queens purely mated in localities where black bees have been for a number of years. You will probably have a mixed progeny just as you describe. In regard to the queen that curled up and appeared to be dead, I would state that she had what we call the cramps. It very frequently happens that when a queen is picked up by the wings she will curl up so tightly that she seems to get a hitch in the back, and, as a consequence, lies down and remains apparently lifeless; but if put into a cage, and left alone a few minutes, she will be found running about as lively as ever.

E. O. O., W.—I think you could use the bees in the greenhouse. There will be some loss from their bumping their heads against the glass, and dying. If possible, keep the temperature higher than 50, at least during the day time. If the temperature goes up to 70 or 80, so the bees can fly, and remains there four or five days, or possibly a week, and then goes down to 50 or lower, a great deal of young brood will be destroyed. You can, if you have had experience enough, transfer the bees in a greenhouse; but I would now advise you to defer the matter till next spring—say about fruit-blooming time. I should be pleased to have you give us an account of your experience this winter—particularly so if you are successful in avoiding the loss of bees.

CONVENTION NOTICE.

The Michigan State Bee-keepers' Association will be held at Petoskey, Jan. 1, 2, 1902. This promises to be the largest-attended meeting of the Association in years. You are invited to attend. Reduced rates on all railroads. Tickets can be bought the 30th and 1st, good to return not later than the 1th. There will be no set programme, but another of our open-congress meetings; those who have attended in the past know what that means, and those who don't should come and find out. A novel design for badge has been ordered in honor of Petoskey.

GEO. E. HILTON, Pres.

LONG tongues are getting to be too much on the order of a "craze." See next issue.

MR. HARRY S. HOWE, of Artemisa, Cuba, the well-known lightning operator, and Miss Maria Habrera, of Hotorro, Cuba, were married at the home of the bride, on the evening of Oct. 11, 1901. Mr. Howe may well consider himself a lucky man, as his wife comes from one of the best families in Cuba.

GLEANINGS proposes to have some articles on wintering. While this question of cellaring bees has been thrashed over and over again, yet I am satisfied there is a good deal to learn along lines that have not been exploited as thoroughly as they might. One is the matter of having a cellar large in proportion to the number of bees confined in it.

I WAS planning to attend the meeting of the Colorado State Bee-keepers' Association; but on account of a great pressure of work I found it impossible to get away. The one I did go to two years ago was certainly a very enthusiastic and profitable meeting. The bee-keepers of the Mountain State can get up about as good a convention as those in any other portion of the country. The last meeting, I understand, was a good one—"the best in the history of the Association."

SINCE I wrote about one of the bee-paradises, the one in Texas (indeed, there are several in that State), I have learned with some degree of pleasure that one of my friends, a hustling young man, is about to start a bee-journal. If writing about bee-paradises results in part in the starting-up of healthy competition, I shall feel that I have done good, even if I do have to work a little harder on our own journal. When I say that I wish all our new rivals success, I mean it. My little trip of six thousand miles has convinced me that this country, with its magnificent distances, is so very large there is no need of our getting jealous of each other. There is plenty of room for all. Come on, boys! we will join hands, i. e., if the "magnificent distances" will permit.

WILL THERE BE LESS ALFALFA HONEY IN THE FUTURE?

A CORRESPONDENT in this issue refers to the fact that the growers of alfalfa hay are beginning to cut earlier than usual; that instead of two cuttings in a season they now get three. The result is that the mower now begins its work just about as soon as the plant begins to bloom. If it should

be found more profitable, in point of hay, to cut early and often, and before full bloom, the ranchmen will, of course, look to their own interests, and not to those of the bee-keepers. There is a bare possibility that the time will come when bee-keeping in the alfalfa regions, where hay is the sole object, will not be as profitable as now. Those who think of going into these new localities would do well to take this into consideration.

THE BEES UNDER THE MACHINE-SHOP.

I HAVE just been down in our bee-cellar under the machine-shop—see p. 868. There was a perfect rumble and roar of machinery overhead. Every now and then some one would drop a heavy casting on the floor, *k'thump*. This produced no disturbance that I could discover. I then turned on the electric lights, and still the bees seemed perfectly quiet. Indeed, I stuck an electric-light globe clear up to the entrance of one hive, and not a bee came out to "see what was up."

We are trying the experiment of opening the cellar-door at night and closing it in the morning, before daylight sets in. As a natural result, the air in the cellar smells sweet and clean; and those magnificent clusters of bees, so quiet, are indeed a pretty sight. Perhaps the fun will come next spring, for there are 250 colonies in a space 8×37; but loose burlap hangs over one end of the inclosure, so the bees really have the air of a cellar 48×96. One thing we have so far demonstrated is that noise, even violent, continual, or intermittent, does not disturb the bees, and this makes it all the better when we enter the cellar, because they have somehow become accustomed to a disturbance.

MOUNTAINS; WHAT ARE THEY GOOD FOR?

THESE great excrescences of rock and earth that tower thousands of feet into the skies, standing, as it would seem, in some cases as impassable barriers to the vanguard of civilization, barren and bleak, wild and dangerous from their rocky precipices, are in reality Godsendings to that same civilization. What would the great deserts of the West do without irrigation? and how could there be irrigation unless there were millions of tons of snow and ice stored on top of those lofty peaks? The water from wells in those regions is generally brackish, and unfit for any purpose; but melted snow, right from the very heavens—what could be better for man or beast? A barren plain remote from the mountains will probably always be a desert; but some of the most arid portions of our country, within one or two hundred miles of those "impassable barriers," have been reclaimed, and there are millions of acres more just like those that will be made wonderfully productive as fast as civilization pushes onward.

In some cases I found that a triple use is made of this snow. Standing thousands of

feet up in the air on the plateaus, or in the canyons of the mountains, it melts and runs into a reservoir, natural or artificial. It is then conveyed by an enormous flume down to some power-house that may utilize anywhere from five to ten thousand horse power. This water is made to drive immense turbines, and these in turn furnish whole cities with power and light; and all this comes from the mere force of gravity. After the water has subserved its purpose in making electricity it is then diverted into the city mains to supply the city with water; and what is left—and that constitutes by far the greater portion of it, is used for irrigation.

There is any quantity of melting snow now going to waste that might be similarly used. It only awaits the progress of Young America to dam it up and run it into the valleys. If I ever felt like seconding Horace Greeley's injunction to "go west, young man," I do now since I have seen the great possibilities of the West. "But," you say, "what has all of this to do with bee-keeping? Mountains mean snow; snow means water; water, irrigation; irrigation, alfalfa; alfalfa, honey."

I used to wonder, when I was a small boy, why God, when he made this earth, did not make it perfectly level; and especially was the conviction forced on me when riding a bicycle in later years. But suppose he had made it level—what then? Saying nothing about the mineral wealth, possibly half of this land of ours would be an irreclaimable desert, and the same would be true of other parts of the world. But we of the East, with our rainfalls, often pity those who have to depend on irrigation. Last year, when there was such a drouth in Kansas, Nebraska, and Iowa, the people in California, Colorado, Arizona, and in all irrigated regions, were fairly laughing in their sleeves. Said they, "This great drouth will make honey scarce; we fear no drouth, because we can always have water. We can have moist soils when we want them; we can control the conditions. When there is a heavy drouth in the East, there will be a scant supply of honey in New York and Chicago. But we who have plenty of water on tap, and can make the ground moist or dry, *just as we want it*, we will go in, produce the honey, and *rake in the shekels*;" and they have.

At another time I will have something to say about how those Western people actually *make water run up hill*. No, they do not overcome the law of gravity, but in effect they cause the water to flow over the entire land, on the hills and in the valleys, everywhere, without pumps or engines.

HONEY AND ITS DIFFERENT FLAVORS.

I THINK mention has been made already of the carload of honey from California. Mr. Calvert says the freight alone on it was almost \$1000 (really \$934.00). Well, while they were putting it up for shipment in dif-

ferent directions I found a section that was a little broken, and took it over home; and I want to tell you that, although it is different from any honey in the East, to me the aromatic minty taste is just exquisite. Mrs. Root said there was too much mint about it to suit her. But one thing I enjoy about honey is the wonderful variety of flavors. It is like going into a peach-orchard where there are a dozen or more different kinds. You may pronounce the peaches from the first tree the finest you ever tasted. But when you taste one from another tree, you may change your mind, and so on till you have sampled the dozen, all different, but each one so wonderfully entrancing to the taste that you get bewildered, and can only say, "May God be praised for having given us this beautiful fruit, with its many exquisite and delicious flavors." Now, I think it is so of honey. Perhaps I should tire of this from California if I should have it right along, but I rather think not. Ernest says it is probably a combination of sweet clover and mountain sage. I have always liked honey from sweet clover—that is, where it is perfectly ripened—ever since I first tasted it in Salt Lake City. It is intensely sweet. Well, now, the sage just gives this a beautiful minty aroma, perhaps a little like wintergreen in choice confectionery. The honey is so thick that you have to spread it on your bread as you spread butter. Now, I like to have samples of these choice honeys from different parts of the world to exhibit to our friends when they call on us—especially the bee-keeping friends. When you are ordering goods from us I think you had better have at least a sample put in of that choice honey from sweet clover and sage. A. I. R.

A MOST UNFORTUNATE AND GLARING ERROR
THAT HAS BEGUN TO FLOAT OVER THE
COUNTRY, LIKE THE OLD WILEY
CANARD.

ALONG about the middle of last November, Special Food Commissioner Jones, of Illinois, made an inroad on the honey-adulterators, or vendors of adulterated honey, in Chicago. He did some splendid work, and for this he has the heartiest thanks of bee-keepers; but, most unfortunately, he has nullified it to a great extent by sending out a statement to the press to the effect that all fancy white comb honey is bogus, and only that which is travel-stained, or, as he says, has a "brown coloring around the cells," is genuine. The market has already been shaken, not only in Chicago and vicinity, but over the whole country.

This same Commissioner Jones appeared before the National Bee-keepers' Association at its convention in Chicago two years ago. At that time he showed an earnest desire to work in harmony with and for the bee-keepers of the country. He followed up the glucose-mixing business in Chicago so energetically that he practically drove adulterated honey out of the city; but now,

in his zeal to carry out the lines of his official duties, he has gone too far, and has unwittingly, as I believe, classed a large portion of the finest and best honey that the bees can produce as bogus. Here is what he is reported to have said in the *Chicago Tribune* of Nov. 18:

"Genuine honey," he declared, "has brown coloring around the cells. Glucose honey is perfectly white. The purchaser can detect the fraud by this simple rule. Honey, butter, and vinegar are the three articles in the purchase of which citizens are most subject to imposition just at present, and they are causing most of the work for the commission. Syrups may be classed with honey in this respect."

Such a statement is as wide of the truth as it can possibly be; for by this definition of pure honey all "No. 1" and "Fancy" comb honey is bogus; and how an intelligent food commissioner could have made such a fearful mistake I can not understand. If he had only consulted some bee-keeper (and there are a hundred or so in the city) he would not have made such a blunder. It is to be feared that, notwithstanding all the refutation that can be made through the papers, this misstatement will take the wings of the wind, as did the old Wiley canard, disseminating untruth and prejudice in a way that will do untold mischief to honest producers of honey. It is the more prejudicial, because the statement, coming as it does from such a person, will be read by thousands of consumers, and what will they do? They will go without honey.

It is to be hoped that the Commissioner will make haste to correct his error; and if he is the man we take him to be he will do so by calling upon competent bee-keepers who can show him that all white comb honey, which he indirectly calls bogus, is the genuine product of the hive, just as much as the second-grade stuff he calls pure, which he says "has a brown coloring around the cells." The honey he describes is what bee-keepers call, technically, "travel-stained"; that is to say, the bees under some conditions incorporated into the cappings foreign matter to such an extent that the face of the honey is darkened in the manner explained.

Mr. R. A. Burnett, of Chicago, who sent the clipping above, writes:

We inclose you the clipping, which will be self-explanatory. It is our opinion that such publications as this have a tendency to turn people from the use of honey, many of them taking the view that Dr. A. J. Park's does, which is indeed a very unhappy one. While Jones's ignorance of the subject upon which he gives a very positive opinion is plain to you and me, it is safe to say that 75 per cent of the people will accept his statement as being the truth, and thus the sale of honey will be largely curtailed.

Chicago, Ill.

R. A. BURNETT.

Mr. Burnett is one of the few strictly honorable commission men of the country. He is one who is in close touch with the honey market, and an ardent friend of bee-keepers. He, like the Root Co., sees evil forebodings. It's too bad.

What shall be done? Bee-keepers everywhere should promptly answer it if it appears in their local dailies.

NOTES OF TRAVEL.

The Arizona Bee Paradise: Shaded Apiaries.

BY E. K. ROOT.

In our last issue I referred to the wonderful fertility of the soil in that bee-keeping paradise—so fertile, indeed, that alfalfa and other honey-plants grow more luxuriantly there than anywhere else in the United States. But of this I shall have more to say at another time. For the present I desire to call attention to the universal method of furnishing artificial shade for whole apiaries. When it is remembered that Arizona is one of the hottest regions in the United States, and that one of its towns, Yuma by name, on the Southern Pacific R. R., has the reputation of being the "hottest place" in the whole country, one can readily see the importance of providing shade for bee-hives. But, like all hot dry climates, that of Arizona is not so insufferable as one might imagine. Notwithstanding the temperature goes up to 110, and sometimes temporarily to 120 in the shade, one does not suffer from the heat nearly as much there as he would in the East with the mercury at 90 or 100 in the shade. Why this difference? It is simply a matter of humidity. A large amount of moisture with a high temperature is killing, as I have before stated. But a high temperature and a low humidity is quite endurable,

as I found it in Arizona, or, as some of the old residents prefer to call it, "God's country." But, moisture or no moisture, unless the hives are shaded combs will surely melt down, and it is absolutely necessary to provide shade. Trees are rather scarce in that irrigated country; and, besides, their shade would not give protection during the *whole* day; so the bee-keepers have found it necessary to construct a substitute in the form of a large trellis, wide enough to shade at least two rows of hives, and long enough to take in 100 colonies, hives spaced about 4 inches apart. But, mark you, these trellises run in the direction of *east* and *west*; so when the sun rises in the morning and passes on its onward journey through the heavens, and down again in the west, it never gets a chance to pour its direct rays on the hives. It can be readily seen that, if the trellis ran north and south, the hives would be shaded only in the middle of the day. While that might do for the East, it will not answer for Arizona.

While I was visiting Mr. J. Webster Johnson and Mr. Wm. Rohrig, both of Tempe, I took three or four views that show how these sheds are constructed. As will be seen, they consist of ordinary skeleton trellises. The uprights in some cases are 2x4's, and in other cases they consist of poles. In some across the tops a bracing of wire is used; in others, light strips of wood. All that seems to be needed is a

FIG. 1. J. WEBSTER JOHNSON'S APIARY.

FIG. 2.— J. WEBSTER JOHNSON'S APIARY, SIDE VIEW.

structure strong enough to stand the winds and support a bed of dried weeds, palm leaves—any sort of shrubbery that can be easily obtained. Of course, it dries up under the influence of the sun, but that makes no difference, for all that is needed is something to break or split the rays of old Sol. The loose stuff is piled loosely on top, and then the whole is held down by means of wire. In some of the views will be seen end-braces that are put up to prevent the general collapse of the structure endwise. Then every one of these is further braced across the top by means of strips or wire. No attempt seems to be made to shut out the light entirely by piling up grasses or weeds, as that would be unnecessary. All that is required is simply to break up the sun's rays. Even if the light does streak through, as appears in the picture in patches, it does no harm.

Every apiary that I visited in Arizona was covered with this kind of trellis, with one exception; and this was the case of a bee-man who had his bees under some great cottonwood-trees along an irrigating-ditch. Let us now examine these pictures.

Fig. 1 is a view of a portion of J. Webster Johnson's apiary where I visited. The long rows of hives in such perfect straight lines, under a shade alike comfortable to man and his bees, presents a rather pretty perspective. Indeed, it is really cool and delightful under these sheds, especially in a light breeze; and, as these structures are very

cheap, I wonder that more of them are not in use in other hot, arid climates. The bee-keepers of Texas, Central California, and of the whole South would do well to adopt them. In the Arizona sheds one can perform all necessary work with the bees, because the hives face outwardly, leaving a nice clean pathway in the center, unobstructed by the flight of bees. Combs can be taken out and strewn all around without the least danger of the sun doing any mischief; and it is indeed a pretty sight to walk down one of these long avenues and watch the bees piling in from the alfalfa-fields. And that reminds me that the field at the right in Fig. 1 as seen in the picture is alfalfa. All the bees had to do was to go across the fence and help themselves, and then go rolling and tumbling in at the entrances with big loads of honey.

Mr. Johnson, as will be seen by Fig. 1, numbers his posts. One post, for instance, will be marked 344, and the next one 348. Between these numbers there will be four hives about four inches apart, so it is easy to see which hive, for example, would be 345 and which 347. It is not, therefore, necessary to tag the individual hives.

Another fact in this connection is that, all the hives shown under the Johnson sheds are of the Jumbo type; that is to say, they are 10-frame Langstroth hives, but 2 inches deeper. Their owner seems to be satisfied that this big hive is better for him than the regular L. depth; and the consequence is

that all his hives—some 375—are of this big size.

As the Johnson bees were as nicely put up as any I had seen, I show a number of views. The proprietor was absent at the time; and as he knew nothing of my proposed visit, or probably did not, one can see how neat and orderly he keeps things about his apiary; and when I say "apiary" it comprises three different sheds all constructed in the manner I have described.

Figs. 2 and 3 show other views of the same yards and the same bees. It will be noted that the space between the sheds, as well as under them, is entirely free of grasses or weeds. To bring about such a result in the East costs more in labor than it is worth. But in an irrigated country it is perfectly simple and easy—why, just cut off the water, and vegetation of all kinds will die off. It is the rule, then, that no water is allowed to flow near an apiary—result, a patch of ground as clean as a floor.

Fig. 4 is a view of a portion of the apiary of Mr. Wm. Rohrig, of Tempe. His sheds differ from those of Mr. Johnson in that, instead of using strips of wood across the top to support the weeds and grasses, he makes use of wire braided back and forth. He finds that this answers every purpose, and is somewhat cheaper.

Usually near one or the other of these long sheds there will be an extracting-house. Sometimes it stands about midway. This

is particularly the case where there are two or three rows of sheds, and it is desirable to have the extracting-house at a point where it will save steps as much as possible. In Fig. 4, that showing the Rohrig apiary, the building is centrally located, or about half way down the long aisle. The extracting-building of Mr. Johnson was located just back of the camera where I stood when these pictures were taken; that is, at the ends of the sheds.

All through Arizona I found a decided preference for hives made of redwood rather than white pine. I was shown hive after hive, of the same age—that is, made and put up at the same time, one of redwood and one of white pine. The very dry climate would affect the latter very seriously, while the former, in nearly every case, seemed to be sound and good. This California redwood is quite expensive, and costs more than white pine. Still, the bee-keepers of that country, if they can not buy such hives of supply-manufacturers, make their own hives on foot-power buzz-saws and horse-power machines, because they find that redwood hives are cheaper in the end, even if they are not so well made. But redwood will not do for brood-frames, as it is too brittle. As a rule these are made of white pine, and shipped from the East.

Mr. Wm. Rohrig, whose picture I presented in our last issue, the gentleman sitting on one of his hives, is the local supply-dealer for that country. Indeed, he sees ns

FIG. 3. J. WEBSTER JOHNSON'S APIARY, SIDE AND END VIEW.

FIG. 4. WM. ROHRIG'S APIARY, TEMPE.

to be a man who is willing to help his brother bee-keepers, answering all their questions. I found him about as well posted as to the actual condition of things in Arizona as any bee-keeper I met. The fact that he owns about 800 colonies in Arizona, and some 200 or 300 in California, goes to show he is a bee-keeper who not only knows how to handle so many, but also understands the art of making them bring in for him the dollars. He was one of the Arizona bee-keepers who came clear to Buffalo to attend the National Convention.

and placed on a new stand and gave them a queen-cell. It forces them into sections in a hurry. This comes pretty nearly getting all of the advantages of both the deep and shallow frames for comb honey. Two of the shallow cases are just about right for a body for the deep frames. I rather think this plan is going to be the thing for the production of section honey. If no increase is desired in the fall, unite the bees back together and it will make strong hives for winter.

A. N. DRAPER.

Upper Alton, Ill.

[But why not have shallow frames in both the upper and lower story? This would save handling two depths of frames, and at the same time permit of handling hives instead.—Ed.]

A SCHEME FOR FORCING BEES INTO SECTIONS.

I tried a few hives this last season on the following plan, and shall try a lot of them next season. I use two of the shallow bodies for a brood-chamber, with five of the deep brood-frames in the center, and ten of the shallow frames above and below in the same two bodies. When the time arrived to put on sections I placed the ten shallow frames in one of the shallow cases and gave them about all of the bees. I took the five deep combs away from them, and five from another hive I had treated the same way,

HIVE-COVERS.

Rambler has "diskivered" a new fastening for covers. Not meaning any disrespect to Rambler, allow me to ask, "What is wrong with the old Van Deusen hive-clamps? The Van Deusen can be relied upon to hold a cover in fair weather or foul, preventing its warping or sailing away; 5 cents will pay for a pair, which, when attached to the cover, are there to stay. There has been a season's discussion of a non-warping cover, and the verdict is a ventilated cover. I have in use the Madary cover, which has a $\frac{3}{8}$ -inch board over the frames, an air-space of $\frac{1}{2}$ -inch, and a $\frac{1}{2}$ -inch to one inch at center redwood cover on top. This cover holds

its shape in exposed positions. The only fault is in the thinness of the inside cover. I winter my bees on their summer stands, and $\frac{3}{8}$ of an inch of lumber is not enough when the thermometer crawls down to zero and below. I recollect that my father's ice-house, in Pennsylvania, kept cool in summer because the space between the studding was packed with sawdust; and I also recollect that, when living at Leadville, Col., I wanted to give my California wife a warm reception, and so packed the spaces between the sills and studding with sawdust, and the rooms in that house would get so hot we were compelled to put a ventilator in the ceiling; and when the stove got down to business it was sometimes necessary to open an outside door to cool off. Now, why can't the ventilated covers be sold with a small strip to close the sides, and the bee-keeper fill in the space between the two covers with sawdust? This would give us a cover warm in winter and cool in summer. The added cost would not exceed a cent a cover, as sawdust can be had everywhere for the asking, and it would not be necessary to pay freight on it, as the bee-keeper would fill the covers when nailing them up. I should like to see this sawdust cover tested in hot and cold climates in comparison with the ventilated cover, and the results given two hive-bodies with a thermometer in each, over these a cover of each style, and the record of the thermometer in heat and cold given. Arizona and Minnesota bee-keepers could test it thoroughly. It is the actual test that proves the merit of an invention. Sawdust may be an ideal padding in ice-house and iceland sections, and be found wanting in a hive-cover.

Murphys, Cal. E. H. SCHAEFFLE.

[You will see by the 1902 catalog of the Root Co., soon to be issued, that we have already anticipated the demand for a double cover. This cover is provided with side cleats so that the space between the two boards can be filled with packing-material or left empty according to circumstances and conditions. Ed.]

BEE-STING POISON IN HOMEOPATHIC PRACTICE.

Mr. Root:—One evening while waiting my turn in a barber shop I picked up the Oct. 1st number of GLEANINGS, and came across the article by Mr. S. P. Holmes, in which he reports the cure of rheumatism by bee-stings. I also noted your editorial notes in which you question whether the disease might not have disappeared or have been removed by the outdoor exercise of taking care of bees. Either one may have been true; but it is also the case that we, especially of the homeopathic school, use *Apis mellifica* a great deal, and for some conditions it is the most powerful remedy of which we know. But it must be in a case in which it is well indicated, as, in fact, of all other remedies, that it will do brilliant work. Its most common use is in in-

flammation of the kidneys, accompanied by dropsy, and also the summer trouble known as urticaria, or "hives." It is not at all unreasonable to suppose that Mr. Holmes' case was one well adapted to treatment by the bee-poison—in fact, many cures of rheumatism have been accomplished by it.

H. R. MIXER, M. D.,

Secretary of Nebraska State Homoeopathic Medical Society.

Falls City, Neb., Oct. 7.

PROPORTION OF SULPHURIC ACID.

You state in GLEANINGS that sulphuric acid in water will clean dark beeswax, and turn it yellow, but you don't give the proportion. Please tell me the amount to a gallon. I tried it, but it was not satisfactory.

B. HAYNES.

Grand Isle, Vt., Oct. 30.

[Sometimes a five-per-cent solution will do the work; then as strong as is required. That is to say, one part raw acid to ten parts water; but if the wax is very dirty or black you may require to use as high as 25 per cent. Use acid enough to get the yellow color. It is cheap; and when you have secured the proper color you can make your wax enough more valuable to more than pay the expense of the acid.—Ed.]

HOW THE LITTLE UTTER BROTHERS RAN FROM THE CROAKING FROGS.

This story is about two brothers who used to live in York State. Their names, as I remember, were Joe and Bill Utter. They were two little boys. They, at the time this happened, had been fishing. They were told not to stay late, as something might catch them. Well, they disobeyed, and they began to be somewhat superstitious. Strange noises were heard in the woods. Pretty soon they heard the deep bullfrog guttural, "Bill Utter! Bill Utter-r-r-r! That ain't you, Bill." Then it came, "Joe Utter! Joe Utter-r-r-r-r!" The boys dropped their line and ran. At last account Bill was still running.

Oberlin, O.

CHALON FOWLS.

[Mr. Fowls does not say whether these two boys were the same as the two brothers in the now celebrated Utter bee and fruit case; but from the fact that "Bill was still running," the fruit-man who was defeated in the recent lawsuit, we are left to infer that he is the same one. Ed.]

Will you please tell me how you form nuclei to the best advantage where you keep nuclei over a strong colony separated by screen wire?

CARL F. BUCK.

Augusta, Kan., Nov. 8.

[We generally use hatching brood. Two frames of such brood, with adhering bees, are set down in one of the compartments. Even if the adhering bees go back, the young brood just hatched will, of course, remain in their new quarters. You will

understand, of course, it does not require so many bees in these nuclei over lower stories, for the simple reason that the warmth from the cluster below rises and gives plenty of heat for the babies above. As an additional precaution, we keep the entrance of this nucleus closed for 24 hours, or until the young bees are hatched out and can defend their home. Of course, there are other ways of forming nuclei, but the hatching-brood plan we consider best. The Somerford method, as described in our A B C book, under "Nucleus," could be used very well—in fact, any other good plan whereby too many bees do not leave for their old home.—ED.]

And the Lord said, It is not good that the man should be alone. I will make a help meet for him.—GEN. 2:18.

Eye hath not seen, nor ear heard, neither have entered into the heart of man, the things which God hath prepared for those that love him. I Cor. 2:9.

I wish to talk to-day to married people who have brought up families—especially those where the children are married and gone away, or perhaps have gone away without being married. I wish to talk to the husbands and wives who are living alone together, or perhaps mostly alone, much as they did when they were first married, before God sent any children into their home. It is a subject I have touched on once or twice before; but it is one that has so much to do with the happiness of the homes in the world that I think I may be excused for taking it up again and again. Come to think of it, I do not know but it is a talk that *all* married people need, from the time they are first married until God calls them.

Somehow during my brief life I have had quite a little to do with husbands and wives who could not get along together. I have talked and plead with both, before divorce proceedings were started, and I have talked with both *after* the divorce. I have urged that the teachings and the spirit of Christ Jesus would do away with all this trouble and anxiety, unrest, and misery. In talking with a neighbor I was visiting a few days ago he said there were four families right in his neighborhood where the father and mother separated after the children were grown up and gone. They lived together and got on very well, apparently, while busy with the cares of rearing the family; but after the children were gone, and the father and mother were in shape to take a little rest, or, suppose we say, in shape to take a good long *vacation* with occasional visits to the children— I should say just when they were at the best time in their lives to have a really good time together, they *quarreled*, and finally were

separated by law. Why, what a sad thing this is! I suggested to this friend of mine that the gospel of the dear Savior would have made such a thing impossible. And then he told me this story. He said he knew the two parties quite well. They were pious in the extreme; had family worship regularly, no matter what was on hand. He gave me the following incident:

One day he went over to these neighbors quite early, on an errand. It was just time for prayers, and he was asked to sit down and wait until worship was over, then they would attend to his wants. The boys were outdoors, but they had to be called in. The father read from the Bible, then he and his wife sang a part of a hymn, and perhaps the children joined in. I can imagine the older girls would, even if the boys didn't. Then all were expected to kneel down, even the stranger who was with them. If I remember correctly, he, even as a boy, did not "take much stock" in such proceedings, and did not kneel down; but he did wait until it was all through before he could get the thing he came for.

You know, friends, I have often exhorted you to hold fast to the old-fashioned style of family worship. I have said that, if discord did not drive away family worship, then family worship would certainly drive away discord. Well, my informant thinks the Bible-reading, the hymns, and the prayers, kept right on; but notwithstanding all these influences, after the children were gone this father and mother began to have disagreements. It grew upon them gradually; and in a couple of years it culminated in the old gentleman giving the poor wife a *pounding*. Why, it fairly makes my blood chill to write it; and this was simply because he *happened* to be the stronger of the two. He took upon himself the responsibility of striking the poor woman whom God had given as a help and companion, as in the language of our text. Some of you may say the less such things are mentioned, the better. They are too sad and shameful even to talk about. Well, God knows, dear friends, I would much rather not talk about them; and I have taken this subject up only because I wish to inquire into the matter, and find out, if I can, the remedy. It is a very strong case— at least so it seems to me

of going through a *form* of worship without making any practical application of it to the affairs of every-day life. It is *profession* without *possession*; and, oh how much there is of it in this world!

In one of David C. Cook's Sunday-school papers a few weeks ago I read a story of a great missionary conference. A wonderful address was made by a missionary right from Africa. The audience was moved to tears, and a great contribution was raised. Well, *during* this stirring address from one of the world's greatest mission workers, two "street Arabs" crept slyly into the building to get out of the storm. One of them was a colored boy who was already well along in consumption. The great

speaker and his companion passed by these two boys while they were talking animatedly about the great work they were going to bring about among the colored people away off across the water. All at once one of the two caught a view of the two ragged urchins, almost out of sight in one of the pews, and he was proceeding to hustle them out in a jiffy, asking them what *business* they had to come into God's holy place in such a plight as that. A young lady, a Sunday-school teacher, happened to be near; and, even if the great doctors of divinity did not notice the awful inconsistency of the thing, this girl did. She protested, and insisted that the great truths that had just been proclaimed from the desk should be put into *practice*, and that, too, *at once*. The colored boy was cared for as long as he lived; the other one, despite the inconsistency of his treatment, had gotten hold of the wonderful truths expressed in the eloquent sermon, and with a little encouragement soon accepted Christ as his Savior. This may be fiction; but, oh dear me! God knows it is not *all* fiction, and I do not know that the story is overdrawn. It has been a hint to me ever since I read it, to look out for the ragged and sin-stained urchins who may lurk about *my* path.

Now, about this husband and wife, or, if you choose, these husbands and wives who have separated, are separating, or who are (*may* be) contemplating separation, just as their eyes rest on these pages. Dear brother and sister, I know something about the matter. I have had some experience, even if I am only 62 years old. When people get to be of my age, some sooner and some later, gradual changes come over them. First the man and his wife, without knowing it, become forgetful and absent-minded. Why, for a year back I have been appalled when proof I could not dispute has been brought me to show I have been doing things I had declared I did not do. I have room for only one illustration here.

A few days ago Mrs. Root and I were on that beautiful woodland path on the way to Sunday-school. All at once she said, "There, I have not got my specs." I volunteered to go and get them, but she tripped off ahead of me, saying she was not sure I could find them. But I had the door-key in my pocket, and so I ran on ahead of her and unlocked the door. She got her glasses and handed them to me, saying she thought she had better have the case. Then she handed the case to me and I put the spectacles inside of it, and supposed I handed them back to her. We locked up the house again, and hurried back so as not to lose time; but when we got to Sunday-school she excused herself for not taking a class by saying she could not find her glasses. When we arrived home, there they were, inside of the case, on the table in the center of the room. We both went back after them to make sure, and then we both left them lying on the table, hurrying back with the happy consciousness of having done our

duty. Of course, we had a big laugh about it; and now every little while we two do things of this kind. I have put something away that we may want in the future; and for fear I may forget where I put it I say, "Now, Sue, will you help me to remember that I put this thing here do you see?"

"Yes," she replies, "I see, and I think I will remember."

Well, when the thing is wanted we have both forgotten where we put it. Now, friends, do you not see what a chance this gives Satan? If there should not be perfect trust and harmony and love between these two elderly people, they might easily get to blaming one another. I heard a man say, a few days ago, "Now, who took my *Rural New-Yorker*? It just came from the postoffice yesterday, and I laid it right up here" (putting his hand on a shelf pretty well up out of the way), "but somebody has taken it. Where is it?"

The wife and children all went to hunting for the *Rural New-Yorker*. I myself had asked him to let me see it, as I did not get it up in our "cabin," and we both wanted it right away, for we were in a hurry. Finally he said something like this: "Mr. Root, I have threatened to do it before, and now I believe I will do it. I will have me a secretary that I can lock up, and will put the papers in it, and turn the key and *put it in my pocket*, and the rest can have them after I get through with them."

I suppose that, if his good wife had told him then and there that she found the paper in another place, exactly where he laid it, he might have declared, even before company, that he did *not* lay it down there, but on the high shelf. His wife, however, is one of those discreet, gentle, lovable women. She had more wisdom than some women who refuse to be abused for things that are the fault of the abuser. She handed him the paper, but said nothing; but she afterward told Mrs. Root she found it right where she was quite sure he himself left it. Now, I have known a trifling thing like this to stir up wicked feelings in the heart of perhaps more than one member of the family. By the way, I wonder what our good friend Collingwood, of the *Rural New-Yorker*, will say when I inform him that, when his paper comes from the postoffice, everybody at this home wants it at once, and this, too, in a family where there is a great number of papers and periodicals of all kinds. And let me say here to my good friend (he is a bee-keeper, so he will excuse me) that, instead of feeling cross, and making threats about locks and keys, he should thank God from the bottom of his heart for two things especially. One is that he has a good-sized family of children, who, wife included, want to read and *do* read such a good Christian paper as the *Rural New-Yorker*; and, secondly, he should thank God from the bottom of his heart that he has been so prospered as a farmer that he can subscribe regularly for such a multitude of papers that it is some-

times a hard matter to find any particular one on short notice. And this illustrates how we often get cross, and grumble about the very things we ought to be devoutly thankful for.

I have thought many times of late that God has spoiled us by giving us too much. He has been too kind, and we are getting to be ungrateful; and this certainly is true in a majority of cases with husbands and wives who quarrel after the family has grown up. One of the reasons why trouble comes between the man and his wife is, as I have suggested, that they are becoming forgetful, and do not realize it. Another is, that their health begins to fail, perhaps in many ways. They do not *hear* what is said as distinctly as they used to do. They do not *see* as well. The glasses get lost. As we get older there is more apt to be indigestion unless we are careful. We do not take as much outdoor exercise as we used to do, and we suffer in consequence. When there are no children (or other people) around we are not as careful to be courteous and kind as we used to be. Satan puts it into our heads to think it is a fine thing to speak out plainly. Both of us become more careless than we used to be because things are not crowding, perhaps. Little by little an irritable spirit gets into one or both of our hearts. Family worship may be gone through with as a form, but the spirit may be lacking. In other words, the Spirit may be *grieved* away, as we are warned in Ephesians.

Some months ago I told you of an experience I had that frightened me. I dreaded to speak of it then, but I felt that it might prove a warning to others as it had been; and still is a warning to me. Something that belonged particularly to myself was out of place. I did not mean to be unpleasant or unkind, but I fear I must have been so, thoughtlessly. At any rate I spoke in a complaining tone. I was informed that nobody had touched it but myself. Whatever the condition of things, it was certainly my own doings. I attempted to explain that it was not my own doings, and could not have been. By this time I certainly was out of temper; a bad spirit had entered my heart. Now, dear brothers and sisters, let me assure you that you do not know how *contagious* a bad spirit or a bad temper is. The reply I received was something different from any thing I had ever heard from the person who uttered it. It raised a tempest in my heart—such a tempest as I never dreamed, especially of late years, was possible. That little warning began to ring out sharp and clear, "Lord, help." But for some reason or other the Lord did not help. I prayed earnestly, but Satan had gotten a foothold. He kept declaring that I was wronged without reason, and that it was not my duty to bear it. I knew it was Satan. God knows I love, through my poor life, felt his clutches *often* enough so I ought to know him. I prayed most earnestly. I tried to read my papers; but my eyes

went away out into vacancy beyond the papers, and pictured the wrong I had suffered in different forms. Words came thronging in troops—hard bitter words. I arose and went out into the darkness of the night, but they followed me still. I could only groan and pray. I did not understand it then, and I do not understand it now. The whole thing was preposterous. All of it grew out of a little unimportant matter. Suppose I *was* wrongfully accused; suppose I *was* right, and somebody else wrong—what did it matter, any way? See what Peter says:

What glory is it, if, when ye are buffeted for your faults, ye shall take it patiently? but if when ye do well, and suffer for it, ye take it patiently, this is acceptable with God.—1. PETER 2:20.

I knew all these things, and I knew I had taugth all my life the beauty of suffering for Christ's sake—of returning good for evil, and all that; but I was caught in Satan's toils, and I could not get out. Thank God, I did have sense enough to keep still and not say a word. This mental conflict, this mental *wrestling*, if you choose, with the prince of darkness, kept his hold on me for hours; and all next day I felt like one who had been through a fit of sickness, or had labored beyond his strength. It was not my *muscles* that were sore, however—it was my spirituality. Since that time I look with horror at the thought of the demon that lurks out of sight, almost unknown, in my own heart. The Bible says, "The heart is deceitful above all things, and desperately wicked: who can know it?" I know, if others do not, that this is true. The memory of this thing I am telling about has made me afraid.

I presume people are unhappy *after* they have separated. I know by what some have confessed to me how much mental suffering they endure while considering the matter of divorce. I am pretty sure that language can not express the misery and suffering that would be mine if any thing serious were to happen between myself and the companion God has given me. After this thing I have spoken of, I resolved over and over again that I would avoid even the *appearance* of evil along this line. I decided to set the example of avoiding any sort of dispute or disagreement between us two when we were alone. I resolved to keep back *all* fretful or impatient speeches, and declared to myself and before my Savior that I would be gentle and kind and courteous to "the woman I love" as I would be to any other woman whom I might meet on the street, for instance, or to the bee-keepers' wives or grown-up daughters where I may be visiting. Some people may smile at the idea of being as pleasant and courteous and obliging to *your own wife* as to other women; but, my good friend, if you are, *every moment of your life*, as gallant and civil to your wife as to any other woman, you are a model husband.*

*It sometimes transpires that something *must* be said to your wife that you know pretty well will produce unpleasant feelings. I have had several experiences of this kind, some of them quite recently. Be-

After having had a hand-to-hand tussle with Satan, we often have some of our happiest and most pleasant surprises—that is, if we come out victorious. After Satan did his best to tempt the Lamb of God, and failed, we are told that angels ministered to that well-beloved Son, and I am sure it is so in our own experience.

You know I wanted Mrs. Root to go with me on a vacation, and live in that cabin in the woods. The idea seemed to her—yes, and to lots of other people—in some respects preposterous. Just think of it—leaving a good nice home with all modern comforts and conveniences, and going away off in the woods, four hundred or five hundred miles away from home where there was not *any thing!* I told you in one of these talks that I "captured" her forty years ago, and I was going to capture her this time, and take her up to my cage in the woods. When she finally consented, and was safely landed there, I set myself to work to make her happy. I succeeded. Even she herself admitted that my project was a success, and we are talking about it now, every day, of another trip there in the spring.

Dear brothers and sisters, I have asked you to undertake some difficult things, perhaps. You may say it is not worth while to take such pains to try to be kind and civil, and to be careful of every word and act. I am now going to try to tell you of the rewards we get for this kind of service. Several times I have decided it was not in my power to tell you of the real happiness and joy that has filled my heart for the past two months. Perhaps I can succeed in one way. When I first became acquainted with Mrs. Root it seemed to me this whole wide world had no joy for me that would equal having her for a daily companion. Yes, I remember well the day after our marriage when we rode together quite a number of miles to a railroad station. As she sat by my side it gave me a great thrill of happiness. My heart fairly bounded at the thought of being with her and laboring for her all the rest of my life. It was our honeymoon. I looked forward to much happiness and to great happiness. You know my enthusiastic disposition. Well, dear friends, what I wish to say is this: My expectations and anticipations on that day have been *more* than realized. But the best part of our honeymoon came after we had been married more than *forty years*. Years ago, when a young man seemed to care so

fore you do any thing or say any thing, pray earnestly for grace from on high; pray for the Holy Spirit in such quantity (if that is the way to express it) that Satan can not possibly get any hold on you; then go to your wife alone, put your arm about her to assure her of your love and kindly feeling. Present the matter carefully, and, above all, *lovingly*. So far as you are personally concerned consent to bear any burden for her sake, God helping you, and he always will help you, and you will come out triumphant. God planned in the beginning of the world that you *two* should be *one*; and through Christ Jesus, his only Son, you may be *one*; and this world may be to you both a world of joy and happiness instead of being a "wilderness of woe," as it is with some husbands and wives because they *persist* in letting Satan manage.

very much for some good girl, I have heard people say, "Why, he loves the very ground she treads on." Well, if this was ever really true in my experience, it was when we were up there in the woods together. Now, this is exactly what God intended. It was what he planned in the beginning. Our text tells about it in Genesis, and the same thing is repeated over and over again on almost every page of that dear old Bible; and when we read that wonderful concluding text from Corinthians, "Eye hath not seen, nor ear heard, neither have entered into the heart of man, the things that God hath prepared for them that love him," I believe this promise is largely fulfilled in the relations that God intended should exist between husband and wife. I am convinced that oftentimes surroundings hinder this loving trust and confidence. We two were off together away from the care and worry of business and other things here at home. We were so situated that I could take part in all the household cares in a way I had never done before—not even when we were first married; yes, and she could take part in all *my* work. She used to go out in the woods a part of every day, and enter into full sympathy with me and my work just as I did in the house with her and her work. Our regard for each other is of a different kind now from what it was in the days of courtship. It is a quieter, steadier, purer, and a more holy and sacred regard—certainly more unselfish.

Now, please, dear brother, do not understand that I am thinking Mrs. Root has any unusual merit more than your wife would have under like circumstances. If she is not willing to go with you as Mrs. Root consented to go with me, it is most likely your own fault. You can win her if you choose and if you will, not only to the home of your choice, but it is your privilege to win her, if she is not already there, to Christ Jesus; and it is the privilege of both of you to enter together *here in this life* into the happiness and joy described in the second of our texts.

CREATING IN DOMESTIC ANIMALS AN APPE-
TITE FOR FOODS THEY ARE NOT ACCUS-
TOMED TO USE.

Last summer we planted some of Mills' Prizewinner beans in my garden in the woods in Northern Michigan. You will remember the Prizewinner bean is the one that enabled me here in Ohio to grow two crops of dry beans on the same ground, with the same seed, in one season. Well, these beans made a prodigious growth in the rich woods dirt. In fact, when I was there, just before they were getting ready

to blossom. I thought they would be all vines and no beans; but later on, Mr. Hilbert wrote me there was an astonishing yield of beans on those same vines. The stalks were something like two feet high and two feet broad, and just yellow with bean-pods. I told friend Hilbert that, as he took such a fancy to them, he might save the seed and plant it another year. He took the beans home and put them on the barn floor till he could get time to thrash them out. Pretty soon the chickens got to breaking the pods open and eating the beans. He was astonished at this, for he says he never before saw a dry bean that a chicken would eat. As he regarded the seed as valuable, he covered the beans up, as he supposed, so the chickens could not get at them. But they seemed determined to have them. In fact, he had to fight, almost, to keep the chickens away. Now, he decided that this unusual occurrence was because the beans were of a different variety, and something the chickens liked; and, by the way, they cook quicker than any other bean I ever saw—in fact, they are cooked all to pieces before you know it, and I do think they are the best table beans—that is, in the shape of a dry bean—I ever got hold of. I will not except even lima beans.

Well, it may be the chickens discovered that this bean was different from other white beans. My impression is, however, that they simply acquired an appetite for them under the circumstances. Probably they were confined to the barn some rainy day, and wanted something to do. Chickens are curious, especially young ones. They broke open the pods, swallowed a few beans, found they digested all right, and one after another learned the trick. By the way, I wish Bro. Hilbert would try those same chickens with the common Navy white bean, and see if they will not eat them since they have learned how.

You may suggest that beans at the present price are rather expensive feed for fowls. My dear friend, cull beans can be bought in great quantity at a very low price where beans are grown largely. After the chickens have learned to eat good beans they will eat the culls, without a doubt. Then here is another thing: Hundreds of bushels of beans—may be thousands—are thrown away, or put among the culls, just because they have a little stain on the outside. This stain does not hurt them a particle—it only makes them look bad. We have for years cooked our cull beans for poultry.* I have told you with what avidity they eat them, especially in winter, when they do not have a great variety of food, and how it starts

them to laying. Well, one day when we cooked up some beans for the chickens (they were sorted beans that had already been sorted once) they looked so good I decided to taste them. They were just exactly as good to eat as beans that are all white. People who are suffering from the want of a good wholesome food might use these cull beans.

A few days ago one of my neighbors in the Traverse region, who raised quite a few beans was throwing the bean straw out on the manure-heap. These beans had got caught by the frost, and a good many of them did not thrash out. I suggested the straw was valuable for cattle, if kept under shelter until cold winter weather gave them an appetite, and also that the unripened beans could be easily thrashed out for the poultry. They keep a large lot of poultry, and all kinds of grain are expensive away up north. Now, their chickens had not learned to eat beans, and the owner of the beans had not learned to cook them for the chickens nor for the pigs (they keep pigs also); and although they grew beans by the acre, they had been in the habit of wasting bean-stalks and the cull beans.

Now, this matter touches on another one—of the cows and horses not eating sweet clover. The successful farmer should see to it that his chickens, pigs, cows, and horses are *educated* to eat things that might otherwise be thrown away. Here is an article I just took from the *Rural New-Yorker*, that touches on this matter; and it contains so much other valuable information that I give it entire. The truck farmer, and farmers in general, keep, as a rule, more or less poultry. They can not afford to lose the valuable stuff poultry will consume. Here is the article:

CLOVER AND COW-PEA BENEFITS.

Reference has been made in these notes to the usefulness of crimson clover and cow peas as hen forage. We are able to report an increasing partiality for these nitrogenous foods among the two flocks of chickens kept on the Rural grounds, and correspondingly good results in the way of egg production. Hens readily take to clover in any variety, but they are often shy of beans, seldom eating them uncooked. An appetite for raw peas or beans may be considered an acquired taste coming on gradually. Our hens ignored the cow-pea seeds the first season they were grown here, and developed the taste only late in the winter when scratching the pods open by chance in a sheltered part of the field. The example of contented old biddies coming in with comfortably extended craws, and an urgent thirst for water to complete the swelling process proved contagious, and they all now hurry to the field at once on being released from the yard. There can be no doubt as to the beneficial effect of the exercise needed to get the pods open, nor of the high food value of the beans themselves. The Rural grounds lie in a strip about 800 feet long by 200 wide. There are poultry houses near each end, and the flocks have but little chance to mingle, as they are necessarily kept yarded most of the time; yet the cow-pea habit, which we heartily approve, seems to have been communicated. The second flock has no access to the field, but acquired the taste from scratching the gathered pods shelled for seed. An increase in egg yield was noted in both cases as quickly following the ripening of the Early Black cow peas, which is the variety best suited for us. Cow-pea seeds, when ready for market, are too costly for poultry food, but we are convinced that a patch of these hustling land-improvers handy to the chicken-yard is a good investment where practicable. Crimson clover has become a necessity, sown in August between bush fruits and after early

* Since the above was put in type I have had some old red kidney beans cooked for my new strain of young poultry—the progeny of that fighting rooster. They had not yet learned to eat beans, and wouldn't. I took away their other feed, and tried starving them to it, but they would not eat them, even then. Finally I mashed the beans up and stirred in them some chop feed, so as to make it look like their daily mash, and it was all gone in a twinkling. I was obliged to go to all this pains in order to convince them that beans are good to eat, and *now* they eat them with avidity.

crops to improve our soil and diminish washing by winter rains, and incidentally as forage for the fowls, who keep the more accessible strips sheared as closely as with a lawn-mower. The season has been favorable, and the plants on early-sown strips are now seven to eight inches high; but we find such leafy plants do not, as a rule, winter as well as those closely picked by the fowls. Chickens are fond of green food, but eat very few weeds with relish. If not provided with clover in this manner they are very troublesome on the lawn, when at liberty. These clover strips entice them away, and thus fit in all along the line.

The above touches on another thing that has been on my mind a good deal. It costs so much to hire labor nowadays (more in Michigan than down here in Ohio) that we must study to grow crops that can be produced with little labor. I have told you about our winter onions. They have never had any attention whatever except to gather the crop of sets. Well, in the Traverse region they grow beautiful grapes on the hillsides, without any cultivation whatever. The owners say they do better to let them trail on the ground; and they ripen quicker because of the heat of the sun on those sandy hills.

Well, there is quite a list of things that may be grown for poultry, and the poultry be allowed to gather the crop and do their own feeding; and I doubt if any system of feeding will give as good results as letting the fowls go out in the fields and gather their own food, helping themselves to the sweet corn as it stands in the fields, shelling out the cow peas, and helping themselves to grains of different kinds sown in waste places expressly for the poultry. They will lay more eggs and raise more chickens, and I do not know but I may say *better* ones, where they are *educated* to do this kind of foraging. I have seen a great brood of chickens hatched out in a buckwheat-field, and they grew to maturity without ever being fed or cared for in any shape or manner. The mother hen happened to hatch her chickens just as the buckwheat was far enough along so the chicks could eat it.

Now, friends, do not let any stuff be thrown away or go to waste until you have faithfully tried getting some of your domestic animals to *learn how* to eat it.

CONVENTION NOTICE.

There will be a bee keepers' convention (annual) held in Canadaigua, N. Y., by the Ontario Co. B. K. A. on Dec. 12 and 13. FRIEDEMANN GRUBNER, Naples, N. Y., Nov. 15. Secretary.

Minnesota Bee-keepers' Supply Mfg. Co., Manufacturers of Bee-hives, Sections, Shipping-cases, and Everything Used by Bee-keepers.

Orders filled promptly. We have the best shipping facilities in the world. You will save money by sending for our price list. Address

Minnesota Bee-keepers' Supply Mfg. Co.,
Nicollet Island Power Building, Minneapolis, Minn.

Queens! Untested, \$1.00; tested, \$1.25 and upward. See former ads. and circular.
J. B. Case, Port Orange, Florida.

Wants and Exchange.

WANTED.—To sell my entire bee business, consisting of a 10-acre ranch three miles west of Phoenix, all in alfalfa, with water, for \$1300; a 20-acre ranch with water, 8 miles from Phoenix, for \$1000; bee sheds and fixtures on a rented 5-acre lot, wagons, two extractor tanks, 500 colonies of bees at \$5.00 per colony, in two-story hives. Reason for selling, I wish to retire, because I am tired of doing my own cooking, and have enough to live on anyway.

JOHN NIPPERT, Box 1051, Phoenix, Arizona.

WANTED.—To exchange Dadant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax. O. H. HYATT, Shenandoah, Iowa.

WANTED.—To sell cheap, 20 acres of good Florida land, well situated, at a low price. Address for particulars, MRS. I. B. WEIR, Toledo, Florida.

WANTED.—A good farm hand, with temperate habits, by the year, who wishes to learn the bee-business. I keep 500 colonies.

W. J. STAHMANN, Bruce, Wis.

WANTED.—To buy 300 colonies bees in Mississippi, Louisiana, Arkansas, or Texas. Write M. STEVENSON, Dardenne, Missouri.

WANTED.—To sell a custom saw and feed mill and 27 swarms of bees with supplies, all in first-class condition. F. I. RIGGS, Box 48 Buckton, N. Y.

WANTED.—To exchange Barred Plymouth Rocks—single birds, trios, and breeding pens—and eggs in season, for Root's 8-frame hives, extractor, or offer. My birds are a combination of best strains in America. Chamberlin Hill Poultry Farm, Jordan, N. Y.

WANTED.—To sell or exchange three saw-benches with saws (\$15 each), one ditto (\$20), machines for boring, matching, sanding, dovetailing, and press-cutting (\$5 to \$15 each), leather belting, sh. fling, pulleys, etc., at half price; all in good running order; will take honey or offers; will take 10 per cent less for cash. Write C. W. COSTELLO, Sanford, Maine.

WANTED.—To exchange a No. 15 two-frame Cowan honey-extractor for a No. 5 Novice extractor. ADOLPH SEGERLIN Anita, Pa.

WANTED.—A queen-breeder with experience. Correspondence solicited. Reference required and given. Address G. F. DAVIDSON, Fairview, Texas.

WANTED.—To sell 600 colonies of bees in 8 and 10 frame Dov'd and Danzenbaker hives at \$2.00 and \$2.25 each. W. N. CANNON, Greenville, Ala.

WANTED.—To sell our entire plant and situation, including a complete line of machinery for manufacturing bee hives, comb-foundation, etc. In connection with same we have a first-class up-to-date planing-mill in every respect. Our good will and list of customers go with it. This is a bargain, and will pay you to investigate. Address

W. R. GRAHAM & SON, Greenville, Texas.

WANTED.—To buy a home somewhere in a good bee locality, and in a mild climate, and where there is a good chance for good schools. DANIEL DANIELSEN, Clarkson, S. D.

WANTED.—A situation as assistant apiarist, or charge of small apiary and fruit or poultry farm, in the southern or western States. Good reference can be given. CHAS. G. GIBBS, Brunswick, O.

FOR SALE.—Fine ripe extracted touch-me-not honey, in 60-lb. square tin cans, 2 cans to a case, delivered at R. R. station at 75c. Sample postpaid, 8c.

C. A. BUNCH, La Paz, Marshall Co., Ind.

FOR SALE.—1000 lbs. light amber extracted honey at 5c per lb. W. C. GATHRIGHT, Las Cruces, N. M.

WANTED.—Comb and extracted honey, State price, kind, and quantity. R. A. BURNETT & Co., 199 South Water St., Chicago, Ill.

WANTED.—Comb honey and beeswax, State price delivered at Cincinnati. C. H. W. WEBER, 2116-2118 Central Ave., Cincinnati, O.

Notice!

QUIRIN, the queen-breeder, still has 100 of those long-tongued red-clover queens on hand at \$1 each, or 6 for \$5. If you want one speak quick. For testimonials see former adv'ts.

Bees Wanted!

We are expecting to establish several out-apiaries next season and desire all the bees we can get: want 'em on movable frames, and near home. They must be cheap at this time of year. Parties placing us in correspondence with those having bees to sell will be remembered next season when we have a nice lot of those long-tongued red-clover queens on hand (in case we succeed in purchasing of said parties).

In our circular we list numerous articles used by bee-keepers, on which we will give 10 to 20 per cent discount from now until the coming March. Address all orders and inquiries to

H. G. Quirin, Parkertown, Ohio.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOS, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

FENCE! STRONGEST MADE.

Bull-strong, Chickentight. Sold to the Farmer at Wholesale Prices. Fully Warranted. Catalog Free. COLLEN SPRING FENCE CO., Box 101 Winchester, Indiana, U. S. &

White Wyandottes!

Bred from Dustin's best. Some fine cockerels on hand already to ship

J. F. MOORE, : TIFFIN, OHIO.

SPRAYING
with the incomparable **BORDEAUX NOZZLE** and our world's best outfit you are also lute master of the situation. Insects and disease fall before this all-conquering outfit. See the book. It is free. Write for it now. THE DEEMING CO., SALEM, OHIO. Western Agts., Henion & Hubbell, Chicago.

The Storm Proof KING WIND MILL
produces 25 to 50% more net power from any kind of wind than any other mill on the Wheel being only 1 in, this vents the wind like a knife and is 400% more storm proof than any other. Exceedingly light, but wonderfully strong. Very sensitive—runs in lightest winds. Numerous sizes—6 ft up, both pumping and power, back geared or direct stroke. Send for circulars and prices before you buy. Medina Mfg. Co., Box 11 Medina, O.

\$2 for 10c.
Our large illustrated Drug Book contains 5000 listed drugs, medicines, family remedies, trusses, instruments, veterinary preparations, paints, oils, flavoring extracts, etc. We save you 15 to 75% on any of them. The book costs us \$2. We mail it to you for ten cents and refund the amount on your first order. Keller Chemical Co., Dept. 49 Chicago.

Union Combination Saw

For Ripping, Cross-cutting, Rabbering, Mitering, Grooving, Gaining, Boring, Scroll-sawing, Edge-moulding, Beading. Full line FOOT and HAND POWER machinery. Send for catalogue. SENECA FALLS MFG. CO., 44 Water St., Seneca Falls, N.Y.

200-Egg Incubator for \$12.80
Perfect in construction and action. Hatches every fertile egg. Write for catalogue to-day. GEO. H. STAHL, Quincy, Ill.

THE GYPHERS INCUBATOR

IS THE STANDARD HATCHER OF THE WORLD.

Used with uniform success on twenty-six Government Experiment Stations in the U.S., Canada, Australia and New Zealand, also by America's leading poultrymen and many thousands of persons in every walk of life. Guaranteed to give satisfaction or price refunded. The original and only genuine non-moisture incubator, fully covered by patent. Winner of **GOLD MEDAL AND HIGHEST AWARD AT THE PAN-AMERICAN**, Oct., 1901. Illustrated, descriptive, 32-page circular **PRICE**. Complete Catalogue and Poultryman's Guide, 224 pages, 8x11 inches, weighing one and a quarter pounds, 10c in stamps for postage. Ask for Book No. 74, and address our nearest office.

Gypfers Incubator Co., Buffalo, N. Y., Chicago, Ill., Boston, Mass., New York, N. Y.

IT TAKES FIVE CATALOGUES

printed in five different languages to tell the people of the many points of superiority of our **SUCCESSFUL Incubators & Brooders.**

One 200 egg machine will hatch more chicks than 20 steady old hens each time it is filled with eggs. They will be stronger, more healthy chicks, too. These machines will do for you just what they have done for thousands of others. Write for 1-8 page Catalog enclosing 6c to pay postage. We ship machines and handle correspondence for the East from our new house in Buffalo. Write nearest office.

DES MOINES INCUBATOR COMPANY,

Box 503, Des Moines, Iowa, or Box 503, Buffalo, N. Y.

STERN OLD MOTHER EXPERIENCE

has enabled us after 16 years to make perfect **The Reliable Incubators and Brooders.** You ought to have our **20th Century Poultry Book** in the house. It will cost you but 10 cents and will make you a master in the poultry business. **Reliable Incubator & Brooder Co., Box B-49 Quincy, Ills.**

How Your Hens Would Lay!

If you fed cut raw bone. Doubles your profit; more fertile eggs for hatching, more vigorous chicks.

MANN'S BONE CUTTER

1902 MODEL

New design, open hopper, enlarged table, new device to control feed. You can set it to suit any strength. Never clogs. Sent on

Ten Days' Free Trial. No money asked for until you prove our guarantee on your own premises, that our new model will cut any kind of bone with adhering meat and gristle, faster and easier and in better shape than any other type of bone cutter. If you don't like it, send it back at our expense. Free Catalog explains all.

F. W. MANN CO., BOX 37, MILFORD, MASS.

A LITTLE BEAUTY

is what they call the 55 egg. MARILLA INCUBATOR.

"Pretty is as pretty does" applies here, too. It is not a toy-made just like our large machines. Guaranteed to please you. "Satisfaction or no sale" our motto. Marilla Brooders the best made. Hated like

a house. Crowding impossible. Complete catalogue for 1 cents. **MARILLA INCUBATOR COMPANY, BOX 62, ROSE HILL, N. Y.**

The Sure Hatch

is the incubator for the poultry raiser, whether farmer or fancier. Anyone can run them, because they run themselves. Anyone can own them, because the price is right. Machines and results guaranteed. You take your risk. Our Game-Game Brooder is the best at any price, and we sell it very low. Handsome catalogue containing hundreds of views and full of honest poultry information, mailed free. When writing address nearest office.

Sure Hatch Incubator Co., City Center, Neb., or Columbus, O.

JUST AS NATURAL

as the bird and a good deal more reliable. Doesn't stay off the nest and allow the eggs to chill but hatches every egg that can be hatched. THE PETALUMA INCUBATOR

is absolutely perfect as to incubator essentials—proper application and distribution of heat and moisture, regulation and ventilation. For 54 to 224 eggs. **WE PAY FREIGHT ANYWHERE** in the U.S. Handsome catalog free. **Petaluma Incubator Co., Box 125 Petaluma, Cal.**

Bushels of Eggs

if you get a fast cutting **Dandy Bone Cutter.** Price \$3 up. Sold direct or 30 days trial. Handsome catalogue free. **STRATTON MFG. CO., BOX 54, ERIE, PA.**

ALWAYS READY.

The ADAM Green Bone CUTTER

is always clean and ready for work. Impossible to choke it up. Cleans itself. **The Only Bone Cutter with all ball bearings.**

Works quickly and easily. No choking or injuring of fowls by shivers or sharp pieces. Cuts a clean light shave that is easily digested by smallest chicks. Send for Catalog No. 59. Contains much valuable information on the cut

bone question. You will be pleased with it. Sent free upon request.

W. J. ADAM, JOLIET, ILLS.

The Egg Question Solved

by the HUMPHREY Green Bone CUTTER

Guaranteed to cut more bone, easier and quicker than any other of your money back. Only open hopper machine. Cuts and Egg Record free.

HUMPHREY & SONS, Box 31, Joliet, Ills.

*These prices are not the publishers' prices for these papers, but they are our special reduced prices when taken in connection with GLEANINGS. In many cases they are just one-half the regular rate.

How to get the Price for any or all of the Papers Named Above:

1. Gleanings in Bee Culture, one year, \$1.00.
2. If you want only one additional paper, add the price found in the top of the column in which that paper appears
3. If you want several papers in addition to Gleanings, each one may be had at the price named at the top of the column. For instance: Gleanings, Success (3rd col.) and Rural New-Yorker (3rd col.), will cost you \$2.50.
4. You may select as many papers from each column as you wish.
5. Every order sent us must include Gleanings.
6. Foreign postage extra.

CONDITIONS. Offers are subject to withdrawal at any time. Subscriptions to the Review of Reviews, Youth's Companion, and Country Gentleman must be strictly new. New subscriptions sent for Success, Youth's Companion, or Gleanings will receive the balance of this year free. Neither the Review of Reviews nor Post Fountain Pen will be sent in any combination amounting to less than \$2.50.

CHRISTMAS PRESENTS.—We will send all papers or pen to one or separate addresses as desired. In this way you can easily make desirable Christmas Presents.

Red Glover Queens -FOR- 1902

Warranted Purely Mated.
The Long-Tongue Variety.

How to get One for Only 30 cts.

We have arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all he mails for us will be **warranted** purely mated.

We want every one of the readers of Gleanings in Bee-Culture, who is not now a reader of the old weekly American Bee Journal, to have one of these Superior Red Clover Queens. We have received most excellent reports from the Queens we supplied during the past season. And next year our breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoker.

Orders for these fine, "long-reach" **warranted** Queens will be filled in rotation—"first come, first served"—beginning as early in June, 1902, as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you receive the new queen, no matter from whom you order).

In order that all who are not now readers of the American Bee Journal can have one of these fine Queens, we will make the price **only 30 cents** each, when taken in connection with a year's subscription. That is, send us \$1.30 (if you are a **NEW** subscriber), and we will book your order for a Warranted Queen, and enter your name on our list of subscribers and send you the Bee Journal **every week** from the time we receive your name and \$1.30 **until the end of next year (1902)**. So the sooner you send in your order the more copies of the Bee Journal you will receive. If you have not seen the weekly American Bee Journal, send for a free sample copy. Address,

GREAT CLUBBING OFFERS!

My friends, how many of you are reading some of the many most excellent magazines of the day? If you are reading none, you are missing a great treat. Perhaps you regard them as luxuries. Possibly they are in some instances. They certainly help to fill out our lives, and give to us broader views. They are like windows that allow us to look out over the wide world. This life is not wholly one of dollars and cents—at least it ought not to be. Enjoyment, pure and simple, enjoyed just for the sake of enjoyment, is desirable and beneficial. To many there are few things that are more enjoyable than the bright pages of a really good magazine. To those who wish to give the magazines a trial, and to those who are already reading them, I can offer some of the lowest clubbing rates that have ever been offered. Here is a list of magazines, together with the regular prices at which they are published:

Review of Reviews.....	\$2.50	Cosmopolitan.....	\$1.00
Current Literature.....	\$3.00	Leslie's Popular Monthly.....	1.00
New England Magazine.....	3.00	The Householder.....	1.00
Leslie's Weekly.....	4.00	Good Housekeeping.....	1.00
North American Review.....	5.00	The Designer.....	1.00
Success.....	1.00		

If you subscribe for one or more of these magazines, in connection with the Bee-keepers' Review, I can make the following offers:

Success and the Bee-keepers' Review for only.....	\$1.75
Success and any one of the above \$1 00 magazines and the Bee-keepers' Review for only.....	2.50
Success and any two of the above \$1 00 magazines and the Bee-keepers' Review for only.....	3 00
Success and any three of the above \$1 00 magazines and the Bee-keepers' Review for only.....	3.50
Success, Review of Reviews (new), and the Bee-keepers' Review for only.....	3 00
Success, Review of Reviews (old), and the Bee-keepers' Review for only.....	4 00
Success, Current Literature (new), and the Bee-keepers' Review for only.....	3 00
Success, Current Literature (old), and the Bee-keepers' Review for only.....	4 00
Success, the New England Magazine, and the Bee-keepers' Review for only.....	3 00
Success, Review of Reviews (new), any one of the above \$1 00 magazines, and the Review, for only.....	3.50
Success, Leslie's Weekly, and the Bee-keepers' Review for only.....	3.75
Success, Review of Reviews (new), Leslie's Weekly, and the Bee-keepers' Review for only.....	4.75
Success, North American Review (new), Review of Reviews (new), and the Review for only.....	5.00

Magazines will be sent to one or different addresses as desired.

New subscribers to the Review will receive the rest of this year free.

N. B.—For \$1.00 in addition to any of the above offers I will book your order for a Superior Stock queen, to be delivered next spring.

W. Z. Hutchinson, Flint, Michigan.

J. M. JENKINS, Wetumpka, Ala.

DECLINE IN GLASS

There has been a sharp decline in the price of glass, so that we are able to restore our list prices on shipping-case glass, and we can offer 8x10 glass for cold-frames and greenhouse sash, until further notice, at \$3.50 per box; 5 boxes, \$17; 10 boxes, \$32.50. We do not think the present low prices will continue long, as the manufacturers' association is as strong as ever, and prices will undoubtedly advance again after the first of the year. If you will need glass in the next few months we advise you laying in a stock now while prices are down.

GLASS HONEY-JARS.

We have spoken a number of times in this department in regard to the increasing popularity of the No. 25 jar for retailing extracted honey. They hold an even pound, seal with a rubber ring between the edge of the jar and the porcelain cap, sealed tight by means of a tin rim screwed on. After the honey is used there is nothing nicer than this jar for putting up choice canned fruit. We find that, during the past year, we have disposed of 200 gross of No. 25, besides 50 gross of No. 143, the same style jar, holding 11 oz. of honey. Last June we had a carload of these jars and the Masons. We have just ordered another carload. The manufacturers are able to pack them cheaper in crates than in barrels, and say they carry safely in these crates. We offer them from now on, put up in crates, at \$5.75 per gross; 3 gross or more at \$5.50. In partitioned boxes of 2 dozen each, \$1.00 per gross more. Packed in barrels, 50 cts. per gross more than in crates. No. 143, holding 14 oz., will be 25 cents per gross less than No. 25.

MASON FRUIT-JARS DECLINED.

It may be out of season to advertise fruit-jars; but now is the time to buy them cheap. For orders placed this month, we offer them at the following special prices. We will not list them any lower in our catalog than last season, as the price will no doubt rise again next spring, therefore these special prices are limited to the forehanded ones who buy early. If you can use a quantity, write us for special prices. These are best machine-made jars, with zinc porcelain-lined caps and rubbers, put up one dozen in a partitioned box.

Pint jars, 52c doz.; 6 doz., \$2.99; 12 doz., \$5.75.
Qt. " 55c " 6 " 3.10; 12 " 6.00.
2-qt. " 75c " 6 " 4.10; 12 " 8.00.

Special Notices by A. I. Root.

GIANT GIBRALTAR ONION SEED.

Last season the seed was all sold, and no more could be obtained. Several of our friends were disappointed. We can now fill orders, however, with new seed if you send in at once. Ounce, 20 cts.; 1 lb., \$2.50. About a dozen plants were sent rather late up to my woods garden in Michigan last season. They all made fine large onions. One of them now stands on my desk, and is 16 inches around, and weighs 1 lb. 11 ounces. It looks exactly like the Spanish onions seen in the markets. The flavor is very mild. Many people eat them raw like apples; and for cooking they are the nicest onion I ever tasted. My impression is, the seed had better be started in the greenhouse or in a cold-frame, and grow them by the transplanting method. There has been some complaint about their keeping qualities. The one on my table I propose to keep there as a test.

SEED POTATOES FOR 1902.

On page 656, Aug. 1, I gave prices on seed potatoes for planting in 1902 as follows: $\frac{1}{2}$ peck, 25 cts.; peck, 40 cts.; $\frac{1}{2}$ bushel, 75 cts.; bushel, \$1.40; barrel, \$4.00. Small seconds, half the above prices. I have been watching quotations since then, and no reliable seedsmen has made any better prices. We will ship them (when they go south, where wanted before April 1, 1902), from now until December 15 at our risk against

frost, at the above figures; or we will keep them safely for you till next spring in our specially arranged potato-cellar. We can furnish, at the above prices, White Bliss Triumph, Early Ohio, Boyce, Sir Walter Raleigh, New Russet, and Craig. As our supply of many is limited, you had better order at once if you want them. Seed potatoes, especially the earlies and extra earlies, are likely to be away up before another spring. Our seconds will probably all be gone very soon at the above low figures.

OTHER POTATOES IN SMALL QUANTITIES.

We can furnish the following kinds in small quantities, say not to exceed a peck or half a bushel: Early Trumbull, New Queen, Lee's Favorite, Freeman, State of Maine, Maule's Commercial, Carman No. 3, White Mammoth, Early Michigan.

Any of the above potatoes will be furnished in very small quantities at 5 cents per lb., or by mail at 15 cts. per lb., or 3 lbs. for 10 cts. Potatoes for premiums can be sent by mail, but 10 cts. per lb. extra for postage and packing will be required.

POTATOES TO BE GIVEN AWAY.

Everybody who sends \$1.00 for GLEANINGS may have 25 cents' worth of potatoes providing he mentions it when he sends in the money; and every subscriber who sends us \$1.00 for a new subscriber so that GLEANINGS may go into some neighborhood or family where it has not been before, may have 50 cents' worth of potatoes; but you must pay all postage, express, or freight on your potatoes. We can give away potatoes, but we can not give away postage stamps.

POTATOES FOR TABLE USE.

In our last issue I mentioned that friend Hilbert was offered 50 cents a bushel for his Russets. In a week they were up to 63 cents; and to-day, Nov. 30, potatoes are quoted in the Cleveland markets at 85 to 90 cents. By this you can see that my price of \$4.00 a barrel is not very high for choice seed potatoes true to name. If potatoes continue to rise I may be obliged to advance prices before our next issue.

PRICES ON CLOVER SEEDS AT THIS DATE.

Although the market is not very well settled as yet for 1902, as nearly as we can make out the prices will be about as follows. But let it be understood there are liable to be fluctuations, and we can not be responsible unless for immediate orders.

Alsike clover, bu., \$10; $\frac{1}{2}$ bu., \$5.25; peck, \$2.75; 1 lb., 20 cts., or by mail 30 cts.

Medium clover, bu., \$7.00; $\frac{1}{2}$ bu., \$3.75; peck, \$2.00; 1 lb., 18 cts., or 28 cts. by mail.

White Dutch clover is the same as alsike. Peavine, or Mammoth Red clover, same as medium. Alfalfa, bu., \$6.00; $\frac{1}{2}$ bu., 3.25; peck, \$1.75; 1 lb., 15 cts., or 25 cts. by mail.

Crimson, or scarlet clover, bu., \$4.50; $\frac{1}{2}$ bu., \$2.40; peck, \$1.25; 1 lb., 10 cts., or by mail 20 cts.; 3 lbs. by mail, 50 cts.

Sweet clover, 100 lbs., 10 cts. per lb.; 40 lbs. at 12 cts.; 1 lb., 15 cts.; by mail, 25 cts. per lb.

The prices of garden seeds in general will probably be much the same as last year. Peas will probably be still higher. Beans may be higher. We expect to quote prices on all kinds of garden seeds through our journal some time in January. If any of the friends should want prices earlier, we will make the very best figures we can; and should there be a decline in the market after the goods are shipped—that is, where the amount is sufficiently great to warrant it, we will make a rebate, even after the seeds are sold and paid for.

Wisconsin Farm Lands.

The best of farm lands can be obtained now in Marinette County, Wisconsin, on the Chicago, Milwaukee & St. Paul Railway, at a low price and on very favorable terms. Wisconsin is noted for its fine crops, excellent markets, and healthful climate. Why rent a farm when you can buy one much cheaper than you can rent, and in a few years it will be your own property? For particulars address F. A. Miller, General Passenger Agent, Chicago, Milwaukee & St. Paul Railway, Chicago.

GUS. DITTMER, AUGUSTA, WIS

Get the Best Queens.

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas.
Dear Friends—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I've bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season. Yours fraternally,
 J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per doz. Un-tested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per doz. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden, Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of *The Southland Queen*, the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
 HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Honey Column.

GRADING-RULES.

FANCY.—All sections to be well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional cell, the outside surface of the wood well scraped of propolis.
A. No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside of the wood well scraped of propolis.
No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.
No. 2.—Three-fourths of the total surface must be filled and sealed.
No. 3.—Must weigh at least half as much as a full-weight section.
 In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

CITY MARKETS.

MILWAUKEE.—The supply of honey is very fair on this market, and the demand seems very moderate—not quite what it should be, although there may be a reason; the attention of the consumers is attracted to the fancy show-windows of articles that please the eye as we do as taste. We quote fancy 1-lb. sections, 15a16; A No. 1, 14a15; amber almost nominal 12a14. Extracted white, in bbls, cans, and pails, 8a9; amber, 7a7½. Beeswax, 26a28.
 A. V. BISHOP & Co.,
 119 Buffalo St., Milwaukee, Wis.

CINCINNATI.—There is a good deal of extracted honey offered, and prices if any thing, are a little lower. Dark sells for 5; lighter, 5½a6; fancy, 6½a8. The prices of comb honey keep up, fancy sells at 15a16; lower grades, 12½a14½.
 C. H. W. WEBER,
 Dec. 7. 2146 Central Ave., Cincinnati, Ohio.

PHILADELPHIA.—Honey in good demand and arriving freely. Sales not so brisk on account of holidays. Trade always dull in January. We quote fancy comb, 15a16; No. 1, 14a15; buckwheat, 12. Extracted, amber, 6; white, 7a8. Beeswax, 26. We are producers of honey—do not handle on commission.
 WM. A. SELSER,
 Dec. 9. 10 Vine St., Philadelphia, Pa.

CHICAGO.—The honey market is of a slow nature, with little change in price of any of the grades. At this season of the year many of the retailers have laid in a supply sufficient to carry them over the holidays. Choice grades of white comb honey, 14½a15; good to No. 1, 13½a14; light amber, 12½a13; dark grades, including buckwheat, 10a12. Extracted white, 5½a7; amber, 5¼a5¾; dark, 5a5¼. The scale of prices varying according to flavor, body, and package. Beeswax steady at 28.
 R. A. BURNETT & Co.,
 Dec. 7. 199 South Water St., Chicago, Ill.

NEW YORK.—The demand for comb honey continues to be brisk, while stock held here is not very large, the receipts are sufficient to supply all demand so far. We quote fancy white, 15; No. 1, 14; No. 2, 12a13; buckwheat, 10½. FRANCIS H. LEGGETT & Co.,
 Dec. 7. Franklin and Varick Sts., New York.

WANTED.—Comb honey in any quantity. Please advise what you have to offer.
 EVANS & TURNER,
 Town St., Cor. 1th, Columbus, Ohio.

FOR SALE.—Extracted honey, basswood or clover, in 160-lb. kegs, at 7c; amber, 6c; buckwheat in kegs, cans, or 30 to 75 lb. wooden pails, 5½c; sample, 6c.
 C. B. HOWARD, Komms, N. Y.

We will be in the market for honey the coming season in carloads and less than carloads and would be glad to hear from producers everywhere which they will have to offer.
 SEAVEY & FLARSHHEIM,
 1318-1321 Union Avenue, Kansas City, Mo.

FOR SALE.—30 to 35 cases heartcase honey, two cans to a case (120 lbs.); new cans; 7 cts. per pound.
 JOHN A. THORNTON, Lima, Ills.

FOR SALE.—Basswood, clover, and sweet-clover extracted honey, at 7c, in kegs and cans
 DR. C. L. PARKER, Station A, R. F. D.,
 Syracuse, N. Y.

FOR SALE.—Extracted honey in 160-lb. kegs. Buckwheat, 5½; mixed, 6; basswood, 7. Send postoffice money-order on Moravia, N. Y., and will ship promptly.
 N. L. STEVENS, Venice, N. Y.

WANTED.—Honey; car lots or otherwise. Will send man to receive when sufficient amount to justify, and pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station.
 THOS. C. STANLEY & SON, Fairfield, Ill.

FOR SALE.—Fancy and No. 1 comb honey; about 2000 lbs. or more.
 WM. MORRIS, Las Animas, Col.

FOR SALE.—10,000 lbs. light-amber alfalfa extracted honey in 75-lb. cans, at 5c a pound.
 R. T. STINNETT, Mesilla Park, N. M.

FOR SALE. Extracted honey, from alfalfa, at 7c per pound. Send for sample.
 D. S. JENKINS, Las Animas, Col.

WANTED.—Comb and extracted honey. State price, kind, and quantity.
 R. A. BURNETT & Co.,
 199 South Water St., Chicago, Ill.

WANTED.—Comb honey and beeswax. State price delivered at Cincinnati.
 C. H. W. WEBER,
 2146-2148 Central Ave., Cincinnati, O.

FOR SALE.—Fine ripe extracted touch-me-not honey, in 60-lb. square tin cans, 2 cans to a case, delivered at R. R. station at 7½c. Sample postpaid, 8c.
 C. A. BUNCH, La Paz, Marshall Co., Ind.

How to get the Price for any or all of the Papers Named Above:

1. Gleanings in Bee Culture, one year, \$1.00.
2. If you want only one additional paper, add the price found in the top of the column in which that paper appears.
3. If you want several papers in addition to Gleanings, each one may be had at the price named at the top of the column. For instance: Gleanings, S. S. Times, (3rd col.) and Rural New-Yorker (3rd col.), will cost you \$2.50.
4. You may select as many papers from each column as you wish.
5. Every order sent us must include Gleanings.
6. Foreign postage extra.
7. We will send all papers or pen to one or separate addresses as desired.

CONDITIONS.—Offers are subject to withdrawal at any time. Subscriptions to the Review of Reviews, Youth's Companion, Current Literature, and N. E. Magazine must be strictly new. Neither the Review of Reviews nor Post Fountain Pen will be sent in any combination amounting to less than \$2.50.

THE A. I. ROOT COMPANY, MEDINA, O.

Gleanings in Bee Culture

[Established in 1873.]

Devoted to Bees, Honey, and Home Interests.

Published Semi-monthly by

The A. I. Root Co., - - Medina, Ohio.

A. I. ROOT, Editor of Home and Gardening Dep'ts.
E. R. ROOT, Editor of Apicultural Dept.
J. T. CALVERT, Bus. Mgr.
A. L. BOYDEN, Sec.

TERMS. \$1.00 per annum; two years, \$1.50; three years, \$2.00, five years, \$3.00, *in advance*; or two copies to one address, \$1.50; three copies, \$2.00; five copies, \$3.75. The terms apply to the United States, Canada, and Mexico. To all other countries 48 cents per year extra for postage.

DISCONTINUANCES. The journal is sent until orders are received for its discontinuance. We give notice just before the subscription expires, and further notice if the first is not heeded. Any subscriber whose subscription has expired, wishing his journal discontinued, will please drop us a card at once; otherwise we shall assume that he wishes his journal continued, and will pay for it soon. Any one who does not like this plan may have his journal stopped after the time paid for by making this request when ordering.

RATES OF ADVERTISING. These will be furnished on application.

Notice!

QUIRIN, the queen-breeder, still has 100 of those long-tongued red-clover queens on hand at \$1 each, or 6 for \$5. If you want one speak quick. For testimonials see former adv'ts.

Bees Wanted!

We are expecting to establish several out-apiaries next season and desire all the bees we can get; want 'em on movable frames, and near home. They must be cheap at this time of year. Parties placing us in correspondence with those having bees to sell will be remembered next season when we have a nice lot of those long-tongued red-clover queens on hand (in case we succeed in purchasing of said parties).

In our circular we list numerous articles used by bee-keepers, on which we will give 10 to 20 per cent discount from now until the coming March. Address all orders and inquiries to

H. G. Quirin, Parkertown, Ohio.

FANCY EXTRACTED HONEY.—An extra-fine lot of clover honey that I had reserved for bottling, but owing to change of plans will sell in bulk. From combs entirely capped and fully ripened, thick and rich. Now candied perfectly hard and dry. Cans hold 74 lbs. net. Per can, \$5.50. Fancy comb honey, 22 lbs. in case, per case, \$3.30

J. A. GREEN, Ottawa, Ill.

FOR SALE!—U. S. Patent Apiary. Protect your bees, and get more honey. You can do so with the aid of my new improved bee-hive swing, which securely protects the bees from various classes of insects and small animals, and provides a neat warm housing for winter. Will sell State, county, or farm rights upon application. Address

Chas. O. Lett, Eclectic, Ala.

Wants and Exchange.

Notices will be inserted under this head at 10 cts. per line. You must SAY you want your adv't in this department, or we will not be responsible for any error. You can have the notice as many times as you please; but all over ten lines will cost you according to our regular rates. We can not be responsible for dissatisfaction arising from these "swaps."

WANTED.—To exchange Dadant uncapping-cans, Root's No. 5 extractor, and other supplies, for honey or wax. O. H. HYATT, Shenandoah, Iowa.

WANTED.—To exchange 50 T supers, mostly unused; 25 section-holder supers, unused; 25 second-hand supers, 25 eight-frame hive-bodies, many new; 100 L. combs, 10-inch fdn. mill, Novice extractor, Porter bee-escapes, all-zinc honey-boards, queen and drone traps, zinc-perforator for making queen-excluding zinc, greenhouse or hothed glass, made up or in flat; a large quantity of 8x10 sash, also odd sizes. Send for prices. Wanted—queens, honey, wax, St. Bernard dog, or offers. J. A. GREEN, Ottawa, Ill.

WANTED.—To exchange a No. 15 two-frame Cowan honey-extractor for a No. 5 Novice extractor. ADOLPH SEGERLIN, Anita, Pa.

WANTED.—A situation as assistant apiarist, or charge of small apiary and fruit or poultry farm, in the southern or western States. Good reference can be given. CHAS. G. GIBBS, Brunswick, O.

WANTED.—Position as bee-keeper by young man, single; have handled bees all my life; own 40 colonies at present; can furnish references. I am teaching school now but shall be at liberty Feb. 14, 1902. Distance no objection; shall not hire for less than 4 months. State wages and nature of work. B. E. GOODENOUGH, Coventry, Vt.

WANTED.—Buyer for 100 colonies; eight and ten Hoffman frame hives. Over-stocked; all or part. R. A. YEAMSLAW, Walnut Grove, Cal.

WANTED.—To exchange extracted honey for foot-power saw or offers. Also wanted Texas horse-mint seed. W. C. GATHRIGHT, Las Cruces, N. M.

WANTED.—To purchase from two to four hundred colonies of bees, Langstroth hives preferred, in or near the State of Virginia. Please write. G. BOOMHOWER, Gallupville, N. V.

WANTED.—A position by an experienced and practical bee-man to take charge of an apiary or supply house. California, Florida, or Cuba preferred. Address "E," care of GLEANINGS, Medina, Ohio.

WANTED.—To correspond with honey producers east of Ohio, with the idea of adding high-grade honey to established family route. F. W. PROCTOR, Box 302, Spencer, Mass.

WANTED.—To sell 105 colonies of bees at \$2.50 each; or will rent them. H. VOGELER, New Castle, Calif.

WANTED.—One copy each 1888 and 1895 editions of the ABC of Bee Culture. Must be in good condition. Will give a year's subscription to GLEANINGS, or a copy of the 1901 edition of the A. B. C. Do not send until you write us. THE A. I. ROOT CO., Medina, O.

WANTED.—To exchange a Columbia talking-machine with 15 records, and gen'l misc., for bee-supplies or empty worker-combs in Hoffman frames; also want to buy some bees, but must be cheap and near here. PRESTON STORE & PRODUCE CO., Dority, W. Va.

WANTED.—To exchange high-grade L. Colton surveyor's compass and tripod for good bicycle, or offers. F. VAN DE MARK, Ripley, Okla. 1 cr.

Wm. A. Selser, Honey Expert,

When you buy honey, send a 3-oz. bottle, have it tested, to be sure it is pure. Price \$2.50 per sample. By doing this you may avoid over ten times this amount in litigation with pure-food laws. Chemist's certificate given.

The A. I. Root's Co.'s Office, 10 Vine Street, Philadelphia, Pa.

G. B. LEWIS CO., WATERTOWN, WIS.

*	<p>Our new catalog, describing and listing the FINEST LINE OF BEE KEEPERS' SUPPLIES IN THE WORLD, will be ready about the first of the year. If you have not been receiving a copy annually, send us your name and address and one will be mailed to you free. Prices will be same as last season with the exception of the narrow plain sections with no beeways, which will be 25 cts. per M less.</p>	*

BEE - SUPPLIES!

**ROOT'S GOODS
AT
ROOT'S PRICES.**

C. H. W. Weber, Cincinnati, Ohio.
2146-2148 Central Ave.

A NEW AND COMPLETE stock for 1901 now on hand. I am The Root Company's representative for Cincinnati and surrounding territories. . . You save TIME and FREIGHT CHARGES by having goods shipped from here. Convenience of railroad facilities here enables me to do so. Before buying elsewhere, write for my prices and catalog, which will be mailed you free of charge.

GLEANINGS

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.

BEE CULTURE

ILLUSTRATED SEMI-MONTHLY
Published by THE A. I. ROOT CO.
\$1.25 PER YEAR MEDINA, OHIO.

VOL. XXIX.

DEC. 15, 1901.

No. 24.

I'M AFRAID that, after reading p. 939, some beginner will expect a little more than he will realize. I suppose that \$28 dollars from a swarm in a fairly good season would be considered by Mr. Doolittle as rather exceptional.

I AM SURPRISED to find that, with a single exception, Maeterlinck's Life of the Bee is spoken of on both sides of the ocean as a work without fault. Can it be that its brilliancy and beauty blind the eyes to what are really serious defects?

IMPRISONMENT of nuclei for 24 hours, as mentioned p. 148, would not only give time for young bees to hatch out, but would go a great way toward making the bees stay that were already hatched out. [Yes, I think that is a good point.—ED.]

THE CHICAGO CONVENTION, Dec. 5, was a great success, both as to interest and numbers in attendance. C. P. Dadant, W. L. Cogshall, and others brought it up nearly if not quite on a level with the old Northwestern conventions which were so popular. No reason why there should not be a Northwestern at Chicago every fall. Editor York is a capital presiding officer.

"NO SET PROGRAM" is mentioned in the notice of Michigan convention, page 940. That seems to be getting to be quite the rule, and a good rule it is. The long papers can be read just as well in the bee-journals, but the face-to-face discussions can not be had without the meeting together. [Yes, providing we had live men to do the discussing; and usually our bee conventions have such men on hand.—ED.]

J. E. HAND says, p. 932, that the rule to winter outdoors colonies heavy in bees and stores, and cellar those light in either, holds good "wherever it is at all desirable to winter in the cellar." Perhaps, perhaps, friend Hand; but whenever I've tried win-

tering strong colonies out it has been at a loss. [But, generally speaking, I think friend Hand's rule a good one. Here is the situation for a large number. They have more bees than one cellar can accommodate. Obviously some colonies will have to be outdoors—which shall they be? The strong ones, of course.—ED.]

THERE YOU GO again, Mr. Editor, on a side track. You say, p. 929, that in *some* seasons \$5.00 per colony might be made in Florida, etc. Sure; and a good deal more than that in Marengo. But I don't begin to reach \$1.00 in the worst year; and I ought to reach \$5.00 in the *very worst* year if it is correct to say "that at least \$5.00 a year is a conservative estimate." [I beg pardon, doctor; I was giving you rather moderate wages. Let me see. Some time ago you figured up what the earning capacity of your bees was per colony. Have you got the data handy? If so, let us have it so that we can see how much you *are* satisfied with.—ED.]

F. B. SIMPSON, in *Review*, stands sponsor himself for the idea that freak best queens should not be selected to breed from, and tells me to come on with my brickbats. Well, here comes one, F. B. G. M. Doolittle says that for 30 years he has followed the plan of breeding from the best (and, if I understand him correctly, the more of a freak a queen was by way of securing exceptional yields, the better she suited him as a breeder), and as a result he has not only brought up his average, but has secured a much greater uniformity in the yields of different colonies. I don't say your plan is not better, F. B., but I believe breeding from the greatest yielders—freaks, if you please—yields excellent results; and it is easier to follow out than your plan for us common folk.

THAT SLEEPY FELLOW on p. 936 says he would pronounce a queen pure Italian if her workers were all three-banded or all five-banded. Please wake up, Rip, long enough to tell us some things. Would you pronounce pure a queen such as the editor mentions on the next page, with workers

varying from three to five bands? If not, and if there are no queens which produce *all* five-banders, do you pronounce impure all that produce part five-banders? Suppose I take the yellowest five-banders I can find, and have a queen of that stock mate with a drone of stock having black blood, but so little of it that no worker of that stock has less than two bands. The progeny of such union would not, of course, be pure Italian; and, if kept without any mingling, would not the black blood remain? By persistent selection from that stock, don't you believe I could get uniform three-banders? and would you call those uniform three-banders with the black blood still left in them—would you call them pure Italians?

AN EDITOR who will insist upon ungrammatical expressions ought to be "took" and "shook" until "well shaken." If "shook" (aside from its grammatical form) expresses to *your mind* an idea different from the idea expressed by "shaken," Mr. Editor, then there's something wrong with your mind, and the sooner you send it to some country school for repairs the better. If you mean bumped, say "bumped," as I think they do in England, but don't say "shook" when you *mean* either "bumped" or "shaken." I've had enough work trying to learn correct English without any bad examples "in high places." [Look here, doctor; if you are going to correct all the accepted ungrammatical English, you will have a job on your hands. For instance, when you sit on your doorstep, and call your wife out to admire the beautiful sunset, do you speak of the *setting* or *sitting* sun? Come now; there are bigger giants that are setting bad examples for you. Go for *them*. Now, honor bright, don't you think it sounds better to say the sun *sits* than *sits*?—ED.]

COMMISSIONER JONES, of the Illinois Pure-food Commission, is severely blamed on p. 942. I don't know, but I *think* he is not guilty. Newspapers are not always reliable. Some one else may have said what is credited to Mr. Jones, or what he did say may have been distorted. But severe blame is due somewhere, and, according to the *Amer. Bee Journal*, the *Chicago Tribune* is not willing to do its fair share to help undo the mischief already wrought. [I think you are probably correct, for I have already had intimations that a subordinate, instead of Commissioner Jones himself, furnished the reporter with that rank nonsense. In my editorial, you will remember, I stated that the Commissioner is *reported* to have said so and so; but whether he did or did not say it, if his sentiments are not expressed it is his bounden duty to correct the mistake. In the absence of any statement to the contrary, he stands as approving the nonsense. My own feeling is that, if I were in his shoes, the "subordinate" would be politely told to turn the reporters over to his superior; and, further, there would be a corrected statement over my own

signature that would set me right before a very large class of people—the honey-producers.—ED.]

THE MOUNTAINS have a big credit to their account, p. 941, for storing snow and ice to be used afterward to irrigate the great deserts. But ought not the debit side be given also? If the mountains were not there would there be any desert? Does not the mountain condense and stop the moisture that would otherwise descend in beneficent showers on the now desert plain? [That is a hard question to answer. But even if the mountains did not act as a barrier to the moisture or rains, they still have the advantage that they are great storage reservoirs, if I may use so incongruous a term, for millions of tons of snow. Suppose, for instance, that Illinois, Iowa, Kansas, and Nebraska had always had to depend on irrigation. Think you they would have had the drouth of last season, or ever would have one? Never. Then, besides this, the land in the vicinity of the mountains can be watered whenever plant life requires it. The mountains make it possible to have a *dry* and hot atmosphere; and with storage reservoirs for water the conditions are such that certain kinds of crops can be grown that can not be grown with any success in the rain-belts. Understand, I am not claiming that irrigated lands are better than lands in the East; but the fact is, one supplements the other.

Again, some people positively can not live in a rain-belt, owing to pulmonary troubles. There are thousands and thousands who have to find life and health by moving to these dry climates—climates made so, if your theory is correct, by the mountains. Somewhere I saw the statement that over half of the inhabitants of Denver and Los Angeles are "one-lungers." While this is probably greatly overdrawn, yet you would be surprised to see how many among your casual acquaintances have gone to these places because they had to or die in the East.—ED.]

Who says the winter has no cheer
For man or bird or beast?
If summer reigns within the heart,
Stern Zero brings a feast.

We have just received from Mr. Wartmann, of Bienne, Switzerland, two maps of that country by cantons, or counties. By the various colors one can see by one map just how many colonies of bees per 1000 inhabitants there are in a given locality; and by the other, how many colonies there are at certain elevations, which latter vary immensely, of course, in that country—the

New Hampshire of Europe." Such an arrangement for the different States here would certainly be interesting, and perhaps profitable. The European governments pay great attention to such things. We thank Mr. Wartmann for sending the maps, of which he himself is the author.

We have just received a copy of a French bee-journal, published quarterly in Tunis, Algeria, Africa, entitled *Bulletin de la Société d'Apiculture de Tunisie*. Algeria being an integral part of France, this journal is fully abreast with the times, although it says that bee-keeping there is mostly in the hands of the natives. It contains 32 pages the size of this, with a table of contents of great merit, especially good for beginners. Those who can read French will find this journal worthy of particular attention. The French have had control of Algeria since 1856. On the northern coast, nearly parallel with the shore of the Mediterranean, running a thousand miles west of Tunis (near ancient Carthage), there is a well-equipped railroad, built by French engineers. Morocco, on the west, has not a mile of railroad, but is still in practical savagery under Mohammedan rule.

AMERICAN BEE JOURNAL.

Mr. York wrote a vigorous protest to the *Chicago Tribune* relative to Commissioner Jones's misleading statement about the bogus nature of white comb honey, as explained in our previous issue. He delivered the article in person, with a section of his own best white comb honey. The *Tribune* printed a few garbled extracts from the article, but in a way that seems more like a defense of its course than an attempt to right a wrong. Doubtless that paper poses as a "friend of American labor," yet it rides rough-shod right over it. But the regard the *Chicago* dailies have for authentic information is shown by their treatment of the canteen question in that place. Bro. York, those sheets are hopeless. As you say, it is "exasperating" to read them.

ROCKY MOUNTAIN BEE JOURNAL.

This journal is holding its own in point of interest, and even gaining a little. The two following editorial items are worth pondering over:

The logical outcome of the present great era of trust formation is national, State, and municipal operation of all industries dependent upon the concession of special privileges.

The "cellar apiaries" in Los Angeles and San Francisco are credited with enormously augmenting the honey crop of California, and greatly to the detriment of producers of honest honey. Here is work for the new honey association. The glucose-mixers should be relentlessly prosecuted to the full extent of the law. No mercy should be shown them—nor the adulterator of any other food product.

A new source of danger to the bees is described below:

At the recent meeting of the Utah State Bee-keepers' Association a good many bee fatalities are reported as resulting from the poisonous fumes exhaled by

the great smelter-stacks. Both bees and smelters are numerous in the vicinity of Denver, but we have never heard of the latter being fatal to the former. Possibly a different system of smelting, employing more virulent chemicals, is necessary for the extraction of the precious values from the ores of Utah. The remedy would seem to lie in the use of smoke-consumers; and their use would need to be compelled by a stringent State statute, as trust corporations have never been known to be influenced except by brute force or self-interest.

Concerning foul brood in Colorado, the following editorial is strong but interesting:

In years past, Colorado has, perhaps, suffered more from the ravages of foul brood, in proportion to the number of colonies kept, than any other State. The truth is, in some of the districts nearly all the large apiaries were swept away before their owners realized the fatal character of the disease. These men never read a text-book on apiculture nor a bee-journal, nor belonged to a bee-keepers' association, and resisted the bee-inspectors until their bees were dead and their hives a rotten mess of corruption. Most of these fossilized apiarists have never re-entered the ranks, and the few that did have stepped out into the light and have become progressive apiarists in all that the phrase implies.

Here is the next paragraph, which is more hopeful:

While foul brood whipped out many of the original apiarists of the State, it is not considered a serious menace by the intelligent "new blood" that has succeeded them. In the "locality" broadly included in the term Colorado (probably just as applicable to the entire Rocky Mountain region) the character of the honey-flow is such as to permit a system of management for comb honey that practically renders the apiary immune from the disease.

A BURLESQUE ON LONG TONGUES.

The Factor of Time in Producing New Varieties.

BY S. E. MILLER.

For some time past, the wheels in my head have been working on a new problem. I have conceived the idea of developing a strain of bees whose tongues will be long enough to reach the nectar in the red-clover blossoms. It should not take over three to six months to bring this strain to perfection, and—just think! what an acquisition this would be for the queen-rearer! and it might also indirectly benefit the honey-producer. I think it was Dr. Miller who, some years ago, suggested that all jokes should be labeled. I will, therefore, state that the above is a joke. However, there is a serious side to this question, and it is the serious side which I propose to discuss.

The long-tongue discussion has hardly been discussed. There has scarcely been time to rear a tested queen and ascertain the merits of her workers since the discussion commenced, until—presto, change! and we have the long-tongued bees made to order, guaranteed to cure or money refunded. If your druggist does not keep them, send a dollar direct to Dr. Long Tongue, golden-banded red-clover queen-breeder.

Now, brother bee-keepers of the queen-rearing persuasion, do not conclude that I wish to compare you with the fellow who induces simple credulous people suffering from some imaginary affliction to send their hard-earned cash for his nostrums in the hope of being benefited. The advertiser has, of course, a right to say what he likes in the space which he pays for, provided he uses no bad language; but when we say we have been or pretend to be able to furnish queens whose workers will gather the nectar from red clover, are we not, in ninety-nine cases out of a hundred, claiming what is not true? Are we not going too fast in pretending to have now that which we may hope to develop in a decade or perhaps a century? Great improvement in the animal and vegetable kingdoms has not been accomplished in a day or a year.

Many patient, energetic, studious, and intelligent minds have worked on these problems for decades, even centuries. Many men have devoted almost their lifetime to the improvement of a single species, or certain varieties of various fruits, flowers, animals, and fowls. Note, Mr. Burbank, of California, has devoted a great portion of his life to the improvement of plums, potatoes, etc., and has also, I believe, by hybridization, produced some new and rare gladioli. Considering the above, how can we claim to have the desired long-tongued bee? Such a bee is something not to be found every day in every queen-rearer's apiary. Among many hundreds of queens that I have had under my observation in the past 16 years, I had one real red-clover queen.

One of the chief if not the first essential to the development of the red-clover bees of the future is the controlling of the mating of queens. With this accomplished we shall be in a fair way toward accomplishing our object. In the absence of this the best we can do is to prevent the flight of undesirable drones. The red-clover bee of the future will not come up to our standard simply by having a long tongue. The ideal long-tongued bee, in addition to possessing the long tongue, must be industrious, vigorous, hardy, as gentle as possible without detracting from any of the first four essentials; and in order to please some of us it must have yellow bands around it or be yellow all over. The queens must be prolific, and possess all other desirable traits.

Now, Mr. Queen-rearer (I almost said queen-breeder, but you are not a queen-breeder—you rear the queens, and they breed according to their own sweet will), have I set before you a hard task? If so, do not be discouraged, but go forth and set to work; and after you have done all you can, and your son has taken up the work where you left off on account of old age, and has devoted a score of years to the development of the ideal long-tongued bee, he may come back and report that he has lengthened the bee's tongue by a third, and has not let any of the other essentials retrograde, but, on

the contrary, has improved them; but don't you come back to-morrow or next week or next year, and say, "I've got that queen now," or I will tell you you're another.

Remember, now, ninety per cent of that queen's daughters (no, I will drop to fifty per cent) must be as good as she is; but if only ten per cent come up to the standard I can not take her, and your son will have to go back and teach his son to take up the work, and labor to reach the goal.

I should like to tell all about that red-clover queen; but as this article is already longer than I had intended I will simply state that her workers gathered nectar from red clover, and stored it in quantities in 1-lb. sections, while all other bees in the yard gathered practically nothing.

Bluffton, Mo.

[I have been thinking myself that something more ought to be said along the lines presented by Mr. Miller. There was a time when there was a great craze for yellow bands. It grew to such intensity that many breeders were looking only for color, forgetting every thing else. While this was true, there were a few who looked for excellence as well as beauty. But the temptation in most cases was to breed out dark and breed in the yellow, at a sacrifice of many very desirable qualities. It was J. M. Rankin or Dr. Miller, I believe, who started the discussion about long tongues. It will be remembered that I discouraged the latter, and even ridiculed the idea; notwithstanding, he insisted that the Europeans had found that there was considerable variation in the length of tongues, and that we in America ought to give the matter some thought.

Two seasons ago, when red clover was at its height, I determined to look into the matter. The bees were working on a field of red clover near our out-yard. I noticed how the Italians (there were no blacks) probed down into the shorter flower-tubes of the clover-heads near the edges; how they would reach down into the longer tubes, and apparently reach in vain. I watched the bees come and go on one head for some little time. After they had secured all the nectar it was possible for them to get out of the little tubes, I pulled the head; then, taking the end of each tube in turn, I squeezed it up till I could force the drop of nectar out. In the long tubes I observed that the bees could not get more than a tenth, or merely a taste of the nectar. The shorter ones they sucked dry. I then began to see that, if those same bees had longer tongues, or tongues long enough to reach into the longest tubes, we should be able to get *tons* and *tons* of good honey that now literally goes to waste. It was during this season we had one colony from an imported queen that far outstripped every thing else in the apiary on red clover; and, as I have before stated, this colony would gather honey and store it when other bees would be trying to rob, or would starve

to death without a supply of honey already in the hive. I immediately began to measure the tongues of its bees, and I was not a little gratified to see that these same bees had longer tongue-reach than those that were inclined to rob at the same time. Fearing that I might have made a mistake I had one of our men do some measuring, and his observations were the same as mine. I then began to think that there might be something in long tongues. We called for reports. A few came in, that for the time being seemed to confirm the theory, but they really proved nothing. We asked for more reports, but they have not come in. As I have already said, no *substantial* proof has been advanced that long tongues are in proportion to the honey yield, and so far there is only a theoretical advantage. And now that two seasons have gone by, it is but fair to say that the proof is still lacking, either because of the apathy of bee-keepers to report or because there is no real direct relation between the two. But the value of our red-clover queen under consideration we considered rested not on the length of the tongues of her bees, but on the fact that they gathered honey from red clover when other bees were idle; and her daughters were sold because the mothers' bees gathered honey in excess of other colonies; and I believe that those who are advertising long-tongued stock are really placing more stress on their honey-gathering qualities, and not because they may have long tongues as compared with other bees in the yard.

Mr. Miller is strictly correct in saying that it will take years to stretch the tongues of our present varieties. But in the mean time let us concentrate our efforts toward breeding bees for business. If we get long tongues, well and good; but let us not go so far as to concentrate all our energies on yellow bands or long tongues, or some other feature that of itself amounts to nothing.—Ed.]

THE SEASON OF 1901.

A Big Honey-flow for our Big Friend; Long Tongues and Honey-gathering.

BY G. M. DOOLITTLE.

I commenced to keep bees in the spring of 1869, so have been in the bee-keeping business for nearly 33 years. During those years we have had many peculiar seasons, but none so much so as that of 1901; therefore I thought the readers of GLEANINGS might like to know something about it.

We have been in the habit, of late, of laying considerable stress on location, which was right and proper; but the bee-keeper who fails to realize that seasons are *not* alike, and so conforms to set rules of working, expecting that the same rule will work the same result each season, if applied to the same locality, will find that success

will not always follow such a course. The successful apiarist must keep an eye out for *all* the little and big kinks which often come up in the business, so as to turn each and every thing to the best advantage, leaving no stone unturned which will allow of a pound of honey being obtained which would otherwise have gone to waste by not being treasured in the hive, and, finally, into some of the necessities or luxuries of home life for himself and family. These thoughts suggest themselves from the fact that a honey-flow came so suddenly from an unexpected source this season that Doolittle came very near being caught with his "porridge-dish bottom side up," last June. The bees were set from the cellars about the middle of April; but the weather was so bad for the next two weeks that it seemed that the results would have been better had they been left in the cellar till May 1. High winds, with mostly cool, cloudy weather, prevailed all through the last half of April, yet there would often come a few minutes of sunshine, by the sun's peeking out through some rift in the clouds, when the bees would go out in search of water and early pollen, only to get lost by the clouds going over the sun again. With May came nice weather for the bees, and they went to brooding with a will, as plenty of pollen was to be obtained from the different early pollen-bearers, while early honey came in from the willows and soft and hard maple. Then it came on to rain, and it did rain most of the time for nearly or quite a month, being cool withal the most of the time, so that, in spite of all I could do by way of feeding or coaxing, brood-rearing stopped pretty much entirely in all colonies, the "pretty much" being at the out-apiary, and the "entirely" here at home. I was so eager about this brood matter, as brood at this time meant workers in the basswood-honey harvest, that, before I was hardly aware of it, the red clover, standing on the hundreds of acres in this locality, commenced to assume a pinkish hue, and then turn red, something not known for nearly or quite 20 years, owing to a midge working in the head, thus blighting the buds just before the blossoms opened, so that we had neither blossoms nor seed in these parts for that length of time.

At about the same time the rain ceased, the skies' cleared off, and the weather became warm, and then hot—so hot it could hardly be endured by humanity from June 20 to July 10. June 15th I stopped feeding, and on the 17th I thought it would be best to take the feeders off, some of which were placed on the hives in extra-surplus arrangements. When I came to the first of these surplus arrangements I found the bees in there building comb with a little thin nectar in the cells, the sight of which stimulated me to greater activity, if possible, than that manifested by the bees. Feeders were rushed off, and the supers, filled with sections, rushed on, so that the night of the 18th found every thing in readiness for the

harvest, which, by the 20th, was coming in at a good basswood rate, only that the nectar from clover is much thinner than that from basswood. Had I not had every thing in readiness to set right on the hives (the surplus arrangements being all filled during the winter with sections having foundation and baits in them) I should have lost much from this rush of nectar coming on so rapidly from an unexpected source. The red clover continued in bloom from June 15 till nearly August 1, that giving nectar in June and the first third of July being mostly from the small kind, while, beginning with July 10, the mammoth kind gave the most, the yield from each being curtailed to quite an extent, as field after field was cut for hay. Basswood yielded fairly well, but the yield from this was mixed with the clover yield, so that it was impossible to tell just what the basswood yield would have been had no clover been in bloom.

With August came a dearth of honey which lasted till about the middle of that month, when buckwheat began to yield very moderately, and continued thus for about two weeks, when the season for 1901 was over, so far as honey was concerned. The larger number of colonies in each apiary were heavily drawn on for queen-rearing, those at the out-apiary to supply bees for nuclei, and those at home by having their queens taken from them to supply early orders, so that I can not tell what the yield from the whole would have been had these colonies not been robbed in this way. From the few colonies which were not drawn on in this way I obtained an average yield per colony of 180 lbs. of section honey, here at the home yard, and about 175 at the out-apiary, this being the highest average yield of any year in my bee-keeping history. The best before was in 1877, when the average yield was 166½ pounds per colony. But in 1877 a small part was extracted honey, while this year I extracted none.

Having the results at my command, and seeing that Prof. Gillette, of the Colorado Experiment Station, desired bees for the purpose of measuring their tongues, I sent him 12 bees from each of four colonies, numbering them as 1, 2, 3, and 4. No. 1 was from my old honey-gathering stock, which I have been about 30 years in trying to perfect. No. 2 was from a queen I got by way of exchange in 1900; No. 3 was from a gold-en breeder, and No. 4 was from a queen of the long-tongued stock introduced April 29, 1901.

Colony 1 gave 261 completed one-pound sections, 21 partly filled, and had about 42 lbs. in their hive October 1 for wintering, or about 317 lbs., all told.

Colony 2 gave 44 poorly filled sections, and had 12 lbs. in the hive October 1, or about 54 lbs. in all.

Colony 3 gave 68 completed sections, and had 37 pounds in the hive October 1, or 105 lbs. in all. But this colony was drawn on for brood for queen-rearing several times a week during the whole of the season, so it

would be impossible to tell just what it would have done had it been otherwise.

Colony 4 gave 65 sections and had 28 lbs. for winter. The result of Prof. Gillette's measurements is as follows: No. 1 gave an average tongue-length of 25.4 hundredths of an inch; No. 2, 25.6; No. 3, 25.6; and No. 4, 25.8. From these measurements it will be seen that the bees from the long-tongued stock really had the longest tongues by four-tenths of a hundredth of an inch over No. 1. It will also be seen that the colony having the shortest tongues gave more honey by 65 pounds than all of the other three colonies, having longer tongues, combined. All were worked as nearly alike as possible, with the exceptions noted.

It may be claimed that all these colonies gave bees with unusually long tongues. This may be so; but it does *not* prove that the gathering was in proportion to the length of tongue.

On page 401, May 1, 1901, I see a proposition to send the measurements of tongues from both good and poor workers to Dr. Miller, so he could tabulate a report of the same. I have been looking anxiously for that report; but if it has been given I have failed to see it. When Rambler reads the above he may feel different from what he did when he wrote on "back numbers" on page 745. No, no, Rambler; Doolittle *always* rejoices when one brings out something ahead of what has been done in the past, and *never* thinks of "whacking" back because some one has been enabled to give an advanced thought on something he has dug out. I have been experimenting and writing these 30 years only that I might be of some little help to the bee-keeping world; and to the one who is thus working, improvements which are *real* are always a cause for rejoicing. True Christianity consists, in part, according to the Bible, in making the world better for having lived in it.

[A partial answer to this is given in the answer to Mr. Miller, just preceding. In the record of your four colonies, the measurements of the tongues are so nearly alike that really there is no difference, at least for practical purposes—that is, honey production. Between the bees in No. 1 and those in No. 4 there is only $\frac{1}{1000}$. This is so infinitesimal that it counts for nothing. If, however, No. 1 showed a tongue-reach of $\frac{16}{100}$ and No. 4 $\frac{23}{100}$, or $\frac{2}{10}$, then there would be a decided variation. It is evident, however, that colony No. 1 did not produce the 317 lbs. of honey, all told, because its bees had longer tongues than those of the others. Its honey-gathering qualities were dependent on some other characteristic or combination of them. Prof. Gillette's figures show tongue *length*. Now, it may be that the actual tongue *reach* was much greater in the colony that produced the largest amount of honey than in the others. You will remember I have drawn a distinction between tongue *reach* and tongue *length*.—Ed.]

RAMBLE 195.

Peculiar Conditions in Central California; the Rapid Growth of Alfalfa; too Much Irrigation the Cause of Blight in the Blossoms.

BY RAMBLER.

It does not take a great amount of observation in Central California to learn soon that the conditions for honey-production are entirely different from what they are in the older and more familiar fields in the United States; and, furthermore, the conditions are very perplexing. In New York, where I first learned to sling honey, and, in fact, in all portions of the East, if honey comes at all we know within a few days when the flow will be at its best, and we can prepare our colonies accordingly; or, in other words, the wide-awake bee-keeper will have his dish right side up and will catch the liquid. It is the same in the sage districts of Southern California. But in the great San Joa-

quin Valley the bee-man does not know where he is at, half of the time. The bees start in very nicely in February upon the almond bloom, and then through March and into April there is a succession of fruit bloom; and just as the colonies begin to get ready to swarm, and do swarm sometimes, there comes a dearth of honey; and all through May, and often through June, the bees use up what little surplus honey they have gathered, and, unless fed, they starve.

I am told that the bees do commence work sometimes in June upon alfalfa; but during the two years of my experience, this commencing to work has been between July 1 and not until late in the season. If the yield commences early in June, some of that big force bred in March and April holds out to gather some honey and to hold up the breeding of bees, and a good honey crop is secured. The same may be said with some modifications if the yield does not commence until July. During the past season the honey-yield was deferred until well up to September, and the alfalfa cut but a small figure in the yield; and upon this point I should like to compare notes with bee-keepers in other alfalfa districts, where irriga-

A CALIFORNIA BEE-KEEPER WITH DOG AND GUN.

It is during this starvation period that the bees are brought up with a round turn in their swarming plans; and, no matter how much honey they may get afterward, the fever does not return; and I am wondering, Mr. Editor, if it is the same conditions that check swarming in Texas and other points.

My experience in this location covers two years; and during this time all of the breeding from fruit bloom has been a useless tax

tion is practiced, and learn if the same conditions exist.

In Central California we have an abundance of water for irrigation. It is used lavishly upon the alfalfa-fields, and the growth of the foliage is rapid and rank. In the height of the season I planted a stake in the field, and every 24 hours measured a particular stalk, and for several days the average growth was $1\frac{3}{4}$ inches per day. All through April and May the alfalfa comes to maturity, and is mown; but the blossoms are of no use to the bees, for they are blasted.

The editor of GLEANINGS will remember the rank growth of alfalfa all around my cabin, and the fuzzy white tips of blasted blossoms. This condition continued all through the period of irrigation; and, as a consequence, alfalfa yielded but little honey. When I observe such effects I naturally try to find the cause; and I had a

suspicion that it was from too much flooding with water. In comparing notes with my neighbor, Mr. Fray, he entertained the same idea. He has kept bees in this valley for several years, and his explanation of the cause of blasted blossoms is very reasonable. He says that, when there is a light rainfall through the winter, little snow on the mountains, there is less water for irrigation, and it is taken from the ditches in June. Then the non-irrigated fields of alfalfa will bloom, and yield honey. But if there is a heavy rainfall, and all of the mountain reservoirs are filled, and the water is not taken off until August, there will be but little alfalfa bloom and honey, and that has been the condition during the past season.

To verify Mr. Fray's opinion, there was a patch around my cabin that did not get its drenching with water, and that particular spot was well covered with blossoms. It seems, then, that the conditions in Central California are directly the opposite of the conditions in the South. There they must have the rain; but here only a small amount is necessary; but with either a light or a heavy rainfall there is an uncertainty when the flow will commence.

The past season has been one of extreme uncertainty. Up to Sept. 1 but little honey had been extracted; but late fall flowers came on in abundance; our hopes were revived; the extractor was operated clear up to Oct. 30; and in my case, where I expected barely three tons, nearly a carload was secured.

The great problem in this valley is to learn how to hold the bees in when they want to increase, and make them increase when they don't want to. I think the problem is not very hard to solve; but as my plan is as yet theoretical I will not now present it.

Before I leave Central California I wish to say a word about my good neighbors, and somehow I always have splendid neighbors. Mr. W. W. Westcott and his good wife are bee-keepers, and always working together in the apiary. Mr. W. could hardly open a hive unless the "Mrs." was on the other side of it operating the smoker. Perhaps her knowledge of bee-keeping was not very bookish, but upon one point she excelled; and that was in the baking of graham bread, an article of food for which the Rambler is partial.

Mr. Fray was another good neighbor. His portable honey-house was described some months ago. When not engaged with the bees he has a habit of taking long trips to the mountains, with dog and gun; and many a deer and bear and mountain lion have scented powder from his trusty rifle.

I herewith present his photo, with said gun and dog. He thought the pile of honey cans and cases around my cabin would show up well as a background. Said cans and cases were nearly all filled afterward, which is not a very discouraging feature.

Another good neighbor is a fine old Swiss

gentleman, and his combination is bees and a vineyard, and the product is honey and wine. That is not according to my idea for the use of grapes; but upon my first visit my neighbor did not know my sentiments, and he brought out a bottle of his choice wine. I told him I never drank wine.

There was a perplexed expression on his face, and in his broken English he said, "You vas him Ramplear; tid not I zee he peektur in him bee-baper you vas had him a pottle?"

"Ha! you vas him Ramplear; tid I not zee he peektur in him bee-baper you vas had him a pottle?"

"Oh! no, sir;" said I, laughing; "that was not a bottle, it was my camera. See, I have it with me now." He put up his hands as though to ward off any intention of picture-taking on my part, and I let that part pass; but in his apiary I found a great curiosity—a hive of bees and growing grass,

Bermuda grass is a genuine pest in this country; and when it gets into a vineyard, or an alfalfa-field, if neglected at all it will

soon take full possession. A hive placed near it, with a crack in the bottom, is sure to be invaded. The bees have a vexatious time with their octopus. I mentioned the case to other bee-men, but they treated it as nothing new, for they had all experienced the same thing, and a simple remedy is a tight bottom-board.

[The cause that brings about the cessation of swarming in Central California is very different from that which operates in Texas and Arizona. In the former, the bees stop swarming because starvation stares them in the face; in the latter, the very opposite extreme—an onrush of honey—checks increase.

All through the line of my travels I heard complaints about alfalfa-blossoms blighting at certain seasons and in certain localities. I remember distinctly my conversation with the Rambler at his cabin home on this point during the past summer; but at that time I think he had not fully settled in his own mind what was the cause. If it is indeed too much irrigation, then bee-keepers ought to contrive some way, if they have a grain of influence, to get their ranchmen neighbors to use less water. I should be inclined to believe that the very thing that brings about the blight of the blossoms would also operate to affect the quality and quantity of the hay. This is a matter for experiment stations to take up providing they have not already done so. In the mean time I should be glad to hear from any in the alfalfa regions, and have them give their experience and observations.—Ed.]

DRONES AND QUEENS.

"Good morning, Mr. Doolittle. Did you ever read any of Mr. Kirby's writings?"

"Yes, I think so. He was quite a prominent man years ago, and thought by some to be quite an authority about matters pertaining to bee culture at that time."

"An old gentleman visited me a few days ago, and he said Kirby claimed that the drones assisted quite largely in the production of royal jelly, which he believed; and that good queens could not be produced unless there were plenty of drones in the hive where queens were being reared. I tried to make the old gentleman think that he was mistaken, but it was of no use; so I have come to see you to see what you think of the claim."

"This is only the unearthing of the old theory which Kirby and others believed in forty to fifty years ago."

"Why do you call it a theory?"

"Because all of my experience goes to

prove that the drones are of no use whatever except to fertilize the queens, with the possibility of adding their mite to the warmth necessary during cool nights for the development of the brood, and possibly in helping to maintain the desired heat for comb-building."

"But suppose a colony is very anxious for drones. Do you not suppose they would be more contented if they had such?"

"Undoubtedly, if a colony which was anxious for drones could be kept actually droneless, both in the brood and mature drone shape, drones would aid toward contentment; but I have never known a case of a colony desiring drones but that they would manage to raise some in some corner of the hive. So I reason that such a thing as keeping a colony, desiring drones, absolutely droneless, is pretty nearly, if not quite, a myth."

"But what was your experience going to prove—that Kirby's claims were only theory?"

"When this theory was being resurrected, some 25 years ago, I had a number of queens superseded early in May, before there were any drones in the apiary, and they were as good queens as I had ever reared. Now, if the drones assist in the preparation of royal jelly these queens should have been inferior, to say the least, to those reared when drones were plentiful. Is not this right?"

"It would look that way, certainly."

"Again, I have many times had queens reared in March and April, when there would be no drone brood in the hive, or any in any hive in the whole apiary; and after a month or more, when drones had emerged and were flying, had them fertilized and become fair queens. However, queens reared in a season when no honey or pollen is being gathered, and at a time when regular feeding can not be done, are usually inferior to those reared when honey and pollen are plentiful."

"But the old gentleman told me that if I would remove a queen from a colony having plenty of drones I would see a profusion of queen-cells dotting the combs, which I could not secure at a time when there were but few drones in the hive."

"This is another of the old ideas, and something I have proved as fallacious. In August, 1873, I think it was (I could tell by referring to my diary), I had the largest lot of queen-cells built by the removal of a queen which I ever had. The number, as I recollect it, was 163, yet this hive was devoid of drones at the time, having killed them after the bass-wood-honey flow was over."

"Were these cells all good ones, and did they produce all good queens?"

"Of course, all did not give good queens; but the number of as good queens as can be reared this way was in proportion to the cells built. If my memory serves me right, queens were reared from this colony on account of the queen showing no disposition

to rear drones, as she rarely laid eggs in drone comb before the middle of June."

"The old gentleman further said that, if a queenless colony of black bees was supplied with eggs from an extra choice pure Italian queen, the offspring would not be pure, on account of their being contaminated with the royal jelly produced through the black drones and nurses. What do you think of this matter?"

"Pallacious as any of the rest."

"Why do you say that?"

"The first Italian queen that ever came into these parts was an extra good one. In fact, I have had very few queens that would so nearly duplicate themselves in their queen progeny as this one would. As she came late in July, not a drone was reared from her brood that season, nor was there a single Italian drone or queen in all this section of country when she came. She was introduced into a colony of black bees, as there were no others to introduce her to; and as soon as the larvae from the black queen were all sealed, she was taken out and introduced to another colony, when the former colony went to work rearing queens. Thus she was changed until queens were obtained for the whole apiary of about 25 colonies. These queens mated with black drones, of course, as well as to be raised by black bees. Now, according to what we have always been taught, these queens, having all mated with black drones, should have produced hybrid workers, or bees, a part of which should have been black, to say nothing about their being nursed by black bees, and fed royal jelly in which there was an element coming from the black drone, according to what the old gentleman would have us think."

"Yes. And did you not find it so?"

"No. Not one of those queens ever produced a black bee."

"That is strange."

"Yes, and I thought so at the time; but since then we have had other instances where queens were so thoroughly bred along the Italian side that their daughters never gave a black bee, though they met pure black drones. But when the daughters of these queens came to produce bees, then it was that part of the bees emerging from the cells were black. I used to think the theory of black nurses imparting impurity to the royal larvae was invented to palm off poorly marked Italian stock. But as we have heard so little about this matter of late, I have not touched it before in some time."

"What is royal jelly, or what is it composed of?"

"As to what royal jelly is composed of, I do not feel competent to tell, not being a chemist. But all of my experience goes to prove that the drones have nothing whatever to do with it."

"Well, what is your idea then?"

"Ideas are of little value by the side of facts; still, I will tell you what I think, and perhaps some one will tell us in the

near future how far these ideas are out of the way. My idea is that royal jelly is the same food as that given to the worker larva during the first 48 to 60 hours of its existence, and that it is the abundance of the supply that is kept up from the time the larva hatches till the cell is sealed that changes the egg laid for a worker into a queen. It is also my opinion that said food is composed of honey, pollen, and water, taken into the stomachs of the nurse-bees and formed into chyme, when it is fed to the larva. But I must leave you now, as I have an article due for the *American Bee Journal*, which must be written yet to-day."

J. H. MARTIN, ALIAS "THE RAMBLER," IN CUBA.

MR. MARTIN, whom we sent from California to Cuba to write up bee-keeping in that island, famous for its honey, arrived there safe and sound. He writes us he is so well pleased with the country that he will sojourn there for a while. He will continue making the production of honey his business, and during his spare time he will make tours over the island, taking along his camera and gathering material for his *Rambles*. This series of articles will be unusually interesting, and will begin soon.

NOMINATIONS.

A SHORT TIME ago I nominated Mr. Wm. Rohrig, of Tempe, Arizona, and Mr. Harry E. Hill, of Fort Pierce, Fla., as possible members of the Board of Directors of the National Bee-keepers' Association. The latter, it will be remembered, is editor of the *American Bee-keeper*. While he appreciates the honor thus conferred, he says he deeply regrets the use of his name in this connection; that the *American Bee-keeper* prefers remaining outside, with the assurance that it will earnestly co-operate with the Association in every move which it recognizes as beneficial to the fraternity. He prefers, then, not to have his name appear as a candidate. Mr. Rohrig feels that he is not competent to fill the position; and that, if he thought his name would be seriously considered, he would ask to have some other name put in its place.

I can guarantee that either or both of the men would fill the office very acceptably; but I do not wish to push their names forward if they do not wish to be considered.

SLANDERS ON THE HONEY BUSINESS.

EVER since the alleged interview with Commissioner Jones, in which the latter is made to say in effect that all fancy and No. 1 comb honey is adulterated because it has

white cappings, there has been an unusual crop of slanders in the papers concerning the honey business. The result of this is that the bee-keeping industry has been damaged to the extent of a good many thousand dollars. We have sent every paper publishing such stuff a respectful protest, telling them the facts and sending a copy of our \$1000 reward card,* to the effect that we will pay that much to any one furnishing proof that comb honey is successfully manufactured, and so perfect an imitation that it can not be detected from the genuine. We have made our replies in such a way that it will be easy for them to back down if they will. The editor of the *American Bee Journal* and of the *Modern Farm and Busy Bee*, I note, are also engaged in the same work.

It is the duty of every bee-keeper who sees such false reports to answer them at once. The refutation should be couched in respectful language, and should be accompanied with proof or \$1000 reward offer.

I shall be glad to believe that Commissioner Jones did not utter the foolish statements that are imputed to him. I am also pleased to learn that, so far as he is concerned, he is probably quite willing to have all such statements corrected providing the papers will print his denial. At the Chicago convention recently, a committee consisting of Geo. W. York, C. P. Dadant, and Dr. C. Miller was appointed. But our subscribers must not expect these gentlemen to do all the work of answering these canards. A bee-keeper in his own locality has more influence—much more—than an outsider hundreds of miles away.

CANDIED HONEY—"EDUCATING" THE PUBLIC.

In a letter recently received from R. C. Aikin, of Loveland, Col., he writes that he put up over 20,000 lbs. of honey in lard-pails, let it candy, and that now there is less than a fourth of it left, or a total of 16,000 lbs. of candied honey sold in three months. He is now buying more extracted, and proposes to put it in paper bags, just "to save money and to head off the tin trust," as he says. This goes to show what can be accomplished in one's own locality by educating the consumers. In the East they have been taught to call for extracted, not candied. It may be well, in view of the large amount of the glucosed product on the market in jelly-tumblers, with a little piece of dry comb in it, to educate our consumers to the use of candied honey. Just imagine, if you please, the glucose people trying to make their product candy solid. If the consumers of the whole United States were "educated," or made to understand that our product in the granulated form of a certain amount of consistency was absolutely pure, they would buy honey in that shape and give the glucosed

jelly-tumbler the go-by. There, now, I do not mean to advocate that we of the East should put out candied honey exclusively. Oh, no! but I only desire to show that, where a locality is "educated" to the use of honey in this form, it would buy quantities and quantities of it, as well as clear extracted, because it would know it was getting *pure* honey.

SQUARE VERSUS TALL SECTIONS.

THE demand for the tall is certainly increasing. Already in several markets it is outselling the square shape. A short time ago I picked out two fancy plain sections from our stock, one of each type, photographed them, and here is the result.

They are both equally well filled, and weigh the same. One section is $1\frac{1}{8} \times 4 \times 5$ inches; the other one, $1\frac{1}{2} \times 4\frac{1}{4}$ square. While the figures above show an actual difference in thickness the appearance does not. Now, then, which box looks to be the larger of the two? If you were the consumer, and the same price were charged for each, which one would you take?

It costs the producer no more to produce one than the other. Many grocers find that the tall ones are taken in preference, and have been obliged to advance the price a cent or two, so that in some localities the tall box brings a higher price.

Now, please do not understand me as saying that this applies to all localities, for I know it does not; but many a bee-keeper would do well to produce the two kinds and let them stand on their merits on the market.

PROPOSED FOUL-BROOD LEGISLATION FOR NEW JERSEY AND THE STATE OF MAINE.

ELSEWHERE I have referred to the fact that an effort will be made to get a foul-brood law passed in New Jersey. Black and foul brood have crept over into that little State, and some of the bee-men there are beginning to realize that something must be done. The State is small, and an inspector's expenses would be comparatively light. While an appropriation of \$500 would be enough for Wisconsin, \$100 or \$200 would do for New Jersey.

Mr. George N. Wanser wrote me, asking for suggestions. In reply I told him it was

*We will furnish \$1000 reward cards free for this purpose.

very important that there be a State bee-keepers' association; and that the first business of that association should be to pass suitable resolutions calling attention to the prevalence of foul brood in that State, and the need of legislation; that it would not be possible, ordinarily, to get a foul-brood bill passed unless the law-makers of the State know that the State organization of beekeepers is back of the movement.

Mr. Wanser, complying with my suggestion, is very desirous that such an organization be formed in his State. Every person interested in the welfare of the bee industry is therefore requested to send him, at Cranford, N. J., his name and address, so arrangements can be made for a date and place of the first meeting.

Mr. J. B. Mason, of Mechanic Falls, Me., is making a similar effort to call a State meeting for a like purpose. Those interested will of course put themselves in communication with him at once.

FOUL BROOD IN MICHIGAN; INSPECTOR RANKIN'S REPORT.

WE have just received a report which will speak for itself. I well remember when we were trying to get the law passed, under which Inspector Rankin was working, the statement was made that there was no need of this law; that foul brood was confined to small localities, and quite isolated from the great honey sections of the State. But what are the facts? Out of 3286 colonies, the Inspector finds 402 diseased. This does not look so bad; but when he says he found the disease present in 119 apiaries, or 57.7 per cent of *the whole number*, then the situation is worse than we had reason to suspect. It goes to show that the law was passed none too soon. If it had been enacted two years ago, foul brood would not have got such a start.

Another fact, somewhat alarming to Ohio bee-keepers, is that the disease is "more prevalent in the older sections of the country; that is, they are more diseased in *Central and Southern Michigan* than in the northern part of the State." Italics mine. That means to the Ohio bee-keepers that the disease is working very fast over into our State already. Originally it was in Ontario and Wisconsin; and it became so bad that foul-brood legislation had to be enacted in those States. When it was brought under control in Ontario and Wisconsin the disease naturally worked toward the State where there was no law—Michigan. After getting a good foothold, then the law was passed. The whole logic of events shows that Ohio must follow suit, for we can not and must not be the dumping-ground of Wisconsin, Michigan, and Ontario.

In a similar way the bee-keepers in the States bordering on New York (where there is a good law) can well stop and reflect. In fact, an effort is already being made in New Jersey, or will be made, rather, to get

protective legislation. California has a good law, but it is already evident that the disease had got a big start before the inspectors could get in their work.

To the Honorable Dairy and Food Commissioner:

SIR—I herewith submit my report for the work done during the months of July, August, September, and October, as State Inspector of Apiaries. I have visited in all 206 apiaries, having in them a total of 3286 colonies. I have found 402 diseased colonies, making a total of 12.1 per cent of those inspected. I have found the disease present in 119 apiaries, which is 57.7 per cent of the whole number inspected. It will be noticed that the majority of the yards that contained the disease have in them only a few, and many times only one colony. It is impossible to tell exactly how many of the diseased colonies have been destroyed by the owners—perhaps 50 per cent of those condemned. I have been compelled to burn only one colony against the will of the owner. These apiaries were scattered through the counties of St. Joseph, Hillsdale, Lenawee, Washtenaw, Jackson, Calhoun, Barry, Eaton, Ingham, Livingston, Oakland, Macomb, St. Clair, Lapeer, Genesee, Shiawassee, Clinton, Ionia, Muskegon, Montcalm, Gratiot, Saginaw, Iuscola, Sauiiac, Oceana, Mason, Lake, Manistee, Wexford, Benzie, Kalkaska, and Antrim.

I have found the disease more prevalent in the older sections of country; that is, there is more disease in Southern and Central Michigan than in the northern part of the State. In the north it is confined to localities, and is not of very long standing. In almost every case it can be traced back to the bringing-in of diseased bees or fixtures from the South. In the Southern part, however, the disease is scattered promiscuously, and breaks out in yards, infecting many colonies, without any apparent source of contamination.

I have found many bee-keepers who are perfectly ignorant of the disease; and, even when it is present in their yards, and a large proportion of their bees are diseased, they fail to see that any thing serious is wrong. These bee-keepers, of course, belong to the class who keep a few bees as a side issue, and are not posted in modern apiculture. Then, again, I have found the disease present in the apiaries of specialists in bee culture, who are unfortunate enough to be located in the same vicinity with one of these other bee-keepers who are not posted. The uninformed man will not listen to the advice and pleadings of the specialists, but will leave diseased colonies to die, and be robbed out by the bees from the larger yard, in this way working ruin on the helpless specialist, who can not control the action of his ignorant neighbor. Then, oftentimes, when this specialist resorts to the protection of the law to compel his neighbor to clean up the diseased yard he is looked upon by the people of his vicinity with the utmost contempt.

The most active agents in spreading the disease are, first, that of robbing out colonies which have become weak and run down; and, second, that of using old hives in which the bees have died from the disease.

A grave difficulty arises when treating the bees to overcome foul brood, in that it is a very hard matter to impress upon the uneducated man the necessity of careful work and the nature of bacteria. He will neglect some small but important matter, or fail to take some necessary precaution in order to insure success. As a consequence, the treatment is frequently a failure. This is not always the case, however; many apiarists are eager to learn all that is to be known about the disease, and by careful, persistent work have stamped it out of their yards. The treatment used by many apiarists has been to kill the infected colony with sulphur, remove the hive to a cellar, and cut out and save for home use all good honey, scrape clean, and disinfect the hive, finally burning all refuse, scrapings, and inside furniture. This method of treatment entails much less work than attempting to cure the colony, and the honey and also the hive are saved.

The needs are great, and many localities where the disease is known to exist have not been visited at all. Many of the localities visited this summer must be covered again at the beginning of next season to insure the effectual stamping-out of the disease. I have met with the most hearty co-operation on the part of the intelligent apiarists of the State. They have not only manifested an interest in the work, but in many cases have materially assisted in the eradication of the disease in their locality.

Respectfully submitted,

JOHN M. RANKIN.

Lansing, Mich.

NOTES OF TRAVEL.

The Most Extensive Bee-keeper for his Age in the United States; More about Arizona Bee-keeping.

BY E. R. ROOT.

I desire to introduce to you to-day the youngest "big" bee-keeper in the United States, Mr. W. L. Chambers, of Phoenix, Ariz. For one so young he owns more bees than any other person in the land. Short in stature, slight in frame, boyish in face, he has achieved results in the little time he has kept bees that even some of our veterans who have been years in the business might well envy. At the age of 15 he started with seven colonies which he bought and paid for out of his own savings in chicken money. But, unfortunately, foul brood got into those precious seven the first season; but, nothing

W. L. CHAMBERS.

The youngest big bee keeper in the world.

daunted, he went about to cure them. Said his neighbors, "He never will make a bee-keeper; he is too frail—too small. He would have done better to stay in the chicken business;" and when foul brood broke out and his \$15 investment nearly proved a failure they said, "I told you so." But give up bee-keeping just because he had a little bad luck at the start? Not he. He was made of better stuff. Even if he was small and only a boy, he meant business. In spite of his loss from foul brood he saved out of what was alive more than enough to make up for his loss. Listen: He actually made one colony out of the seven the next season bring him in a revenue of \$20 of clean cash. If we add to this the increase and what the other colonies did we can see

that his investment panned out probably better than the chicken business would have done. But this was because he *started* right and had a business head, because he adopted the good rule of making the bees pay their way; for the only money he ever invested outside of that earned by the bees themselves was that \$15 of chicken money. He soon increased the seven colonies up to a fair-sized apiary. His bee money, as fast as he earned it, he kept and invested it in more bees and hives. So successful was he in his management that *he bought one whole yard outright, and made that yard pay for itself in one season.*

He could not afford to buy factory supplies; but somehow he managed to get a foot-power buzz-saw operated by means of a crank. He was too small and light to furnish the power, so he hired a man, turning the crank while he did the cutting of the boards. Mere boy as he was, there are no factory hives that are better made, and I think I know what I am talking about. He kept on working this way economically, keeping always before him the good rule of investing no money unless the bees furnished it; and so successfully has he carried out this policy that now he has over 500 colonies, and is *only 20 years old.* Think of it. This feat is the more remarkable from the fact that he was so frail and health so poor that he had to be taken out of school early. He could not do the ordinary hard work on the fruit-ranch of his father; neither could he confine himself to school, and therefore he took up bee-keeping. With the exception of the little help he hires, he does all the work himself. By using brains he manages to avoid the lifting of heavy extracting-supers, and thus saves his back (none too strong for such work) some strains that might otherwise be put upon him. Since engaging in bee-keeping he has had fairly good health, and, what is more, he not only makes both ends meet in his business but he is making money.

As soon as Mr. Chambers found I was in that vicinity he chased up and down the country on his bicycle, trying to find me. Finally, after going hither and yon, just missing me, he located me out in the country, going to the home of Mr. Wm. Rohrig in the night. I then made an appointment to meet him the next day, and, sure enough, bright and early he was on hand with a pretty little trotter and a nice light easy single buggy, both of which were bought and paid for out of the profits of his bees.

We first drove over to his father's, who, we found, was running a fruit-ranch in one of the most favored sections in all Arizona, for that business. And such fruit! On arriving at his home a big dish of luscious mammoth strawberries was placed before me. Hot and dry as I was, those berries filled a long-felt want. While engaged in taking care of the fruit a younger sister of Mr. Chambers brought out an old hen which had come from an egg that had been hatched on the shelf in the house; for you

will remember that I said the climate in Arizona is so very warm and uniform that even eggs, under some conditions, if left long enough, will hatch right on the pantry shelves.

After stopping at the beautiful fruit-ranch of the senior Mr. Chambers we took the road again to visit some of the out-yards. The next place we stopped at was the Chambers Asylum apiary, so named because of a public institution in that vicinity. The yard is right in the midst of a lot of alfalfa-fields, and hence it is, of course, very favorably located.

Fig. 2 shows an interior view and how the hives stand on low benches running from one end of the shed inclosure to the other.

The object of this is to bring the hives up to convenient working distance. Some of them are deep square hives which he bought up that he does not like.

All through this part of Arizona are used very extensively little square frames; and when one buys up apiaries he very often is impelled to take a hive and frame that he does not like, and that was the case with Mr. Chambers. As fast as he can, he is trans-

FIG. 2.—CHAMBERS' ASYLUM APIARY.

ferring them into hives of Langstroth dimensions, as he finds they are more convenient, and better in every way; and in this connection I will state that he is very emphatic in that he wants thick-top-bar frames one inch wide, and gentle Italians. He thinks life is too short to fuss with poor contrivances when it costs but little more to have things right. I noticed that the bees at this apiary

in fact, at all his yards that I stopped at—were very gentle. This is owing to the fact that there are no breaking of bur-combs, or very little of it, to irritate the bees during extracting time, and the bees themselves are from imported Italian stock. We could go all through the yard without veil or smoker; and this was in marked contrast to my experience at some of the other apiaries I visited in that part of Arizona where hybrids and thin top-bars are used.

Right adjoining the Asylum apiary was an extracting-house, Fig. 3, having wire-cloth sides at one end, and covered with cheap cloth for a shade. Mr. Chambers has these structures at each yard; and during times of robbing he can carry on extracting secure from intrusion; and

FIG. 3.—THE CHAMBERS EXTRACTING-HOUSE.

FIG. 4.—ANOTHER OF MR. CHAMBERS' OUT-YARDS.]

those bees that do get inside are allowed to get out by means of bee-escapes.

HOW MR. CHAMBERS AVOIDS THE USE OF
QUEEN-EXCLUDERS.

He prefers Langstroth hives, ten-frame in width. The full ten frames are used in the brood-nest, making a spacing of 1 $\frac{1}{8}$ s from center to center. The extracting-supers are of the same width, and in these are put eight frames spaced far enough apart to fill out the space. This, he says, discourages the queen from going above, because the combs are too deep for ordinary brood-rearing. When he uncaps he cuts the combs down to the width of the top-bar, leaving the cells deep at the bottom as well as at the top. He acknowledges that some prefer excluders; but he says thick combs, in his experience, prevent the queen from entering them, and they are easier to uncap.

THE ECONOMIC IMPORTANCE OF COTTONWOODS TO ARIZONA.

I have already said that all the apiaries in Arizona, so far as I knew, were under those long sheds, with one exception; and that one is

the apiary of H. L. Sanderson, of Phoenix, located under a long row of cottonwood-trees, as shown in Fig. 5. Mr. S. himself stands in the foreground. These trees, I think, were only about four or five years old; and yet, look at their size! Give them five years more and they would be veritable monarchs.

Like the eucalyptus of California, cottonwoods are veritable God-sends to the arid climate of Arizona. They are very rapid growers -- so rapid, in fact, that they in a few years come to be mammoth shade-trees.

This portion of Arizona was originally a perfect desert; and even after it was reclaimed by means of irrigation there were no trees. It was soon found that the cottonwoods would thrive amazingly, and they were set along near the ditches, in front of residences, or wherever water could be easily obtained; for nothing will grow here in Arizona, as I have already explained, un-

FIG. 5.—H. L. SANDERSON AND HIS APIARY UNDER THE COTTONWOODS.

less there is water. The climate and soil are such that, given water, the most luxuriant growth can be obtained; and this is especially true of the cottonwood. Nearly all the roadsides are skirted on one or both sides with irrigation-ditches; and along the ditches are these trees. In one of our drives with Mr. Chambers or with Mr. Rohrig, I do not remember which, we passed a line of them some 15 or 20 inches in diameter, and through them was running barbed wire. Posts had been set out, and wire tacked on them. The posts began to sprout at the roots and at the top, and grew into trees; and there they were, mammoth spreading shade-trees, with the wire running right centrally through them. They grow so rapidly that they can be grown and cut for firewood; but for building purposes the timber is almost valueless.

you cite it just as if it were a fact that these people had bought 10,000 cases, and apparently assume that they must necessarily have many of them left on hand — to show that my estimate of the crop must be wrong. False premises lead to erroneous conclusions. On Feb. 3, 1901, the Escondido people asked me to submit prices on cases and cans, saying they might want from "3000 to 5000, if the yield is a big one." The yield was not a big one with them, and they did not take even as many as their lowest estimate. I am in position to *know* just how many they, as well as others, did take, and it was upon positive knowledge in the premises that I based my estimate for the whole of California. Of course the careful reader will see that there is absolutely nothing said as to actual yield, but the average reader will say, "Escondido is a little bit of a side station, and they bought 10,000 cases and did not have honey enough to fill half of them, therefore Clayton's a Bull, and the truth is not in him." C. H. CLAYTON.

Lang, Cal., Nov. 23.

THICK HONEY DURING DRY SEASONS.

The past summer has cut our honey crop down to a mere pittance of what we expected in the spring. Bees can not make honey when there is none to gather. I managed to fill two alcohol-barrels with a mixed variety of extracted. I never saw such hard work in extracting as this year. It seemed as though the water was all evaporated out of the honey, and it was as thick as old buckwheat honey is in cold weather. Did you ever notice that the dry season seemed to work that way with the honey you were extracting? I shall sell my honey as it is, for I have had poor luck in canning it in glass cans. It seems funny that people will pay 15 cts. for a section of honey that will not weigh a pound, and lots of comb at that, when they can for a shilling get a pound of pure honey. E. L. BLACKMORE.

Aplington, Ia., Sept. 25.

[In hot dry climates, especially those in the West, the honey is always thicker. It is not surprising that, during a very severe drouth in a locality usually having considerable humidity, the honey should be thicker.—ED.]

A CORRECTION FROM CALIFORNIA.

Friend Root:—Referring to your last issue of GLEANINGS, page 907, letter from Jamul and your comments thereon: Both letter and comments are misleading. Your correspondent avers, "so he is told," they decided "there would be 10,000," and then goes on, without even an "if," to make his figures, portraying the immensity of the crop from "a mere speck." Here is no information as to the number of cases actually needed or used. Then, in your footnote,

WASHINGTON AS A BEE COUNTRY.

Please tell J. O. Haynes, page 908, that, if he wishes to keep out of alkali water and hot weather, by coming to the State of Washington he will have to come west of the Cascade Mountains; then he will be in God's *chosen* country for water, climate, fruit, etc. Here we have no hot weather; 70° is the average in summer; and for a few days, not to exceed two weeks, it goes up to 80 or possibly 90. He will find no mosquitos, chigoes, ticks, flies, or gnats, and scarcely any fleas; only one kind of snake, and that a garter snake. In winter, away up here in the northwest corner of the northwest State of the Union, he will scarcely see it below 40°. I can now pick the finest of roses, pansies, daisies, sweet peas, red clover, white clover, and dandelion blooms all on my five lots, and can do so almost every week in the year. He will find no windstorms here; no thunder and lightning, and plenty of nature's best and purest spring and snow water he ever saw, and living is as cheap as anywhere, and plenty of every thing. But he won't find this a very good bee country, for the simple reason that the summers are entirely too cool, caused by a continued northwest wind which blows over the Olympic Mountains, which are continually covered with snow for many miles in distance. I have kept bees here six years. The first year I was away out in the woods, and they made over 100 lbs. per colony, part extracted and part comb. For the next four years they made from nothing to 25 lbs.; but this year they did well, making 125 lbs. of comb honey right here in town, and the country around here is overstocked with bees, and also cattle, which run loose and eat up all the bee-pasture. A SUBSCRIBER.

Centralia, Wash., Nov. 27.

Rejoice, and be exceeding glad.—MATT 5:12.

The Bible is a hopeful book; in fact, it holds out hope when nothing else in the world does, and when the whole wide world has absolutely nothing to offer to make one hopeful or cheerful. It runs all through the book. It offers encouragement and cheer to the fainting heart under all circumstances. In that celebrated sermon on the mount, called the "beatitudes," Jesus offered encouragement to those in trouble. He said, "Blessed are the poor in spirit; they that mourn; the meek; those who hunger and thirst after righteousness; the merciful; the pure in heart; the peacemakers." What a beautiful character all these things in a single person would make up! Then he closes by saying that a blessing will come to us when we are persecuted and misrepresented for doing right. He says we may rejoice and be glad; and this thought is what I have taken for my text. Let us go on a little further in that chapter from which I have quoted. He tells us we are the salt of the earth and the light of the world. Oh what a power for good in the world is the man or woman who can always "rejoice and be glad"! I do not mean that one should always have a broad grin or be exhibiting joy or gladness by noisy demonstration. What I have more in mind is a quiet inward joy and gladness that is so deeply rooted it can stand the knocks and jars of the busy world. I do not see how there can be any real joy and gladness in any human heart without faith in God, or a dependence upon him. When you get up in the morning you ought to be glad. You *may* be glad. Thank God for giving you a human life to live, the *first thing you do*, and keep the thought in your mind all day long. Keep saying to yourself, if you can not do it otherwise, "Thank God for the *privilege* of showing faith and hope in him, in my daily contact with the world." I know how hard it is, for I am trying it right along. A letter was just laid on my table. The writer of it is a young man, and he tells me some of his troubles and trials. He says in the outset that it seems to him that "God is pretty hard on him." I presume we are almost all of us tempted at different times to let such thoughts come into our minds. We ask how it is that God *could* allow things to occur in this way. Do not harbor such a thought for an instant, dear friends. It is anarchy, or something worse than that. When Satan can persuade you that God is not *fair*, or that he is not doing his best for you, he will very soon get you into trouble; therefore thank God the first thing you do every morning as soon as you wake up. Then thank him for the difficulties that are

going to beset your path before the night comes. If you are letting God lead, you surely *will* meet with difficulty. You will be tempted to be cross and impatient and uncourteous. When I was up there in the woods I did not have nearly as much temptation of that sort as I do now. I was relieved of my responsibilities for the time being. Yes, I *might* stay up there and *shirk* my responsibilities. I might let letters lie on my desk from people scattered all over where GLEANINGS goes, wanting my advice in regard to matters of health. Others want advice about spiritual matters. Sometimes some of the great writers for our standard periodicals, because they have read these Home Papers, want me to give them my opinion in regard to their difficulties. Sometimes I am surprised and almost startled to think my opinion should be valued on matters away up above my quiet life. Suppose I should become cross and impatient, and inform the writers that I have more business on hand now than I can profitably attend to. It just now occurs to me that the above *may* be true; but what a poor specimen of a follower of Christ Jesus I should be if I should *refuse* to lend a helping hand!

The only way for me to do effective work is to keep hopeful, pleasant, good-natured, and brave. I do not get very much persecution nowadays; but I see a good many others who are persecuted oftentimes because they are helpless. I am sometimes tempted to do as Moses did when he struck down the Egyptian. But that was Moses' first and greatest blunder—that is, if I read correctly. I wish to do the very best and wisest thing for both oppressed and oppressor. How shall I do it? By being hopeful, thankful, and cheerful. It is the same way with you, my friend; for you can not expect to conquer difficulties at all unless you are hopeful and thankful, and, I should say, unless you are continually praying the great Father for help and advice and instruction.

The President of the United States is just now making himself exceedingly popular with the American people at large by putting men into the various important offices who are *best fitted* for them. In another direction he is making a host of bitter enemies by this new way of proceeding. May God give him grace, and may our people give him such encouragement that he will not *care* what his enemies *do* and *say*. I need not remind you that there is a tremendous need of capable men to fill important places—more need than the world ever knew before. A few days ago an engineer on the Wabash road made a mistake resulting in the death of about a hundred people. I mention this to suggest to you the need of careful men, or men who are competent in every way to take charge of important positions. Not long ago somebody on our premises turned a certain valve. I suppose there are a thousand or more valves in our whole establishment. Then

there are about as many electric buttons and switches. Once in a great while some boy comes to work for us who does not seem to have sense enough, or does not seem to have caught on to present times enough, to keep his restless fingers away from the valves or electric buttons. Well, as I was saying, somebody (we have not been able to find out who), at half-past four in the afternoon, turned a valve. It very soon threw things out of joint. Investigation was started; but as nothing *seemed* to be out of place anywhere, the matter was dropped till the next morning; then it was found that, had a fire occurred during the night, it would have found us with the water supply cut off. Now, it is not alone the engineers who occupy positions of grave responsibility, but even the small boys have more or less responsibility resting on their shoulders almost as soon as they enter any big establishment.

Well, some people seem to have the idea that one can not bear responsibility and keep good-natured. Some time ago we had an engineer in our employ who objected to the increased responsibilities (on account of enlarging our works) that rested on his shoulders. He said the responsibility was getting to be too great for any man; that, if we kept on, it would make a man crazy, and he would have to go to the insane-asylum. Well, I have thought since that time there might be a grain of truth in his remark. His successor is a very good-natured, active, intelligent man who has studied electricity, steam, etc., in a technical school. For many months he shouldered his cares and worries with wonderful cheerfulness and good nature; but when that valve I have mentioned was shut, without giving him any notice, or without his authority, he was pretty full of indignation. It may have been righteous indignation, for it was a serious matter. And by the way, it is a very difficult matter indeed to protest against certain kinds of carelessness or thoughtless meddling, and keep in a Christian frame of mind. With all of my talk, and with all my exhortations, I am afraid I am, in this line, only a poor bungling follower of the Lord Jesus.

The Bible teaches us that we should be hopeful under all emergencies, and I believe it is possible.

Our old pastor, Rev. W. S. Ament, who has been for years a missionary in China, gave us a talk last Sunday at our church. He was with the little band at Peking when they were surrounded by Boxers, and expected to lose their lives every minute. He said he was not afraid nor disturbed when he heard the first gunshot that seemed to be the opening of the attack on their little band. He said it gave him a thrill of joy, notwithstanding the danger, for it meant to him the *redemption of China* from heathenism. Now, I hope I should have the same courage if called upon to stand before the cannon's mouth; but I am really *afraid* my courage would not be equal to Bro. Ament's.

A good many public servants seem to think it is a part of their business to be overbearing and domineering. When I am traveling on the cars, and have my bicycle along with me, I am always in a hurry to get it from the baggage-car: and in order to save the time of the busy baggage-master I have been in the habit of taking the check off my wheel and handing both checks to the baggageman. A few days ago I commenced to slip off the leather strap, when the baggageman yelled out, "Let go of that wheel until I get ready to take the check off myself." I apologized, and assured him I had no thought of taking liberties; that in traveling I often did that way to save the baggageman's time. I was careful to catch his eye and let him see I was not only friendly and good-natured, but not at all appalled by his domineering way. He softened down a little, and said if he should let everybody help themselves to their own baggage the baggage would soon be gone, and he would get "fired" in no time. Now, this man could just as well have enforced his authority by telling me in a gentle way that my proceeding was contrary to the rules.

Not only should the Christian man or woman be cheerful and pleasant and courteous and kind to *humanity*, whether it be high or low, rich or poor, but he should be courteous and kind to domestic animals. I can hardly tell you how I have been pained within the last year by seeing horses scolded, whipped, and sworn at, when they were doing their very level best. When a horse comes out of the stable in the morning he thanks God for having given him a life to live. He is glad, too, at the prospect of going to work and helping along the great machinery of this world. How do I know? Well, I admit he has not told me so in plain words, but I know pretty well how horses feel by their actions, exactly as I know how bees feel by *their* actions. The horse enjoys life—that is, if his owner will let him enjoy it. It is fun for him to learn new tricks; to be taught to adapt himself to circumstances; to watch his master and see what is wanted, and to learn to do it in the very best possible manner. Oh how I have longed to see the owner or the driver give his horse a pat on the neck, and hear him tell him, with kind words, that he has done *well*, in order that *even the horse* may "rejoice and be glad"!

On our ranch we were pulling stumps and tearing out roots. Sometimes it was a question whether the team could pull the stump or whether they *ought* to pull it. The owner said they would pull it if we gave them a little time. When the horses had done their best, and the obstruction did not come, the wise driver would say, as he patted their glossy necks, "Well, girls, you have done pretty well; but I guess we will let you try it *now* in another direction." His team was a big heavy pair of mares. They understood what he meant by pulling off in another way, and they swung around

without trouble or getting tangled in the whiffletrees. When they pulled in the new direction some of the roots snapped, and they knew *as well as he did* that the stump was coming. After he had rested them a little he tried them in the direction they went first, and the stump was out. Now, it would be better for the team to let them succeed, even if it did take considerable time, than to have the horses see we tried the stump and gave it up. Horses easily learn to lose confidence in their driver. They take his "dimensions" about as quickly as he takes theirs. Now, suppose that driver had called his horses fools, and scolded them, and may be whipped them unreasonably because he got angry. It would have spoiled the enjoyment and happiness of the horses as well as their driver, perhaps, for all day. Do you smile because I suggest that a horse may be made miserable all day because some incident of the morning has broken his spirits or spoiled his peace of mind? Why, I have seen a horse that started out in the morning with head up, eyes bright and ears erect, catching in every word that was said, and every thing that was going on. I have seen such a horse hang his head in a sort of listless despair that was almost pitiful to behold, just because the man who happened to be over him for the time had whipped and scolded and sworn at him until his ambition was all gone, and he did not take any more interest in the work being done than the plow he was laboring to pull. The man who has the love of God in his heart so that it overflows constantly, even in the direction of his horse, will find a thousand things to indicate to him day by day that his horses know more of what is said and of what is being done than anybody gives them credit for. I have seen a driver, just because he was tired, fly into a passion, and yell at and jerk his horses when they were doing the best they knew how, but made a mistake. On one occasion I had a team that worked for me two days. A different man drove the team the second day. These two men had a different phraseology in talking to their horses. The first day the horses had been taught a peculiar way of operating to do their work best. When the new man got hold of the lines he did not know about this, and so he whipped, cursed, and yelled at them just because they followed the custom of the day before. I remonstrated, and explained matters; but as soon as I got out of sight this fellow was abusing the horses in just the same way. Why, I think the horses were entirely right and he entirely wrong. It seemed to me that day, from every point of view, that the brutes had more sense, and ever so much more of a human spirit, than the man who was trying to drive them.

I have not handled horses much for many years; but I told Mrs. Root I was beginning to want a horse. I wish especially to show the world there is at least *one* man who appreciates this wonderful gift that

God bestowed on his children when he gave them such a bright, strong, kind, intelligent, brave animal for a helper.*

Horses, above all other domestic animals, seem to have a sort of dignity about them. When I see their noble traits, and their willingness to endure almost any thing in the way of toil, even when not properly watered and fed, it touches my heart. When somebody confesses to me that his horse has not had a bit of water all day, and yet he is required to keep on with his unremitting hard work, I feel like losing my Christian courtesy and denouncing the man and defending the horse. Oh how I *should* rejoice to see every hard-working horse in our land in charge of a Christian driver — a driver who administers correction lovingly when it is needed, and who *loves* his horses, and loves God *more* because he, in his loving kindness, has given us this grand and noble domestic animal to minister to our wants!

SOME GLIMPSSES OF THE GRAND TRAVERSE REGION.

On the next page are two kodak views of that "cabin in the woods" I have told you so much about.

While my daughter Carrie was looking at the picture she wanted to know which one of the above views shows the front door. Well, I rather think we shall have to call Fig. 1 the *front* door. There is not any highway within a quarter of a mile; but my bicycle-path that leads from the highway runs up to the open door. So I think this must be the front door. In the foreground you get a glimpse of the lawn made of lawn grass and white clover, that I made before Mrs. Root would consent to go there. The two large stones at each side of the peach-tree in the foreground were too heavy to get away handily, so we left one of them for a seat, and the other one goes down into the ground. The peach-tree was very handsome before the foliage dropped off, or most of it, and the same with the other one down in the corner.

When Mrs. Root came on to the ground she insisted on a platform in front of the

*Some of you may get the impression that I would let a horse run over me, and that *he* would soon get to be the *master*; but I assure you you are mistaken. I have remonstrated with my men frequently because they would start out to work without a whip. I would always let a horse see that I had a whip in my hand, or one where I could get hold of it, even if I did not use it. One man made himself hoarse in yelling at his horses to get them to start. After a while they learned to wait till he told them to go ahead about three or four times, and then they would slowly begin to move. I cut a whip for him; and after they saw it in his hand they started up promptly at the first word of command. I believe the horse loves the master *more* who makes him *obey* orders than one who lets him get into the habit of having his own way.

door; then everybody who came in was to scrape his shoes and rub off the sand on the doormat. The paths were all of clean sandy loam; but she said she did not want

there. But that was my mistake. Well, just below the floor line, on the south side, we have two long doors hinged along the top. These can be raised up, and propped

up with a stick so as to look like an awning or porch; and this place under the building we use for a wood-shed on one end and for a tool-house on the other end. When we get through work the tools are all laid in the Daisy wheelbarrow, the swinging door raised up, and tools and all are quickly pushed in out of the rain. The window beside the door is covered with mosquito-netting, as you notice. Just over the roof you get a

glimpse of the chimney, made of white bricks. I hauled the bricks and sand, and a carpenter built the chimney. He objected at first; but when questioned he admitted he

the sand tracked in on the carpet, even if it was so white and clean. Then she wanted a board walk to the out-building. This structure was concealed by shrubbery before the leaves had fallen. At each side of this narrow board walk I raked off some level beds and sowed rye, so we had a very green lawn, even in November. The cornice, corner-posts, window-casings, etc., are painted green to harmonize with the woods; and it made a very pretty contrast with the cedar shingles. When the nights began to be cold we found the cold air coming up through the floor so as to make it rather breezy. First I

shall have to explain that there are no windows on the south side, because I understood her to say she did not want windows

once built a chimney for himself. I told him I thought we two together could make one that would do.

FIG. 2. OUR "CABIN IN THE WOODS." REAR VIEW.

FIG. 1. FRONT VIEW OF "CABIN IN THE WOODS."

Cut No. 2 gives a view of the back door. After we had been a month or more in a single room 14x20 we concluded we ought to have a little room by itself for the cook-stove. We had a few boards and shingles left, and so I made a woodshed that you see just under the window. This woodshed communicates with the cellar under the floor of the main building, so the wood can be pushed through right under the trap-door in front of the kitchen stove as I have explained. The back yard was not slicked up as I meant to have it. We did not get many sunshiny days in November; so when the sun came out from the clouds, I got my camera hastily and took it just as it was. At the right-hand corner you get a glimpse of the

thought it would not burn very fast; but, notwithstanding, it was so hot we could hardly touch the panes of glass in the windows of the buildings, and the shingles be-

DIGGING POTATOES IN THE TRAVERSE REGION.

gan to smoke. Had the wind swung around so as to blow toward the building while the heat was at its greatest (the flames

went almost as high as the tall forest trees). I do not think any thing could have saved our little home; and the wind *did* swing around right toward the building about 20 minutes after the fire was at its height. After two such experiences I think I shall be more careful about burning big log-heaps or locating them so near the dwelling after this. The white spot near the building is where there was a heap of white sand—some we drew up from

THE HILBERT FAMILY IN THE POTATO-FIELD.

remains of the big log-heap. We waited for a day when the wind was away from the house. It was wet and snowy, so we

the bay to build the chimney. Although the soil is all more or less sandy, it is nothing like that very white sand that

comes from the shore of the bay. At the left of the picture, near the top, you get a glimpse of the evergreens mixed in with the beeches and maples. I think no view of the woods is so inviting—I might almost say entrancing—to me as one where evergreens are sprinkled here and there among the deciduous trees. All the soil around that little cabin in every direction is of wonderful fertility. Of course, weeds spring up also, like magic; but where you keep them down, and give the garden stuff a chance, this new woods soil seems to be equal to our old land in Ohio, even when it has tons of manure added. I will now give you some glimpses of cleared land.

I wanted to get a glimpse of the little folks—Jimmie and Gladys Hilbert. I meant to have friend Hilbert also, who holds the potato-fork; but in my desire to get the children and the potatoes I did not get the whole of him. By the way, I do not know but I would give quite a little money to have the readers of GLEANINGS see Jimmie and Gladys, and hear them talk. They are away off all over the farm, up to every thing and into every thing, and they talk like a couple of magpies. I can not tell what they are saying, but they talk back and forth, and understand each other without a bit of trouble. I am learning their language now, however, and can catch on pretty well. By the way, don't you think those are handsome potatoes? This is the crop I told you about on p. 914, last issue—that one of 300 bushels to the acre. The frost caught them or they probably would have made more yet. It was about the finest stand of potatoes I ever saw. There was not a scabby one in the whole field of between three and four acres.

Here is a view of friend Hilbert and his family—three girls and two boys. On the right you see my little friend Alice I have told you about so many times. She did not want her picture taken; but her father made her come up and stand with the rest. It was pretty cold weather, and by some means she had got one of the boys' caps on when I snapped the kodak. Friend Hilbert and the two little chicks, I have already de-

scribed. The young man leaning on his potato-hook is Holly, aged 19, the boy who dug 125 bushels of russet potatoes in less than ten hours. The young lady standing near the basket of potatoes is Miss Erna, aged 14, who picked up the 125 bushels as fast as Holly dug them. Now, don't you think friend Hilbert ought to be a happy man with that nice little family? They are workers, every one of them, and I don't think they ever ought to be scolded—that is, not very hard, even if they are sometimes forgetful, or do not feel like getting up as early in the morning as might be desired.

You see these potatoes are rounded up a little; but they are in a deep oblong pit, so they come but little above the surface of the ground. A little straw is put on, and the dirt is thrown over from each side a foot or more in thickness. Some say six inches of dirt is plenty above the straw—that is, if it is located on a spot where the snow is pret-

100 BUSHELS OR MORE OF RUSSET POTATOES READY TO BE BURIED.

ty sure to be drifted over them during severe weather. In order to hold the snow, the potato-tops are usually spread over the heaps. Friend Hilbert had something like 1000 bushels of those russets on a little over three acres. I have explained that it was done by turning under clover in the fall

*It just occurs to me that we ought to have had Mrs. Hilbert also. I do not believe any of the crowd will feel hurt if I suggest that she is the best-looking one of the whole lot. There, hold on; I think I shall have to except Gladys. Well, Mrs. Hilbert is not only a very pleasant and nice-looking woman, but I tell you she is a hustler. May be friend H. does not know it; but if she had not been right by his side during these years they have struggled from poverty up to very comfortable circumstances, he never could have been standing where he is now, financially and every other way; and I wish to tell him once more that he should thank God from the bottom of his heart for the great blessings that are all round about him.

and sowing rye, and then turning the rye under when it was in blossom. He thinks the rye should have been turned under a little sooner. The russets would then have had more time to grow before the frost, and the straw would have been more thoroughly decayed. As it was, it bothered Holly about digging with a hook, as I have told you. Better turn the rye under before it gets to be hard and woody (say just as it is heading out), if you wish it to decay thoroughly by the time the potatoes are dug. On our Medina clay I have never found rye straw to bother in digging, even though we have sometimes waited until there were small grains in the heads. Well, the prospect now is that friend Hilbert will get toward \$1000 for the potatoes grown on that piece of ground. But, mind you, he can not do it *every* year. A good many times potatoes in the Traverse region bring only 20 cents; and they have sold for 18 cents—yes, *even 15*, when the markets were glutted. A good many are prophesying that the price will be low next year because everybody in that region is going to plant his "whole farm" to potatoes. I am inclined to think, however, if business keeps up generally as it is now, potatoes are not likely to be away down as they were four or five years ago.

SWEET CLOVER—IS IT A VALUABLE PLANT FOR HORSES AND CATTLE AFTER THEY LEARN TO EAT IT?

My request for reports from experience has brought out the following letters:

Mr. Root:—Having seen the statement by C. H. Zurburg, Bishop, Ill., in regard to sweet clover, I would simply say that is exactly the case in this vicinity. I have never known a horse or cow to touch it, although it grows abundantly along the roadside, stems as big as a man's finger, five to six feet high; but the bees gather lots of honey from it. ISAAC PARKER, Lansing, Mich., Sept. 27.

Miss Nellie Adams writes me that, from her 20 colonies, she has taken 2100 pounds of section honey, and that the colonies have the upper and lower stories nearly all filled for winter. She has sold all the crop at good figures. She is the boss bee keeper, I think.

Some time ago you spoke about sweet clover being a good hay for stock. We are just overrun with it, and it is called a nuisance. We are obliged by the trustees to keep it mowed down along the road around each farm; and in all my travels I have found but one man who said his stock would eat it. I have seen cattle tied along my road fences, but the cows would not eat a bit of it if there was a bit of other grass that they could possibly get. I really believe they would starve before they would eat it. But it is a great honey-plant. R. L. MCCOLLEY, Tontogany, O., Oct. 5.

Mr. Root:—I indorse all C. H. Zurburg, of Bishop, Ill., says on page 761, except the starving to death. Stock or man will eat any thing before starving to death, as I witnessed in 1862 to '65. Sweet clover abounds in Western Indiana and Eastern Illinois, greatly to the detriment of the land-holders. We remember to our sorrow the many good things that were said about it in bee-papers. All but the one that it is

good for bees is untrue. I have pulled plants on a four acre lot for thirteen years, to rid the lot of the stuff. I got only three plants in 1901—some hopes. We have the pure stuff, sold and described by bee-papers. Land-owners and tenants are much incensed at those who sowed it and the bee-papers that recommended it. We have to cut it along the highway.

You certainly have had enough evidence, such as Mr Zurburg's, to convince a jury or an honest man. Why should we wish our stock to learn to eat it? You seem to think we should take particular pains to teach stock to eat it, which means starve them to it. That trick of your horses you mention sounds as if you had seed to sell yet. Be honest with God and man. We have had the severest drouth here in 1901 since 1857, yet cows and horses failed to eat sweet clover. Green Hill, Ind., Sept. 21. J. A. JOHNSTON.

Friend J., in the above three letters we certainly have evidence enough, as you say, to convince a jury—that is, if we did not have any witnesses on the *other* side. You say that the trick I mentioned about our horses sounds as if I had seed to sell *yet*. Yes, I have seed to sell, even at the present time. We sell all kinds of clover seed because the clovers are all honey-plants, and valuable ones, and we think we are doing good by furnishing sweet clover, because we believe it is a valuable plant, not only for horses and cattle, notwithstanding the above letters, but because it will bring up poor soil in localities where the land is so poor (or so full of alkali) that no other known plant will grow. I *am* trying to be honest with God and man; and if I had the time I still think I could teach *your* horses and cattle to eat sweet clover. Now please read the two following letters on the other side of the question:

Mr. Root:—I noticed your comment on that sweet-clover letter in GLEANINGS for Sept. 15, and give you my experience with sweet clover.

There is a large irrigating canal running through my ranch, and for several years both banks of it have been a thicket of sweet clover all summer, as the canal runs through cultivated fields, and no stock could get at it while green. The clover finally became so thick that it obstructed the water, and some of the ranchmen cut it with scythes on their places. I had heard of sweet clover being good stock feed, and decided to experiment, as I have nearly half a mile of that canal on my place. I put a wire fence along each side of the ditch, about 20 ft. from the water, thus fencing in the ditch its full length on my land, and left an opening into the feed-corral, where I had two cows and from two to three horses most of the time. The next morning after finishing the fence the two cows started in on that sweet clover, although the mangers were full of good alfalfa hay, and the cows in fine condition. The horses went at it that afternoon. The mangers were kept full all the time, and the stock always had access to them; but you ought to see those ditch banks now. They are as clean as if a mower had been used on them. The cows and horses are fat, and I was saved a job of running a scythe or *armstrong* mower. I have 50 stands of bees, but the clover had to go. P. WILKINSKY.

Farmington, N. M., Oct. 5, 1901.

Mr. Root:—I see that C. H. Zurburg has sweet clover that horses will not eat. My experience is different. Last fall I sowed some five acres in timothy. The winter was hard, and, supposing I would have a light catch in February, I sowed sweet clover, got a fair stand, and more than half a stand of timothy. When the timothy seed was ripe and had begun to fall, the sweet clover was from 18 in. to 2 ft. high. I turned in three horses which had never learned to eat sweet clover. After a few days I noticed they were eating the clover and leaving the other grasses, of which there was an abundance, not only timothy but bluegrass and Bermuda grass; but they ate nothing but the clover until they got the last bit of it, and, owing to the extreme drouth, I fear the sweet clover will be all killed. My buggy horse ate sweet-clover hay greedily the first time he ever saw any.

Bees gave no surplus this season, owing to the dry weather and absence of white clover, which was killed by last winter's freezes and absence of snow to protect it. Aster is blooming, and plenty of it.

Boston Sta., Ky., Sept. 21. M. S. GOSNEY.

These contradictory reports would almost seem to indicate that sweet clover is a different plant in some localities from what it is in others; but we frequently have contradictory reports on the matter, right in the same neighborhood. It certainly makes a difference in regard to the stage of growth at the time it is given to the horses and cattle. When it first comes up, before the stalks have had time to become tough and woody, I have seen it eaten with avidity by any horses or cattle I have offered it—that is, after they found out it was good to eat.

1200 FERRETS. All sizes; some trained; first-class stock. New price list free. N. A. KNAPP, Rochester, Lorain Co., Ohio.

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" & cat. 288 free. W. Chester, Pa.

FENCE! STRONGEST MADE. Bull-tight. Sold to the Farmer at Wholesale Prices. Fully Warranted. Catalog Free. **COLLED SPRING FENCE CO.,** Box 101, Winchester, Indiana, U. S. & C.

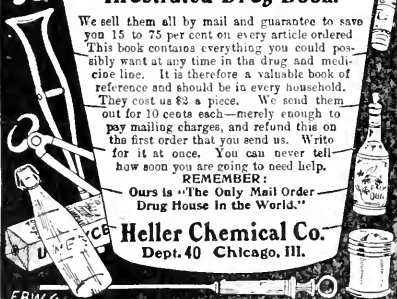

Over 15,000 drugs, medicines, home remedies, tablets, salves, plasters, veterinary remedies, sick room appliances, toilet articles, optical goods, flavoring extracts, paints, oils, etc., are listed in the **Illustrated Drug Book.**

We sell them all by mail and guarantee to save you 15 to 75 per cent on every article ordered. This book contains everything you could possibly want at any time in the drug and medicine line. It is therefore a valuable book of reference and should be in every household. They cost us \$2 a piece. We send them out for 10 cents each—merely enough to pay mailing charges, and refund this on the first order that you send us. Write for it at once. You can never tell how soon you are going to need help.

REMEMBER:
Ours is "The Only Mail Order Drug House in the World."

GREAT CLUBBING OFFERS!

My friends, how many of you are reading some of the many most excellent magazines of the day? If you are reading none, you are missing a great treat. Perhaps you regard them as luxuries. Possibly they are in some instances. They certainly help to fill out our lives, and give to us broader views. They are like windows that allow us to look out over the wide world. This life is not wholly one of dollars and cents—at least it ought not to be. Enjoyment, pure and simple, enjoyed just for the sake of enjoyment, is desirable and beneficial. To many there are few things that are more enjoyable than the bright pages of a really good magazine. To those who wish to give the magazines a trial, and to those who are already reading them, I can offer some of the lowest clubbing rates that have ever been offered. Here is a list of magazines, together with the regular prices at which they are published:

Review of Reviews.....	\$2.50	Cosmopolitan.....	\$1.00
Current Literature.....	\$3.00	Leslie's Popular Monthly.....	1.00
New England Magazine.....	3.00	The Household.....	1.00
Leslie's Weekly.....	4.00	Good Housekeeping.....	1.00
North American Review.....	5.00	The Designer.....	1.00
Success.....	1.00		

If you subscribe for one or more of these magazines, in connection with the Bee-keepers' Review, I can make the following offers:

Success and the Bee-keepers' Review for only.....	\$1.75
Success and any one of the above \$1.00 magazines and the Bee-keepers' Review for only.....	2.50
Success and any two of the above \$1.00 magazines and the Bee-keepers' Review for only.....	3.00
Success and any three of the above \$1.00 magazines and the Bee-keepers' Review for only.....	3.50
Success, Review of Reviews (new), and the Bee-keepers' Review for only.....	3.00
Success, Review of Reviews (old), and the Bee-keepers' Review for only.....	4.00
Success, Current Literature (new), and the Bee-keepers' Review for only.....	3.00
Success, Current Literature (old), and the Bee-keepers' Review for only.....	4.00
Success, the New England Magazine, and the Bee-keepers' Review for only.....	3.00
Success, Review of Reviews (new), any one of the above \$1.00 magazines, and the Review, for only.....	3.50
Success, Leslie's Weekly, and the Bee-keepers' Review for only.....	3.75
Success, Review of Reviews (new), Leslie's Weekly, and the Bee-keepers' Review for only.....	4.75
Success, North American Review (new), Review of Reviews (new), and the Review for only.....	5.00

Magazines will be sent to one or different addresses as desired.

New subscribers to the Review will receive the rest of this year free.

N. B.—For \$1.00 in addition to any of the above offers I will book your order for a Superior Stock queen, to be delivered next spring.

W. Z. Hutchinson, Flint, Michigan.

J. M. JENKINS, Wetumpka, Ala.

Red Glover Queens -FOR- 1902

Warranted Purely Mated.
The Long-Tongue Variety.

How to get One for Only 30 cts.

We have arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all he mails for us will be **warranted** purely mated.

We want every one of the readers of Gleanings in Bee-Culture, who is not now a reader of the old weekly American Bee Journal, to have one of these Superior Red Clover Queens. We have received most excellent reports from the Queens we supplied during the past season. And next year our breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoker.

Orders for these fine, "long-reach" **warranted** Queens will be filled in rotation—"first come, first served"—beginning as early in June, 1902, as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you receive the new queen, no matter from whom you order).

In order that all who are not now readers of the American Bee Journal can have one of these fine Queens, we will make the price **only 30 cents** each, when taken in connection with a year's subscription. That is, send us \$1.30 (if you are a **NEW** subscriber), and we will book your order for a Warranted Queen, and enter your name on our list of subscribers and send you the Bee Journal **every week** from the time we receive your name and \$1.30 **until the end of next year (1902)**. So the sooner you send in your order the more copies of the Bee Journal you will receive. If you have not seen the weekly American Bee Journal, send for a free sample copy. Address,

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

We are headquarters in Chicago for **ROOT'S BEE-KEEPERS' SUPPLIES AT ROOT'S PRICES.**

Catalog Free....

CALIFORNIA SAGE HONEY.

The world again sweetened with our famous sweet. Bees increasing fast. Bee-men very active. Tons of nectar lost for want of bees to gather. The PACIFIC BEE JOURNAL controls thousands of acres of fine field. Many fields to let. A few bees for sale—and climate too. Four hundred pounds to the colony, twenty tons to the 100 colonies in some instances.

Pacific Bee Journal, Los Angeles, Cal.

\$1 per year; 25c for 3 months' trial; 50c this year and six months of 1902; \$1 for this year and all of 1902; with Gleanings, \$1.25 a year.

Subscription Combinations!!

We take pleasure in offering the readers of GLEANINGS a few of our combinations. If you do not see what you want we have a 41-page catalog free for the asking. These prices are for a full year, and may be either for new or renewal, except where stated. Sent to different addresses if desired, and will be mailed direct from the publisher the same as they would if you ordered direct. The offers are made by the publishers, and we are their special agents. Success, Leslie's Monthly, and Cosmopolitan, \$2.00. In the above offer in place of Leslie's or Cosmopolitan you may substitute any of the following: Gleanings, Farm Poultry, Good Housekeeping, Household, Practical Farmer, Designer, Health Culture, Hints, The Era, new subscription to Recreation. Success must be in any list made from above—the others are interchangeable. Everybody's Magazine, Practical Farmer (new subscription), and your choice of a new subscription to either Harper's Bazar, American Boy, Little Folks, or Sunday School Times..... \$1.75
 Gleanings and Great Round World..... 1.99
 Gleanings and Century..... 1.05
 Gleanings and Scribner's..... 3.30
 Gleanings and Outing..... 3.00
 Gleanings and Farm Poultry..... 1.00
 Gleanings and Country Gentleman..... 1.50

Voutas' Companion may be added to any offer for \$1.75, and new subscribers get November and December free, also art calendar. Ladies' Home Journal may be added for \$1.00. McClure's may also be added for \$1.00. By our arrangements with publishers these offers are good until Sept. 1st, 1902. We want to send you our catalog. Ask for it, and address all orders to

C. M. Goodspeed, Eox 791, Skaneateles, N. Y.

FOR SALE.—Will sell cheap, one 10 h p. engine with upright boiler all complete; one 18-inch planer, one saw-table. Inquire of
 J. W. BITTENBENDER, Knoxville, Iowa.

BERMUDA

With cable communication and equable winter temperature of 70 degrees, is reached in 48 hours from New York by the elegant steamers of the Quebec Steamship Company, sailing every ten days up to January, and then every five days. The situation of these islands—south of the Gulf Stream—renders

FROST UNKNOWN,

and the porous coral formation prevents malaria. The Quebec Steamship Company also despatches highest class passenger steamers every ten days for ST. THOMAS, SANTA CRUZ, ST. KITTS, ANTIGUA, GUADALOUPE, DOMINICA, MARTINIQUE, ST. LUCIA, BARBADOS, DEMERARA, and the principal WEST INDIA ISLANDS, affording a charming tropical trip at a cost of about \$4 a day. For descriptive pamphlets, dates of sailing and passages, apply to

A. E. OUTERBRIDGE & CO., Agents,

39 Broadway, New York.

ARTHUR AHERN, Sec., Quebec, Canada.

In this issue, as will be noted, the index for 1901 is omitted; but we will furnish it as an insert in our next issue. Owing to a combination of circumstances it was impossible for us to prepare it as usual for the last number of the year.

MAPLE SUGAR.

There is a great shortage of maple products, both sugar and syrup; and the new crop will not be in for two or three months. We have upward of a ton of nice sugar made up from syrup that was slightly tainted, and with the addition of about 20 per cent of granulated sugar to make it grain. We shall be pleased to mail samples to those interested, and will sell in 100-pound lots or more at 10 cts. per pound.

HONEY MARKET.

We have a good stock of honey, both comb and extracted; and while it has been moving quite freely it has not been going as fast as we should like to see it go. We shall be glad to hear from those interested, stating what quantity you can use, either comb or extracted, and we shall be pleased to give you an attractive price. We still have some 800 cases of the choice thick western honey in cases of 24 sections, with wood slides in place of glass. We have also choice comb honey from New York, Pennsylvania, Alabama, and Michigan. December is usually a good month for honey. If in need, let us hear from you.

GERMAN WAX-PRESS.

We are getting some splendid reports from those who have been trying our new wax-press. Mr. E. T. Flanagan, one of the oldest customers on our books, says: "I have bought goods of you for quite 20 years, but have never received any thing from you that has given me the satisfaction the wax-press has." And he seconds his appreciation by ordering another machine. We have found it impossible to produce a machine thoroughly satisfactory at as low a price as we expected to make. From now on the price will be \$12 each. It will be so listed in our new catalog. If you have many old combs to render, you can pay for it from the increased amount of wax secured the first year.

CATALOG FOR 1902.

The revision of our catalog for 1902 is completed, and we will begin printing them before Jan. 1. It will be some weeks before we get around to our large list of names, but we will do so as early as possible. Among the first to be mailed will be those to our list of subscribers. If you do not get one within a month, let us hear from you. All the matter has been reset, and much of it rewritten, with many new illustrations. Very few changes in prices have been made. Some glass and tin honey-packages formerly listed have been omitted. A new arrangement of hives has been made, which I think will please those who have had difficulty in understanding our system of hive numbers. We continue the same system, but we have arranged right under a picture of each style of hive a table of prices of that hive, nailed and in flat, 8 and 10 frame, in different quantities.

Special Notices by A. I. Root.

MARCH'S CAULIFLOWER AND JERSEY WAKEFIELD CABBAGE SEED.

Last year we bought of friend March \$50 worth of cauliflower seed. It was from his new improved strain of Snowball, the kind that makes a nice white head for every seed you plant, if every thing is favorable. Of course this amount is not very much compared with what some of the large seed-men pay; but it is more than twice as much as we ever sold before. We had also a tremendous lot of orders for March's strain of extra-early Jersey Wakefield cabbage seed; and after buying every ounce of seed he had to spare, we were unable to fill all orders. This season we have

a nice stock of both cabbage and cauliflower seed grown by friend March expressly for us; but to be sure not to be disappointed, perhaps you had better send in your orders early. The practice of growing cold-frame cabbage and cauliflower plants by planting in the fall has been mostly dropped, if I am correct. A later method is to sow the seed in the greenhouse; and when it begins to show the second leaf, transplant to cold-frames and let them grow slowly all winter. This hardens them and gives a big stocky root. The man who gets nice home-grown cabbage and cauliflower in the market first, gets a good profit; and there is always a big demand for nice stocky well-hardened plants in the spring.

Wakefield cabbage seed will be at the old price—20 cts. per oz.; \$2.50 per lb. But this new improved strain of cauliflower seed will be as follows: $\frac{1}{8}$ ounce, 30 cts.; $\frac{1}{4}$ ounce, 50 cts.; 1 ounce, \$1.75. Postage paid at above prices except the cabbage seed by the pound. This will be 10 cents more if wanted by mail.

ANIMAL BREEDING, BY THOMAS SHAW.

The above is the title of a new book just out, by the O. Judd Co. Prof. Shaw, who at present is connected with the University of Minnesota, has made himself well known to our readers, or at least many of them, doubtless, by his book on "weeds" and other valuable books later. See what Prof. Shaw says in his preface in regard to the matter:

Animal breeding is in many of its phases a most intricate subject. While it has its shallows it has also its great depths that have never yet been fathomed. They would take an intellectual giant over his head at the very first plunge. The difficulty, therefore, of writing effectively on such a subject will be at once apparent.

Now, I confess the above gives me confidence in the author of the book. I did not know before that we had a good writer who was honest enough to confess as much as he has in the extract above. The chapter on the "influence of previous impregnation" ought to be worth the price of the book, *even for poultry-breeders*. If we have a flock of white fowls, and a black rooster gets in among them, how much damage will it do, and how long will it last? Prof. Shaw tells us there are good authorities who claim the white hens will be apt to produce speckled chickens all their lives after this one mating. Perhaps that is putting it pretty strong; but with my short experience in such matters I am prepared to accept some such statement.

The book has over 400 pages and about a dozen illustrations. We can mail it from this office for \$1.50. It is probably the most complete and comprehensive work ever published on this subject.

PLANERS

The above cut shows one of our small Planers, of which we make twelve different styles and sizes.

Also large Planers, Band Saws, Buzz Planers, Moulders, Wood Lathes, and all kinds of

CONVENTION NOTICES.

The Wisconsin State Bee-keepers' Association will hold its annual convention in the State Capitol at Madison, Feb. 5 and 6, 1902. The convention promises to be largely attended. Excursion rates of $1\frac{1}{3}$ fare, good for all of the first week in February. All are invited to attend. ADA L. PICKARD, Secretary.
N. E. FRANCE, President.

The California State Bee-keepers' Association will hold its annual convention at the Chamber of Commerce, Los Angeles, on Jan. 15 and 16, 1902. We will try to have a good program. Come, and exchange your bright ideas with your neighbors, and get some of the moss rubbed off your back.

G. S. STUBBLEFIELD, Ptes.

J. F. MCINTYRE, Sec.

The next meeting of the Michigan Bee-keepers' Association will be held at Petosky, January 1 and 2, 1902, and promises to be one of the most interesting meetings in the history of the Association. W. Z. Hutchinson, of the *Bee-keepers' Review*, will be there with his camera, and other prominent men will be there, and we want you to receive this letter as a special invitation to be present. There will be no set program, but such topics as we, as bee-keepers, are interested in, will be taken up and discussed, and we hope you will come prepared to ask questions and answer others. Reduced rates on all railroads. Tickets can be bought Dec. 31 and Jan. 1, good to return not later than Jan. 4. There is no place like these conventions for exchanging views, receiving and imparting knowledge; and as we are all more or less dependent on each other, let us meet in that spirit of friendship and harmony that has always prevailed at our meetings, and make it possible for us to go back to our homes and tell our friends that we were glad we went; that it was just that "feast of reason and flow of soul" that we needed. Trusting that we will meet you there we are Very resp. yours,

GEO. E. HILTON, Pres.
WM. G. VOORHEIS, Sec.
W. Z. HUTCHINSON, Treas.

P. S.—This meeting will be held in the new Normal Hall.

Kind Words from our Customers.

OUR TRANSPLANTING-MACHINE.

Enclosed find \$2.50, for which send me two transplanting-tools. They are the finest thing I ever saw to transplant strawberries with, and nearly every one who has seen them says he must have some. These are for another party.

Alvin, Texas, Sept. 14.

A. J. KIMMONS.

SOMETHING IN REGARD TO THE HOME TALK IN GLEANINGS FOR SEPT. 1.

Mr. A. J. Root:—I have waited some time in order that some older friend and admirer of yours might say something with regard to the criticisms of your Home Talks which came for Sept. 1. As none better able have done so, perhaps you will allow me a chance to ventilate some of my ideas on the subject.

As to Mr. Wm. S. Fehr, he scarcely deserves recognition, for his letter was simply inexcusable. You were altogether too gentle in your reply, as he did not deserve such gentlemanly forbearance. Pray, upon whose authority or example does Mr. Fehr proclaim his *spe dixit* that "it would be better if you were not so quick to see all the handsome women, and talk to all the pretty girls"? Is that not exactly and precisely what they were made for? are not they the absolute perfection of perfect work, from hands whose work is all perfect? Is there a more pleasurable and attractive thing in all God's universe, to a properly constituted man? Why, Mr. Fehr, handsome women were made to be admired. Pretty girls were made to be talked to; and pity the man who does not think so, no matter how old he may be. Of course, it goes without saying that beauty is to be approached decorously and respectfully—yes, *reverently*, as should be every perfect work of our Master's hands; but forbid that any vandal is to teach us to avoid them. If there are any such men, which I do not believe for one moment, I

would not give a piece of drone comb for a Junco brood-nest full of them. Come, come, Mr. Fehr, cure that dyspepsia or else seek a hermitage.
Arbuckle, Cal., Nov. 7.

H. B. JONES.

[Bro. Jones is not quite correct in taking it for granted that no one else has written on the same line that he has in the above.* There has been quite a number of very able articles on the subject; but I have thought best not to give them a place in print, and very likely I would not have given the above were it not for a postscript that he sends along with it. I think it is a little too strong, both the article and the postscript; but as it expresses the feelings of quite a goodly number of our subscribers I have decided to let it pass just as he writes it. Here is the postscript:—]

P. S.—Now see here, Mr. Root. In your usual for-hearing-spirit you will be disinclined to publish this; but will you excuse me if I insist that you should do so, from consideration for the rest of us? Why, how do you suppose we felt on reading that intolerable letter? My wife was so outraged and indignant that she has not been able to cook a good meal since; and many other families are in a similar condition. Why, dear sir, *our* digestions are to be considered, and you have no right, as a fair man, to devote twelve thousand honest gentlemen (more or less) to burnt beef-steak and underdone bread. "Say" (as Ernest says), how would you like it yourself? You have not a particle of "old scratch" in you; but some of us have, and you must let us "claw" back now and then.

I am a small rancher here in the foothills of Colusa Co., where I am almost entirely without frost. I grow oranges, lemons, olives, etc.; I have a few bees which will increase as I learn to manage them. I have your A B C and "Gleanings," which keep us in touch with you. With very much respect

I am yours,

H. B. JONES.

[Will all the dear friends who have so warmly taken my part in the above accept my most hearty thanks?]

Permit me, in this brief footnote, to take the part of Bro. Fehr a little. I think he has some grounds for taking it for granted that, in working for Christ, Jesus and his kingdom, I gave more attention to the "handsome women" and "pretty girls" than I did to mankind in general. One who is filled with the Holy Spirit should give just as much attention—nay, more—to elderly women, those who may be plain in feature and dress—yes, those who may be poor and afflicted. And that is the very thing I have been trying to do—to look up those who seem to have been passed by or overlooked; and may God help me to remember that Jesus died for all. In this line I thank Bro. Fehr for his criticisms along this line of thought.

Free to Poultry-raisers.

Cut green bone has long been recognized as the most valuable of all poultry foods, but only in recent years has there been a machine made which will cut it with ease and rapidity. The Humphrey green-bone and vegetable cutter (the open-hopper machine) has come rapidly to the front, largely because of its guarantee to cut more bone in less time and with less labor than any other, or your money back.

The manufacturers put out a beautiful book describing the machine, the use of green bone, and other poultry topics. It also contains blank pages for a year's record of your poultry. Send for a free copy. Address Humphrey & Sons, Box 51, Joliet, Ill.

A Handsome Helpful Book.

"More Money from Your Hens" is the title of a new book issued by the Stratton Mfg. Co., of Erie, Pa., manufacturer of the well known line of Dandy green-bone cutters. It is attractively printed in two colors, well illustrated, and goes into the question of making poultry profitable, in a very thorough manner. Of course it places special emphasis on the value of freshly cut green bone as an egg producer and growth-promoter. There is no doubt in the minds of poultry-raisers that a little green bone added to the feeding ration is productive of the very best results in two ways; it not only saves in the grain bill, an important feature this fall when grain is high, but it also makes the poultry more productive in every way. It is a double-headed money-maker.

The Dandy bone cutter has been on the market a number of years with increased popularity. It has an automatic feeding device, is strongly and substantially built, has a large cutting capacity, and we know that numerous of our readers have demonstrated that it is a satisfactory machine in every way. You will be interested in the handsome book which they send free.

HONEY QUEENS! Get the Best Queens.

Laws' Long-tongue Leather Queens.
Laws' Improved Golden Queens.
Laws' Holy Land Queens.

Laws' queens are the standard bred queens of America. The largest honey-producers use them and praise them. Laws' queens go everywhere, and can furnish you a queen every month in the year. Four apiaries. Queens bred in their purity. Prices, October to April: Tested or untested, \$1.00 each; 6 for \$5.00. Breeders, none better, \$3.00 each. Address

W. H. Laws, Beeville, Texas.

Dittmer's Foundation !!!

Retail---Wholesale---Jobbing.

I use a PROCESS that produces EVERY ESSENTIAL necessary to make it the BEST and MOST desirable in all respects. My PROCESS and AUTOMATIC MACHINES are my OWN inventions, which enable me to SELL FOUNDATION, and WORK WAX INTO FOUNDATION FOR CASH, at prices that are the lowest. Catalog giving

FULL LINE OF SUPPLIES

with prices and samples, free on application. BEESWAX WANTED.

GUS. DITTMER. AUGUSTA, WIS

Evansville, Ind., Sept. 27th, 1900.

The Jennie Atchley Co., Beeville, Bee Co., Texas:

Dear Friends:—It gives me great pleasure to forward you this unsolicited testimonial regarding the merits of Atchley queens. The three (3) dozen queens purchased of you have made an excellent record for themselves. Not an Atchley queen among the twenty colonies lost during the severe drouth in July. I've bought queens from many breeders; and although the present crop is exceedingly short, the tiers of supers show where the Atchley queens are, and speak volumes for your method of queen-rearing. I find the progeny to be very gentle, strong-winged, uniformly marked, long-lived, of large size, and last, but not least, the best honey-gatherers I ever had. I shall want 100 more next season. Yours fraternally,

J. C. WALLENMEYER.

Prices for Queens.

Tested, \$1.50 each; \$8.00 for 6, or \$15.00 per doz. Untested, February, March, April, and May, \$1.00 each; \$5.00 per 6, or \$9.00 per doz. Fine breeders, \$5.00 each. We have as good bees and queens as money and labor produce. We breed three-band Italians, Golden Carniolans, Cyprians, and Holy-Lands, in their purity, bred in separate yards 5 to 20 miles apart. If you want the best, call for Atchley's improved strains. Safe arrival guaranteed. Send for a sample copy of *The Southland Queen*, the only southern bee-paper, \$1.00 per year. To new subscribers we offer as a premium a nice untested queen in order to get our paper introduced. Catalog, giving queen-rearing and management of apiaries for profit, FREE.

THE JENNIE ATCHLEY CO.,
Beeville, Bee Co., Texas.

KRETCHMER M'FG CO., Red Oak, Iowa.

BEE-SUPPLIES.

Best-equipped factory in the West; carry a large stock and greatest variety of every thing needed in the apiary, assuring BEST goods at the LOWEST prices, and prompt shipment. We want every bee-keeper to have our FREE ILLUSTRATED CATALOG, and read description of Alternating Hives, Ferguson Supers, etc. Write at once for a catalog.

BINGHAM SMOKER.

Dear Sir:—Inclosed find \$1.75. Please send one brass smoke-engine. I have one already. It is the best smoker I ever used. Truly yours,
HENRY SCHMIDT, Hutto, Tex.

MADE TO ORDER

Bingham Brass Smokers.

Made of sheet brass, which does not rust or burn out; should last a lifetime. You need one, but they cost 25 cts. more than tin of the same size. The little open cut shows our brass hinge put on the three larger sizes. No wonder Bingham's four-inch smoke-engine goes without puffing, and does not drop inky drops. The perforated steel fire-grate has 381 holes to air the fuel and support the fire.

Heavy tin smoke-engine, 4-inch stove, per mail, \$1.50; 3½-inch; \$1.10; 3-inch, \$1.00; 2½-inch 90c; 2-inch, 65c. Bingham smokers are the originals, and have all the improvements, and have been the standard of excellence for 22 years. Only three larger ones brass.

T. F. Bingham, Farwell, Michigan.

Books for Bee-keepers and Others.

Any of these books on which postage is not given will be forwarded by mail postpaid, on receipt of price.

In buying books, as every thing else, we are liable to disappointment if we make a purchase without seeing the article. Admitting that the book-seller could read all the books he offers, as he has them for sale, it were hardly to be expected he would be the one to mention all the faults, as well as good things about a book. We very much desire that those who favor us with their patronage shall not be disappointed and therefore we are going to try to prevent it by mentioning all the faults, so far as we can, that the purchaser may know what he is getting. In the following list, books that we approve we have marked with a *; those we especially approve, **; those that are not up to times, †; books that contain but little matter for the price, large type, and much space between the lines, ‡; foreign, §. The bee-books are all good.

As many of the bee-books are sent with other goods by freight or express, incurring no postage, we give prices separately. You will notice that you can judge of the size of the books very well by the amount required for postage on each.

BIBLES, HYMN-BOOKS, AND OTHER GOOD BOOKS.

Postage.]	[Price without postage.
8	Bible, good print, neatly bound..... 20
10	Bunyan's Pilgrim's Progress**..... 40
	Christian's Secret of a Happy Life,** 50c; cloth 1 00
3	John Ploughman's Talks and Pictures, by Rev. C. H. Spurgeon*..... 10
1	Gospel Hymns, consolidated, Nos. 1, 2, 3, and 1, words only; cloth, 10c; paper..... 5
2	Same, board covers..... 20
5	Same, words and music, small type, board cov. 45
10	Same, words and music, board covers..... 75
3	New Testament in pretty flexible covers..... 05
<i>One-third off on all Gospel Hymns mentioned above</i>	
4	New Testament, new version, paper covers..... 10
5	Stepping Heavenward**..... 18
5	Tobacco Manual**..... 45

This is a nice book that will be sure to be read, if left around where the boys get hold of it, and any boy who reads it will be pretty safe from the tobacco habit.

BOOKS ESPECIALLY FOR BEE-KEEPERS.

20	A B C of Bee Culture, cloth..... 1 00
	Advanced Bee Culture, by W. Z. Hutchinson..... 50
3	Amateur Bee-keeper, by J. W. Rouse..... 22
14	Bees and Bee-keeping, by Frank Cheshire, England, Vol. I, §..... 2 36
21	Same, Vol. II, §..... 2 79
	Same, Vols. I. and II., postpaid..... 5 25
10	Bees and Honey, by T. G. Newman..... 65
10	Cook's Manual, cloth..... 1 15
5	Doolittle on Queen-rearing..... 95
2	Dzierzon Theory..... 10
3	Foul Brood; Its Natural History and Rational Treatment..... 22
1	Honey as Food and Medicine..... 05
10	Langstroth Revised, by Chas. Dadant & Son..... 1 10
15	Quinby's New Bee-keeping..... 90
	British Bee-keeper's Guide-book, by Thomas William Cowan, England?..... 40
	The Honey-bee, by Thos. William Cowan..... 95
3	Merrybanks and His Neighbor, by A. I. Root..... 15
	Bienenzucht und Honiggewinnung..... 50

Or "Bee Culture and the Securing of Honey," a German bee-book by J. F. Eggers, of Grand Island, Neb. Postage free.

MISCELLANEOUS HAND-BOOKS.

5	A B C of Carp Culture, by Geo. Finley..... 25
5	A B C of Strawberry Culture,** by T. B. Terry. New edition, revised and enlarged; paper, 45c; cloth, 68c; by mail, 75c.
5	A B C of Potato Culture, Terry** New edition, revised & enlarged; paper, 45c; cloth, 68c, mail 75c. This is T. B. Terry's first and most masterly work.
8	Barn Plans and Out-buildings*..... 90
	Canary birds, paper..... 50
2	Celery for Profit, by T. Greiner**..... 25
The first really full and complete book on celery culture, at a moderate price, that we have had. It is full of pictures, and the whole thing is made so plain that a schoolboy ought to be able to grow paying crops at once without any assistance except from the book.	
15	Draining for Profit and Health, Warring..... 30
10	Fuller's Grape Culturist**..... 1 15

8 | Domestic Economy, by I. H. Mayer, M. D.**... 30
This book ought to save at least the money it costs, each year, in every household. It was written by a doctor, and one who has made the matter of domestic economy a life study. The regular price of the book is \$1.00, but by taking a large lot of them we are enabled to make the price only 30 cents.

10 | Farming for Boys*..... 1 15
This is one of Joseph Harris' happiest productions, and it seems to me that it ought to make farm-life fascinating to any boy who has any sort of taste for gardening.

Farming with Green Manures, postpaid**.....	90
7 Farm, Gardening, and Seed-growing**.....	90
12 Gardening for Pleasure, Henderson*.....	1 10
12 Gardening for Profit**.....	1 10
8 Gardening for Young and Old, Harris**.....	90

This is Joseph Harris' best and happiest effort. Although it goes over the same ground occupied by Peter Henderson, it particularly emphasizes thorough cultivation of the soil in preparing your ground; and this matter of adapting it to young people as well as old is brought out in a most happy vein. If your children have any sort of fancy for gardening it will pay you to make them a present of this book. It has 187 pages and 46 engravings.

3 | Grasses and Clovers, with Notes on Forage Plants..... 20
This is by Henry A. Dreer, author of the book, "Vegetables Under Glass" that has had such a large sale of late. This little book tells how six tons of grass has been grown to the acre, and gives much other valuable matter.

10 | Greenhouse construction, by Prof. Taft**..... 1 15
This book is of recent publication, and is as full and complete in regard to the building of all glass structures as is the next book in regard to their management. Any one who builds even a small structure for plant-growing under glass will save the value of the book by reading it carefully.

12 | Greenhouse Management, by Prof. Taft**..... 1 15
The book is a companion to Greenhouse Construction. It is clear up to the times, contains 400 pages and a great lot of beautiful half-tone engravings. A large part of it is devoted to growing vegetables under glass, especially Grand Rapids lettuce, as well as fruits and flowers. The publisher's price is \$1.50; but as we bought quite a lot of them we can make a special price as above.

5 Garden and Farm Topics, Henderson**.....	60
5 Gregory on Cabbages, paper*.....	20
5 Gregory on Squashes, paper*.....	20
5 Gregory on Onions, paper*.....	20

The above three books, by our friend Gregory, are all valuable. The book on squashes especially is good reading for almost anybody, whether they raise squashes or not. It strikes at the very foundation of success in almost any kind of business.

Handbook for Lumbermen..... 05
5 | Home Pork-making; 125 pages, illustrated..... 40
I think it will pay well for everybody who keeps a pig to have this book. It tells all about the care of the pig, with lots of pictures describing cheap pens, appliances, all about butchering, the latest and most approved short cuts; all about making the pickle, barreling the meat, fixing a smoke-house (from the cheapest barrel up to the most approved arrangement); all about pig-troughs; how to keep them clean with little labor; recipes for cooking pork in every imaginable way, etc. Publisher's price is 50 cents, ours as above.

10 Household Conveniences.....	1 40
15 How to Make the Garden Pay**.....	1 35
2 How to Propagate and Grow Fruit, Green*.....	15
2 Injurious Insects, Cook.....	10
10 Irrigation for the Farm, Garden, and Orchard*.....	85

By Stewart. This book, so far as I am informed, is almost the only work on this matter that is attracting so much interest, especially recently. Using water from springs, brooks, or windmills to take the place of rain, during our great drouths, is the great problem before us at the present day. The book has 274 pages and 142 cuts.

3 Maple Sugar and the Sugar-bush**.....	32
4 Peabody's Webster's Dictionary.....	10

Over 30,000 words and 250 illustrations.

5 | Manures; How to Make and How to Use
 Them; in paper covers..... 30

6 | The same in cloth covers..... 65

6 | Nut Culture-1, postpaid..... 1 50

3 | Onions for Profit**..... 40

Fully up to the times, and includes both the old onion culture and the new method. The book is fully illustrated, and written with all the enthusiasm and interest that characterizes its author, T. Greiner. Even if one is not particularly interested in the business, almost any person who picks up Greiner's books will like to read them through.

| Our Farming, by T. B. Terry**..... 1 50

In which he tells "how we have made a run-down farm bring both profit and pleasure."

If ordered by express or freight with other goods, 10c less.

1 | Poultry for Pleasure and Profit.**..... 10

8 | Practical Floriculture, Henderson.* 10

10 | Profits in Poultry.* 75

1 | Silk and the Silkworm 10

10 | Small-Fruit Culturist, Fuller 75

2 | Sorghum, Stock Beets, Strawberries, and Cement Floors. By Waldo F. Brown..... 08

10 | Talks on Mannes* 35

10 | The New Agriculture; or, the Waters Led Captive (a \$1.50 book) 40

11 | The New Egg-Farm, Stoddard**..... 70

This is an enlarged edition of the 50-cent book published 25 or 30 years ago by H. H. Stoddard. If I could have only one poultry-book it would be the New Egg-farm. This book is of special value to me because it not only discusses most emphatically the value of *exercise* to poultry, but it touches on the value of exercise to all other animated nature including humanity. The book has over 300 pages and 150 illustrations. It is entirely different from any other poultry-book in the world, inasmuch as it discusses mechanical contrivances so that all the varied operations of a poultry-farm may be done as much as possible with the aid of machinery. The regular price is \$1.00, but by buying a quantity we are able to furnish it at price given.

2 | Treatise on the Horse and his Diseases..... 10

5 | Tile Drainage, by W. I. Chamberlain..... 35

Fully illustrated, containing every thing of importance clear up to the present date.

The single chapter on digging ditches, with the illustrations given by Prof. Chamberlain should alone make the book worth what it costs, to every one who has occasion to lay ten rods or more of tile. There is as much science in digging as in doing almost any thing else; and by following the plan directed in the book, one man will often do as much as two men without this knowledge.

5 | Tomato Culture 35

In three parts Part first.—By J. W. Day, of Crystal Springs, Miss., treats of tomato culture in the South, with some remarks by A. I. Root, adapting it to the North. Part second.—By D. Cummins, of Conneaut., O., treats of tomato culture especially for canning-factories Part third—By A. I. Root, treats of plant-growing for market, and high-pressure gardening in general.

3 | Vegetables under Glass, by H. A. Dreer**..... 20

3 | Vegetables in the Open Air*..... 20

This is a sort of companion book to the one above. Both books are most fully illustrated, and are exceedingly valuable, especially at the very low price at which they are sold. The author, H. A. Dreer, has a greenhouse of his own that covers one solid acre, and he is pretty well conversant with all the arrangements and plans for protecting stuff from the weather, and afterward handling to the best advantage when the weather will permit out of doors.

3 | Winter Care of Horses and Cattle..... 25

This is friend Terry's second book in regard to farm matters; but it is so intimately connected with his potato-book that it reads almost like a sequel to it. If you have only a horse or a cow, I think it will pay you to invest in a book. It has 44 pages and 4 cuts.

3 | Wood's Common Objects of the Microscope**.. 47

8 | What to Do and How to be Happy While doing It, by A. I. Root 65

THE A. I. ROOT CO., MEDINA, O.

The A B C of Bee Culture

1900 Edition. 500 Pages.
The only Encyclopædia on Bees.

The last edition, 5000 copies, issued in October, 1899, was exhausted in the short space of one year. Even before the edition was out of the press, 1500 copies had been sold; and before thirty days had passed, 1000 more copies were taken. We immediately set to work to print a new edition. While the edition of 1899 was more thoroughly revised than any previous one, that for 1900 has received even larger additions of new matter, so that the book from beginning to end is almost entirely new. It now contains 500 double-column pages. It has been most carefully gone over by Dr. C. C. Miller, who has prepared a new set of comments, and by Prof. A. J. Cook, of Pomona College, Cal. As before, old subjects have been rewritten. Descriptions of obsolete methods have in all cases been stricken out, and the very latest put in their place.

This 1900 Edition Marks the 75th Thousand.

While the book has been enlarged, and hundreds of pages have been rewritten and revised, the price will be the same as before: \$1.20 postpaid, or \$1.00 by express or freight with other goods; or when sent with our journal, GLEANINGS IN BEE CULTURE, which is a constant appendix to the A B C book, a journal beautifully printed and illustrated, 42 pages, for the very low price of \$1.75 for the two. For quantity of up-to-date bee-literature there is nothing else offered at this low price.

The A. I. Root Co., Medina, Ohio, U. S. A.
